Thin-Lens Theory

4.1 Definition of a Thin Lens

A *thin lens* is a lens whose thickness is assumed to be zero and therefore is negligible. The thin lens is a design tool, used to simulate a real lens during the preliminary stages of optical system design and analysis. This concept is particularly valuable because it enables the optical engineer to quickly establish many basic characteristics of a lens or optical system design. By assuming a lens form where the thickness is zero, the formulas used to calculate object and image relationships are greatly simplified. The drawback to the thin-lens approach is that it is not possible to determine image quality without including the actual lens thickness (and other lens data) in the calculations. As a result, while it is possible to establish many valuable facts about an optical system through the application of thin-lens theory and formulas, the ultimate quality of the image can, at best, only be estimated.

4.2 Properties of a Thin Lens

Figure 4-1 is an illustration of a positive thin lens. Any lens or system analysis must start with several known factors which will generally be provided by the end user, or the customer. From these given factors it will be possible, using thin-lens theory and formulas, to generate the missing information required to completely describe the final lens system. In the case shown in Fig. 4-1, for example, it is given that the system detector (image size) will be 25 mm in diameter and that the full

Figure 4-1. Shown are the basic parameters of the thin lens. In the example discussed in the text, the image size y_i , the field of view θ , and the lens speed (f-number) are given. From these it is possible to determine the focal length (EFL) and diameter (D) of the lens.

field of view for the dealing with required number) of $f/2.0$. Fig. 4-1, since we derive the lens effect for this calculation y_i . In this case the field of view (θ) is the formula:

The diameter of based on the follow

Having now established this lens system, one that meets those specific requirements of the design would be in

4.3 Aperture Entrance and Field Stop

Any lens assembly element, that limits the of light rays originating pass through the lens shown in Fig. 4-1, a in front of the lens. lens would be able to Frequently the aperture diaphragm. This all

Explore Litigation Insights

Docket Alarm provides insights to develop a more informed litigation strategy and the peace of mind of knowing you're on top of things.

Real-Time Litigation Alerts

Keep your litigation team up-to-date with **real-time alerts** and advanced team management tools built for the enterprise, all while greatly reducing PACER spend.

Our comprehensive service means we can handle Federal, State, and Administrative courts across the country.

Advanced Docket Research

With over 230 million records, Docket Alarm's cloud-native docket research platform finds what other services can't. Coverage includes Federal, State, plus PTAB, TTAB, ITC and NLRB decisions, all in one place.

Identify arguments that have been successful in the past with full text, pinpoint searching. Link to case law cited within any court document via Fastcase.

Analytics At Your Fingertips

Learn what happened the last time a particular judge, opposing counsel or company faced cases similar to yours.

Advanced out-of-the-box PTAB and TTAB analytics are always at your fingertips.

API

Docket Alarm offers a powerful API (application programming interface) to developers that want to integrate case filings into their apps.

LAW FIRMS

Build custom dashboards for your attorneys and clients with live data direct from the court.

Automate many repetitive legal tasks like conflict checks, document management, and marketing.

FINANCIAL INSTITUTIONS

Litigation and bankruptcy checks for companies and debtors.

E-DISCOVERY AND LEGAL VENDORS

Sync your system to PACER to automate legal marketing.
