This request must be signed in compliance with 37 CFR 1.33(b) and submitted with the application **upon filing.** 

Applicant may rescind this nonpublication request at any time. If applicant rescinds a request that an application not be published under 35 U.S.C. 122(b), the application will be scheduled for publication at eighteen months from the earliest claimed filing date for which a benefit is claimed.

If applicant subsequently files an application directed to the invention disclosed in the attached application in another country, or under a multilateral international agreement, that requires publication of applications eighteen months after filing, the applicant **must** notify the United States Patent and Trademark Office of such filing within forty-five (45) days after the date of the filing of such foreign or international application. **Failure to do so will result in abandonment of this application (35 U.S.C. 122(b)(2)(B)(iii)).** 

Burden Hour Statement: This collection of information is required by 37 CFR 1.213(a). The information is used by the public to request that an application not be published under 35 U.S.C. 122(b) (and the PTO to process that request). Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.14. This form is estimated to take 6 minutes to complete. This time will vary depending upon the needs of the individual case. Any comments on the amount of time you are required to complete this form should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, Washington, DC 20231. DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. SEND TO: Assistant Commissioner for Patents, Washington, DC 20231.

This correspondence is being deposited with the United States Postal Service as Express Mail addressed to: Mail Stop Patent Application, Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450, on <u>December 16</u>, 2003, Express Mail Receipt No. ER 452602378 US.

## RELAYING KEY CODE SIGNALS THROUGH A REMOTE CONTROL DEVICE

Daniel SauFu Mui

### TECHNICAL FIELD

[0001] The present invention relates generally to remote control devices and, more specifically, to relaying key code signals through a remote control device to operate an electronic consumer device.

#### BACKGROUND

[0002] Most households today possess multiple types of electronic consumer devices, such as televisions, stereo radios, digital video disk players, video cassette recorders, set-top cable television boxes and set-top satellite boxes. Manufacturers of such electronic devices typically supply a remote control device along with each electronic device. It is, therefore, common for a consumer who has multiple electronic devices to have multiple remote control devices.

[0003] A remote control device typically controls a selected electronic consumer device by transmitting infrared key code signals to the selected electronic consumer device. The infrared signals contain key codes of a codeset associated with the selected electronic consumer device. Each key code corresponds to a function of the selected electronic device, such as power on, power off, volume up, volume down, play, stop, select, channel up, channel down, etc. In order to avoid the situation where a

1

PATENT

#### ZIL-568

remote control device unintentionally operates an electronic consumer device that is associated with a different remote control device, manufacturers sometimes use distinct codesets for the communication between various electronic consumer devices and their associated remote control devices. The codesets can differ from each other not only by the bit patterns assigned to various functions of the associated electronic consumer device, but also by the timing information that describes how the key codes should be modulated onto carrier signals to generate key code signals.

[0004] Consumers may find it inconvenient to operate their electronic devices using multiple remote control devices. Thus, a consumer may wish to operate multiple electronic consumer devices using a single remote control device. A single remote control device can store many codesets so that the remote control device can control a corresponding large number of different electronic consumer devices. There are, however, thousands of codesets in use in electronic consumer devices today. Manufacturers of remote control devices, however, may wish to limit the memory on their remote control devices to a size that is insufficient to store the thousands of existing codesets.

[0005] A system is sought for enabling a remote control device to control a selected one of multiple different electronic consumer devices without requiring the codeset associated with the selected electronic consumer device to be stored on the remote control device.

#### SUMMARY

[0006] A system for relaying a key code through a remote control device to an electronic consumer device allows the

2

electronic consumer device to be controlled without storing the associated codeset on the remote control device. Upon receiving a keystroke indicator signal from a remote control device, a key code generator device, such as a settop box, identifies the particular codeset usable to communicate with the selected electronic consumer device. The keystroke indicator signal contains an indication of a key on the remote control device that was pressed, which corresponds to a function of the selected electronic consumer device. Using the identified codeset and the indication of the pressed key, the key code generator device generates a key code and modulates that key code onto a radio frequency carrier signal, thereby generating a first key code signal. The remote control device receives the first key code signal from the key code generator device and modulates the key code onto an infrared frequency carrier signal, thereby generating a second key code signal. The remote control device relays the key code to the selected electronic consumer device in the second key code signal. The key code causes the selected electronic consumer device to perform the desired function. The key code is not stored on the remote control device in a permanent manner, but rather then key code is relayed through the remote control device.

[0007] In another embodiment, a third key code signal (which may, for example, be a radio frequency signal) is communicated directly from the key code generator device to an electronic consumer device. A key code contained in the third key code signal causes the electronic consumer device to perform a desired function.

[0008] In yet another embodiment, the system automatically determines which codeset is usable to communicate with a

3

PATENT

selected electronic consumer device. The key code generator device sends key codes for one particular function from among a series of codesets one-by-one to the selected electronic consumer device. When the key code from one of the codesets causes the electronic consumer device to perform the desired function, electromagnetic noise is introduced into electrical power wiring through which both the electronic consumer device and the key code generator device receive power. When the key code generator device detects this noise on the electrical power wiring, the key code generator device identifies the codeset corresponding to the last transmitted key code to be the codeset usable to communicate with the selected electronic consumer device.

[0009] Other embodiments and advantages are described in the detailed description below. This summary does not purport to define the invention. The invention is defined by the claims.

#### BRIEF DESCRIPTION OF THE DRAWINGS

[0010] The accompanying drawings, where like numerals indicate like components, illustrate embodiments of the invention.

[0011] Figure 1 is a schematic diagram of a system for relaying key code signals through a remote control device. [0012] Figure 2 is a flowchart of a method for relaying key code signals through a remote control device.

[0013] Figure 3 is an illustration of a key code transmitted within a key code signal.

[0014] Figure 4 is a waveform diagram of a first example of a key code signal transmitted by a remote control device in the system of figure 1.

4

#### PATENT

[0015] Figure 5 is a waveform diagram of a second example of a key code signal transmitted by a remote control device in the system of figure 1.

[0016] Figure 6A is an illustration of a modulated digital zero and digital one within the key code signal of figure 5.

[0017] Figure 6B is a more detailed illustration of a mark of a modulated digital zero within the key code signal of figure 5.

#### DETAILED DESCRIPTION

[0018] Reference will now be made in detail to some embodiments of the invention, examples of which are illustrated in the accompanying drawings.

[0019] Figure 1 is a diagram of a system 10 for relaying a key code through a remote control device 11 to an electronic consumer device in accordance with the present invention. Figure 2 is a flowchart that illustrates a method of operation of system 10. System 10 includes a key code generator device 12, remote control device 11, a first electronic consumer device 13 and a second electronic consumer device 14. In this example, second electronic consumer device 14 is a television set. [0020] In a first step (step 100), key code generator device 12 determines the appropriate codeset that controls the type, brand and model of the particular electronic consumer device that is to be controlled. A user uses remote control device 11 to respond to an on-screen display 15 on the screen of television set 14 to step through a sequence of menu screens to identify the codeset corresponding to the device that is to be controlled. The user does this by identifying, on on-screen display 15, the

5

type, brand and model of the particular electronic consumer device. In this example, the user is identifying first electronic consumer device 13, which is a video cassette recorder (VCR) manufactured by Sony with model number 8000. In figure 1, the user is identifying the device type by highlighting the choice "VCR" on the on-screen display. In another example, subsequent to controlling VCR 13, the user may wish to control television set 14, which is a "Gold" model manufactured by RCA. In that case, the user begins identifying television set 14 by highlighting the choice "TV".

[0021] In the present example, key code generator device 12 is a set-top box. Key code generator device 12 generates the on-screen displays and communicates with television set 14 such that key code generator device 12 identifies one of a plurality of codesets that corresponds to one of the electronic consumer devices identified by the user, such as VCR 13 or television set 14. System 10 uses the appropriate codeset to enable remote control device 11 to communicate with VCR 13 and television set 14.

[0022] Next (step 101), the user presses a key on remote control device 11. This key is associated with a function that the user wants performed by an electronic consumer device. For example, the function may be to turn on the power of VCR 13. When the user presses the "VCR power-on" key on remote control device 11, remote control device 11 transmits a keystroke indicator signal 16 from a radio frequency (RF) transmitter 17 on remote control device 11. Alternatively, two or more keys on remote control device 11 may be associated with a single function, such as turning on the power of VCR 13. In that case, the user presses a "VCR" key and then a "power-on" key to cause remote control

6

device 11 to transmit keystroke indicator signal 16. Keystroke indicator signal 16 is transmitted as a signal in a radio frequency band to an RF receiver 18 on key code generator device 12.

[0023] There are multiple forms in which an indication of the pressed key, as well as the identity of the electronic consumer device that is to perform the associated function, can be communicated in keystroke indicator signal 16 from remote control device 11 to key code generator device 12. In one embodiment, the indication of the pressed key is a key code comprised of a standardized system code and standardized key data. In the present example, the standardized system code identifies the type of electronic consumer device that is to be controlled, such as a TV, a VCR, a DVD player, a stereo amplifier, a satellite receiver or a cable receiver. The standardized system code and key data are part of a commonly used codeset that is stored on remote control device 11. Remote control device 11 uses any one of a number of commonly used modulation techniques to modulate the system code and key data to form keystroke indicator signal 16. For example, a microcontroller on remote control device 11 uses timing information associated with the commonly used codeset to generate a pulse width modulated keystroke indicator signal 16.

[0024] In another embodiment, the indication of the pressed key includes a proprietary identification code identifying the pressed key, as well as a proprietary identification code corresponding to the type of the electronic consumer device that is to be controlled. The proprietary identification codes are understood by key code generator device 12, but are not standardized codes that are understood by electronic consumer devices. Remote control

7

PATENT

device 11 uses any one of a number of commonly used modulation techniques to modulate the proprietary identification codes onto keystroke indicator signal 16. [0025] Whether remote control device 11 communicates with key code generator device 12 through a standardized codeset or through proprietary identification codes, codes may be included that do not correspond to pressed keys or functions that are to be performed on electronic consumer devices. For example, in response to receiving any signal from remote control device 11, key code generator device 12 may return a code to remote control device 11 causing a light emitting diode (LED) display on remote control device 11 to turn on.

[0026] Next (step 102), key code generator device 12 determines which key code of the codeset previously identified in step 100 corresponds to the pressed key. [0027] Figure 3 illustrates one example of a key code from a commonly used codeset. The key code is comprised of a standardized system code and standardized key data. Both the system code and the key data are digital values. The 12-bit key code includes a 4-bit system code [0101] and 8bit key data [00011100]. In the present example, the key code is the key code in the identified codeset that corresponds to the "VCR power-on" key of remote control device 11.

[0028] Next (step 103), key code generator device 12 modulates the key code for the power-on function of VCR 13 onto a first carrier signal, thereby generating a first key code signal 19. In this example, the first carrier signal is an RF signal. An RF signal for purposes of this patent document is an electromagnetic signal having a frequency between thirty hertz and three hundred gigahertz.

8

[0029] Figure 4 and figure 5 illustrate key code signal 19 in two specific embodiments. In both embodiments, the key code is transmitted as a stream of digital values 010100011100, where the system code is transmitted first immediately followed by the key data without any place holders between them. The standardized system code determined in step 102 need not identify the brand or model of VCR 13, but only the fact that first electronic consumer device 13 is a VCR. The key code is modulated in step 103 using timing information associated with the codeset for VCR 13. Thus, the particular brand and model of VCR 13 is able to understand the key code modulated using the appropriate timing information.

[0030] In the embodiment of figure 4, key code signal 19 is a 15-bit binary transmission whose bit pattern appears as a universal asynchronous receiver and transmitter (UART) type communication. The binary transmission begins with a start bit and ends with a parity bit and a stop bit. The parity bit is calculated based on the 12-bit key code within the binary transmission. In this example, the value of the parity bit is a digital zero. An intermediary signal is transmitted over the first carrier signal at an intermediary frequency (for example, 100 kHz) to communicate a digital one. The absence of the intermediary signal indicates a digital zero. The intermediary signal has a lower frequency than the first carrier signal. [0031] In the embodiment of figure 5, the 12-bit key code is modulated onto key code signal 19 using pulse width modulation. Digital ones and zeros are characterized by pairs of marks and spaces. The period between successive leading edges of the bursts in a mark is the period of an

9

intermediary signal. The intermediary signal has an intermediary frequency. In a space, there are no bursts. [0032] Figure 6A shows a digital zero and a digital one in key code signal 19 of figure 5 in more detail. A "mark/space" pair represents a digital zero and another "mark/space" pair represents a digital one. The marks and spaces of each pair have predetermined lengths. In the embodiment of figure 5, the mark length of a digital zero is 490 microseconds, and the mark length of a digital zero is 3940 microseconds. The space length of a digital zero is 950 microseconds, and the space length of a digital one is 2000 microseconds.

[0033] Figure 6B shows the bursts of the first carrier signal that comprise the intermediary signal in more detail. In the embodiment of figure 5, the bursts that comprise the intermediary signal occur every ten microseconds, resulting in an intermediary frequency of 100 kilohertz. The duty cycle of the intermediary signal is characterized by an "on time" of four microseconds and an "off time" of six microseconds. There are forty-nine bursts of the carrier signal within each mark length of 490 microseconds.

[0034] Timing information other than that shown in the embodiment of figure 5 can also be used. For example, one common form of pulse width modulation uses an intermediary signal having a frequency of about 38.5 kilohertz. Each period of the intermediary signal has an "on time" of ten microseconds and an "off time" of sixteen microseconds. If such an intermediary signal were used to generate a 490 microsecond mark length of a digital zero shown in figure 6A, there would be 19 bursts of the intermediary signal in the mark. Similarly, if such an intermediary signal were

10

PATENT

used to generate a 3940 microsecond mark length of a digital one shown in figure 6A, there would be 151 bursts of the intermediary signal in the mark.

[0035] Next (step 104), an RF transmitter 20 of key code generator device 12 transmits first key code signal 19 in the form of an RF transmission to an RF receiver 21 on remote control device 11.

[0036] Next (step 105), remote control device 11 receives first key code signal 19 and relays the key code communicated by first key code signal 19 to VCR 13 in the form of a second key code signal 22. Remote control device 11 is a slave to key code generator device 12. Remote control device 11 relays the key code by receiving first key code signal 19 in RF form and translating the communicated key code so that the key code is modulated onto a second carrier signal resulting in second key code signal 22. In this example, the second carrier signal is an infrared signal with a frequency in the range between three hundred gigahertz and three hundred terahertz. Second key code signal 22 is transmitted by an IR transmitter 23 on remote control device 11 to VCR 13. In the embodiment of figure 5, key code signal 19 is converted into key code signal 22 by forming the bursts of the intermediary signal using the second carrier signal with an infrared frequency in the place of the first carrier signal with a radio frequency. For both key code signal 19 and key code signal 22, digital ones and digital zeros are modulated using the same timing for "mark/space" pairs. The waveform diagram of key code signal 22 appears the same as the waveform diagram shown in figure 5 for key code signal 19; only the frequency of the carrier signal that forms the bursts is different.

11

[0037] Next (step 106), second key code signal 22 is received onto electronic consumer device (VCR) 13 by an IR receiver 24.

[0038] Next (step 107), IR receiver 24 on VCR 13 recovers the key code from second key code signal 22. VCR 13 is thereby instructed to perform the function desired by the user. In this example, the function is to power on VCR 13. Other key codes, however, correspond to other functions, such as power off, channel advance, channel back, volume up, volume down, cursor up, cursor down, cursor right, cursor left, select, play, record, stop, forward, rewind and pause.

[0039] In a second example, an electronic consumer device is controlled by an RF key code signal transmitted from key code generator device 12. Subsequent to controlling VCR 13, the user wishes to control second electronic consumer device 14, which is a "Gold" model RCA television set. In the second example, the user uses the on-screen display 15 to identify the type (TV), brand (RCA) and model (Gold) of second electronic consumer device 14. Key code generator device 12 determines the appropriate codeset that controls television set 14. The user then presses a key on remote control device 11 associated with a function that the user wants performed by television set 14. For example, the function is to advance the channel of television set 14. When the user presses the channel advance key on remote control device 11, an indication of the pressed key is transmitted in an RF keystroke indicator signal from remote control device 11 to key code generator device 12. [0040] Key code generator device 12 then determines which key code of the identified codeset corresponds to the pressed key. Key code generator device 12 modulates the

12

PATENT

key code for the channel advance function onto an RF carrier signal, thereby generating a third key code signal 25. Key code generator device 12 uses the same modulation technique to generate both third key code signal 25 and first key code signal 19. Third key code signal 25 is modulated using timing information associated with the codeset that controls RCA Gold television set 14. [0041] In this second example, television set 14 has an RF receiver 26 and is capable of receiving RF key code signals. RF transmitter 20 of key code generator device 12 transmits third key code signal 25 directly to television Third key code signal 25 is received onto set 14. television set 14 by RF receiver 26, and RF receiver 26 recovers the key code from third key code signal 25. Television set 14 is thereby instructed to advance the channel.

[0042] Although remote control device 11 in the first example stores either a proprietary codeset or a standardized codeset and uses that codeset to generate keystroke indicator signal 16, remote control device 11 stores only that single codeset. This codeset is the codeset used by key code generator device 12 to receive communications from remote control device 11. Remote control device 11 can therefore be made inexpensively and may contain a relatively small amount of memory. The memory may, for example, be read only memory (ROM) on a microcontroller integrated circuit (for example, a Z8 microcontroller available from Zilog, Inc. of San Jose, CA.)

[0043] Even though remote control device 11 stores only a single codeset, system 10 of figure 1 nevertheless allows remote control device 11 to control the desired electronic

13

consumer device 13, which may use any one of thousands of different codesets. Key code generator device 12 may, for example, include a hard disk or other mass storage device that stores thousands of possible codesets. The user may use remote control device 11 to select any one of those codesets for communication with the particular electronic In comparison to some conventional consumer device 13. systems where codesets are downloaded into a universal remote control device from a personal computer or other device that is not normally part of an entertainment system, system 10 uses preexisting hardware of the entertainment system (such as the on-screen display functionality, data storage capability, and wireless communication ability of the set-top box) to source and identify codesets.

[0044] Although the specific embodiments of figures 1 and 2 are explained above in connection with the codesets being identified to the key code generator device 12 using an onscreen display, the codeset usable to communicate with an electronic consumer device may be identified to key code generator device 12 in other ways in other embodiments. In one embodiment, for example, the key code generator device includes autoscan functionality. Key code generator device 12 includes an EMI detector 27 that detects electromagnetic interference (EMI) or noise on power cord 28. Power cord 28 is a power cord through which key code generator device 12 receives electrical power from a wall socket 29. Similarly, television set 14 receives power from another wall socket 30 via a power cord 31. VCR 13 receives power from a wall socket 32 via another power cord 33. In accordance with the autoscan functionality, key code generator device 12 identifies the codeset used to

14

PATENT

communicate with a particular electronic consumer device by generating and transmitting a sequence of key code signals relayed through remote control device 11 to the electronic consumer device to be controlled (in this case VCR 13). Each of these key code signals contains a different key code corresponding to the same desired function on different device types, brands and models. [0045] In one example, the desired function is the function of powering on VCR 13. The key code generator device 12 sends the power-on key codes for each of a series of codesets one-by-one to VCR 13. When the key code for one of the codesets causes VCR 13 to perform the desired function (in this case, to power on), VCR 13 introduces noise or other electromagnetic interference via cord 33 into wall socket 32. The power terminal within wall socket 32 is connected through wiring 34 to the power terminal in wall socket 29. The noise generated by VCR 13 is therefore communicated through wiring 34, the power terminal of wall socket 29 and power cord 28 to EMI detector 27 on key code generator device 12. When key code generator device 12 detects the electromagnetic interference on power cord 28, key code generator device 12 automatically identifies the codeset used by VCR 13 as the codeset used to communicate the last key code signal for the power-on function. [0046] Multiple electronic consumer devices may have the same key data for a particular function, for example, the power-on function. A key code, however, also contains a system code (see figure 3) that corresponds to a particular type of electronic consumer device. For example, the system code used for a television set will typically be different than the system code used for a video cassette recorder. Thus, different device types that use the same

15

key data for the power-on function will not respond to a key code containing an incorrect system code. Each of the power-on key codes transmitted in this example by key code generator device 12 contains the system code for a video cassette recorder, so television set 14 does not recognize the key codes. Because key code generator device 12 is aware of the system code communicated, key code generator device 12 determines that it was VCR 13 that was powered on and not television 14.

In another example, the codeset usable to [0047] communicate with VCR 13 is identified to key code generator device 12 using autoscan functionality that does not involve key code generator device 12 having a specialized EMI detection circuit. In that case, the user may be prompted by successive screens of on screen display 15 to push the power-on key on remote control device 11 multiple times. Each time the power-on key is pressed, keystroke indicator signal 16 communicates this to key code generator device 12. Key code generator device 12 in turn generates and transmits a key code signal containing a power-on key code using a different codeset. Each key code signal is relayed through remote control device 11 to the particular electronic consumer device to be controlled. One by one the user is prompted to push the power-on key, and key code generator device 12 in turn generates key codes using different codesets until the electronic consumer device performs a desired function. In this case, first electronic consumer device 13 turns on. The user is prompted not to press the power-on key once the user sees the desired function being performed by first electronic consumer device 13. In the present example, light emitting diodes (LEDs) on the face of VCR 13 may be illuminated to

16

indicate to the user that VCR 13 has powered on. When the user stops pressing the power-on key, then the key code generator device 12 identifies the codeset of the last transmitted key code to be the codeset used by the electronic consumer device.

[0048] In another example, the user presses keys on remote control device 11 to communicate to key code generator device 12 a 3-digit codeset identification number identifying the codeset. The user may determine this codeset identification number by looking up the codeset identification number in a booklet supplied along with the electronic consumer device to be controlled. Alternatively, a table of manufacturers, model numbers and

their associated codesets may be used to lookup the codeset identification number.

[0049] In an embodiment where key code generator device 12 is a set-top box, the set-top box receives a video input signal 35 from a cable television coaxial cable 36. Video input signal 35 is ultimately delivered to television set 14 through cables 37. Coaxial cable 36 is also used to provide networking connectivity between the set-top box and a network 38. Network 38 may, for example, be or include the Internet. A database of codesets 39 is maintained at a remote location. As new electronic consumer devices are introduced onto the market, new codesets may be necessary to communicate with these new devices. So that one such new codeset can be distributed from database of codesets 39 when a new electronic consumer device is introduced into the market, this new codeset is communicated via network 38 and coaxial cable 36 to key code generator device 12. The new codeset is then stored on a mass storage hard disk within the set-top box. In this way, the pre-existing and

17

inexpensive remote control device 11 can be used to control a new electronic consumer device whose required codeset did not exist at the time remote control device 11 and key code generator device 12 were delivered to the user.

[0050] In yet another embodiment, remote control device 11 is a learning remote control device that includes an IR detector 40. In accordance with one method, the learning remote control device 11 is placed so that IR detector 40 can receive an IR transmission from an IR transmitter of another remote control device. Keys corresponding to key codes to be learned are pressed on the other remote control device such that successive key code signals are transmitted from the IR transmitter of the other remote control device to IR detector 40 of the learning remote control device 11. Learning remote control device 11 detects when the envelope of the bursts of the received IR signal changes from low to high and high to low. The time duration between each successive transition is stored such that a key code signal is recorded as timing information for a series of mark lengths and space lengths. As the various keys of the remote control device to be learned are pressed, learning remote control device 11 records successive strings of timing information. The resulting strings of timing information, once collected on learning remote control device 11, are automatically transmitted from learning remote control device 11 in the form of RF signals to key code generator device 12. Key code generator device 12 in turn communicates the captured strings of timing information through coaxial cable 36 and network 38 to database of codesets 39. Personnel maintaining database of codesets 39 then analyze the timing information and generate a codeset that describes the key

18

codes captured by learning remote control device 11. In this way, a new codeset containing key data, systems codes and timing information is added to database of codesets 39. Rather than storing the information as a new codeset that includes separate key codes and timing information, the information for each keystroke can be stored in database of codesets 39 in the form of interval times.

[0051] A single system 10 is therefore described that can support numerous different types of electronic consumer devices that can use multiple different codesets. The remote control device 11 of the system need not include a large memory and stored many codesets. Rather, the remote control device 11 need only relay individual key codes. Remote control device 11 can therefore be a relatively inexpensive device that includes only a small amount of In addition to requiring only a small amount of memory. memory, the very same remote control device 11 can control an electronic consumer device that uses a codeset or protocol that was not in existence at the time the remote control device 11 was delivered to the user. The amount of writable memory (for example, random access memory (RAM) or flash memory) on the remote control device 11 may be so little that it may not be adequate to store a conventional The bulk of the memory of the remote control codeset. device 11 may be relatively inexpensive mask-programmable read only memory (ROM). By reducing the amount of writable memory on remote control device 11, the cost of remote control device 11 is reduced.

[0052] Although the present invention has been described in connection with certain specific embodiments for instructional purposes, the present invention is not limited thereto. Although the method is described above in

19

connection with an inexpensive remote control device whose primary purpose is to control an electronic consumer device, the method can be employed in connection with other types of devices. Due to the limited amount of memory and intelligence required of the remote control device in the present method, the functionality of remote control device 11 can be incorporated into an RF-enabled device (such as a cell phone or RF-enabled personal digital assistant (PDA) or RF-enabled wrist watch or RF-enabled keyboard) without significantly increasing the cost of the device. The first carrier signal used to communicate between the remote control device and the key code generator device need not be an RF signal, and the second carrier signal used to communicate between the remote control device and the electronic consumer device need not be an IR signal. Both the first and second carrier signals can be the same type of signals, for example IR signals. The key code generator device can transmit key codes to the electronic consumer device to be controlled via a hardwired connection rather than a wireless link. The type of key code signal relayed through the remote control device is not limited to any particular protocol.

[0053] Although key code generator device 12 is a set-top box in the embodiment of figure 1 above, in other embodiments the key code generator device 12 is another type of electronic consumer device such as, for example, a television, a stereo radio, a digital video disk player, a video cassette recorder, a personal computer, a set-top cable television box or a set-top satellite box. Although the keystroke indicator signal can be an indication of a pressed key where there is a one-to-one relationship between the key and a function to be performed, in other

20

embodiments a keystroke indicator signal indicates a selected function that is not associated with a specific key on the remote control device. For example, a function can be selected choosing a function from a menu that is displayed on the remote control device. Accordingly, various modifications, adaptations, and combinations of various features of the described embodiments can be practiced without departing from the scope of the invention as set forth in the claims.

21

PATENT

#### CLAIMS

What is claimed is:

1. A method comprising:

(a) receiving a keystroke indicator signal from a remote control device;

(b) generating a key code within a key code generator device;

(c) modulating said key code onto a carrier signal, thereby generating a key code signal; and

(d) transmitting said key code signal from said key code generator device.

2. The method of Claim 1, wherein said key code signal is transmitted in (d) from said key code generator device to said remote control device.

3. The method of Claim 1, wherein said key code signal is transmitted in (d) from said key code generator device to an electronic consumer device.

4. The method of Claim 1, wherein said key code consists of a binary number.

5. The method of Claim 1, wherein said key code comprises a binary number and timing information, and wherein said timing information defines how said binary number is modulated in (c) onto said carrier signal.

22

PATENT

6. The method of Claim 1, further comprising:

(e) pressing a power-on key of said remote control device causing said remote control device to transmit said keystroke indicator signal that is received in (a), wherein said key code signal transmitted in (d) is received onto an electronic consumer device, and wherein said pressing in (e) causes said electronic consumer device to turn on.

7. The method of Claim 1, wherein said carrier signal is in a radio frequency band, wherein said key code signal is received by said remote control device, and wherein said method further comprises:

(e) modulating said key code onto a second carrier signal, thereby generating a second key code signal, said modulating being performed on said remote control device wherein said second carrier signal is in an infrared frequency band; and

(f) transmitting said second key code signal from said remote control device to an electronic consumer device.

8. The method of Claim 7, further comprising:

(g) pressing a power-on key of said remote control device causing said remote control device to transmit said keystroke indicator signal that is received in (a), wherein the pressing in (g) causes said electronic consumer device to turn on.

9. The method of Claim 1, wherein said key code generated in (b) is part of a codeset, and wherein said remote control device does not store said codeset.

23

PATENT

10. The method of Claim 9, wherein said codeset comprises timing information and a plurality of key codes, and wherein said timing information describes a digital one and a digital zero.

11. The method of Claim 1, wherein a codeset comprises a plurality of key codes, each one of said plurality of key codes corresponding to a function of an electronic consumer device, and wherein no more than a single one of said plurality of key codes is present on said remote control device at any given time.

12. The method of Claim 11, wherein said function of said electronic consumer device is taken from the group consisting of: power on, power off, channel advance, channel back, volume up, volume down, cursor up, cursor down, cursor right, cursor left, select, play, record, stop, forward, back and pause.

### 13. A device comprising:

a receiver that receives a first key code signal, wherein said first key code signal is generated by modulating a key code onto a first carrier signal, said first carrier signal falling within a radio frequency band;

a transmitter that transmits a second key code signal, wherein said second key code signal is generated by modulating said key code onto a second carrier signal, said second carrier signal falling within an infrared frequency band; and

a keypad that includes a key that corresponds to said key code, wherein said key code corresponds to a function of an electronic consumer device.

24

14. The device of Claim 13, wherein said key code corresponds to a second function of a second electronic consumer device, as well as to said function of said electronic consumer device.

15. The device of Claim 14, wherein said transmitter transmits a third key code signal, and wherein said third key code signal is generated by modulating said key code onto a third carrier signal.

16. The device of Claim 14, wherein said key code comprises a first binary number and a second binary number, said first binary number corresponding to said function, and said second binary number corresponding to said second function.

17. The device of Claim 13, wherein said keypad includes a second key that corresponds to a second key code, wherein a third key code signal is generated by modulating said second key code onto a third carrier signal, wherein said third key code signal is received by said receiver, and wherein both said first key code and said second key code are not both stored in said device at the same time.

18. The device of Claim 13, wherein a codeset comprises timing information and a plurality of key codes, wherein each of said plurality of key codes corresponds to a different function of said electronic consumer device, wherein said key code is a binary number, and wherein said timing information defines how said binary number is modulated onto said first carrier signal.

25

#### 19. A system comprising:

a key code generator device that generates a first key code and a second key code, wherein a codeset is stored on said key code generator device, said codeset including said first key code and said second key code, wherein said first key code corresponds to a selected function of a first electronic consumer device, and wherein said second key code corresponds to said selected function of a second electronic consumer device; and

means for relaying said first key code and said second key code from said key code generator device to said first electronic consumer device and to said second electronic consumer device without simultaneously storing both said first key code and said second key code on said means.

20. The system of Claim 19, wherein said selected function is taken from the group consisting of: power on, power off, channel advance, channel back, volume up, volume down, cursor up, cursor down, cursor right, cursor left, select, play, record, stop, forward, back and pause.

21. The system of Claim 19, wherein said selected function is power on, and wherein said system automatically determines when said first electronic consumer device powers on.

22. A remote control device, comprising: an RF receiver; an IR transmitter; and means for receiving a key code from said RF receiver and for sending said key code to said IR transmitter such

26

ţ

that said key code is modulated onto an IR carrier signal, said IR carrier signal with said key code modulated thereon being transmitted from said remote control device by said IR transmitter.

23. The remote control device of Claim 22, wherein said key code is not stored on said remote control device immediately prior to said means receiving the key code.

24. The remote control device of Claim 22, wherein said means is a microcontroller.

27

#### PATENT

## RELAYING KEY CODE SIGNALS THROUGH A REMOTE CONTROL DEVICE

Daniel SauFu Mui

ABSTRACT OF THE DISCLOSURE

Upon receiving a keystroke indicator signal from a remote control device, a key code generator device identifies a codeset usable to communicate with a selected consumer device. The keystroke indicator signal contains an indication of a pressed key, which corresponds to a function of the selected consumer device. Using the identified codeset and the key indication, the key code generator device generates a key code and modulates that key code onto a radio frequency carrier signal, thereby generating a first key code signal. The remote control device receives the first key code signal from the key code generator device and modulates the key code onto an infrared frequency carrier signal, thereby generating a second key code signal. The remote control device relays the key code to the selected consumer device in the second key code signal. The key code causes the selected consumer device to perform the desired function.

## DECLARATION AND POWER OF ATTORNEY FOR PATENT APPLICATION

As a below named inventor. I hereby declare that:

My residence, post-office address, and citizenship are as stated below next to my name. I believe I am the original, first and sole inventor (if only one name is listed below), or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought by way of the application entitled:

## "RELAYING KEY CODE SIGNALS THROUGH A REMOTE CONTROL DEVICE"

which (check)

- <u>X</u> is attached hereto.
- and is amended by the Preliminary Amendment attached hereto.

was filed on \_\_\_\_\_\_ as Application Serial No. \_\_\_\_\_

\_\_\_\_\_ and was amended on \_\_\_\_\_\_ (if applicable).

I hereby state that I have reviewed and understood the contents of the above-identified specification, including the claims, as amended by any amendment referred to above. I acknowledge the duty to disclose all information which is material to patentability as defined in 37 CFR 1.56.

## Foreign Application(s) and/or Claim of Foreign Priority

I hereby claim foreign priority benefits under Title 35, United States Code Section 119(a)-(d), of any foreign application(s) for patent or inventor's certificate, or any PCT international application(s) designating at least one country other than the United States of America listed below, and have also identified below any foreign application(s) for patent or inventor's certificate or an PCT international application(s) designating at least one country other than the United States of America filed by me on the same subject matter having a filing date before that of the application(s) on which priority is claimed:

## **DETAILED ACTION**

The application of Daniel SauFu Mui filed 12/16/2003 for Relaying key Code Signals

Through a remote Control Device has been examined. Claims 1-24 are pending.

## Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the

basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 19-20 are rejected under 35 U.S.C. 102(b) as being anticipated by Pope US Patent 5963624.

Regarding claim 19, Pope teaches generator 12 for generating key code for controlling different consumer devices (col. 3 lines 35-40, figure 1) and teaches storing key codes (code set) on the key code generator (col. 5 lines 7-11). Pope teaches the base unit (code generator) transmit control codes to a plurality of consumer devices (figure 1) inherently including a first and second code. Pope teaches an IR transmitter 87 for relaying the key codes to the consumer devices (col. 3 lines 41-45). The codes are stored in the memory of the base unit (code generator)

and is therefore not store in the means (IR transmitter) for transmitting the key code signal to the consumer devices.

Regarding claim 20, Pope teaches channel selection included in the function of the remote control (col. 1 lines 59-63).

Claim 13-16, 22, and 24 are rejected under 35 U.S.C. 102(e) as being anticipated by Wouters et al. US Patent 6915109.

Regarding claims 13 and 22, Wouters et al. teaches a device comprising a receiver receiving a RF modulated remote control signal (col. 4 lines 25-28) and a transmitter transmitting an infrared modulated signal generated from the received RF signal (col. 4 lines 28-33). Wouters et al. also teaches the key code corresponding to the key of keypad is transmitted when the key is selected (col. 4 lines 4 lines 48-57).

Regarding claims 14-16, Wouters et al. teaches the key code corresponding to the key of keypad is transmitted when the key is selected (col. 4 lines 4 lines 48-57). A key code corresponding to a second and third key code is therefore transmitted based on the selected key. Wouters et al. teaches fetching the data from memory corresponding to the key code (col. 4 lines 55-58). The data from the memory is inherently store as binary data. The key code therefore comprises binary data.

Regarding claim 24, Wouters et al. teaches a microcontroller in the form of a microprocessor for receiving the key code (col. 4 lines 52-55).

#### Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1, 3-4, 9 are rejected under 35 U.S.C. 103(a) as being unpatentable over Pope US Patent 5963624 in view of McNair et al. US Patent 5595342.

Regarding claim 1, Pope teaches receiving a keystroke indicator signal which contains an indication of a key on the remote control device 10 that was pressed (col. 2 lines 61-col. 3 line 19), generating a key code (codes for communicating the control function to the appliances) within the code generator 12 and transmitting the key codes to the appliances (col. 3 lines 35-40). Pope is however silent on teaching modulating the key code onto a carrier signal. McNair et al. in an art related control system teaches the control signal is modulated and transmitted to the controlled apparatus as a conventional practice (col. 2 lines 61-65).

It would have been obvious to one of ordinary skill in the art to modulate the key code onto a carrier signal in Pope because modulation of the key code enables the key code signal to be transmitted wirelessly to the appliances and this also represents a conventional practice.

٦

Regarding claim 3, Pope teaches the key code generator 12 transmitting key code signal (control codes) to the consumer devices (col. 3 lines 35-40).

Regarding claim 4, Pope teaches the key code is indicated by low and high (col. 3 lines 45-47) implying the key code signal include ones and zeroes.

Regarding claim 9, Pope teaches the code generated by the code generator 12 is transmitted to the appliances (col. 3 lines 36-40). The code generated by the code generator is not store in the remote control because it is transmitted to the appliances.

Claim 2 is rejected under 35 U.S.C. 103(a) as being unpatentable over Pope US Patent 5963624 in view of McNair et al. US Patent 5595342 and further in view of Goldstein US Patent 5410326.

Regarding claim 2, Pope teaches the remote control receiving key code signals (infrared control signal) from a controller (col. 4 lines 52-56) but is silent on teaching the key code generator transmit key codes to the remote control device. Goldstein in an art related programmable remote control invention teaches a key code generator in the form of a cable box (cable box is considered a key code generator, see page 3 lines 4-5 of the applicant's specification) transmitting key codes to the remote control (col. 13 lines 50-57) in order to update the remote control with new control codes.

It would have been obvious to one of ordinary skill in the art for the key code generator to transmit the key code to the remote control in Pope in view of McNair et al. because this provides the means for updating the remote control with new codes.

Claims 5 and 10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Pope US Patent 5963624 in view of McNair et al. US Patent 5595342 and further in view of Teskey US Patent 6747568.

Regarding claim 5, Pope teaches generating a key code for controlling the consumer appliances (col. 3 lines 35-40) but is silent on teaching the key code comprises timing information defining the binary number is modulated. Teskey in an art related remote control system teaches the format of the remote control signal having the necessary timing and modulation information (col. 3 line 60-col. 4 line 8).

It would have been obvious to one of ordinary skill in the art for the key code to include comprises timing information defining the binary number is modulated in Pope in view of McNair because the timing information defining the binary number is modulated represent information regarding the format of the remote control signal that enables the decoding and demodulating of the receive key code signals.

Regarding claim 10, Pope teaches generating a key code for controlling the consumer appliances (col. 3 lines 35-40) but is silent on teaching the key code comprises timing information defining the binary number (ones and zeroes) is modulated. Teskey in an art related remote control system teaches the format of the remote control signal having the necessary timing and modulation information (col. 3 line 60-col. 4 line 8).

It would have been obvious to one of ordinary skill in the art for the key code to include comprises timing information defining the binary number is modulated in Pope in view of McNair because the timing information defining the binary number is modulated represent

information regarding the format of the remote control signal that enables the decoding and demodulating of the receive key code signals.

Claim 6 is rejected under 35 U.S.C. 103(a) as being unpatentable over Pope US Patent 5963624 in view of McNair et al. US Patent 5595342 and further in view of August et al. US Patent 5671267.

Regarding claim 6, Pope teaches the use of the remote control to control the functions of the appliances (col. 2 line 61-col. 3 line 22) but is not explicit in teaching transmitting a keystroke indicator signal that cause the appliance to turn on. One skill in the art recognizes that a remote control is generally use in turning an appliance on/off and is further evidenced by August et al. (col. 8 lines 3-5).

It would have been obvious to one of ordinary skill in the art for the remote control to transmit a keystroke signal for turning the appliance on in Pope in view of McNair because Pope suggests the use of the remote control to control the functions of the appliances and one skill in the art recognizes that a remote control is generally use in turning an appliance on/off and is further evidenced by August et al.

Claim 7 is rejected under 35 U.S.C. 103(a) as being unpatentable over Pope US Patent 5963624 in view of McNair et al. US Patent 5595342 and further in view of Wouster et al. US Patent 6915109

Regarding claim 7, Pope teaches the remote control receiving key code signals (infrared control signal) from a controller (col. 4 lines 52-56) and the remote control transmits control signal to the appliances (figure 1) but is silent on teaching modulating the key code onto carrier

signal that is in the infrared frequency band. Wouters et al. in an art related remote control invention teaches a remote control receiving a RF modulated remote control signal (col. 4 lines 25-28) and a transmitter transmitting an infrared modulated signal generated from the received RF signal (col. 4 lines 28-33).

It would have been obvious to one of ordinary skill in the art to modulate the key code onto carrier signal that is in the infrared frequency band in Pope in view of McNair because infrared signal represents an alternative to radio signal used in the transmission of remote control signal.

Claim 8 is rejected under 35 U.S.C. 103(a) as being unpatentable over Pope US Patent 5963624 in view of McNair et al. US Patent 5595342 in view of Wouster et al. US Patent 6915109 and further in view of August et al. US Patent 5671267.

Regarding claim 8, Pope teaches the use of the remote control to control the functions of the appliances (col. 2 line 61-col. 3 line 22) but is not explicit in teaching transmitting a keystroke indicator signal that cause the appliance to turn on. One skill in the art recognizes that a remote control is generally use in turning an appliance on/off and is further evidenced by August et al. (col. 8 lines 3-5).

It would have been obvious to one of ordinary skill in the art for the remote control to transmit a keystroke signal for turning the appliance on in Pope in view of McNair in view of Yamaguchi because Pope suggests the use of the remote control to control the functions of the appliances and one skilled in the art recognizes that a remote control is generally use in turning an appliance on/off and is further evidenced by August et al. Claim 18 is rejected under 35 U.S.C. 103(a) as being unpatentable over Wouters et al. US Patent 6915109 in view of Teskey US Patent 6747568.

Regarding claim 18, Wouters et al. teaches the remote control transmit command codes to perform various functions (col. 4 lines 4 lines 48-57). Wouters is silent on teaching the key code comprises timing information defining the binary number is modulated. Teskey in an art related remote control system teaches the format of the remote control signal having the necessary timing and modulation information (col. 3 line 60-col. 4 line 8).

It would have been obvious to one of ordinary skill in the art for the key code to include timing information defining the binary number is modulated in Wouters et al. because the timing information defining the binary number represents information regarding the format of the remote control signal that enables the decoding and demodulating of the receive key code signals.

Claim 21 is rejected under 35 U.S.C. 103(a) as being unpatentable over Pope US Patent 5963624 in view of August et al. US Patent 5671267.

Regarding claim 6, Pope teaches the use of the remote control to control the functions of the appliances (col. 2 line 61-col. 3 line 22) but is not explicit in teaching transmitting a keystroke indicator signal that cause the appliance to turn on. One skill in the art recognizes that a remote control is generally use in turning an appliance on/off and is further evidenced by August et al. (col. 8 lines 3-5).

It would have been obvious to one of ordinary skill in the art for the remote control to transmit a keystroke signal for turning the appliance on in Pope because Pope suggests the use of the remote control to control the functions of the appliances and one skilled in the art recognizes that a remote control is generally use in turning an appliance on/off and is further evidenced by August et al.

Claim 23 is rejected under 35 U.S.C. 103(a) as being unpatentable over Wouters et al. US Patent 6915109 in view of Pope US Patent 5963624.

Regarding claim 23, Wouters teaches transmitting key codes to remote control (see response to claim 13) but is not explicit in teaching the key code is not store on the remote control prior to the remote control receiving the key code. Pope in an art related remote control teaches the remote control receiving control codes updates (col. 4 lines 52-60). The receipt of the code update by the remote control implies that the code was not previously stored in the remote control prior transmitting the updates to the remote controller.

It would have been obvious to one of ordinary skill in the art for the key code is not store on the remote control prior to the remote control receiving the key code because the key codes transmitted to the remote control is used as a means of programming the remote control with new codes.

## Allowable Subject Matter

Claims 11-12 and 17 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Regarding claims 11-12, the prior art of record fail to teach or suggests no more than a single one of the key codes is present on the remote control at any given time.

Regarding claim 17, the prior art of record fail to teach or suggests the first and second key code are not stored in the device at the same time.

## Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Vernal U. Brown whose telephone number is 571-272-3060. The examiner can normally be reached on 8:30-7:00 Monday-Thursday.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Wendy Garber can be reached on 571-272-7308. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).

## AMENDMENT

Dear Sir:

In response to the outstanding, non-final office action dated June 6, 2006 ("Office Action"), Applicant responds as follows and requests the Examiner to amend the above-identified application as follows.

Amendments to the Specification begin on page 2 of this Amendment. Amendments to the Claims are reflected in the listing of claims that begins on page 3 of this Amendment.

There are no amendments to the drawings in this Amendment.

The **Remarks** begin on page 9 of this Amendment.

#### Amendments to the Specification:

Please replace paragraph [0006] with the following replacement paragraph.

[0006] A system for relaying a key code through a remote control device to an electronic consumer device allows the electronic consumer device to be controlled without storing the associated codeset on the remote control device. Upon receiving a keystroke indicator signal from a remote control device, a key code generator device, such as a settop box, identifies the particular codeset usable to communicate with the selected electronic consumer device. The keystroke indicator signal contains an indication of a key on the remote control device that was pressed, which corresponds to a function of the selected electronic consumer device. Using the identified codeset and the indication of the pressed key, the key code generator device generates a key code and modulates that key code onto a radio frequency carrier signal, thereby generating a first key code signal. The remote control device receives the first key code signal from the key code generator device and modulates the key code onto an infrared frequency carrier signal, thereby generating a second key code signal. The remote control device relays the key code to the selected electronic consumer device in the second key code signal. The key code causes the selected electronic consumer device to perform the desired function. The key code is not stored on the remote control device in a permanent manner, but rather thenthe key code is relayed through the remote control device.

2

## Amendments to the Claims:

This listing of claims replaces all prior versions and listings of claims in the application.

### Listing of Claims

1. (original): A method comprising:

(a) receiving a keystroke indicator signal from a remote control device;

(b) generating a key code within a key code generator device;

(c) modulating said key code onto a carrier signal, thereby generating a key code signal; and

(d) transmitting said key code signal from said key code generator device.

2. (original): The method of Claim 1, wherein said key code signal is transmitted in (d) from said key code generator device to said remote control device.

3. (original): The method of Claim 1, wherein said key code signal is transmitted in (d) from said key code generator device to an electronic consumer device.

4. (original): The method of Claim 1, wherein said key code consists of a binary number.

5. (original): The method of Claim 1, wherein said key code comprises a binary number and timing information, and wherein said timing information defines how said binary number is modulated in (c) onto said carrier signal.

6. (original): The method of Claim 1, further comprising:

(e) pressing a power-on key of said remote control device causing said remote control device to transmit said keystroke indicator signal that is received in (a), wherein said key code signal transmitted in (d) is received onto an electronic consumer device, and wherein said pressing in (e) causes said electronic consumer device to turn on.

7. (original): The method of Claim 1, wherein said carrier signal is in a radio frequency band, wherein said key code signal is received by said remote control device, and wherein said method further comprises:

(e) modulating said key code onto a second carrier signal, thereby generating a second key code signal, said modulating being performed on said remote control device wherein said second carrier signal is in an infrared frequency band; and

(f) transmitting said second key code signal from said remote control device to an electronic consumer device.

8. (original): The method of Claim 7, further comprising:

(g) pressing a power-on key of said remote control device causing said remote control device to transmit said keystroke indicator signal that is received in (a), wherein the pressing in (g) causes said electronic consumer device to turn on.

9. (original): The method of Claim 1, wherein said key code generated in (b) is part of a codeset, and wherein said remote control device does not store said codeset.

10. (original): The method of Claim 9, wherein said codeset comprises timing information and a plurality of key codes, and wherein said timing information describes a digital one and a digital zero.

4

11. (currently amended): The method of Claim 1A method comprising:

(a) receiving a keystroke indicator signal from a remote control device;

(b) generating a key code within a key code generator device;

(c) modulating said key code onto a carrier signal, thereby generating a key code signal; and

(d) transmitting said key code signal from said key code generator device, wherein a codeset comprises a plurality of key codes, each one of said plurality of key codes corresponding to a function of an electronic consumer device, and wherein no more than a single one of said plurality of key codes is present on said remote control device at any given time.

12. (original): The method of Claim 11, wherein said function of said electronic consumer device is taken from the group consisting of: power on, power off, channel advance, channel back, volume up, volume down, cursor up, cursor down, cursor right, cursor left, select, play, record, stop, forward, back and pause.

13. (currently amended): A remote control device comprising:

a receiver that receives a first key code signal, wherein said first key code signal is generated by modulating a key code onto a first carrier signal, said first carrier signal falling within a radio frequency band;

a transmitter that transmits a second key code signal, wherein said second key code signal is generated by modulating said key code onto a second carrier signal, said second carrier signal falling within an infrared frequency band; and

a keypad that includes a key that corresponds to said key code, wherein said key code corresponds to a function of an electronic consumer device.

**5** '

14. (original): The device of Claim 13, wherein said key code corresponds to a second function of a second electronic consumer device, as well as to said function of said electronic consumer device.

15. (original): The device of Claim 14, wherein said transmitter transmits a third key code signal, and wherein said third key code signal is generated by modulating said key code onto a third carrier signal.

16. (original): The device of Claim 14, wherein said key code comprises a first binary number and a second binary number, said first binary number corresponding to said function, and said second binary number corresponding to said second function.

17. (currently amended): The device of Claim 13A device comprising:

a receiver that receives a first key code signal, wherein said first key code signal is generated by modulating a key code onto a first carrier signal, said first carrier signal falling within a radio frequency band;

a transmitter that transmits a second key code signal, wherein said second key code signal is generated by modulating said key code onto a second carrier signal, said second carrier signal falling within an infrared frequency band; and

a keypad that includes a key that corresponds to said key code, wherein said key code corresponds to a function of an electronic consumer device, wherein said keypad includes a second key that corresponds to a second key code, wherein a third key code signal is generated by modulating said second key code onto a third carrier signal, wherein said third key code signal is received by said receiver, and wherein both said first key code and said second key code are not both stored in said device at the same time.

6

18. (original): The device of Claim 13, wherein a codeset comprises timing information and a plurality of key codes, wherein each of said plurality of key codes corresponds to a different function of said electronic consumer device, wherein said key code is a binary number, and wherein said timing information defines how said binary number is modulated onto said first carrier signal.

19. (currently amended): A system comprising:

a key code generator device that generates a first key code and a second key code, wherein a codeset is stored on said key code generator device, said codeset including said first key code and said second key code, wherein said first key code corresponds to a selected function of a first electronic consumer device, and wherein said second key code corresponds to said selected function of a second electronic consumer device; and

means for relaying said first key code and said second key code from said key code generator device <u>through a remote control device</u> to said first electronic consumer device and to said second electronic consumer device without simultaneously storing both said first key code and said second key code on said <u>meansremote control device</u>.

20. (original): The system of Claim 19, wherein said selected function is taken from the group consisting of: power on, power off, channel advance, channel back, volume up, volume down, cursor up, cursor down, cursor right, cursor left, select, play, record, stop, forward, back and pause.

21. (original): The system of Claim 19, wherein said selected function is power on, and wherein said system automatically determines when said first electronic consumer device powers on.

22. (original): A remote control device, comprising: an RF receiver;

an IR transmitter; and

means for receiving a key code from said RF receiver and for sending said key code to said IR transmitter such that said key code is modulated onto an IR carrier signal, said IR carrier signal with said key code modulated thereon being transmitted from said remote control device by said IR transmitter.

23. (original): The remote control device of Claim 22, wherein said key code is not stored on said remote control device immediately prior to said means receiving the key code.

24. (original): The remote control device of Claim 22, wherein said means is a microcontroller.

25. (new): A method comprising:

(a) receiving a keystroke indicator signal from a remote control device;

(b) using said keystroke indicator signal to generate a key code, wherein a key code generator device generates said key code;

(c) modulating said key code onto a carrier signal and thereby generating a key code signal;

(d) transmitting said key code signal from said key code generator device to said remote control device, wherein said remote control device transmits said key code signal to an electronic consumer device.

26. (new): The method of Claim 25, wherein said key code generated in (b) is part of a codeset, and wherein said codeset is not stored on said remote control device.

#### <u>REMARKS</u>

Reconsideration and allowance is respectfully requested.

Before entry of this amendment, claims 1-24 were pending. In the Office Action, claims 1-10, 13-16 and 18-24 were rejected, and claims 11-12 and 17 were objected to. In the present amendment, claims 11, 13, 17, and 19 are amended, and claims 25-26 are added. After entry of the amendment, claims 1-26 are pending.

#### I. <u>Claims 11-12 and 17</u>

Claims 11-12 and 17 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form. (See Office Action, p. 10, lines 19-21.) Applicant amends claim 11 such that claims 11-12 include all of the limitations of the base claim 1. Applicant amends claim 17 to include all of the limitations of the base claim 13.

Withdrawal of the objection to claims 11-12 and 17 is respectfully requested.

#### II. Claims 19-20

Claims 19-20 are rejected under 35 U.S.C. § 102(b) as being anticipated by Pope (USP 5,963,624) (Office Action, p. 2, lines 16-17).

#### A. Independent claim 19

Claim 19 as amended recites, "<u>means for relaying</u> said first key code and said second key code <u>from said key code generator device through a remote</u> <u>control device to said first electronic consumer device</u> and to said second electronic consumer device without simultaneously storing both said first key code and said second key code on said remote control device" (emphasis added). Pope does not form the basis for a valid rejection under § 102(b) because Pope does not disclose all of the limitations of claim 19. Specifically,

Pope does not disclose relaying a key code from a key code generator device through a remote control device to an electronic consumer device.

The Examiner states that the IR transmitter 87 of base unit 12/80 of Pope discloses the recited means for relaying key codes. (Office Action, p. 2, lines 22-23). The appliance control codes of Pope, however, are not relayed from base unit 12, through handset 10/50, to an appliance 14/16/18.

Because Pope does not disclose all of the elements of claim 19, reconsideration of the § 102(b) rejection and allowance of claim 19 are requested.

#### B. Dependent claim 20

Claim 20 depends from claim 19 and is allowable for at least the same reasons for which claim 19 is allowable. Reconsideration of the § 102(b) rejection and allowance of claim 20 are requested.

## III. <u>Claims 13-16, 22 and 24</u>

Claims 13-16, 22 and 24 are rejected under 35 U.S.C. § 102(e) as being anticipated by Wouters et al. (USP 6,915,109) (Office Action, p. 3, lines 5-6).

## A. Independent claim 13 and 22

Claim 13 as amended recites, "A remote control device comprising: a receiver that <u>receives</u> a first key code signal . . . <u>within a radio frequency band</u>; a transmitter that <u>transmits</u> a second key code signal . . . <u>within an infrared frequency band</u>; and a keypad . . ." (emphasis added). Claim 22 recites, "A remote control device, comprising: <u>an RF receiver</u>; an IR transmitter; . . . said IR carrier signal . . . being transmitted from said remote control device by said IR transmitter" (emphasis added). Wouters does not form the basis for a valid rejection under § 102(e) because Wouters does not disclose all of the limitations of either claim 13 or claim 22. Specifically, Wouters does not disclose a remote control device with a keypad that both receives a signal within a radio frequency

band and transmits a signal within an infrared frequency band. In addition, Wouters does not disclose a remote control device with an RF receiver and an IR transmitter.

Wouters does not disclose a device with a keypad that transmits an IR signal and receives an RF signal. The Examiner cites passages in Wouters from column 4, lines 25-33 and 48-57 (Office Action, p. 3, lines 7-11). The first passage from lines 25-33 describes radio receiver 13 that receives RF signal 10 and transmits a signal to IR transmitter 14. Radio receiver 13 does not include a keypad. Moreover, radio receiver 13 is not a remote control device. The second passage of Wouters from lines 48-57 describes the remote control unit shown in figure 6 of Wouters (mistakenly referred to as figure 7). The remote control unit described in lines 48-57 includes an IR transmitter and an RF transmitter, but does not include an RF receiver. Wouters does not disclose a remote control device that both receives an RF signal and transmits an IR signal.

Because Wouters does not disclose all of the elements of either claim 13 or claim 22, reconsideration of the § 102(e) rejection and allowance of claims 13 and 22 are requested.

#### B. Dependent claims 14-16

Claim 14 recites "said key code corresponds to a second function of a second electronic consumer device, as well as to said function of said electronic consumer device". The Examiner has not presented a *prima facie* argument of anticipation of claim 14 because the Examiner has not stated that Wouters discloses a key code that corresponds both to a function of an electronic consumer device as well as to a second function of a second electronic consumer device. Wouters does not disclose one key code that corresponds to two separate functions of two different electronic consumer devices.

Claim 16 recites "said key code comprises a first binary number and a second binary number, said first binary number corresponding to said function, and said second binary number corresponding to said second function". The

11

Examiner has not presented a *prima facie* argument of anticipation of claim 16 because the Examiner has not stated that Wouters discloses a key code comprising both (i) a first binary number that corresponds to a function of an electronic consumer device as well as (ii) a second binary number that corresponds to a second function of a second electronic consumer device. Wouters does not disclose a single key code that comprises two binary numbers, one corresponding to the function of one electronic consumer device, and the other corresponding to a second function of a second electronic consumer device.

Claims 14-16 depend directly or indirectly from claim 13. In addition to the reasons explained above, dependent claims 14-16 are allowable for at least the same reasons for which claim 13 is allowable. Reconsideration of the § 102(e) rejection and allowance of claims 14-16 are requested.

## C. Dependent claim 24

Claim 24 recites that the means of claim 22 is a microcontroller. The means of claim 22 is a "means for receiving a key code from said RF receiver". The Examiner states that Wouters discloses "a microcontroller in the form of a microprocessor for receiving the key code (col. 4 lines 52-55)" (Office Action, p. 3, lines 18-19). Applicant respectfully disagrees. The cited passage of Wouters does not disclose a microprocessor for receiving a key code from an RF receiver.

The remote control unit disclosed in the cited passage does not include an RF receiver. Thus, the central processing unit (CPU) inside the remote control does not receive a key code from any RF receiver. Instead, Wouters discloses that the CPU determines which code needs transmitting based on which key is tapped by the user. Wouters explains:

"In this case the user taps a key, the CPU (Central processing unit) inside the remote control determines which code (corresponding to the tapped key) needs transmitting (by IR or RF) and fetches the required data from its memory which comprises a data base or other means in

12

which tapped codes are linked to data to be transmitted" (Wouters, col. 4, lines 57-62) (emphasis added).

Therefore, Wouters does not disclose a microcontroller that receives a key code from an RF receiver.

Claim 24 depends from claim 22. In addition to the reasons explained above, dependent claim 24 is allowable for at least the same reasons for which claim 22 is allowable. Reconsideration of the § 102(e) rejection and allowance of claim 24 are requested.

IV. Claims 1, 3-4 and 9

Claims 1, 3-4 and 9 are rejected under 35 U.S.C. § 103(a) as being unpatentable over Pope in view of McNair et al. (USP 5,595,342) (Office Action, p. 4, lines 9-10). To establish a *prima facie* case of obviousness, the Examiner must demonstrate three criteria. The MPEP § 2142 states:

"To establish a prima facie case of obviousness, three basic criteria must be met. <u>First</u>, there must be some <u>suggestion or</u> <u>motivation</u>, either in the references themselves or in the knowledge generally available to one of ordinary skill in the art, to modify the reference or to combine reference teachings. <u>Second</u>, there must be a reasonable <u>expectation of success</u>. <u>Finally</u>, the reference (or references when combined) must <u>teach or suggest all the claimed limitations</u>." MPEP § 2142 (emphasis added).

## A. Independent claim 1

The combination of Pope and McNair does not form the basis for a valid rejection of claim 1 under § 103(a) because, among other things, the references when combined do not teach or suggest all of the claim elements. Claim 1 recites, "(a) receiving a keystroke indicator signal from a remote control device; (b) generating a key code within a key code generator device . . .". Neither Pope nor McNair teaches generating a key code within a key code generator device.

Moreover, neither Pope nor McNair teaches both a keystroke indicator signal and a key code signal.

The Examiner states that "Pope teaches receiving a keystroke indicator signal which contains an indication of a key on the remote control device 10 that was pressed (col. 2 lines 61-col. 3 line 19), generating a key code (codes for communicating the control function to the appliances) within the code generator  $\underline{12} \dots$ " (Office Action, p. 4, lines 11-14) (emphasis added). Applicant respectfully disagrees. Pope does not teach generating a key code within a key code generator device.

The appliance control code that is transmitted by base unit 12 of Pope is not generated within base unit 12. Instead, base unit 12 receives the appliance control codes from handset 10/50. Pope explains:

"The present invention uses a digital cordless telephone handset to store a variety of appliance control codes. These <u>appliance control</u> <u>codes can be transmitted to a base unit</u>. The base unit can translate the appliance control codes to control signals such as infrared control signals, to control an electrical appliance" (Pope, col. 1, lines 31-36) (emphasis added) *See also* Pope, col. 2, lines 48-52 and 63-65.

The appliance control codes are not generated within the base unit 12 of Pope. Instead, the appliance control codes are transmitted from the handset 10/50 to the base unit 12, where they are translated to control signals. Base unit 12 of Pope does not receive a keystroke indicator and then generate a key code. Pope states, "Once an appliance control code is received by the base unit, the base unit will know to transfer the control code to an appliance" (Pope, col. 4, lines 49-51) (emphasis added).

According to the tenets of claim differentiation, a "keystroke indicator signal" cannot be interpreted to be the same as a "key code signal". Such a claim interpretation is presumptively unreasonable. <u>See, e.g.</u>, *Karlin Tech. Inc. v. Surgical Dynamics Inc.*, 177 F.3d 968, 50 USPQ2d 1465, 1468 (Fed. Cir. 1999). In addition, such a claim interpretation would render claim 1 internally

• .

inconsistent because "keystroke indicator/key code" information that was already received by the key code generator device would later be generated by the key code generator device. Thus, Pope does not teach both a keystroke indicator and a key code. The handset 10/50 of Pope transmits an appliance control code and not a keystroke indicator.

McNair does not teach modulating a key code. McNair does not teach a key code. McNair is directed to a control system for a gas-fired, central heating system and does not concern key code signals for electronic consumer devices. Thus, there would be no motivation to combine McNair with Pope even if McNair did disclose a limitation of claim 1 (which it does not).

Neither Pope nor McNair teaches both (i) a keystroke indicator signal and (ii) a key code signal. Nor does either Pope or McNair teach generating a key code within a key code generator device. Because the combination of Pope and McNair does not disclose all of the elements of claim 1, Pope and McNair do not form the basis for a valid rejection under § 103(a). Reconsideration of the § 103(a) rejection and allowance of claim 1 are requested.

### B. Dependent claims 3-4 and 9

Claim 9 recites, "said key code generated in (b) is part of a codeset, and wherein <u>said remote control device does not store said codeset</u>" (emphasis added). With respect to base claim 1, the Examiner states that "Pope teaches receiving a keystroke indicator signal which contains an indication of a key on the <u>remote control device 10</u>" (Office Action, p. 4, lines 11-12) (emphasis added). Thus, the Examiner considers that handset 10 of Pope teaches the remote control device recited in claim 9. The Examiner then states, "The code generated by the code generator is not store in the remote control because it is transmitted to the appliances" (Office Action, p. 5, lines 6-7). Applicant respectfully disagrees.

The appliance control codes of Pope are stored on handset 10 and are transmitted from handset 10 to base unit 12. Base unit 12 does not generate the

15

appliance control codes. Instead base unit 12 receives the appliance control codes and then translates them into infrared control signals. Pope explains:

"The present <u>invention uses a digital cordless telephone handset to</u> <u>store a variety of appliance control codes</u>. These appliance control codes can be <u>transmitted to a base unit</u>. The base unit can translate the appliance control codes to control signals such as infrared control signals, to control an electrical appliance" (Pope, col. 1, lines 31-36) (emphasis added)

"The cordless digital telephone handset includes a memory 66 . . . used to <u>store the appliance control codes</u>. Preferably, the appliance control codes can be transmitted to the base unit 12 . . ." (Pope, col. 2, lines 48-52) (emphasis added).

"Fig. 2 is a diagram of a handset 50 of the present invention.... The <u>appliance control codes are stored in a memory 66</u>" (Pope, col. 4, lines 17-28) (emphasis added).

Claims 3-4 and 9 depend from claim 1. In addition to the reasons explained above, dependent claims 3-4 and 9 are allowable for at least the same reasons for which claim 1 is allowable. Reconsideration of the § 103(a) rejection and allowance of claims 3-4 and 9 are requested.

V. Dependent claim 2

Claim 2 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Pope in view of McNair and further in view of Goldstein (USP 5,410,326) (Office Action, p. 5, lines 8-10).

Claim 2 includes the following limitations of base claim 1, "(a) receiving a keystroke indicator signal from a remote control device; (b) generating a key code within a key code generator device . . .." None of Pope, McNair or Goldstein teaches generating a key code within a key code generator device. Moreover, none of Pope, McNair or Goldstein teaches both a keystroke indicator signal and a key code signal.

In addition, claim 2 recites "wherein said key code signal is transmitted in

(d) from said key code generator device to said remote control device". The Examiner seems to admit that Pope and McNair are silent on teaching that the key code generator transmits the key code signal to the remote control device. (Office Action, p. 5, lines 12-13) (emphasis added).

None of Pope, McNair or Goldstein teaches (i) receiving a keystroke indicator signal from a remote control device, (ii) generating a key code within a key code generator, and (iii) transmitting <u>a key code signal</u> from the key code generator device back to the remote control device.

The fact that Goldstein may teach sending an IR code or an entire codeset from a cable television converter box to a remote control device to update the remote control device does not teach transmitting <u>a key code signal</u> from a key code generator device back to the remote control device. Goldstein does not teach transmitting a key code signal as opposed to a key code or a codeset.

In addition, the cable television converter box of Goldstein does not teach a key code generator because the cable television converter box of Goldstein receives complete codesets from a remote database or is loaded with complete codesets. (Goldstein, col. 15, lines 20-68; col. 17, lines 62-67). To the contrary, Goldstein teaches that the GLUE logic 95 in the universal remote control 5, as opposed to the converter box, generates the IR sequences from the codes. Goldstein states, "The glue logic 95 will supply the IR sequences from codes, stored in the RAM 90, upon command of the user. . . . These codes describe carrier frequencies, pulse widths and pulse duration to be generated to the glue logic 95 for producing infrared pulses from the infrared diode 97" (Goldstein, col. 13, lines 23-33). Thus, Goldstein does not teach transmitting a key code signal from a key code generator.

Finally, the motivation posited by the Examiner to combine Goldstein and Pope is non-existent. (See Office Action, p. 5, lines 18-20). There would be no motivation to update the remote control device of claim 2 with new codesets, as allegedly taught by Goldstein, because claim 2 does not recite that any key code or codeset is ever stored on the remote control device. Claim 2 recites

17

transmitting a key code signal to the remote control device and does not recite transmitting a codeset to the remote control device. The motivation proposed by the Examiner would only result in a combination wherein codesets, or at least key codes, are stored on a remote control device.

The combination of Pope, McNair and Goldstein does not form the basis for a valid rejection of claim 2 under § 103(a) because the combination does not teach transmitting a key code signal from the key code generator device back to the remote control device. Moreover, none of Pope, McNair or Goldstein teaches both (i) a keystroke indicator signal and (ii) a key code signal. Nor does any of Pope, McNair or Goldstein teach generating a key code within a key code generator device. Finally, there is no motivation to combine the teachings of Goldstein with the teachings of Pope and McNair in such a way as to obtain all of the limitations of claim 2. Therefore, reconsideration of the § 103(a) rejection and allowance of claim 2 are requested.

### VI. Dependent claims 5 and 10

Claims 5 and 10 are rejected under 35 U.S.C. § 103(a) as being unpatentable over Pope in view of McNair and further in view of Teskey (USP 6,747,568) (Office Action, p. 6, lines 1-3).

Claims 5 and 10 depend directly or indirectly from claim 1 and include the following limitations of claim 1: "(a) receiving a keystroke indicator signal from a remote control device; (b) generating a key code within a key code generator device . . .." None of Pope, McNair or Teskey teaches generating a key code within a key code generator device. Moreover, none of Pope, McNair or Teskey teaches both a keystroke indicator signal and a key code signal.

In addition, claim 10 recites that "said timing information describes a digital one and a digital zero". The Examiner admits that Pope "is silent on teaching the key code comprises timing information defining the binary number (ones and zeros) in modulated." But the Examiner states that Teskey "teaches the format of the remote control signal having the necessary timing and modulation

information (col. line 60-col. 4 line 8)" (Office Action, p. 6, lines 15-18). Applicant disagrees that Teskey teaches "the necessary timing and modulation information." The passage of Teskey cited by the Examiner does not teach timing information that defines a digital one or a digital zero. In fact, Teskey does not mention a digital one, a digital zero or any type of mark/space representation.

The combination of Pope, McNair and Teskey does not form the basis for a valid rejection of either claim 5 or claim 10 under § 103(a) because the combination does not teach both (i) a keystroke indicator signal and (ii) a key code signal. Nor does any of Pope, McNair or Teskey teach generating a key code within a key code generator device. And with regard to claim 10, Teskey does not teach timing information that defines a digital one or a digital zero. Therefore, reconsideration of the § 103(a) rejection and allowance of claims 5 and 10 are requested.

### VII. Dependent claim 6

Claim 6 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Pope in view of McNair and further in view of August (USP 5,671,267) (Office Action, p. 7, lines 3-5).

Claim 6 includes the following limitations of base claim 1, "(a) receiving a keystroke indicator signal from a remote control device; (b) generating a key code within a key code generator device . . .." None of Pope, McNair or August teaches generating a key code within a key code generator device. Moreover, none of Pope, McNair or August teaches both a keystroke indicator signal and a key code signal.

In addition, claim 6 recites, "(e) pressing a power-on key of said remote control device causing said <u>remote control device to transmit said keystroke</u> <u>indicator signal</u> that is received in (a), wherein said <u>key code signal transmitted in</u> (d) is received onto an electronic consumer device, and wherein said pressing in (e) causes said electronic consumer device to turn on" (emphasis added). The Examiner states that Pope "is not explicit in teaching transmitting a keystroke

indicator signal that cause the appliance to turn on. One skill in the art recognizes that a remote control is generally use in turning an appliance on/off and is further evidence by August et al. (col. 8 lines 3-5)" (Office Action, p. 7, lines 7-8). The Examiner does not explicitly state that August teaches a remote control device transmitting a keystroke indicator signal, and indeed August does not teach a keystroke indicator signal. The passage of August cited by the Examiner teaches handset unit 10 of August using a key code signal, as opposed to a keystroke indicator signal, to turn a television set on and off. According to the tenets of claim differentiation, a "keystroke indicator signal" cannot be interpreted to be the same as a "key code signal".

None of Pope, McNair or August teaches (i) receiving a keystroke indicator signal from a remote control device, (ii) generating a key code within a key code generator, and (iii) transmitting a key code signal from the key code generator to an electronic consumer device to turn on the electronic consumer device.

The combination of Pope, McNair and August does not form the basis for a valid rejection of claim 6 under § 103(a) because the combination does not teach both (i) a keystroke indicator signal and (ii) a key code signal. Nor does any of Pope, McNair or August teach generating a key code within a key code generator device. Reconsideration of the § 103(a) rejection and allowance of claim 6 are requested.

#### VIII. Dependent claim 7

Claim 7 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Pope in view of McNair and further in view of Wouters (Office Action, p. 7, lines 16-18).

Claim 7 includes the following limitations of base claim 1, "(a) receiving a keystroke indicator signal from a remote control device; (b) generating a key code within a key code generator device . . .." None of Pope, McNair or Wouters teaches generating a key code within a key code generator device. Moreover,

20

none of Pope, McNair or Wouters teaches both a keystroke indicator signal and a key code signal.

In addition, claim 7 recites "wherein said key code signal is received by said remote control device". The Examiner states that "Pope teaches the remote control receiving key code signals (infrared control signal) from a controller (col. 4 lines 52-56)" (Office Action, p. 7, lines 19-20). The Examiner does not state, however, that Pope teaches the remote control device receiving a key code signal from the key code generator device that generated the key code. The passage of Pope cited by the Examiner teaches receiving an infrared signal from a controller, such as a television remote control. The cited passage does not teach receiving a key code signal from a key code generator device.

The combination of Pope, McNair and Wouters does not form the basis for a valid rejection of claim 7 under § 103(a) because the combination does not teach receiving a key code signal from the key code generator device back on the remote control device. Moreover, none of Pope, McNair or Wouters teaches both (i) a keystroke indicator signal and (ii) a key code signal. Nor does any of Pope, McNair or Wouters teach generating a key code within a key code generator device. Therefore, reconsideration of the § 103(a) rejection and allowance of claim 7 are requested.

#### IX. Dependent claim 8

Claim 8 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Pope in view of McNair and in view of Wouters and further in view of August (Office Action, p. 8, lines 9-11).

The 4-way combination of Pope, McNair, Wouters and August does not form the basis for a valid rejection of claim 8 under § 103(a) for the same reasons explained above with relation to claims 1 and 7. The 4-way combination does not teach receiving a key code signal from the key code generator device back on the remote control device. Nor does the 4-way combination teach both (i) a keystroke indicator signal and (ii) a key code signal. Nor does the 4-way

combination teach generating a key code within a key code generator device. Therefore, reconsideration of the § 103(a) rejection and allowance of claim 8 are requested.

#### X. Dependent claim 18

Claim 18 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Wouters in view of Teskey (Office Action, p. 9, lines 1-2).

The combination of Wouters and Teskey does not form the basis for a valid rejection of claim 18 under § 103(a) for the same reasons explained above with relation to claim 13. Neither Wouters nor Teskey discloses a device with a keypad that both transmits an IR signal and receives an RF signal.

Because combination of Wouters and Teskey does not disclose all of the elements of claim 18, reconsideration of the § 102(e) rejection and allowance of claim 18 are requested

### XI. <u>Dependent claim 21</u>

Claim 21 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Pope in view of August (Office Action, p. 9, lines 13-14).

The combination of Pope and August does not form the basis for a valid rejection of claim 21 under § 103(a) for the same reasons explained above with relation to claim 19. Neither Pope nor August discloses relaying first and second key codes from a key code generator device through a remote control device to both a first electronic consumer device and a second electronic consumer device without simultaneously storing both the first and second key codes on the remote control device.

Because combination of Pope and August does not disclose all of the elements of claim 21, reconsideration of the § 102(e) rejection and allowance of claim 21 are requested.

22

#### XII. Dependent claim 23

Claim 23 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Wouters in view of Pope (Office Action, p. 10, lines 6-7).

The combination of Wouters and Pope does not form the basis for a valid rejection of claim 23 under § 103(a) for the same reasons explained above with relation to claim 22. In addition, neither Wouters nor Pope discloses a remote control device with both an RF receiver and an IR transmitter. The remote control unit 3 of Wouters does not include an RF receiver. The handset 10/50 of Pope does not include an IR transmitter. In fact, Pope teaches against including an IR transmitter on the handset. Pope explains:

"One advantage of having the infrared transmitter attached to the base unit 12 is that the base unit 12 can be typically powered by house current. Since no battery is used, the infrared transmitter can draw more power than is used in battery-type systems. For example, if a button is continuously pressed in a battery-type system, in order to conserve power the infrared signal is not continuously sent, but is sent intermittently. The base unit 12 connected to AC power need not be limited in this fashion. Additionally, it is also possible to have the base unit 12 supply a greater amount of power to the infrared transmitter to transmit a greater amount of infrared energy. In this manner, it may be possible for the infrared bulb to not be focused directly towards the appliance" (Pope, col. 3, lines 46-60) (emphasis added).

Because combination of Wouters and Pope does not disclose the limitations as recited by claim 23, reconsideration of the § 102(e) rejection and allowance of claim 23 are requested.

XIII. New claims 25-26

Applicant is adding new claims 25-26, each of which is supported by the specification and allowable over the cited references. No new matter is added.

### XIV. Conclusion

In view of the foregoing amendments and remarks, Applicant respectfully

submits that the entire application (claims 1-26 are pending) is in condition for allowance. Applicant respectfully requests that a timely Notice of Allowance be issued in this case. If the Examiner would like to discuss any aspect of this application, the Examiner is requested to contact the undersigned at (925) 621-2121.

I hereby certify that this correspondence is being deposited with the United States Postal Service as First Class Mail in an envelope addressed to: Mail Stop Amendment, Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.

#### **DETAILED ACTION**

This action is responsive to communication filed on August 06, 2006.

#### **Response to Amendment**

The examiner has acknowledged the amendment of claims 11, 13, 17, 19, and the addition of claims 25-26.

#### **Response to Arguments**

Applicant's arguments filed August 6, 2006 have been fully considered but they are not persuasive.

Applicant argues on page 10 that the reference of Wouters does not disclose a remote control device with a keypad that receive a signal in a radio frequency range and transmit a signal in a infrared frequency band, it is the examiner's position that Wouters teaches a remote control represented by the system of devices 1 and 2 that includes a receiver (13), keypad (3) and a transmitter (14) that transmit infrared code that received radio frequency signal (col. 3 lines 21-35).

Applicant's argues 11 (claims 14-16) that the reference of Wouters does not teach a key code that corresponds both to a function of an electronic consumer device as well as to a second function of a second electronic consumer device, it is the position Wouters teaches a key code generator (3) for generating key codes for controlling different function on various electrical appliances (col. 1 lines 24-26, col. 3 lines 21-35). The key codes for controlling the different devices inherently includes a first and second key code.

Regarding applicant's argument regarding claim 24 on page 12, Wouters teaches the microcontroller controlling the operation of the remote by converting the key code indications, which is the function to be performed by the device, into IR control signal and the IR control signal is transmitted by the remote control to the electronic device (col. 4 lines 50-60).

Regarding applicant's argument regarding claims 1, 3-4, and 9, Pope teaches receiving a keystroke indicator signal which contains an indication of a key on the remote control device 10 that was pressed (col. 2 lines 61-col. 3 line 19), generating a key code (codes for communicating the control function to the appliances) within the code generator 12. Applicant's describe the key stroke indicator signal as the signal that indicate which key on the remote control was pressed (page 3 lines 6-9) and also disclosed that the key code corresponds to a function of the electronic device (page 1 paragraph 003).

## Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claim 13-16, 19, 22, and 24-26 are rejected under 35 U.S.C. 102(e) as being anticipated by Wouters et al. US Patent 6915109.

Regarding claims 13 and 22, Wouters et al. teaches a remote control which includes the system of devices 1 and 2 (figure 1) comprising a receiver receiving a RF modulated remote control signal (col. 4 lines 25-28) and a transmitter transmitting an infrared modulated signal generated from the received RF signal (col. 4 lines 28-33). Wouters et al. also teaches the key code corresponding to the key of keypad is transmitted when the key is selected (col. 4 lines 4 lines 48-57).

Regarding claims 14-16, Wouters et al. teaches the key code corresponding to the key of keypad is transmitted when the key is selected (col. 4 lines 4 lines 48-57). A key code corresponding to a second and third key code is therefore transmitted based on the selected key. Wouters et al. teaches fetching the data from memory corresponding to the key code (col. 4 lines 55-58). The data from the memory is inherently store as binary data. The key code therefore comprises binary data.

Regarding claims 19, Wouters et al. teaches a key code generator (3) for generating key codes for controlling different function on various electrical appliances (col. 1 lines 24-26, col. 3 lines 21-35). The key codes for controlling the different devices inherently includes a first and second key code. Wouters et al. teaches an antenna (9) for transmitting the key code from the key code generator to a remote control (12) and the remote control 12 transmit the key code to the selected appliances (col. 3 lines 31-34). Wouters et al. teaches the key code receive by the remote control is demodulated, decoded and transmitted to the appliance (col. 4 lines 25-37). The key code is therefore not stored in the memory of the remote control .

Regarding claim 24, Wouters et al. teaches a microcontroller in the form of a microprocessor for receiving the key code (col. 4 lines 52-55).

Regarding claims 25-26, Wouters et al. teaches receiving a key stroke indicator signal (5) from a remote control (3) and the key code indicator signal is use by key code generator 8 to generate a key code (col. 3 lines 21-30);

modulating the key code signal unto a carrier and transmitting the key code to the remote control (12) (col. 4 lines 28-33) and the remote control transmit the key code to the electronic device (col. 3 lines 31-34). Wouters et al. teaches the key code receive by the remote control is demodulated, decoded and transmitted to the appliance (col. 4 lines 25-37). The key code is therefore not stored in the memory of the remote control .

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1, 3-4, 9 are rejected under 35 U.S.C. 103(a) as being unpatentable over Pope US Patent 5963624 in view of McNair et al. US Patent 5595342.

Regarding claim 1, Pope teaches receiving a keystroke indicator signal which contains an indication of a key on the remote control device 10 that was pressed (col. 2 lines 61-col. 3 line 19), generating a key code (codes for communicating the control function to the appliances) within the code generator 12 and transmitting the key codes to the appliances (col. 3 lines 35-40). Pope is however silent on teaching modulating the key code onto a carrier signal. McNair et al. in an art related control system teaches the control signal is modulated and transmitted to the controlled apparatus as a conventional practice (col. 2 lines 61-65).

It would have been obvious to one of ordinary skill in the art to modulate the key code onto a carrier signal in Pope because modulation of the key code enables the key code signal to be transmitted wirelessly to the appliances and this also represents a conventional practice.

Regarding claim 3, Pope teaches the key code generator 12 transmitting key code signal (control codes) to the consumer devices (col. 3 lines 35-40).

Regarding claim 4, Pope teaches the key code is indicated by low and high (col. 3 lines 45-47) implying the key code signal include ones and zeroes.

Regarding claim 9, Pope teaches the code generated by the code generator 12 is transmitted to the appliances (col. 3 lines 36-40). The code generated by the code generator is not store in the remote control because it is transmitted to the appliances.

Claim 2 is rejected under 35 U.S.C. 103(a) as being unpatentable over Pope US Patent 5963624 in view of McNair et al. US Patent 5595342 and further in view of Goldstein US Patent 5410326.

Regarding claim 2, Pope teaches the remote control receiving key code signals (infrared control signal) from a controller (col. 4 lines 52-56) but is silent on teaching the key code generator transmit key codes to the remote control device. Goldstein in an art related programmable remote control invention teaches a key code generator in the form of a cable box (cable box is considered a key code generator, see page 3 lines 4-5 of the applicant's specification) transmitting key codes to the remote control (col. 13 lines 50-57) in order to update the remote control with new control codes.

It would have been obvious to one of ordinary skill in the art for the key code generator to transmit the key code to the remote control in Pope in view of McNair et al. because this provides the means for updating the remote control with new codes.

Claims 5 and 10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Pope US Patent 5963624 in view of McNair et al. US Patent 5595342 and further in view of Teskey US Patent 6747568.

Regarding claim 5, Pope teaches generating a key code for controlling the consumer appliances (col. 3 lines 35-40) but is silent on teaching the key code comprises timing information defining the binary number is modulated. Teskey in an art related remote control system teaches the format of the remote control signal having the necessary timing and modulation information (col. 3 line 60-col. 4 line 8).

Page 7

It would have been obvious to one of ordinary skill in the art for the key code to include comprises timing information defining the binary number is modulated in Pope in view of McNair because the timing information defining the binary number is modulated represent information regarding the format of the remote control signal that enables the decoding and demodulating of the receive key code signals.

Regarding claim 10, Pope teaches generating a key code for controlling the consumer appliances (col. 3 lines 35-40) but is silent on teaching the key code comprises timing information defining the binary number (ones and zeroes) is modulated. Teskey in an art related remote control system teaches the format of the remote control signal having the necessary timing and modulation information (col. 3 line 60-col. 4 line 8).

It would have been obvious to one of ordinary skill in the art for the key code to include comprises timing information defining the binary number is modulated in Pope in view of McNair because the timing information defining the binary number is modulated represent information regarding the format of the remote control signal that enables the decoding and demodulating of the receive key code signals.

Claim 6 is rejected under 35 U.S.C. 103(a) as being unpatentable over Pope US Patent 5963624 in view of McNair et al. US Patent 5595342 and further in view of August et al. US Patent 5671267.

Regarding claim 6, Pope teaches the use of the remote control to control the functions of the appliances (col. 2 line 61-col. 3 line 22) but is not explicit in teaching transmitting a keystroke indicator signal that cause the appliance to turn on. One skill in the art recognizes that

Page 8

a remote control is generally use in turning an appliance on/off and is further evidenced by August et al. (col. 8 lines 3-5).

It would have been obvious to one of ordinary skill in the art for the remote control to transmit a keystroke signal for turning the appliance on in Pope in view of McNair because Pope suggests the use of the remote control to control the functions of the appliances and one skill in the art recognizes that a remote control is generally use in turning an appliance on/off and is further evidenced by August et al.

Claim 7 is rejected under 35 U.S.C. 103(a) as being unpatentable over Pope US Patent 5963624 in view of McNair et al. US Patent 5595342 and further in view of Wouster et al. US Patent 6915109

Regarding claim 7, Pope teaches the remote control receiving key code signals (infrared control signal) from a controller (col. 4 lines 52-56) and the remote control transmits control signal to the appliances (figure 1) but is silent on teaching modulating the key code onto carrier signal that is in the infrared frequency band. Wouters et al. in an art related remote control invention teaches a remote control receiving a RF modulated remote control signal (col. 4 lines 25-28) and a transmitter transmitting an infrared modulated signal generated from the received RF signal (col. 4 lines 28-33).

It would have been obvious to one of ordinary skill in the art to modulate the key code onto carrier signal that is in the infrared frequency band in Pope in view of McNair because infrared signal represents an alternative to radio signal used in the transmission of remote control signal.

Claim 8 is rejected under 35 U.S.C. 103(a) as being unpatentable over Pope US Patent 5963624 in view of McNair et al. US Patent 5595342 in view of Wouster et al. US Patent 6915109 and further in view of August et al. US Patent 5671267.

Regarding claim 8, Pope teaches the use of the remote control to control the functions of the appliances (col. 2 line 61-col. 3 line 22) but is not explicit in teaching transmitting a keystroke indicator signal that cause the appliance to turn on. One skill in the art recognizes that a remote control is generally use in turning an appliance on/off and is further evidenced by August et al. (col. 8 lines 3-5).

It would have been obvious to one of ordinary skill in the art for the remote control to transmit a keystroke signal for turning the appliance on in Pope in view of McNair in view of Yamaguchi because Pope suggests the use of the remote control to control the functions of the appliances and one skilled in the art recognizes that a remote control is generally use in turning an appliance on/off and is further evidenced by August et al.

Claim 18 is rejected under 35 U.S.C. 103(a) as being unpatentable over Wouters et al. US Patent 6915109 in view of Teskey US Patent 6747568.

Regarding claim 18, Wouters et al. teaches the remote control transmit command codes to perform various functions (col. 4 lines 4 lines 48-57). Wouters is silent on teaching the key code comprises timing information defining the binary number is modulated. Teskey in an art related remote control system teaches the format of the remote control signal having the necessary timing and modulation information (col. 3 line 60-col. 4 line 8).

It would have been obvious to one of ordinary skill in the art for the key code to include timing information defining the binary number is modulated in Wouters et al. because the timing information defining the binary number represents information regarding the format of the remote control signal that enables the decoding and demodulating of the receive key code signals.

Claims 20-21 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wouters et al. US Patent 6915109 in view of August et al. US Patent 5671267.

Regarding claims 20-21, Wouters teaches the use of the remote control to control the functions of the appliances (col. 3 lines 31-35) but is not explicit in teaching transmitting a keystroke indicator signal that cause the appliance to turn on. One skill in the art recognizes that a remote control is generally use in turning an appliance on/off and is further evidenced by August et al. (col. 8 lines 3-5).

It would have been obvious to one of ordinary skill in the art for the remote control to transmit a keystroke signal for turning the appliance on in Wouters because Wouters suggests the use of the remote control to control the functions of the appliances and one skill in the art recognizes that a remote control is generally use in turning an appliance on/off and is further evidenced by August et al.

Claim 23 is rejected under 35 U.S.C. 103(a) as being unpatentable over Wouters et al. US Patent 6915109 in view of Pope US Patent 5963624.

Regarding claim 23, Wouters teaches transmitting key codes to remote control (see response to claim 13) but is not explicit in teaching the key code is not store on the remote

control prior to the remote control receiving the key code. Pope in an art related remote control teaches the remote control receiving control codes updates (col. 4 lines 52-60). The receipt of the code update by the remote control implies that the code was not previously stored in the remote control prior transmitting the updates to the remote controller.

It would have been obvious to one of ordinary skill in the art for the key code is not store on the remote control prior to the remote control receiving the key code because the key codes transmitted to the remote control is used as a means of programming the remote control with new codes.

## Allowable Subject Matter

Claims 11-12, and 17 are allowed.

Regarding claims 11-12, the prior art of record fail to teach or suggests no more than a single one of the key codes is present on the remote control at any given time.

Regarding claim 17, the prior art of record fail to teach or suggests the first and second key code are not stored in the device at the same time.

### Conclusion

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO

MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Vernal U. Brown whose telephone number is 571-272-3060. The examiner can normally be reached on 8:30-7:00 Monday-Thursday.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Wendy Garber can be reached on 571-272-7308. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

# AMENDMENT

Dear Sir:

In response to the outstanding, final office action dated October 19, 2006 ("Office Action"), Applicant responds as follows and requests the Examiner to amend the above-identified application as follows.

There are no amendments to the specification in this Amendment.

Amendments to the Claims are reflected in the listing of claims that

begins on page 2 of this Amendment.

There are no amendments to the drawings in this Amendment.

The **Remarks** begin on page 8 of this Amendment.

## Amendments to the Claims:

This listing of claims replaces all prior versions and listings of claims in the application.

## Listing of Claims

1. (original): A method comprising:

(a) receiving a keystroke indicator signal from a remote control device;

(b) generating a key code within a key code generator device;

(c) modulating said key code onto a carrier signal, thereby generating a key code signal; and

(d) transmitting said key code signal from said key code generator device.

2. (original): The method of Claim 1, wherein said key code signal is transmitted in (d) from said key code generator device to said remote control device.

3. (original): The method of Claim 1, wherein said key code signal is transmitted in (d) from said key code generator device to an electronic consumer device.

4. (original): The method of Claim 1, wherein said key code consists of a binary number.

5. (original): The method of Claim 1, wherein said key code comprises a binary number and timing information, and wherein said timing information defines how said binary number is modulated in (c) onto said carrier signal.

6. (original): The method of Claim 1, further comprising:

(e) pressing a power-on key of said remote control device causing said remote control device to transmit said keystroke indicator signal that is received

in (a), wherein said key code signal transmitted in (d) is received onto an electronic consumer device, and wherein said pressing in (e) causes said electronic consumer device to turn on.

7. (original): The method of Claim 1, wherein said carrier signal is in a radio frequency band, wherein said key code signal is received by said remote control device, and wherein said method further comprises:

(e) modulating said key code onto a second carrier signal, thereby generating a second key code signal, said modulating being performed on said remote control device wherein said second carrier signal is in an infrared frequency band; and

(f) transmitting said second key code signal from said remote control device to an electronic consumer device.

8. (original): The method of Claim 7, further comprising:

(g) pressing a power-on key of said remote control device causing said remote control device to transmit said keystroke indicator signal that is received in (a), wherein the pressing in (g) causes said electronic consumer device to turn on.

9. (original): The method of Claim 1, wherein said key code generated in (b) is part of a codeset, and wherein said remote control device does not store said codeset.

10. (original): The method of Claim 9, wherein said codeset comprises timing information and a plurality of key codes, and wherein said timing information describes a digital one and a digital zero.

11. (previously presented): A method comprising:

(a) receiving a keystroke indicator signal from a remote control device;

(b) generating a key code within a key code generator device;

(c) modulating said key code onto a carrier signal, thereby generating a key code signal; and

(d) transmitting said key code signal from said key code generator device, wherein a codeset comprises a plurality of key codes, each one of said plurality of key codes corresponding to a function of an electronic consumer device, and wherein no more than a single one of said plurality of key codes is present on said remote control device at any given time.

12. (original): The method of Claim 11, wherein said function of said electronic consumer device is taken from the group consisting of: power on, power off, channel advance, channel back, volume up, volume down, cursor up, cursor down, cursor right, cursor left, select, play, record, stop, forward, back and pause.

13. (previously presented): A remote control device comprising:

a receiver that receives a first key code signal, wherein said first key code signal is generated by modulating a key code onto a first carrier signal, said first carrier signal falling within a radio frequency band;

a transmitter that transmits a second key code signal, wherein said second key code signal is generated by modulating said key code onto a second carrier signal, said second carrier signal falling within an infrared frequency band; and

a keypad that includes a key that corresponds to said key code, wherein said key code corresponds to a function of an electronic consumer device.

14. (original): The device of Claim 13, wherein said key code corresponds to a second function of a second electronic consumer device, as well as to said function of said electronic consumer device.

15. (original): The device of Claim 14, wherein said transmitter transmits a third key code signal, and wherein said third key code signal is generated by modulating said key code onto a third carrier signal.

16. (original): The device of Claim 14, wherein said key code comprises a first binary number and a second binary number, said first binary number corresponding to said function, and said second binary number corresponding to said second function.

17. (previously presented): A device comprising:

a receiver that receives a first key code signal, wherein said first key code signal is generated by modulating a key code onto a first carrier signal, said first carrier signal falling within a radio frequency band;

a transmitter that transmits a second key code signal, wherein said second key code signal is generated by modulating said key code onto a second carrier signal, said second carrier signal falling within an infrared frequency band; and

a keypad that includes a key that corresponds to said key code, wherein said key code corresponds to a function of an electronic consumer device, wherein said keypad includes a second key that corresponds to a second key code, wherein a third key code signal is generated by modulating said second key code onto a third carrier signal, wherein said third key code signal is received by said receiver, and wherein both said first key code and said second key code are not both stored in said device at the same time.

18. (original): The device of Claim 13, wherein a codeset comprises timing information and a plurality of key codes, wherein each of said plurality of key codes corresponds to a different function of said electronic consumer device, wherein said key code is a binary number, and wherein said timing information defines how said binary number is modulated onto said first carrier signal.

5

19. (previously presented): A system comprising:

a key code generator device that generates a first key code and a second key code, wherein a codeset is stored on said key code generator device, said codeset including said first key code and said second key code, wherein said first key code corresponds to a selected function of a first electronic consumer device, and wherein said second key code corresponds to said selected function of a second electronic consumer device; and

means for relaying said first key code and said second key code from said key code generator device through a remote control device to said first electronic consumer device and to said second electronic consumer device without simultaneously storing both said first key code and said second key code on said remote control device.

20. (original): The system of Claim 19, wherein said selected function is taken from the group consisting of: power on, power off, channel advance, channel back, volume up, volume down, cursor up, cursor down, cursor right, cursor left, select, play, record, stop, forward, back and pause.

21. (original): The system of Claim 19, wherein said selected function is power on, and wherein said system automatically determines when said first electronic consumer device powers on.

22. (currently amended): A remote control device, comprising:

<u>a keypad;</u>

an RF receiver;

an IR transmitter; and

means for receiving a key code from said RF receiver and for sending said key code to said IR transmitter such that said key code is modulated onto an IR

carrier signal, said IR carrier signal with said key code modulated thereon being transmitted from said remote control device by said IR transmitter.

23. (original): The remote control device of Claim 22, wherein said key code is not stored on said remote control device immediately prior to said means receiving the key code.

24. (original): The remote control device of Claim 22, wherein said means is a microcontroller.

25. (currently amended): A method comprising:

(a) receiving a keystroke indicator signal from a remote control device;

(b) using said keystroke indicator signal to generate a key code, wherein a key code generator device generates said key code;

(c) modulating said key code onto a carrier signal and thereby generating a key code signal; and

(d) transmitting said key code signal from said key code generator device to said remote control device, wherein said remote control device transmits said key code signal to an electronic consumer device.

26. (previously presented): The method of Claim 25, wherein said key code generated in (b) is part of a codeset, and wherein said codeset is not stored on said remote control device.

### <u>REMARKS</u>

Reconsideration and allowance is respectfully requested.

Before entry of this amendment, claims 1-26 were pending. In the Office Action, claims 1-10, 13-16 and 18-26 were rejected, and claims 11-12 and 17 were allowed. In the present amendment, claims 22 and 25 are amended. After entry of the amendment, claims 1-26 are pending.

#### I. <u>Claims 13-16, 19, 22 and 24-26</u>

Claims 13-16, 19, 22 and 24-26 are rejected under 35 U.S.C. § 102(e) as being anticipated by Wouters et al. (USP 6,915,109) (Office Action, p. 4, lines 1-2).

### A. Independent claims 13 and 22

Claim 13 recites, "A remote control device comprising: a receiver that <u>receives</u> a first key code signal . . . <u>within a radio frequency band</u>; a transmitter that <u>transmits</u> a second key code signal . . . <u>within an infrared frequency band</u>; and a <u>keypad</u> . . ." (emphasis added). Claim 22 as amended recites, "A remote control device, comprising: <u>a keypad</u>; <u>an RF receiver</u>; <u>an IR transmitter</u>" (emphasis added). Wouters does not form the basis for a valid rejection under § 102(e) because Wouters does not disclose all of the limitations of either claim 13 or claim 22. Specifically, Wouters does not disclose a device with a keypad that both receives a signal within a radio frequency band and transmits a signal within an infrared frequency band.

Wouters does not disclose a device with a keypad that transmits an IR signal and receives an RF signal. The Examiner has not stated a *prima facie* case of anticipation because that Examiner has not alleged that Wouters discloses a single device with a keypad that both transmits an IR signal and receives an RF signal. Instead, the Examiner states, "Wouters et al. teaches a remote control which includes the <u>system of devices</u> 1 and 2 (figure 1)

comprising a receiver receiving a RF modulated remote control signal (col. 4 lines 25-28) and a transmitter transmitting an infrared modulated signal generated from the received RF signal (col. 4 lines 28-33)." (Office Action, p. 4, lines 3-6). The Examiner's statement that Wouters discloses <u>a system of devices</u> 1 and 2 that comprise an RF receiver and an IR transmitter is insufficient to allege a *prima facie* case of anticipation of claims that recite <u>a device comprising</u> a keypad, a receiver and a transmitter. For example, claim 13 does not recite a system of devices, but rather "a remote control device". The RF receiver, IR transmitter and keypad of Wouters are not on the same device. In fact, in Wouters the keypad on remote control unit 3 is in a separate room (1) from receiver 13 and transmitter 14 (room 2). And the unit 3, receiver 13 and transmitter 14 are the basis for the Examiner's argument. (See Office Action, p. 2, lines 10-13).

The Examiner cites column 4, lines 25-28, of Wouters as disclosing an RF receiver and column 4, lines 28-33, as disclosing an IR transmitter (Office Action, p. 4, lines 5-6). The first passage from lines 25-28 describes radio receiver 13 on a device in room 2. The second passage from lines 28-33 refers to an IR transmitter also in room 2. Wouters does not disclose a keypad in room 2. The only keypad disclosed in Wouters is on IR remote control unit 3 in room 1. The remote control unit 3 described in lines 48-57 includes IR transmitter 4 and RF transmitter 8, but does not include an RF receiver. Thus, the Examiner does not state that Wouters discloses a single device with a keypad, an RF receiver and an IR transmitter. Nor does Wouters disclose a device with all three of these elements.

Because Wouters does not disclose all of the elements of either claim 13 or claim 22, reconsideration of the § 102(e) rejection and allowance of claims 13 and 22 are requested.

### B. Dependent claims 14-16

Claim 14 recites "said key code corresponds to a second function of a

9 ·

second electronic consumer device, as well as to said function of said electronic consumer device". The Examiner has not presented a prima facie argument of anticipation of claim 14 because the Examiner has not stated that Wouters discloses a single key code that corresponds to two separate functions. Instead, the Examiner states, "A key code corresponding to a second and third key code is therefore transmitted based on the selected key." (Office Action, p. 4, lines 10-11) (emphasis added). But claim 14 does not recite second and third key codes; claim 14 recites only one key code. In addition, the Examiner states that "Wouters teaches a key code generator (3) for generating key codes for controlling different function on various electrical appliances (col. 1 lines 24-26, col. 3 lines 21-35). The key codes for controlling the different devices inherently includes a first and second key code." (Office Action, p. 2, lines 17-20) (emphasis added). Claim 14 does not recite first and second key codes. Instead, claim 14 recites "said key code", "said function" and "a second function". The Examiner has not stated that Wouters discloses one key code that corresponds both to a function of an electronic consumer device as well as to a second function of a second electronic consumer device. And in fact Wouters does not disclose one key code that corresponds to two separate functions of two different electronic consumer devices.

Claim 16 recites "said key code comprises a first binary number and a second binary number, said first binary number corresponding to said function, and said second binary number corresponding to said second function". The Examiner has not presented a *prima facie* argument of anticipation of claim 16 because the Examiner has not stated that Wouters discloses a key code comprising both (i) a first binary number that corresponds to a function of an electronic consumer device as well as (ii) a second binary number that corresponds to a second function of a second electronic consumer device. Instead, the Examiner simply states, "The data from the memory is inherently store as binary data. The key code therefore comprises binary data." (Office Action, p. 4, lines 13-14). The Examiner does not mention a first binary number

10

ł

of a key code corresponding to a first function, as well as a second binary number of the same key code corresponding to a second function. In fact, Wouters does not disclose a single key code that comprises two binary numbers, one corresponding to the function of one electronic consumer device, and the other corresponding to a second function of a second electronic consumer device.

Claims 14-16 depend directly or indirectly from claim 13. In addition to the reasons explained above, dependent claims 14-16 are allowable for at least the same reasons for which claim 13 is allowable. Reconsideration of the § 102(e) rejection and allowance of claims 14-16 are requested.

### C. Dependent claim 24

Claim 24 recites that the means of claim 22 is a microcontroller. The means of claim 22 is a "means for receiving a key code from said RF receiver". The Examiner states that Wouters discloses "a microcontroller in the form of a microprocessor for receiving the key code (col. 4 lines 52-55)" (Office Action, p. 5, lines 1-2). The passage of Wouters cited by the Examiner, however, does not disclose a microprocessor for receiving a key code from an RF receiver.

The remote control unit disclosed in the passage cited by the Examiner does not include an RF receiver. Therefore, the central processing unit (CPU) that is inside remote control unit 3 of Wouters does not receive a key code from any RF receiver. Instead, Wouters discloses that the CPU determines which code needs transmitting based on which key is tapped by the user. (No keypad is included in the devices in room 2 of Wouters.) Wouters explains:

"In this case the user taps a key, the CPU (Central processing unit) inside the remote control determines which code (corresponding to the tapped key) needs <u>transmitting (by IR or RF</u>) and fetches the required data from its memory which comprises a data base or other means in <u>which tapped codes are linked to data to be transmitted</u>" (Wouters, col. 4, lines 57-62) (emphasis added).

Thus, Wouters does not disclose a microcontroller that receives a key code from an RF receiver.

Claim 24 depends from claim 22. In addition to the reasons explained above, dependent claim 24 is allowable for at least the same reasons for which claim 22 is allowable. Reconsideration of the § 102(e) rejection and allowance of claim 24 are requested.

#### D. Independent claim 19

In the Office action dated June 6, 2006, claim 19 was rejected as being anticipated by Pope (USP 5,963,624). Now in the present final Office Action, claim 19 is rejected under a new argument as being anticipated by Wouters.

Claim 19 recites, "said codeset including said first key code and said second key code, wherein said <u>first key code</u> corresponds to <u>a selected function</u> <u>of a first electronic consumer device</u>, and wherein said <u>second key code</u> corresponds to <u>said selected function of a second electronic consumer device</u>" (emphasis added). Wouters does not form the basis for a valid rejection under § 102(e) because Wouters does not disclose a codeset that includes two key codes: one key code corresponding to a function of one electronic consumer device, and the other key code corresponding <u>to the same function</u> ("said selected function") of another electronic consumer device.

The Examiner has not presented a *prima facie* argument of anticipation of claim 19 because the Examiner has not stated that Wouters discloses the two recited key codes that correspond to the same function on different electronic consumer devices. Nor has the Examiner stated that Wouters discloses that those two key codes are included in a codeset stored on a key code generator device. In fact, Wouters does not mention key codes that correspond to the same function on separate electronic consumer devices.

Because Wouters does not disclose all of the elements of claim 19, reconsideration of the § 102(b) rejection and allowance of claim 19 are requested.

12

### E. Independent claim 25

Claim 25 recites, "receiving a keystroke indicator signal <u>from a remote</u> <u>control device;</u> . . . transmitting said key code signal from said key code generator device <u>to said remote control device</u>, wherein said remote control device transmits said key code signal to an electronic consumer device." (emphasis added). Wouters does not form the basis for a valid rejection of claim 25 under § 102(e) because Wouters does not disclose (i) receiving a keystroke indicator signal from a remote control device, (ii) transmitting a key code signal to the remote control device, and then (iii) transmitting the key code signal from the remote control device to an electronic consumer device.

The Examiner has not stated a *prima facie* case of anticipation because that Examiner has not alleged that Wouters discloses (i) receiving a signal <u>from a</u> <u>remote control device</u>, (ii) transmitting a second signal <u>to the remote control</u> <u>device</u>, and (iii) transmitting a third signal <u>from the remote control device</u>. Instead, the Examiner states that Wouters discloses:

"receiving a key stroke indicator signal (5) from <u>a remote control (3)</u> and the key code indicator signal is used by key code generator 8 to generate a key code (col. 3 lines 21-30); modulating the key code signal unto a carrier and transmitting the key code to <u>the</u> <u>remote control (12)</u> (col. 4 lines 28-33) and the remote control transmit the key code to the electronic device (col. 3 lines 31-34). Wouters et al. teaches the key code receive by the remote control is demodulated, decoded and transmitted to the appliance (col. 4 lines 25-37)." (Office Action, p. 5, lines 3-9) (emphasis added)

The Examiner argues that the recited "keystroke indicator signal" is disclosed by infrared signal 5 of Wouters. Moreover, the Examiner argues that the recited "remote control device" is infrared remote control unit 3 of Wouters. But then the Examiner improperly argues that the item labeled 12 in room 2 of Wouters is also the recited remote control device. This is improper. The Examiner has engaged in improper claim construction by arguing (i) that the recited remote control device from which a keystroke indicator signal is received is disclosed by item 3 in room 1 of Wouters for purposes of one claim limitation, and (ii) that the same

recited remote control device is disclosed by item 12 in room 2 of Wouters for purposes of another limitation of the same claim. Alternatively, the Examiner is arguing that the recited remote control device is in two rooms of Wouters at the same time. Therefore, Wouters does not disclose the recited remote control device from which a first signal is received and to which a second signal is transmitted.

An additional reason why the Examiner's argument fails is that Wouters does not disclose that item 12 in figure 1 is a remote control device. The reference numeral 12 does not appear at all in the specification of Wouters.

Because Wouters does not disclose all of the elements of claim 25, reconsideration of the § 102(b) rejection and allowance of claim 25 are requested.

### F. Dependent claim 26

Claim 26 recites, "wherein said codeset is not stored on said remote control device". The Examiner states that infrared remote control unit 3 of Wouters discloses the recited "remote control device". (Office Action, p. 5, line 4) The Examiner also states, "The key code is therefore not stored in the memory of the remote control" (Office Action, p. 5, lines 9-10). First, the Examiner has not stated a *prima facie* case of anticipation of claim 26 because claim 26 <u>does not</u> recite "wherein the key code is not stored on said remote control device". Second, Wouters does not disclose that a codeset is not stored on infrared remote control unit 3. In fact, Wouters suggests the contrary:

"In this system <u>a remote control unit</u> is used which comprises both an IR transmitter and an antenna for transmission of RF signals. In this case the user taps a key, <u>the CPU</u> (Central processing unit) <u>inside the remote control</u> determines which code (corresponding to the tapped key) needs transmitting (by IR or RF) and <u>fetches the required data</u> from its memory which comprises a data base or other means in which tapped codes are linked to data to be transmitted." (Wouters, col. 4, lines 54-62) (emphasis added).

Third, dependent claim 26 is allowable for at least the same reasons for which claim 25 is allowable because claim 26 depends from claim 25. Reconsideration of the § 102(e) rejection and allowance of claim 26 are requested.

### II. <u>Claims 1, 3-4 and 9</u>

Claims 1, 3-4 and 9 are rejected under 35 U.S.C. § 103(a) as being unpatentable over Pope (USP 5,963,624) in view of McNair et al. (USP 5,595,342) (Office Action, p. 6, lines 1-2).

### A. Independent claim 1

Claim 1 recites, "(a) receiving a keystroke indicator signal from a remote control device; (b) generating a key code within a key code generator device . . . generating a key code signal". The combination of Pope and McNair does not form the basis for a valid rejection of claim 1 under § 103(a) because the references when combined do not teach (i) generating a key code within a key code generator device, (ii) a keystroke indicator signal as well as a key code signal, or (iii) modulating a key code.

(i) <u>Neither Pope nor McNair teaches generating a key code within a key</u> <u>code generator device</u>.

The Examiner states that "Pope teaches receiving a keystroke indicator signal which contains an indication of a key on the remote control device 10 that was pressed (col. 2 lines 61-col. 3 line 19), generating a key code (codes for communicating the control function to the appliances) within the code generator  $12 \dots$ " (Office Action, p. 6, lines 3-6) (emphasis added). Pope does not, however, teach generating a key code within base unit 12. The appliance control code that is transmitted by base unit 12 of Pope is not generated within base unit 12. Instead, base unit 12 receives the appliance control codes from handset 10/50. Pope explains:

"The present invention uses a digital cordless telephone <u>handset</u> to <u>store</u> a variety of <u>appliance control codes</u>. These <u>appliance control</u>

> <u>codes</u> can be <u>transmitted to</u> a <u>base unit</u>. The base unit can translate the appliance control codes to control signals such as infrared control signals, to control an electrical appliance" (Pope, col. 1, lines 31-36) (emphasis added) *See also* Pope, col. 2, lines 48-52 and 63-65.

The appliance control codes are not generated within the base unit 12 of Pope. Instead, the appliance control codes are transmitted from the handset 10/50 to the base unit 12, where they are translated to control signals. Base unit 12 of Pope does not receive a keystroke indicator and then generate a key code. Thus, Pope does not teach the recited "receiving a keystroke indicator signal from a remote control device" (emphasis added). Pope states, "Once an appliance control code is received by the base unit, the base unit will know to transfer the control code to an appliance" (Pope, col. 4, lines 49-51) (emphasis added). Thus, in Pope, an appliance control code is received by base unit 12 and is then transferred to an appliance; the appliance control code is not generated within base unit 12.

# (ii) Pope and McNair do not teach both a keystroke indicator signal and a key code signal.

The Examiner states that "Pope teaches receiving a keystroke indicator signal which contains an indication of a key on the remote control device 10 that was pressed (col. 2 lines 61-col. 3 line 19), . . ." (Office Action, p. 6, lines 3-6). Nowhere, however, does Pope teach a keystroke indicator signal in the passage cited by the Examiner, which is reproduced below in its entirety:

"Keypad 30 includes the numbers 1-9, the "star" and the "pound" key. Additionally, "up arrow" key 30a and "down arrow" key 30b can be used to scroll through a menu. A "transmit" key 30c can be used to transmit the <u>appliance control code</u> once the appliance control has been selected. In one embodiment, the user gets into the menu by pressing an "up arrow" or a "down arrow" key. Alternately a "menu" button (not shown) is used. The keys for numbers 1-9 can have different meanings once the user is in the menu. Menu functions can be printed above the normal telephone control keys. FIG. 1 shows compact disc, television, cable and AC signal control menu-function buttons. The setup menu can be entered, one of

16

ł

these buttons pressed, and then using the up and down arrows, the <u>specific controls</u> for a given electrical appliance can be scrolled through. The different <u>appliance controls</u> can be listed in the order of frequency of use. For example, the "mute" function could be the first function listed in each menu selection.

Alternately, individual functions can be mapped with the associated buttons of the keypad, and a display 32 need not be used. Buttons similar to a "shift," "alt," and "control" on a normal computer keypad can be used to change the meanings of buttons "0" to "9," "star," and "pound." The different meanings associated with different buttons can be printed in different colors, which are the same colors of the associated buttons "shift," "alt," "alt," or "control."" (Pope, col. 2, line 61 – col. 3, line 19) (emphasis added)

Thus, the passage of Pope above teaches appliance controls and appliance control codes but does not teach a keystroke indicator signal as the Examiner maintains.

Moreover, it is improper to construe the appliance control codes of Pope to teach both a keystroke indicator signal and a key code signal. According to the tenets of claim differentiation, a "keystroke indicator signal" cannot be interpreted to be the same as a "key code signal". Such a claim interpretation is presumptively unreasonable. <u>See, e.g., Karlin Tech. Inc. v. Surgical Dynamics Inc.</u>, 177 F.3d 968, 50 USPQ2d 1465, 1468 (Fed. Cir. 1999). In addition, such a claim interpretation would render claim 1 internally inconsistent because "keystroke indicator/key code" information that was already received by the key code generator device would later be generated by the key code generator device. Thus, Pope does not teach both a keystroke indicator and a key code. The handset 10/50 of Pope transmits an appliance control code and not a keystroke indicator.

### (iii) Neither Pope nor McNair teaches modulating a key code.

The Examiner admits that Pope is silent on teaching modulating a key code onto a carrier signal. (Office Action, p. 6, line 7) Moreover, McNair does not teach modulating a key code. McNair does not teach a key code. And the

Examiner does not state that McNair teaches <u>modulating a key code</u> onto a carrier signal. Instead, the Examiner states that McNair teaches "the control signal is modulated" (Office Action, p. 6, line 8). This is insufficient to establish a *prima facie* case of obviousness.

Moreover, there would be no motivation to combine McNair with Pope even if McNair did disclose a limitation of claim 1 (which it does not). McNair is directed to a control system for a gas-fired, central heating system and does not concern key code signals for electronic consumer devices.

Therefore, Pope and McNair do not form the basis for a valid rejection under § 103(a) because neither Pope nor McNair teaches (i) generating a key code within a key code generator device, (ii) a keystroke indicator signal as well as a key code signal, or (iii) modulating a key code. In addition, there is no motivation to combine McNair with Pope to arrive at all of the limitations of claim 1. For these reasons, reconsideration of the § 103(a) rejection and allowance of claim 1 are requested.

### B. Dependent claims 3-4 and 9

Claim 9 recites, "said key code generated in (b) is part of a codeset, and wherein <u>said remote control device does not store said codeset</u>" (emphasis added). With respect to base claim 1, the Examiner states that "Pope teaches receiving a keystroke indicator signal which contains an indication of a key on the <u>remote control device 10</u>" (Office Action, p. 6, lines 3-4) (emphasis added). Thus, the Examiner considers that handset 10 of Pope teaches the remote control device recited in claim 9. The Examiner then states, "The code generated by the code generator is not store in the remote control because it is transmitted to the appliances" (Office Action, p. 6, lines 18-19). This incorrectly characterizes the teachings of Pope. The appliance control codes of Pope are indeed stored on handset 10 and are transmitted from handset 10 to base unit 12. Pope explains:

> "The present <u>invention uses a digital cordless telephone handset to</u> <u>store a variety of appliance control codes</u>. These appliance control codes can be <u>transmitted to a base unit</u>. The base unit can translate the appliance control codes to control signals such as infrared control signals, to control an electrical appliance" (Pope, col. 1, lines 31-36) (emphasis added)

> "The cordless digital telephone <u>handset</u> includes a memory 66 . . . used to <u>store the appliance control codes</u>. Preferably, the appliance control codes can be transmitted to the base unit 12 . . ." (Pope, col. 2, lines 48-52) (emphasis added).

"Fig. 2 is a diagram of a handset 50 of the present invention. . . . The <u>appliance control codes are stored in a memory 66</u>" (Pope, col. 4, lines 17-28) (emphasis added).

Base unit 12 does not generate the appliance control codes. Instead, base unit 12 receives the appliance control codes, which were stored in memory 66 of handset 10, and then translates the appliance control codes into infrared control signals. Thus, Pope does not teach that handset 10 does not store a codeset.

Claims 3-4 and 9 depend from claim 1. In addition to the reasons explained above, dependent claims 3-4 and 9 are allowable for at least the same reasons for which claim 1 is allowable. Reconsideration of the § 103(a) rejection and allowance of claims 3-4 and 9 are requested.

#### III. Dependent claim 2

Claim 2 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Pope in view of McNair and further in view of Goldstein (USP 5,410,326) (Office Action, p. 7, lines 1-2).

Claim 2 includes the following limitations of base claim 1, "(a) receiving a keystroke indicator signal from a remote control device; (b) generating a key code within a key code generator device . . .." Claim 2 also recites "wherein said key code signal is transmitted in (d) from said key code generator device to said remote control device".

None of Pope, McNair or Goldstein teaches either (i) generating a key code within a key code generator device or (ii) both a keystroke indicator signal and a key code signal. Moreover, the Examiner seems to admit that Pope and McNair are silent on teaching that the key code generator transmits the key code signal to the remote control device. (Office Action, p. 7, lines 4-10). And Goldstein does not teach this limitation.

None of Pope, McNair or Goldstein teaches transmitting a key code signal from the key code generator device back to the remote control device. The fact that Goldstein may teach sending an IR code or an entire codeset from a cable television converter box to a remote control device to update the remote control device does not teach transmitting a key code signal from a key code generator device back to the remote control device. Indeed, Goldstein does not teach transmitting a key code signal as opposed to a key code or a codeset. The cable television converter box of Goldstein does not teach a key code generator because the cable television converter box of Goldstein receives complete codesets from a remote database or is loaded with complete codesets. (Goldstein, col. 15, lines 20-68; col. 17, lines 62-67). The television converter box of Goldstein is not a key code generator because the GLUE logic 95 in the universal remote control 5, as opposed to the television converter box, generates the IR sequences from the codes. Goldstein states, "The glue logic 95 will supply the IR sequences from codes, stored in the RAM 90, upon command of the user.... These codes describe carrier frequencies, pulse widths and pulse duration to be generated to the glue logic 95 for producing infrared pulses from the infrared diode 97" (Goldstein, col. 13, lines 23-33) (emphasis added). Thus, Goldstein does not teach transmitting a key code signal from a key code generator.

In addition, the motivation posited by the Examiner to combine Goldstein and Pope is non-existent. (See Office Action, p. 7, lines 11-13). There would be no motivation to update the remote control device of claim 2 with new codesets, as allegedly taught by Goldstein, because claim 2 does not recite that any key

code or codeset is ever stored on the remote control device. Claim 2 recites transmitting a key code signal to the remote control device and does not recite transmitting a codeset to the remote control device. The motivation proposed by the Examiner would only result in a combination wherein codesets, or at least key codes, are stored on a remote control device.

The combination of Pope, McNair and Goldstein does not form the basis for a valid rejection of claim 2 under § 103(a) because the combination does not teach (i) generating a key code within a key code generator device, (ii) both a keystroke indicator signal and a key code signal, or (iii) transmitting a key code signal from the key code generator device back to the remote control device. Finally, there is no motivation to combine the teachings of Goldstein with the teachings of Pope and McNair in such a way as to obtain all of the limitations of claim 2. Therefore, reconsideration of the § 103(a) rejection and allowance of claim 2 are requested.

### IV. Dependent claims 5 and 10

Claims 5 and 10 are rejected under 35 U.S.C. § 103(a) as being unpatentable over Pope in view of McNair and further in view of Teskey (USP 6,747,568) (Office Action, p. 7, lines 14-16).

Claims 5 and 10 depend directly or indirectly from claim 1 and include the following limitations of claim 1: "(a) receiving a keystroke indicator signal from a remote control device; (b) generating a key code within a key code generator device . . .." None of Pope, McNair or Teskey teaches (i) generating a key code within a key code generator device or (ii) both a keystroke indicator signal and a key code signal.

In addition, claim 10 recites that "said timing information describes a digital one and a digital zero". The Examiner admits that Pope "is silent on teaching the key code comprises timing information defining the binary number (ones and zeros) in modulated." But the Examiner states that Teskey "teaches the format of the remote control signal having the necessary timing and modulation

information (col. line 60-col. 4 line 8)" (Office Action, p. 8, lines 7-10). Teskey does not, however, teach "the necessary timing and modulation information." The passage of Teskey cited by the Examiner does not teach timing information that defines a digital one or a digital zero. In fact, Teskey does not mention a digital one, a digital zero or any type of mark/space representation.

The combination of Pope, McNair and Teskey does not form the basis for a valid rejection of either claim 5 or claim 10 under § 103(a) because the combination does not teach (i) generating a key code within a key code generator device or (ii) both a keystroke indicator signal and a key code signal. And with regard to claim 10, Teskey does not teach timing information that defines a digital one or a digital zero. Therefore, reconsideration of the § 103(a) rejection and allowance of claims 5 and 10 are requested.

#### V. Dependent claim 6

Claim 6 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Pope in view of McNair and further in view of August (USP 5,671,267) (Office Action, p. 8, lines 16-18).

Claim 6 includes the following limitations of base claim 1, "(a) receiving a keystroke indicator signal from a remote control device; (b) generating a key code within a key code generator device . . .." None of Pope, McNair or August teaches (i) generating a key code within a key code generator device or (ii) both a keystroke indicator signal and a key code signal.

In addition, claim 6 recites, "(e) pressing a power-on key of said remote control device causing said <u>remote control device to transmit said keystroke</u> <u>indicator signal</u> that is received in (a), wherein said <u>key code signal transmitted in</u> (d) is received onto an electronic consumer device, and wherein said pressing in (e) causes said electronic consumer device to turn on" (emphasis added). The Examiner states that Pope "is not explicit in teaching transmitting a keystroke indicator signal that cause the appliance to turn on. One skill in the art recognizes that a remote control is generally use in turning an appliance on/off and is further

evidence by August et al. (col. 8 lines 3-5)" (Office Action, p. 8, line 20 – p. 9, line 2). The Examiner has not presented a *prima facie* case of obviousness because the Examiner has not stated that August teaches a remote control device transmitting a keystroke indicator signal. Indeed, August does not teach a keystroke indicator signal. The passage of August cited by the Examiner teaches handset unit 10 of August using a key code signal, as opposed to a keystroke indicator signal, to turn a television set on and off. Interpreting a "keystroke indicator signal" to be the same as a "key code signal" would be contrary to the tenets of claim differentiation.

The combination of Pope, McNair and August does not teach (i) receiving a keystroke indicator signal from a remote control device, (ii) generating a key code within a key code generator, and (iii) transmitting a key code signal from the key code generator to an electronic consumer device to turn on the electronic consumer device. Nor does the combination teach both a keystroke indicator signal and a key code signal. Reconsideration of the § 103(a) rejection and allowance of claim 6 are requested.

### VI. Dependent claim 7

Claim 7 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Pope in view of McNair and further in view of Wouters (Office Action, p. 9, lines 8-10).

Claim 7 includes the following limitations of base claim 1, "(a) receiving a keystroke indicator signal from a remote control device; (b) generating a key code within a key code generator device . . .." The combination of Pope, McNair and Wouters teaches neither (i) generating a key code within a key code generator device nor (ii) both a keystroke indicator signal and a key code signal.

In addition, claim 7 recites "wherein said key code signal is received by said remote control device". The Examiner states that "Pope teaches the remote control receiving key code signals (infrared control signal) from a controller (col. 4 lines 52-56)" (Office Action, p. 9, lines 11-12). The Examiner has not presented

a *prima facie* case of obviousness because the Examiner has not stated that Pope teaches a remote control device that receives a key code signal <u>from a key</u> <u>code generator device</u> that generated the key code. The passage of Pope cited by the Examiner teaches receiving an infrared signal from a controller, such as a television remote control. The cited passage does not teach receiving a key code signal from a key code generator device. Interpreting a "remote control device" to be the same as a "key code generator device" recited in the same claim would be contrary to the tenets of claim differentiation.

The combination of Pope, McNair and Wouters does not form the basis for a valid rejection of claim 7 under § 103(a) because the combination does not teach any of (i) receiving a key code signal from the key code generator device back on the remote control device, (ii) both a keystroke indicator signal and a key code signal, or (iii) generating a key code within a key code generator device. Therefore, reconsideration of the § 103(a) rejection and allowance of claim 7 are requested.

### VII. Dependent claim 8

Claim 8 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Pope in view of McNair and in view of Wouters and further in view of August (Office Action, p. 10, lines 1-3).

The 4-way combination of Pope, McNair, Wouters and August does not form the basis for a valid rejection of claim 8 under § 103(a) for the same reasons explained above with relation to claims 1 and 7. The 4-way combination does not teach any of (i) receiving a key code signal from the key code generator device back on the remote control device, (ii) both a keystroke indicator signal and a key code signal, or (iii) generating a key code within a key code generator device. Therefore, reconsideration of the § 103(a) rejection and allowance of claim 8 are requested.

### VIII. Dependent claim 18

Claim 18 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Wouters in view of Teskey (Office Action, p. 10, lines 14-15).

The combination of Wouters and Teskey does not form the basis for a valid rejection of claim 18 under § 103(a) for the same reasons explained above with relation to claim 13. Neither Wouters nor Teskey discloses a device with a keypad that both transmits an IR signal and receives an RF signal.

Because combination of Wouters and Teskey does not disclose all of the elements of claim 18, reconsideration of the § 102(e) rejection and allowance of claim 18 are requested

### IX. Dependent claims 20-21

Claims 20-21 are rejected under 35 U.S.C. § 103(a) as being unpatentable over Wouters in view of August (Office Action, p. 11, lines 6-7).

Both claim 20 and claim 21 depend from claim 19 and incorporate the limitations of claim 19. The combination of Wouters and August does not form the basis for a valid rejection of either claim 20 or claim 21 under § 103(a) for the same reasons explained above with relation to claim 19. Neither Wouters nor August discloses a codeset that includes two key codes: one key code corresponding to a function of one electronic consumer device, and the other key code corresponding to the same function of another electronic consumer device. The Examiner has not presented a *prima facie* argument of obviousness because the Examiner has not stated that the combination of Wouters and August discloses a codeset with two recited key codes that correspond to the same function on different electronic consumer devices. Neither Wouters nor August teaches the recited codeset with key codes that correspond to the same function on separate electronic consumer devices. August does not mention a codeset.

Because combination of Wouters and August does not disclose a codeset with two key codes that correspond to the same function on two electronic

consumer devices, reconsideration of the § 103(a) rejection and allowance of claims 20-21 are requested.

## X. Dependent claim 23

ð,

Claim 23 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Wouters in view of Pope (Office Action, p. 11, lines 18-19).

Claim 23 depends from claim 22 and incorporates the limitations of claim 22. The combination of Wouters and Pope does not form the basis for a valid rejection of claim 23 under § 103(a) for the same reasons explained above with relation to claim 22. Neither Wouters nor Pope teaches a device with a keypad, a radio frequency receiver and an infrared transmitter.

The RF receiver, IR transmitter and keypad of Wouters are not on the same device. The remote control unit 3 of Wouters does not include an RF receiver. Pope does not teach an RF receiver. And Pope even teaches against including an IR transmitter on the handset. Pope explains:

"One advantage of having the infrared transmitter attached to the base unit 12 is that the base unit 12 can be typically powered by house current. Since no battery is used, the infrared transmitter can draw more power than is used in battery-type systems. For example, if a button is continuously pressed in a battery-type system, in order to conserve power the infrared signal is not continuously sent, but is sent intermittently. The base unit 12 connected to AC power need not be limited in this fashion. Additionally, it is also possible to have the base unit 12 supply a greater amount of power to the infrared transmitter to transmit a greater amount of infrared energy. In this manner, it may be possible for the infrared bulb to not be focused directly towards the appliance" (Pope, col. 3, lines 46-60) (emphasis added).

Because combination of Wouters and Pope does not disclose all of the limitations of claim 23, reconsideration of the § 103(a) rejection and allowance of claim 23 are requested.

### XI. Conclusion

In view of the foregoing amendments and remarks, Applicant respectfully submits that the entire application (claims 1-26 are pending) is in condition for allowance. Applicant respectfully requests that a timely Notice of Allowance be issued in this case. If the Examiner would like to discuss any aspect of this application, the Examiner is requested to contact the undersigned at (925) 550-5067.

I hereby certify that this correspondence is being deposited with the United States Postal Service as First Class Mail in an envelope addressed to: Mail Stop AF, Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450. Dellace m By Darien K. Wallace

# AMENDMENT

Dear Sir:

Examiner:

In response to the outstanding, non-final office action dated June 6, 2006 ("Office Action"), Applicant responds as follows and requests the Examiner to amend the above-identified application as follows.

Amendments to the Specification begin on page 2 of this Amendment. Amendments to the Claims are reflected in the listing of claims that begins on page 3 of this Amendment.

There are no amendments to the drawings in this Amendment. The **Remarks** begin on page 9 of this Amendment.

## Continuation Sheet (PTO-303)

Continuation of 11. does NOT place the application in condition for allowance because: Regarding applicant's argument regarding the system of devices as disclosed by Wouters, it is the examiner's position that the remote control device as claimed, is not limited to a single housing. The remote control device of Wouters which includes subcomponents 1 and 12 (figure 1) for receiving a RF modulated remote control signal (col. 4 lines 25-28) and a transmitter transmitting an infrared modulated signal generated from the received RF signal (col. 4 lines 28-33) and furthe includes a keypad (col. 4 lines 44-58) anticipates the invention as claimed.

# NOTICE OF APPEAL FROM THE PRIMARY EXAMINER TO THE BOARD OF PATENT APPEALS AND INTERFERENCES

Applicant hereby appeals to the Board of Patent Appeals and Interferences from the decision of the Primary Examiner dated October 19, 2006, finally rejecting claims 1-10, 13-16 and 18-26 of the above-referenced application.

A Petition For A One-Month Extension Of Time is submitted along with this Notice of Appeal. A check is enclosed that includes the \$500 Notice of Appeal fee required under 37 CFR §41.20(b)(1) and the \$120 1-month extension fee.

I hereby certify that this correspondence is being deposited with the United States Postal Service as First Class Mail in an envelope addressed to: Mail Stop AF, Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.

# PETITION FOR EXTENSION OF TIME

Dear Sir:

Appellant respectfully petitions under 37 C.F.R. §1.136 for a one-month extension of time within which to file a Notice of Appeal following the 3-month period after the final Office Action dated October 19, 2006, such extension allowing the undersigned until February 20, 2007, to file the Notice of Appeal.

As set forth in the enclosed transmittal letter, a check in the amount of \$620.00 is enclosed that includes the one-month extension fee as provided by 37 C.F.R. §1.17(a)(1).

I hereby certify that this correspondence is being deposited with the United States Postal Service as First Class Mail in an envelope addressed to: Mail Stop AF, Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.

Mail Stop Appeal Brief - Patents COMMISSIONER FOR PATENTS P.O. Box 1450 Alexandria, VA 22313-1450

### APPEAL BRIEF

This Appeal Brief is filed pursuant to 37 CFR § 41.37 in support of the Notice of Appeal dated on February 19, 2007.

### I. REAL PARTY IN INTEREST

The real party in interest is the assignee, ZiLOG, Inc., as named in the caption above.

## **II. RELATED APPEALS AND INTERFERENCES**

Based on information and belief, there are no appeals or interferences that could directly affect or be directly affected by or have a bearing on the decision by the Board of Patent Appeals and Interferences (the "Board") in the pending appeal.

### **III. STATUS OF CLAIMS**

The application at issue, filed on December 16, 2003, included 24 claims. In an amendment dated July 28, 2006, claims 25-26 were added. Claims 1-26 are subject to this Appeal.

> 03/27/2007 HGUTEMA1 00000098 10737029 01 FC:1402 500.00 OP

### **IV. STATUS OF AMENDMENTS**

An amendment dated December 19, 2006, was filed subsequent to a final Office action dated October 19, 2006 ("Office Action"). An Advisory Action dated February 7, 2007 ("Advisory Action"), stated that the amendment was entered. The advisory action included an explanation of how the amended claims would be rejected.

# V. SUMMARY OF CLAIMED SUBJECT MATTER

The following summary pursuant to 37 CFR §41.37(c)(1)(v) is a concise explanation of the claims and is to be read in light of the disclosure. This summary does not limit the claims. (See MPEP §1206).

An embodiment of Appellant's novel system 10 is illustrated in figure 1 (replicated below). System 10 relays a key code through a remote control device

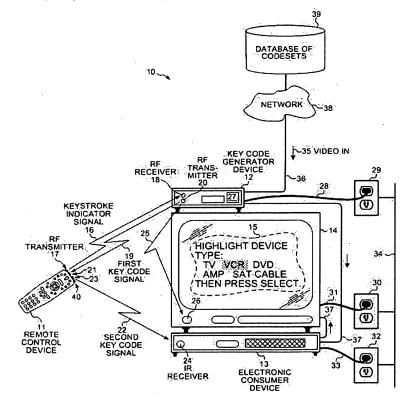

FIG. 1

2

### Appeal Brief Application Serial No. 10/737,029

to an electronic consumer device. The key code is not stored in the remote control device in a permanent manner, but rather is relayed through the remote control device. System 10 includes a remote control device 11, a key code generator device 12, a first electronic consumer device 13 (a VCR) and a second electronic consumer device 14 (a TV).

Upon receiving a keystroke indicator signal from remote control 11, key code generator 12 identifies the particular codeset usable to communicate with the selected electronic consumer device. The keystroke indicator signal contains an indication of a key on the remote control that was pressed, which corresponds to a function of the selected electronic consumer device. Using the identified codeset and the indication of the pressed key, key code generator 12 generates a key code and modulates that key code onto a radio frequency carrier signal, thereby generating a first key code signal 19. Remote control 11 receives first key code signal 19 from key code generator 12 and modulates the key code onto an infrared frequency carrier signal, thereby generating a second key code signal 22. Remote control 11 relays the key code to the selected electronic consumer device in second key code signal 22. The key code causes the selected electronic consumer device to perform the desired function.

#### A. Independent claim 1

Independent claim 1 is directed to a method of generating a key code within a key code generator device, as described in steps 101 through 104 in figure 2 (replicated below). As shown in figures 1 and 2, claim 1 recites a method of (a) receiving keystroke indicator signal 16 from remote control device 11 (Specification, p. 6, lines 26-28); (b) generating a key code within key code generator device 12 (Specification, p. 8, lines 14-16); (c) modulating the key code onto a carrier signal thereby generating first key code signal 19 (Specification, p. 8, lines 26-29); and (d) transmitting key code signal 19 from key code generator device 12 (Specification, p. 11, lines 4-5).

### Appeal Brief Application Serial No. 10/737,029

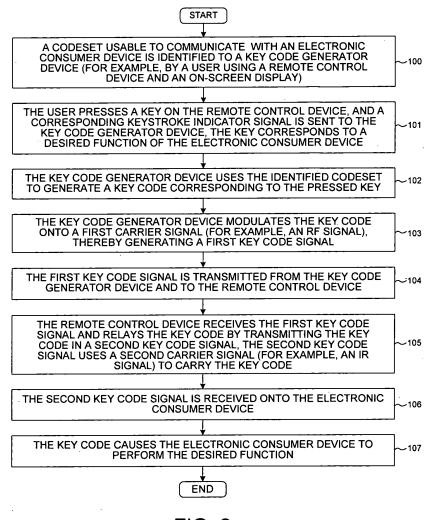

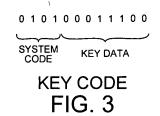

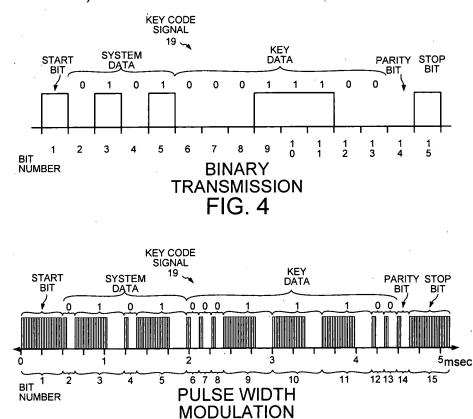

FIG. 2

Dependent claim 2 is directed to the method of claim 1, but includes the limitation that first key code signal 19 is transmitted from key code generator device 12 to remote control device 11 (Specification, p. 11, lines 6-7). Dependent claim 3 includes a limitation that first key code signal 19 is transmitted from key code generator 12 to the selected electronic consumer device (Specification, p. 12, lines 13-15). Dependent claim 4 includes the limitation that the key code consists of a binary number (Specification, p. 8, lines 18-20) as depicted in figure 3 (replicated below).

> Appeal Brief Application Serial No. 10/737,029

Dependent claim 5 includes the limitation that the key code comprises a binary number and timing information. The timing information defines how said binary number is modulated onto the carrier signal to generate first key code signal 19 (Specification, p. 9, lines 9-11) as depicted in figures 4 and 5 (replicated below).

Dependent claim 6 includes the limitation that keystroke indicator signal 16 corresponds to a power-on function, and first key code signal 19 is received

FIG. 5

Appeal Brief Application Serial No. 10/737,029

onto an electronic consumer device and causes the electronic consumer device to be powered on. Dependent claim 7 recites that first key code signal 19 is received by remote control device 11 and includes the further steps of (e) modulating the key code onto a second carrier signal, thereby generating second key code signal 22 (Specification, p. 11, lines 8-11) and (f) transmitting second key code signal 22 to the selected electronic consumer device (Specification, p. 12, lines1-3). Claim 7 also includes the limitation that the first carrier signal is in a radio frequency band and the second carrier signal is in an infrared frequency band.

Dependent claim 8 is directed to the method of claim 7, but includes a further limitation that keystroke indicator signal 16 corresponds to a power-on function, and second key code signal 22 causes the selected electronic consumer device to be powered on (Specification, p. 12, lines 4-7).

Dependent claim 9 includes the limitation that the key code is part of a codeset and that the codeset is not stored in remote control device 11 (Specification, p. 19, lines 11-13). Dependent claim 10 is directed to the method of claim 9, but includes a limitation that the codeset comprises timing information and a plurality of key codes. Furthermore, the timing information describes a digital one and a digital zero, as described at page 11, lines 26-28, of the Specification.

### B. Independent claim 13

Independent claim 13 relates to remote control device 11 shown in figure 1. Remote control device 11 comprises: an RF receiver 21 that receives a first key code signal 19 (Specification, p. 11, lines 5-6); an IR transmitter 23 that transmits a second key code signal 22 (Specification, p. 11, lines 17-21); and a keypad that includes a key that corresponds to a key code. The key code corresponds to a function of an electronic consumer device. First key code signal 19 is generated by modulating the key code onto a first carrier signal having a radio frequency band. Second key code signal 22 is generated by

> Appeal Brief Application Serial No. 10/737,029

6

modulating the key code onto a second carrier signal having an infrared frequency band.

Dependent claim 14 is directed to the remote control device of claim 13, but includes the limitation that the key code corresponds to the function and to a second function. The second function corresponds to a second electronic consumer device. Dependent claim 16 is directed to the remote control device of claim 14, but includes the limitation that the key code comprises a first binary number and a second binary number. The first binary number corresponds to the function, and the second binary number corresponds to the second function.

Dependent claim 18 is directed to the remote control device of claim 13, but includes the limitation that a codeset comprises timing information and a plurality of key codes. Each key code is a binary number and corresponds to a different function of the electronic consumer device. Furthermore, the timing information defines how the binary number is modulated onto the first carrier signal (Specification, p. 11, lines 26-28).

#### C. Independent Claim 19

Claim 19 is directed to a key code generator device and a means for relaying key codes from the key code generator device through a remote control device. The key code generator device generates a first key code and a second key code. Claim 19 recites a "means for relaying said first key code and said second key code from said key code generator device through a remote control device." More specifically, the first key code corresponds to a function of a first electronic consumer device, and the second key code corresponds to the same function of a second electronic consumer device (Specification, p. 15, lines 25-26). As illustrated in Figure 1, the corresponding structure includes remote control device 11.

#### D. Independent Claim 22

Claim 22 is directed to remote control device 11 comprising a key pad, RF

Appeal Brief Application Serial No. 10/737,029

receiver 21, IR transmitter 23, and a means for receiving a key code from RF receiver 21 and for sending the key code to IR transmitter 23. Claim 24 recites that the corresponding structure includes a microcontroller integrated circuit (Specification, p. 13, line 27).

### E. Independent claim 25

Independent claim 25 is directed to a method for relaying a key code from key code generator 12 to an electronic consumer device through remote control device 11, and includes the steps 101 through 105 depicted in figure 2. Claim 25 recites a method of (a) receiving keystroke indicator signal 16 from remote control device 11 (Specification, p. 6, lines 26-28); (b) using keystroke indicator signal 16 to generate a key code within key code generator device 12 (Specification, p. 8, lines 14-16); (c) modulating the key code onto a carrier signal thereby generating first key code signal 19 (Specification, p. 8, lines 26-29); and (d) transmitting a key code signal from key code generator device 12 to remote control device 11 (Specification, p. 11, lines 4-7) and transmitting the key code signal to an electronic consumer device from remote control device 11.

Dependent claim 26 is directed to the method of claim 25 but includes the limitation that the key code is part of a codeset, and the codeset is not stored in remote control device 11 (Specification, p. 19, lines 11-13).

VI. GROUNDS OF REJECTION TO BE REVIEWED ON APPEAL

The following are grounds of rejection to be reviewed on appeal:

1) Claims 13-16, 19, 22, and 24-26 stand rejected under 35 USC §102(e) as being anticipated by Wouters et al. (US Patent 6,915,109).

2) Claims 1, 3-4, 9 stand rejected under 35 USC §103(a) as being unpatentable over Pope (US Patent 5,963,624) in view of McNair et al. (US Patent 5,595,342).

### Appeal Brief Application Serial No. 10/737,029

3) Claim 2 stands rejected under 35 USC §103(a) as being unpatentable over Pope in view of McNair and further in view of Goldstein (US Patent 5,410,326).

4) Claim 5 and 10 stand rejected under 35 USC §103(a) as being unpatentable over Pope in view of McNair and further in view of Teskey (US Patent 6,747,568).

5) Claim 6 stands rejected under 35 USC §103(a) as being unpatentable over Pope in view of McNair and further in view of August et al. (US Patent 5,671,267).

6) Claim 7 stands rejected under 35 USC §103(a) as being unpatentable over Pope in view of McNair and further in view of Wouters.

7) Claim 8 stands rejected under 35 USC §103(a) as being unpatentable over Pope in view of McNair in view of Wouters and further in view of August.

8) Claim 18 stands rejected under 35 USC §103(a) as being unpatentable over Wouters in view of Teskey.

9) Claim 20-21 stand rejected under 35 USC §103(a) as being unpatentable over Wouters in view of August.

10) Claim 23 stands rejected under 35 USC §103(a) as being unpatentable over Wouters in view of Pope.

### VII. ARGUMENT

#### A. Claims 13-16, 19, 22, and 24-26 (1st ground of rejection)

Claims 13-16, 19, 22 and 24-26 are rejected under 35 U.S.C. § 102(e) as being anticipated by Wouters et al. US Patent 6,915,109. (Office Action, p. 4, lines 1-2). "A rejection for anticipation under section 102 requires that each and

# Appeal Brief Application Serial No. 10/737,029

9

every limitation of the claimed invention be disclosed in a single prior art reference." *In re Paulsen*, 30 F.3d 1475, 1478-79, 31 USPQ2d 1671, 1673 (Fed. Cir. 1994) citing *In re Spada*, 911 F.2d 705, 708, 15 USPQ2d 1655, 1657 (Fed. Cir. 1990).

#### 1. Independent claims 13 and 22

Claim 13 recites, "A remote control device comprising: <u>a receiver</u> that receives a first key code signal . . . within a radio frequency band; <u>a transmitter</u> that transmits a second key code signal . . . within an infrared frequency band; and a <u>keypad</u> . . ." (emphasis added). Claim 22 recites, "A remote control device, comprising: a <u>keypad</u>; an <u>RF receiver</u>; an <u>IR transmitter</u> ..." (emphasis added).

Wouters does not form the basis for a valid rejection under § 102(e) because Wouters does not disclose all of the limitations of either claim 13 or claim 22. Although Wouters discloses a system of devices including an IR remote control unit 3 in room 1 and an RF receiver 13 and an IR transmitter 14 in room 2, Wouters does not disclose a device with a keypad that both receives a signal within a radio frequency band and transmits a signal within an infrared frequency band.

The Examiner has not alleged that Wouters discloses a single device with a keypad that both receives an RF signal and transmits an IR signal. Instead, the Examiner states, "Wouters et al. teaches a remote control which includes the system of devices 1 and 2 (figure 1) comprising a receiver receiving a RF modulated remote control signal (col. 4 lines 25-28) and a transmitter transmitting an infrared modulated signal generated from the received RF signal (col. 4 lines 28-33)." (Office Action, p. 4, lines 3-6). The Examiner's statement that Wouters discloses a system of devices 1 and 2 that comprise an RF receiver and an IR transmitter is insufficient to allege a *prima facie* case of anticipation of claims that recite a device comprising a keypad, a receiver and a transmitter. In fact, the only keypad disclosed in Wouters is on remote control unit 3, which is located in a separate room (room 1) from RF receiver 13 and IR transmitter 14 (room 2).

Appeal Brief Application Serial No. 10/737,029

The remote control unit 3 described at column 4, lines 48-57, includes IR transmitter 4 and RF transmitter 8, but does not include an RF receiver. Thus, the Examiner does not state that Wouters discloses a single device with a keypad, an RF receiver and an IR transmitter. Nor does Wouters disclose a device with all three of these elements.

In the Advisory Action, the Examiner states, "Regarding applicant's argument regarding the <u>system of devices</u> as disclosed by Wouters, it is the examiner's position that the remote control device as claimed, is not limited to a single housing" (Advisory Action, p. 2, lines 2-3) (emphasis added). The Examiner then again cites column 4, lines 25-28, column 4, lines 28-33 and column 4, lines 44-58, of Wouters as disclosing all of the elements of claims 13 and 22. The Examiner is improperly interpreting the claim term "remote control device" contrary to how that term is used in the claims and in the specification. Both claims 13 and 22 recite a "device" and not a "system". As the term "remote control device" is depicted in the drawings and used in the specification, such a "remote control device" does not describe a "system" with an RF receiver in one room of a house and an RF transmitter in another room of the house.

Finally, this statement that disavows any claim scope to a "remote control device" with an RF receiver in one room and an RF transmitter in another room is dispositive to claim interpretation. By virtue of this disclaimer of claim scope, the term a "remote control device" is to be interpreted as excluding a "system" with multiple components in separate rooms. <u>See Invitrogen Corporation v. Biocrest Manufacturing</u>, 327 F.3d 1364, 1368, 66 USPQ2d 1631, 1633 (Fed. Cir. 2003); *Inverness Med. Switz. GmbH v. Princeton Biomeditech Corp.*, 309 F.3d, 1365, 1372, 64 USPQ2d 1926, 1932 (Fed. Cir. 2002); *Rheox*, 276 F.3d at 1327, 61 USPQ2d at 1374; *CVI/Beta Ventures, Inc. v. Tura LP*, 112 F.3d 1146, 1159, 42 USPQ2d 1577, 1583 (Fed. Cir. 1997); *Southwall Techs. Corp. v. Cardinal IG Co.*, 54 F.3d 1570, 1576, 34 USPQ2d 1673, 1676 (Fed. Cir.), *cert. denied*, 116 S.Ct. 515 (1995).

### Appeal Brief Application Serial No. 10/737,029

Because Wouters does not disclose all of the elements of either claim 13 or claim 22, reversal of the improper §102(e) rejection of claims 13 and 22 by the Board is requested.

#### 2. Dependent claims 14-16

Claim 14 recites "<u>said key code</u> corresponds to a second function of a second electronic consumer device, as well as to said function of said electronic consumer device" (emphasis added). Wouters does not disclose one key code that corresponds to two separate functions of two different electronic consumer devices.

The Examiner has not stated that Wouters discloses a single key code that corresponds to two separate functions. Instead, the Examiner states, "A key code corresponding to <u>a second and third key code</u> is therefore transmitted based on the selected key." (Office Action, p. 4, lines 10-11) (emphasis added). In addition, the Examiner states that "Wouters teaches a key code generator (3) for generating <u>key codes</u> for controlling different function on various electrical appliances (col. 1 lines 24-26, col. 3 lines 21-35). The <u>key codes</u> for controlling the different devices inherently include <u>a first and second key code</u>." (Office Action, p. 2, lines 17-20) (emphasis added). However, claim 14 does not recite a first and second key code. Instead, claim 14 recites "said key code", "said function" and "a second function". The Examiner has not stated that Wouters discloses one key code that corresponds both to a function of an electronic consumer device as well as to a second function of a second electronic consumer device.

Claim 16 recites "<u>said key code</u> comprises a first binary number and a second binary number, said first binary number corresponding to said function, and said second binary number corresponding to said second function" (emphasis added). Wouters does not disclose a single key code that comprises two binary numbers, one corresponding to the function of one electronic

### Appeal Brief Application Serial No. 10/737,029

consumer device, and the other corresponding to a second function of a second electronic consumer device.

The Examiner has not presented a *prima facie* argument of anticipation of claim 16 because the Examiner has not stated that Wouters discloses a key code comprising both (i) a first binary number that corresponds to a function of an electronic consumer device as well as (ii) a second binary number that corresponds to a second function of a second electronic consumer device. Instead, the Examiner simply states, "The data from the memory is inherently store as binary data. The key code therefore comprises binary data." (Office Action, p. 4, lines 13-14). The Examiner does not mention a first binary number of a key code corresponding to a first function, as well as a second binary number of the same key code corresponding to a second function.

Claims 14-16 depend directly or indirectly from claim 13. In addition to the reasons explained above, dependent claims 14-16 are allowable for at least the same reasons for which claim 13 is allowable. Reversal of the improper §102(e) rejection of claims 14-16 by the Board is requested.

### 3. Dependent claim 24

Claim 24 recites that the means of claim 22 is a microcontroller. The means of claim 22 is a "means for receiving a key code from said RF receiver". The Examiner states that Wouters discloses "a microcontroller in the form of a microprocessor for receiving the key code (col. 4 lines 52-55)" (Office Action, p. 5, lines 1-2). The passage of Wouters cited by the Examiner, however, does not disclose a microprocessor for receiving a key code from an RF receiver.

The remote control unit disclosed in the passage cited by the Examiner does not include an RF receiver. Therefore, the central processing unit (CPU) that is inside remote control unit 3 of Wouters does not receive a key code from any RF receiver. Instead, Wouters discloses that the CPU determines which code needs transmitting based on which key is tapped by the user. (No keypad is included in the devices in room 2 of Wouters.) Wouters explains:

# Appeal Brief Application Serial No. 10/737,029

"In this case the user taps a key, the CPU (Central processing unit) inside the remote control determines which code (corresponding to the tapped key) needs transmitting (by IR or RF) and fetches the required data from its memory which comprises a data base or other means in which tapped codes are linked to data to be transmitted" (Wouters, col. 4, lines 57-62) (emphasis added).

Thus, Wouters does not disclose a microcontroller that receives a key code from an RF receiver.

Claim 24 depends from claim 22. In addition to the reasons explained above, dependent claim 24 is allowable for at least the same reasons for which claim 22 is allowable. Reversal of the § 102(e) rejection and allowance of claim 24 are requested.

### 4. Independent claim 19

Claim 19 recites, "said codeset including said first key code and said second key code, wherein said first key code corresponds to <u>a selected function</u> <u>of a first electronic consumer device</u>, and wherein said second key code corresponds to <u>said selected function of a second electronic consumer device</u>" (emphasis added). Wouters does not form the basis for a valid rejection under §102(e) because Wouters does not disclose a codeset that includes two key codes: one key code corresponding to a function of one electronic consumer device, and the other key code corresponding <u>to the same function</u> ("said selected function") of another electronic consumer device.

The Examiner has not presented a *prima facie* argument of anticipation of claim 19 because the Examiner has not stated that Wouters discloses the two recited key codes that correspond to the same function on different electronic consumer devices. Nor has the Examiner stated that Wouters discloses that those two key codes are included in a codeset stored on a key code generator device. In fact, Wouters does not mention key codes that correspond to the same function on separate electronic consumer devices.

### Appeal Brief Application Serial No. 10/737,029

Because Wouters does not disclose all of the elements of claim 19, reversal of the improper §102(e) rejection of claim 19 by the Board is requested.

#### 5. Independent claim 25

Claim 25 recites, "receiving a keystroke indicator signal <u>from a remote</u> <u>control device</u>; . . . transmitting said key code signal from said key code generator device <u>to said remote control device</u>, wherein said remote control device transmits said key code signal to an electronic consumer device." (emphasis added). Wouters does not form the basis for a valid rejection of claim 25 under § 102(e) because Wouters does not disclose (i) receiving a keystroke indicator signal from a remote control device, (ii) transmitting a key code signal to the remote control device, and then (iii) transmitting the key code signal from the remote control device to an electronic consumer device.

The Examiner has not stated a *prima facie* case of anticipation because that Examiner has not alleged that Wouters discloses (i) receiving a signal <u>from a</u> <u>remote control device</u>, (ii) transmitting a second signal <u>to the remote control</u> <u>device</u>, and (iii) transmitting a third signal <u>from the remote control device</u>. Instead, the Examiner states that Wouters discloses:

"receiving a key stroke indicator signal (5) from <u>a remote control (3)</u> and the key code indicator signal is used by key code generator 8 to generate a key code (col. 3 lines 21-30); modulating the key code signal unto a carrier and transmitting the key code to <u>the</u> <u>remote control (12)</u> (col. 4 lines 28-33) and the remote control transmit the key code to the electronic device (col. 3 lines 31-34). Wouters et al. teaches the key code receive by the remote control is demodulated, decoded and transmitted to the appliance (col. 4 lines 25-37)." (Office Action, p. 5, lines 3-9) (emphasis added)

The Examiner argues that the recited "keystroke indicator signal" is disclosed by infrared signal 5 of Wouters. Moreover, the Examiner argues that the recited "remote control device" is infrared remote control unit 3 of Wouters. But then the Examiner improperly argues that the item labeled 12 in room 2 of Wouters is also the recited remote control device. This is improper. The Examiner has engaged

### Appeal Brief Application Serial No. 10/737,029

in improper claim construction by arguing (i) that the recited remote control device from which a keystroke indicator signal is received is disclosed by item 3 in room 1 of Wouters for purposes of one claim limitation, and (ii) that the same recited remote control device is disclosed by item 12 in room 2 of Wouters for purposes of another limitation of the same claim. Alternatively, the Examiner is arguing that the recited remote control device is in two rooms of Wouters at the same time. Therefore, Wouters does not disclose the recited remote control device from which a first signal is received and to which a second signal is transmitted.

An additional reason why the Examiner's argument fails is that Wouters does not disclose that item 12 in figure 1 is a remote control device. The reference numeral 12 does not appear at all in the specification of Wouters.

Because Wouters does not disclose all of the elements of claim 25, reversal of the improper §102(e) rejection of claim 25 by the Board is requested.

#### 6. Dependent claim 26

Claim 26 recites, "wherein said codeset is not stored on said remote control device". The Examiner states that infrared remote control unit 3 of Wouters discloses the recited "remote control device". (Office Action, p. 5, line 4) The Examiner also states, "The key code is therefore not stored in the memory of the remote control" (Office Action, p. 5, lines 9-10). First, the Examiner has not stated a *prima facie* case of anticipation of claim 26 because claim 26 <u>does not</u> recite "wherein the key code is not stored on said remote control device". Second, Wouters does not disclose that a codeset is not stored on infrared remote control unit 3. In fact, Wouters suggests the contrary:

"In this system <u>a remote control unit</u> is used which comprises both an IR transmitter and an antenna for transmission of RF signals. In this case the user taps a key, <u>the CPU</u> (Central processing unit) <u>inside the remote control</u> determines which code (corresponding to the tapped key) needs transmitting (by IR or RF) and <u>fetches the required data</u> from its memory which comprises a data base or other means in which

Appeal Brief Application Serial No. 10/737,029

tapped codes are linked to data to be transmitted." (Wouters, col. 4, lines 54-62) (emphasis added).

Third, dependent claim 26 is allowable for at least the same reasons for which claim 25 is allowable because claim 26 depends from claim 25. Reversal of the improper §102(e) rejection of claim 26 by the Board is requested.

### B. Claims 1, 3-4 and 9 (2nd ground of rejection)

Claims 1, 3-4 and 9 are rejected under 35 U.S.C. § 103(a) as being unpatentable over Pope (USP 5,963,624) in view of McNair et al. (USP 5,595,342) (Office Action, p. 6, lines 1-2). To establish a *prima facie* case of obviousness, the Examiner must demonstrate that "the reference (or references when combined) must teach or suggest all the claimed limitations." MPEP § 2142.

# 1. Independent claim 1

Claim 1 recites, "(a) receiving a keystroke indicator signal from a remote control device; (b) generating a key code within a key code generator device . . . generating a key code signal". The combination of Pope and McNair does not form the basis for a valid rejection of claim 1 under § 103(a) because the references when combined do not teach (i) generating a key code within a key code generator device, (ii) a keystroke indicator signal as well as a key code signal, or (iii) modulating a key code.

# (i) <u>Neither Pope nor McNair teaches generating a key code within a</u> key code generator device.

The Examiner states that "Pope teaches receiving a keystroke indicator signal which contains an indication of a key on the remote control device 10 that was pressed (col. 2 lines 61-col. 3 line 19), generating a key code (codes for communicating the control function to the appliances) within the code generator 12 ..." (Office Action, p. 6, lines 3-6) (emphasis added). Pope does not,

### Appeal Brief Application Serial No. 10/737,029

however, teach generating a key code within base unit 12. The appliance control code that is transmitted by base unit 12 of Pope is not generated within base unit 12. Instead, base unit 12 receives the appliance control codes from handset 10/50. In Pope, a digital cordless telephone handset 10/50 is used as a universal remote control device to control electrical appliances. Pope explains:

"The present invention uses a digital cordless telephone <u>handset to</u> <u>store a variety of appliance control codes</u>. These appliance control codes can be <u>transmitted to a base unit</u>. The base unit can translate the appliance control codes to control signals such as infrared control signals, to control an electrical appliance" (Pope, col. 1, lines 31-36) (emphasis added). *See also* Pope, col. 2, lines 48-52 and 63-65.

The appliance control codes are not generated within the base unit 12 of Pope. Instead, the appliance control codes are transmitted from the handset 10/50 to the base unit 12, where they are translated to control signals. Base unit 12 of Pope does not receive a keystroke indicator and then generate a key code. Thus, Pope does not teach the recited "receiving a keystroke indicator signal from a remote control device" (emphasis added). Pope states, "Once an appliance control code is received by the base unit, the base unit will know to transfer the control code to an appliance" (Pope, col. 4, lines 49-51) (emphasis added). Thus, in Pope, an appliance control code is received by base unit 12 and is then transferred to an appliance; the appliance control code is not generated within base unit 12.

# (ii) <u>Pope and McNair do not teach both a keystroke indicator signal</u> and a key code signal.

The Examiner states that "Pope teaches receiving a keystroke indicator signal which contains an indication of a key on the remote control device 10 that was pressed (col. 2 lines 61-col. 3 line 19), . . ." (Office Action, p. 6, lines 3-6). Nowhere, however, does Pope teach a keystroke indicator signal in the passage cited by the Examiner, which is reproduced below in its entirety:

# Appeal Brief Application Serial No. 10/737,029

> "Keypad 30 includes the numbers 1-9, the "star" and the "pound" key. Additionally, "up arrow" key 30a and "down arrow" key 30b can be used to scroll through a menu. A "transmit" key 30c can be used to transmit the appliance control code once the appliance control has been selected. In one embodiment, the user gets into the menu by pressing an "up arrow" or a "down arrow" key. Alternately a "menu" button (not shown) is used. The keys for numbers 1-9 can have different meanings once the user is in the menu. Menu functions can be printed above the normal telephone control keys. FIG. 1 shows compact disc, television, cable and AC signal control menu-function buttons. The setup menu can be entered, one of these buttons pressed, and then using the up and down arrows, the specific controls for a given electrical appliance can be scrolled through. The different appliance controls can be listed in the order of frequency of use. For example, the "mute" function could be the first function listed in each menu selection.

Alternately, individual functions can be mapped with the associated buttons of the keypad, and a display 32 need not be used. Buttons similar to a "shift," "alt," and "control" on a normal computer keypad can be used to change the meanings of buttons "0" to "9," "star," and "pound." The different meanings associated with different buttons can be printed in different colors, which are the same colors of the associated buttons "shift," "alt," alt," or "control."" (Pope, col. 2, line 61 – col. 3, line 19) (emphasis added)

Thus, the passage of Pope above teaches appliance controls and appliance control codes but does not teach a keystroke indicator signal as the Examiner maintains.

Moreover, it is improper to construe the appliance control codes of Pope to teach both a keystroke indicator signal and a key code signal. According to the tenets of claim differentiation, a "keystroke indicator signal" cannot be interpreted to be the same as a "key code signal". Such a claim interpretation is presumptively unreasonable. <u>See, e.g., Karlin Tech. Inc. v. Surgical Dynamics</u> *Inc.*, 177 F.3d 968, 50 USPQ2d 1465, 1468 (Fed. Cir. 1999). In addition, such a claim interpretation would render claim 1 internally inconsistent because "keystroke indicator/key code" information that was already received by the key code generator device would later be generated by the key code generator device. Thus, Pope does not teach both a keystroke indicator and a key code.

### Appeal Brief Application Serial No. 10/737,029

The handset 10/50 of Pope transmits an appliance control code and not a keystroke indicator.

### (iii) Neither Pope nor McNair teaches modulating a key code.

The Examiner admits that Pope is silent on teaching modulating a key code onto a carrier signal. (Office Action, p. 6, line 7) Moreover, McNair does not teach modulating a key code. McNair does not teach a key code. And the Examiner does not state that McNair teaches <u>modulating a key code</u> onto a carrier signal. Instead, the Examiner states that McNair teaches "the control signal is modulated" (Office Action, p. 6, line 8). This is insufficient to establish a *prima facie* case of obviousness.

Moreover, there would be no motivation to combine McNair with Pope even if McNair did disclose a limitation of claim 1 (which it does not). McNair is directed to a control system for a gas-fired, central heating system and does not concern key code signals for electronic consumer devices.

Therefore, Pope and McNair do not form the basis for a valid rejection under § 103(a) because neither Pope nor McNair teaches (i) generating a key code within a key code generator device, (ii) a keystroke indicator signal as well as a key code signal, or (iii) modulating a key code. In addition, there is no motivation to combine McNair with Pope to arrive at all of the limitations of claim 1. For these reasons, reconsideration of the § 103(a) rejection and allowance of claim 1 are requested.

### 2. Dependent claims 3-4 and 9

Claim 9 recites, "said key code generated in (b) is part of a codeset, and wherein <u>said remote control device does not store said codeset</u>" (emphasis added). With respect to base claim 1, the Examiner states that "Pope teaches receiving a keystroke indicator signal which contains an indication of a key on the <u>remote control device 10</u>" (Office Action, p. 6, lines 3-4) (emphasis added). Thus, the Examiner considers that handset 10 of Pope teaches the remote control device recited in claim 9. The Examiner then states, "The code

Appeal Brief Application Serial No. 10/737,029

20

generated by the code generator is not store in the remote control because it is transmitted to the appliances" (Office Action, p. 6, lines 18-19). This incorrectly characterizes the teachings of Pope. The appliance control codes of Pope are indeed stored on handset 10 and are transmitted from handset 10 to base unit

12. Pope explains:

"The present <u>invention uses a digital cordless telephone handset to</u> <u>store a variety of appliance control codes</u>. These appliance control codes can be <u>transmitted to a base unit</u>. The base unit can translate the appliance control codes to control signals such as infrared control signals, to control an electrical appliance" (Pope, col. 1, lines 31-36) (emphasis added)

"The cordless digital telephone <u>handset</u> includes a memory 66 . . . used to <u>store the appliance control codes</u>. Preferably, the appliance control codes can be transmitted to the base unit 12 . . ." (Pope, col. 2, lines 48-52) (emphasis added).

"Fig. 2 is a diagram of a handset 50 of the present invention.... The <u>appliance control codes are stored in a memory 66</u>" (Pope, col. 4, lines 17-28) (emphasis added).

Base unit 12 does not generate the appliance control codes. Instead, base unit 12 receives the appliance control codes, which were stored in memory 66 of handset 10, and then translates the appliance control codes into infrared control signals. Thus, Pope does not teach that handset 10 does not store a codeset.

Claims 3-4 and 9 depend from claim 1. In addition to the reasons explained above, dependent claims 3-4 and 9 are allowable for at least the same reason for which claim 1 is allowable. Reversal of the § 103(a) rejection and allowance of claims 3-4 and 9 by the Board is requested.

### C. <u>Dependent claim 2 (3rd ground of rejection)</u>

Claim 2 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Pope in view of McNair and further in view of Goldstein (USP 5,410,326) (Office Action, p. 7, lines 1-2).

# Appeal Brief Application Serial No. 10/737,029

Claim 2 includes the following limitations of base claim 1, "(a) receiving a keystroke indicator signal from a remote control device; (b) generating a key code within a key code generator device . . .." Claim 2 also recites "wherein said key code signal is transmitted in (d) from said key code generator device to said remote control device".

None of Pope, McNair or Goldstein teaches either (i) generating a key code within a key code generator device or (ii) both a keystroke indicator signal and a key code signal. Moreover, the Examiner seems to admit that Pope and McNair are silent on teaching that the key code generator transmits the key code signal to the remote control device. (Office Action, p. 7, lines 4-10). And Goldstein does not teach this limitation.

None of Pope, McNair or Goldstein teaches transmitting <u>a key code signal</u> from the key code generator device back to the remote control device. The fact that Goldstein may teach sending an IR code or an entire codeset from a cable television converter box to a remote control device to update the remote control device does not teach transmitting <u>a key code signal</u> from a key code generator device back to the remote control device. Indeed, Goldstein does not teach transmitting a key code signal as opposed to a key code or a codeset. The cable television converter box of Goldstein does not teach a key code generator because the cable television converter box of Goldstein receives complete codesets from a remote database or is loaded with complete codesets. (Goldstein, col. 15, lines 20-68; col. 17, lines 62-67). The television converter box of Goldstein is not a key code generator because the GLUE logic 95 in the universal remote control 5, as opposed to the television converter box, generates the IR sequences from the codes. Goldstein states:

"The glue logic 95 will supply the IR sequences from codes, stored in the RAM 90, upon command of the user. . . . These codes describe carrier frequencies, pulse widths and pulse duration to be generated to the glue logic 95 for producing infrared pulses from the infrared diode 97" (Goldstein, col. 13, lines 23-33) (emphasis added).

### Appeal Brief Application Serial No. 10/737,029

Thus, Goldstein does not teach transmitting a key code signal from a key code generator.

In addition, to establish obviousness, there must be "something in the prior art as a whole to suggest the desirability, and thus the obviousness of making the combination." Interconnect Planning Corp. v. Feil, 774 F.2d 1132, 1143, 227 USPQ 543, 551 (Fed. Cir. 1985) quoting Lindemann Maschinenfabrik GMBH v. American Hoist Derrick Co., 730 F. 2d 1452, 1462, 221 USPQ 481, 488 (Fed. Cir. 1984). The motivation posited by the Examiner to combine Goldstein and Pope is non-existent. The Examiner states that Goldstein teaches "a cable box transmitting key codes to the remote control in order to update the remote control with new control codes." (Office Action, p. 7, lines 11-13) (emphasis added). But there would be no motivation to update the remote control device of claim 2 with new codesets, as allegedly taught by Goldstein, because claim 2 does not recite that any key code or codeset is ever stored on the remote control device. Claim 2 recites transmitting a key code signal to the remote control device and does not recite transmitting a codeset to the remote control device. The motivation proposed by the Examiner would only result in a combination wherein codesets, or at least key codes, are stored on a remote control device.

The combination of Pope, McNair and Goldstein does not form the basis for a valid rejection of claim 2 under § 103(a) because the combination does not teach (i) generating a key code within a key code generator device, (ii) both a keystroke indicator signal and a key code signal, or (iii) transmitting a key code signal from the key code generator device back to the remote control device. Furthermore, there is no motivation to combine the teachings of Goldstein with the teachings of Pope and McNair in such a way as to obtain all of the limitations of claim 2. Therefore, reversal of the improper § 103(a) rejection of claim 2 by the Board is requested.

### Appeal Brief Application Serial No. 10/737,029

#### D. Dependent claims 5 and 10 (4th ground of rejection)

Claims 5 and 10 are rejected under 35 U.S.C. § 103(a) as being unpatentable over Pope in view of McNair and further in view of Teskey (USP 6,747,568) (Office Action, p. 7, lines 14-16).

Claims 5 and 10 depend directly or indirectly from claim 1 and include the following limitations of claim 1: "(a) receiving a keystroke indicator signal from a remote control device; (b) generating a key code within a key code generator device . . .." None of Pope, McNair or Teskey teaches (i) generating a key code within a key code generator device or (ii) both a keystroke indicator signal and a key code signal.

In addition, claim 10 recites that "said timing information describes a digital one and a digital zero". The Examiner admits that Pope "is silent on teaching the key code comprises timing information defining the binary number (ones and zeros) in modulated." But the Examiner states that Teskey "teaches the format of the remote control signal having the necessary timing and modulation information (col. line 60-col. 4 line 8)" (Office Action, p. 8, lines 7-10). Teskey does not, however, teach "the necessary timing and modulation information." The passage of Teskey cited by the Examiner does not teach timing information that defines a digital one or a digital zero. In fact, Teskey does not mention a digital one, a digital zero or any type of mark/space representation.

The combination of Pope, McNair and Teskey does not form the basis for a valid rejection of either claim 5 or claim 10 under § 103(a) because the combination does not teach (i) generating a key code within a key code generator device or (ii) both a keystroke indicator signal and a key code signal. And with regard to claim 10, Teskey does not teach timing information that defines a digital one or a digital zero. Therefore, reversal of the improper § 103(a) rejection of claims 5 and 10 by the Board is requested.

E. Dependent claim 6 (5th ground of rejection)

Claim 6 is rejected under 35 U.S.C. § 103(a) as being unpatentable over

Appeal Brief Application Serial No. 10/737,029

Pope in view of McNair and further in view of August (USP 5,671,267) (Office Action, p. 8, lines 16-18).

Claim 6 includes the following limitations of base claim 1, "(a) receiving a keystroke indicator signal from a remote control device; (b) generating a key code within a key code generator device . . .." None of Pope, McNair or August teaches (i) generating a key code within a key code generator device or (ii) both a keystroke indicator signal and a key code signal.

In addition, claim 6 recites, "(e) pressing a power-on key of said remote control device causing said remote control device to transmit said keystroke indicator signal that is received in (a), wherein said key code signal transmitted in (d) is received onto an electronic consumer device, and wherein said pressing in (e) causes said electronic consumer device to turn on" (emphasis added). The Examiner states that Pope "is not explicit in teaching transmitting a keystroke indicator signal that cause the appliance to turn on. One skill in the art recognizes that a remote control is generally use in turning an appliance on/off and is further evidence by August et al. (col. 8 lines 3-5)" (Office Action, p. 8, line 20 – p. 9, line 2). The Examiner has not presented a prima facie case of obviousness because the Examiner has not stated that August teaches a remote control device transmitting a keystroke indicator signal. Indeed, August does not teach a keystroke indicator signal. The passage of August cited by the Examiner teaches handset unit 10 of August using a key code signal, as opposed to a keystroke indicator signal, to turn a television set on and off. Interpreting a "keystroke indicator signal" to be the same as a "key code signal" would be contrary to the tenets of claim differentiation.

The combination of Pope, McNair and August does not teach (i) receiving a keystroke indicator signal from a remote control device, (ii) generating a key code within a key code generator, and (iii) transmitting a key code signal from the key code generator to an electronic consumer device to turn on the electronic consumer device. Nor does the combination teach both a keystroke indicator

### Appeal Brief Application Serial No. 10/737,029

25

signal and a key code signal. Reversal of the improper § 103(a) rejection of claim 6 by the Board is requested.

# F. Dependent claim 7 (6th ground of rejection)

Claim 7 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Pope in view of McNair and further in view of Wouters (Office Action, p. 9, lines 8-10).

Claim 7 includes the following limitations of base claim 1, "(a) receiving a keystroke indicator signal from a remote control device; (b) generating a key code within a key code generator device . . .." The combination of Pope, McNair and Wouters teaches neither (i) generating a key code within a key code generator device nor (ii) both a keystroke indicator signal and a key code signal.

In addition, claim 7 recites "wherein said key code signal is received by said remote control device". The Examiner states that "Pope teaches the remote control receiving key code signals (infrared control signal) from a controller (col. 4 lines 52-56)" (Office Action, p. 9, lines 11-12). The Examiner has not presented a *prima facie* case of obviousness because the Examiner has not stated that Pope teaches a remote control device that receives a key code signal from a key code generator device that generated the key code. The passage of Pope cited by the Examiner teaches receiving an infrared signal from a controller, such as a television remote control. The cited passage does not teach receiving a key code signal from a key code generator device. Interpreting a "remote control device" to be the same as a "key code generator device" recited in the same claim would be contrary to the tenets of claim differentiation.

The combination of Pope, McNair and Wouters does not form the basis for a valid rejection of claim 7 under § 103(a) because the combination does not teach any of (i) generating a key code within a key code generator device, (ii) both a keystroke indicator signal and a key code signal, or (iii) receiving a key code signal from the key code generator device back on the remote control

### Appeal Brief Application Serial No. 10/737,029

device. Therefore, reversal of the improper § 103(a) rejection of claim 7 by the Board is requested.

### G. Dependent claim 8 (7th ground of rejection)

Claim 8 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Pope in view of McNair and in view of Wouters and further in view of August (Office Action, p. 10, lines 1-3).

The four-way combination of Pope, McNair, Wouters and August does not form the basis for a valid rejection of claim 8 under § 103(a) for the same reasons explained above with relation to claims 1 and 7. The 4-way combination does not teach any of (i) receiving a key code signal from the key code generator device back on the remote control device, (ii) both a keystroke indicator signal and a key code signal, or (iii) generating a key code within a key code generator device.

Furthermore, it is impermissible to "pick and choose" individual elements among the references to recreate the claimed invention because "[o]ne cannot use hindsight reconstruction to pick and choose among isolated disclosures in the prior art to deprecate the clamed invention." *In re Fritch*, 972 F.2d 1260, 1266, 23 USPQ2d 1780, 1784 (Fed. Cir. 1992) *citing In re Fine*, 837 F.2d 1071,1075, 5 USPQ2d 1596,1600 (Fed. Cir. 1988). There is no motivation to combine the teachings of the four-way combination in such a way as to obtain all of the limitations of claim 8. For these reasons, reversal of the improper § 103(a) rejection of claim 8 by the Board is requested.

#### H. Dependent claim 18 (8th ground of rejection)

Claim 18 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Wouters in view of Teskey (Office Action, p. 10, lines 14-15).

The combination of Wouters and Teskey does not form the basis for a valid rejection of claim 18 under § 103(a) for the same reasons explained above

### Appeal Brief Application Serial No. 10/737,029

with relation to claim 13. Neither Wouters nor Teskey discloses a device with a keypad that both transmits an IR signal and receives an RF signal.

Because combination of Wouters and Teskey does not disclose all of the elements of claim 18, reversal of the improper § 103(a) rejection of claim 18 by the Board is requested.

#### I. Dependent claims 20-21 (9th ground of rejection)

Claims 20-21 are rejected under 35 U.S.C. § 103(a) as being unpatentable over Wouters in view of August (Office Action, p. 11, lines 6-7).

Both claim 20 and claim 21 depend from claim 19 and incorporate the limitations of claim 19. The combination of Wouters and August does not form the basis for a valid rejection of either claim 20 or claim 21 under § 103(a) for the same reasons explained above with relation to claim 19. Neither Wouters nor August discloses a codeset that includes two key codes: one key code corresponding to a function of one electronic consumer device, and the other key code corresponding to the same function of another electronic consumer device. The Examiner has not presented a *prima facie* argument of obviousness because the Examiner has not stated that the combination of Wouters and August discloses a codeset with two recited key codes that correspond to the same function on different electronic consumer devices. Neither Wouters nor August teaches the recited codeset with key codes that correspond to the same function on separate electronic consumer devices. August does not mention a codeset.

Because combination of Wouters and August does not disclose a codeset with two key codes that correspond to the same function on two electronic consumer devices, reversal of the improper § 103(a) rejection of claims 20-21 by the Board is requested.

J. Dependent claim 23 (10th ground of rejection)

Claim 23 is rejected under 35 U.S.C. § 103(a) as being unpatentable over

# Appeal Brief Application Serial No. 10/737,029

Wouters in view of Pope (Office Action, p. 11, lines 18-19).

Claim 23 depends from claim 22 and incorporates the limitations of claim 22. The combination of Wouters and Pope does not form the basis for a valid rejection of claim 23 under § 103(a) for the same reasons explained above with relation to claim 22. Neither Wouters nor Pope teaches a device with a keypad, a radio frequency receiver and an infrared transmitter.

The RF receiver, IR transmitter and keypad of Wouters are not on the same device. The remote control unit 3 of Wouters does not include an RF receiver. Pope does not teach an RF receiver. And Pope even teaches against including an IR transmitter on the handset. Pope explains:

"One advantage of having the infrared transmitter attached to the base unit 12 is that the base unit 12 can be typically powered by house current. <u>Since no battery is used, the infrared transmitter can draw more power</u> than is used in battery-type systems. For example, if a button is continuously pressed in a battery-type system, in order to conserve power the infrared signal is not continuously sent, but is sent intermittently. The base unit 12 connected to AC power need not be limited in this fashion. Additionally, it is also possible to have the base unit 12 supply a greater amount of power to the infrared transmitter to transmit a greater amount of infrared energy. In this manner, it may be possible for the infrared bulb to not be focused directly towards the appliance" (Pope, col. 3, lines 46-60) (emphasis added).

Thus, Pope teaches away from the limitation of claim 23 because "it suggests that the line of development flow from the reference's disclosure is unlikely to be productive of the result sought by the applicant." *In re Gurley*, 27 F.3d 551, 553, 31 USPQ2d 1130, 1131 (Fed. Cir. 1994).

Because the combination of Wouters and Pope does not disclose all of the limitations of claim 23 as explained above with relation to claim 22, reversal of the improper §103(a) rejection of claim 23 by the Board is requested.

# Appeal Brief Application Serial No. 10/737,029

### VIII. CONCLUSION

The Examiner has not established a prima facie case of anticipation or obviousness. With regard to independent claims 13 and 22, Wouters does not disclose a device with a keypad that both receives a signal within a radio frequency band and transmits a signal within an infrared frequency band. With regard to independent claim 19, Wouters does not disclose a codeset that includes two key codes: one key code corresponding to a function of one electronic consumer device and the other key code corresponding to the same function of another electronic consumer device. With regard to independent claim 25, Wouters does not disclose (i) receiving a keystroke indicator signal form a remote control device, (ii) transmitting a key code signal to the remote control device, and then (iii) transmitting the key code signal from the remote control device to an electronic consumer device. With regard to independent claim 1, the combination of Pope and McNair does not teach (i) generating a key code within a key code generator device, (ii) a key stroke indicator signal as well as a key code signal, or (iii) modulating a key code. The Board is requested to reverse the §102 and §103 rejections of claims 1-10, 13-16, 18-26.

I hereby certify that this correspondence is being deposited with the United States Postal Service as First Class Mail in an envelope addressed to: Mail Stop Appeal Brief - Patents, Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.

Appeal Brief Application Serial No. 10/737,029

### IX. CLAIMS APPENDIX

1. (original): A method comprising:

(a) receiving a keystroke indicator signal from a remote control device;

(b) generating a key code within a key code generator device;

(c) modulating said key code onto a carrier signal, thereby generating a key code signal; and

(d) transmitting said key code signal from said key code generator device.

2. (original): The method of Claim 1, wherein said key code signal is transmitted in (d) from said key code generator device to said remote control device.

3. (original): The method of Claim 1, wherein said key code signal is transmitted in (d) from said key code generator device to an electronic consumer device.

4. (original): The method of Claim 1, wherein said key code consists of a binary number.

5. (original): The method of Claim 1, wherein said key code comprises a binary number and timing information, and wherein said timing information defines how said binary number is modulated in (c) onto said carrier signal.

6. (original): The method of Claim 1, further comprising:

(e) pressing a power-on key of said remote control device causing said remote control device to transmit said keystroke indicator signal that is received in (a), wherein said key code signal transmitted in (d) is received onto an electronic consumer device, and wherein said pressing in (e) causes said electronic consumer device to turn on.

31

7. (original): The method of Claim 1, wherein said carrier signal is in a radio frequency band, wherein said key code signal is received by said remote control device, and wherein said method further comprises:

(e) modulating said key code onto a second carrier signal, thereby generating a second key code signal, said modulating being performed on said remote control device wherein said second carrier signal is in an infrared frequency band; and

(f) transmitting said second key code signal from said remote control device to an electronic consumer device.

8. (original): The method of Claim 7, further comprising:

(g) pressing a power-on key of said remote control device causing said remote control device to transmit said keystroke indicator signal that is received in (a), wherein the pressing in (g) causes said electronic consumer device to turn on.

9. (original): The method of Claim 1, wherein said key code generated in (b) is part of a codeset, and wherein said remote control device does not store said codeset.

10. (original): The method of Claim 9, wherein said codeset comprises timing information and a plurality of key codes, and wherein said timing information describes a digital one and a digital zero.

11. (previously presented): A method comprising:

(a) receiving a keystroke indicator signal from a remote control device;

(b) generating a key code within a key code generator device;

(c) modulating said key code onto a carrier signal, thereby generating a key code signal; and

(d) transmitting said key code signal from said key code generator device, wherein a codeset comprises a plurality of key codes, each one of said plurality

of key codes corresponding to a function of an electronic consumer device, and wherein no more than a single one of said plurality of key codes is present on said remote control device at any given time.

12. (original): The method of Claim 11, wherein said function of said electronic consumer device is taken from the group consisting of: power on, power off, channel advance, channel back, volume up, volume down, cursor up, cursor down, cursor right, cursor left, select, play, record, stop, forward, back and pause.

13. (previously presented): A remote control device comprising:

a receiver that receives a first key code signal, wherein said first key code signal is generated by modulating a key code onto a first carrier signal, said first carrier signal falling within a radio frequency band;

a transmitter that transmits a second key code signal, wherein said second key code signal is generated by modulating said key code onto a second carrier signal, said second carrier signal falling within an infrared frequency band; and

a keypad that includes a key that corresponds to said key code, wherein said key code corresponds to a function of an electronic consumer device.

14. (original): The device of Claim 13, wherein said key code corresponds to a second function of a second electronic consumer device, as well as to said function of said electronic consumer device.

15. (original): The device of Claim 14, wherein said transmitter transmits a third key code signal, and wherein said third key code signal is generated by modulating said key code onto a third carrier signal.

16. (original): The device of Claim 14, wherein said key code comprises a first binary number and a second binary number, said first binary number

33

corresponding to said function, and said second binary number corresponding to said second function.

17. (previously presented): A device comprising:

a receiver that receives a first key code signal, wherein said first key code signal is generated by modulating a key code onto a first carrier signal, said first carrier signal falling within a radio frequency band;

a transmitter that transmits a second key code signal, wherein said second key code signal is generated by modulating said key code onto a second carrier signal, said second carrier signal falling within an infrared frequency band; and

a keypad that includes a key that corresponds to said key code, wherein said key code corresponds to a function of an electronic consumer device, wherein said keypad includes a second key that corresponds to a second key code, wherein a third key code signal is generated by modulating said second key code onto a third carrier signal, wherein said third key code signal is received by said receiver, and wherein both said first key code and said second key code are not both stored in said device at the same time.

18. (original): The device of Claim 13, wherein a codeset comprises timing information and a plurality of key codes, wherein each of said plurality of key codes corresponds to a different function of said electronic consumer device, wherein said key code is a binary number, and wherein said timing information defines how said binary number is modulated onto said first carrier signal.

19. (previously presented): A system comprising:

a key code generator device that generates a first key code and a second key code, wherein a codeset is stored on said key code generator device, said codeset including said first key code and said second key code, wherein said first key code corresponds to a selected function of a first electronic consumer

34

device, and wherein said second key code corresponds to said selected function of a second electronic consumer device; and

means for relaying said first key code and said second key code from said key code generator device through a remote control device to said first electronic consumer device and to said second electronic consumer device without simultaneously storing both said first key code and said second key code on said remote control device.

20. (original): The system of Claim 19, wherein said selected function is taken from the group consisting of: power on, power off, channel advance, channel back, volume up, volume down, cursor up, cursor down, cursor right, cursor left, select, play, record, stop, forward, back and pause.

21. (original): The system of Claim 19, wherein said selected function is power on, and wherein said system automatically determines when said first electronic consumer device powers on.

22. (previously presented): A remote control device, comprising:

a keypad;

an RF receiver;

an IR transmitter; and

means for receiving a key code from said RF receiver and for sending said key code to said IR transmitter such that said key code is modulated onto an IR carrier signal, said IR carrier signal with said key code modulated thereon being transmitted from said remote control device by said IR transmitter.

23. (original): The remote control device of Claim 22, wherein said key code is not stored on said remote control device immediately prior to said means receiving the key code.

24. (original): The remote control device of Claim 22, wherein said means is a microcontroller.

25. (previously presented): A method comprising:

(a) receiving a keystroke indicator signal from a remote control device;

(b) using said keystroke indicator signal to generate a key code, wherein a key code generator device generates said key code;

(c) modulating said key code onto a carrier signal and thereby generating a key code signal; and

(d) transmitting said key code signal from said key code generator device to said remote control device, wherein said remote control device transmits said key code signal to an electronic consumer device.

26. (previously presented): The method of Claim 25, wherein said key code generated in (b) is part of a codeset, and wherein said codeset is not stored on said remote control device.

# X. EVIDENCE APPENDIX

No evidence has been submitted pursuant to 37 C.F.R. §§ 1.130, 1.131 or 1.132. No affidavit or declaration has been submitted under § 1.130 to disqualify a commonly owned patent or a published application as prior art. No affidavit or declaration of a prior invention has been submitted under § 1.131. No affidavit or declaration traversing rejections or objections has been submitted under § 1.132. No such evidence was entered by the Examiner and relied upon by Appellants in this appeal.

In the rejections that are to be reviewed in this appeal, the Examiner has not relied upon any non-patent documents.

# XI. RELATED PROCEEDINGS APPENDIX

No decision has yet been rendered by a court or the Board in this or any related proceeding.

The real party in interest is the assignee, ZiLOG, Inc., as named in the caption above.

# **II. RELATED APPEALS AND INTERFERENCES**

Based on information and belief, there are no appeals or interferences that could directly affect or be directly affected by or have a bearing on the decision by the Board of Patent Appeals and Interferences (the "Board") in the pending appeal.

# **III. STATUS OF CLAIMS**

The application at issue, filed on December 16, 2003, included 24 claims. In an amendment dated July 28, 2006, claims 25-26 were added. Claims 1-26 are subject to this Appeal.

# **IV. STATUS OF AMENDMENTS**

An amendment dated December 19, 2006, was filed subsequent to a final Office action dated October 19, 2006 ("Office Action"). An Advisory Action dated February 7, 2007 ("Advisory Action"), stated that the amendment was entered. The advisory action included an explanation of how the amended claims would be rejected.

# V. SUMMARY OF CLAIMED SUBJECT MATTER

The following summary pursuant to 37 CFR 41.37(c)(1)(v) is a concise explanation of the claims and is to be read in light of the disclosure. This summary does not limit the claims. (See MPEP §1206).

An embodiment of Appellant's novel system 10 is illustrated in figure 1 (replicated below). System 10 relays a key code through a remote control device

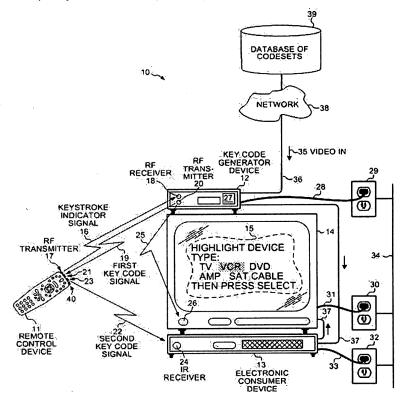

FIG. 1

### Amended Appeal Brief Application Serial No. 10/737,029

to an electronic consumer device. The key code is not stored in the remote control device in a permanent manner, but rather is relayed through the remote control device. System 10 includes a remote control device 11, a key code generator device 12, a first electronic consumer device 13 (a VCR) and a second electronic consumer device 14 (a TV).

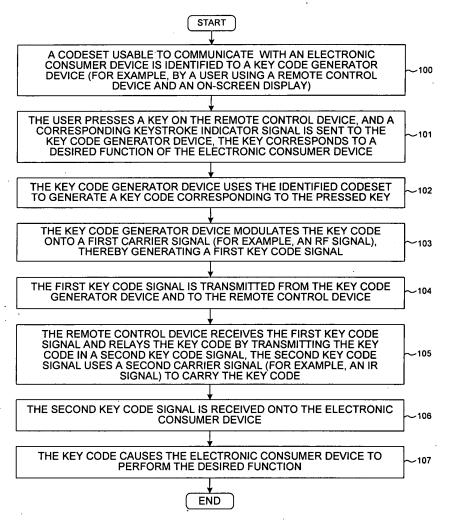

Upon receiving a keystroke indicator signal from remote control 11, key code generator 12 identifies the particular codeset usable to communicate with the selected electronic consumer device. The keystroke indicator signal contains an indication of a key on the remote control that was pressed, which corresponds to a function of the selected electronic consumer device. Using the identified codeset and the indication of the pressed key, key code generator 12 generates a key code and modulates that key code onto a radio frequency carrier signal, thereby generating a first key code signal 19. Remote control 11 receives first key code signal 19 from key code generator 12 and modulates the key code onto an infrared frequency carrier signal, thereby generating a second key code signal 22. Remote control 11 relays the key code to the selected electronic consumer device in second key code signal 22. The key code causes the selected electronic consumer device to perform the desired function.

#### A. Independent claim 1

Independent claim 1 is directed to a method of generating a key code within a key code generator device, as described in steps 101 through 104 in figure 2 (replicated below). As shown in figures 1 and 2, claim 1 recites a method of (a) receiving keystroke indicator signal 16 from remote control device 11 (Specification, p. 6, lines 26-28); (b) generating a key code within key code generator device 12 (Specification, p. 8, lines 14-16); (c) modulating the key code onto a carrier signal thereby generating first key code signal 19 (Specification, p. 8, lines 26-29); and (d) transmitting key code signal 19 from key code generator device 12 (Specification, p. 11, lines 4-5).

> Amended Appeal Brief Application Serial No. 10/737,029

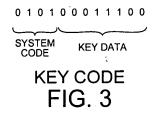

ราว การการสาวสาวการสุดพาสาร (1983) - 20

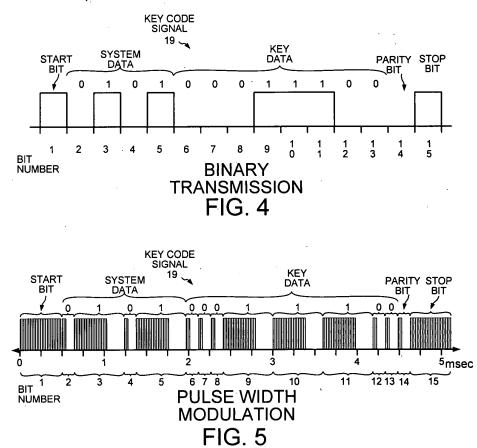

## FIG. 2

Dependent claim 2 is directed to the method of claim 1, but includes the limitation that first key code signal 19 is transmitted from key code generator device 12 to remote control device 11 (Specification, p. 11, lines 6-7). Dependent claim 3 includes a limitation that first key code signal 19 is transmitted from key code generator 12 to the selected electronic consumer device (Specification, p. 12, lines 13-15). Dependent claim 4 includes the limitation that the key code consists of a binary number (Specification, p. 8, lines 18-20) as depicted in figure 3 (replicated below).

Amended Appeal Brief Application Serial No. 10/737,029

Dependent claim 5 includes the limitation that the key code comprises a binary number and timing information. The timing information defines how said binary number is modulated onto the carrier signal to generate first key code signal 19 (Specification, p. 9, lines 9-11) as depicted in figures 4 and 5 (replicated below).

Dependent claim 6 includes the limitation that keystroke indicator signal 16 corresponds to a power-on function, and first key code signal 19 is received

> Amended Appeal Brief Application Serial No. 10/737,029

onto an electronic consumer device and causes the electronic consumer device to be powered on. Dependent claim 7 recites that first key code signal 19 is received by remote control device 11 and includes the further steps of (e) modulating the key code onto a second carrier signal, thereby generating second key code signal 22 (Specification, p. 11, lines 8-11) and (f) transmitting second key code signal 22 to the selected electronic consumer device (Specification, p. 12, lines1-3). Claim 7 also includes the limitation that the first carrier signal is in a radio frequency band and the second carrier signal is in an infrared frequency band.

Dependent claim 8 is directed to the method of claim 7, but includes a further limitation that keystroke indicator signal 16 corresponds to a power-on function, and second key code signal 22 causes the selected electronic consumer device to be powered on (Specification, p. 12, lines 4-7).

Dependent claim 9 includes the limitation that the key code is part of a codeset and that the codeset is not stored in remote control device 11 (Specification, p. 19, lines 11-13). Dependent claim 10 is directed to the method of claim 9, but includes a limitation that the codeset comprises timing information and a plurality of key codes. Furthermore, the timing information describes a digital one and a digital zero, as described at page 11, lines 26-28, of the Specification.

#### B. Independent claim 11

Independent claim 11 is directed to a method of relaying key codes through a remote control device to an electronic consumer device, wherein no more than a single key code is present on the remote control device at any given time. Figure 1 shows that a keystroke indicator signal 16 is received from a remote control device 11. (Specification, p. 6, lines 26-28). A key code generator device 12 then generates a key code. (Specification, p. 8, lines 14-16). Each key code corresponds to a function of an electronic consumer device 13. The key code is then modulated onto a carrier signal to generate a key code signal 19.

> Amended Appeal Brief Application Serial No. 10/737,029

(Specification, p. 8, lines 26-29). Examples of key code signal 19 are also shown in figures 4 and 5. Key code signal 19 is then transmitted from key code generator device 12 to remote control device 11. (Specification, p. 11, lines 4-5). No more than a single key code is present on remote control device 11 at any given time.

#### C. Independent claim 13

Independent claim 13 relates to remote control device 11 shown in figure 1. Remote control device 11 comprises: an RF receiver 21 that receives a first key code signal 19 (Specification, p. 11, lines 5-6); an IR transmitter 23 that transmits a second key code signal 22 (Specification, p. 11, lines 17-21); and a keypad that includes a key that corresponds to a key code. The key code corresponds to a function of an electronic consumer device. First key code signal 19 is generated by modulating the key code onto a first carrier signal having a radio frequency band. Second key code signal 22 is generated by modulating the key code onto a second carrier signal having an infrared frequency band.

Dependent claim 14 is directed to the remote control device of claim 13, but includes the limitation that the key code corresponds to the function and to a second function. The second function corresponds to a second electronic consumer device. Dependent claim 16 is directed to the remote control device of claim 14, but includes the limitation that the key code comprises a first binary number and a second binary number. The first binary number corresponds to the function, and the second binary number corresponds to the second function.

Dependent claim 18 is directed to the remote control device of claim 13, but includes the limitation that a codeset comprises timing information and a plurality of key codes. Each key code is a binary number and corresponds to a different function of the electronic consumer device. Furthermore, the timing information defines how the binary number is modulated onto the first carrier signal (Specification, p. 11, lines 26-28).

Amended Appeal Brief Application Serial No. 10/737,029

7

#### D. Independent Claim 19

Claim 19 is directed to a key code generator device and a means for relaying key codes from the key code generator device through a remote control device. The key code generator device generates a first key code and a second key code. Claim 19 recites a "means for relaying said first key code and said second key code from said key code generator device through a remote control device." More specifically, the first key code corresponds to a function of a first electronic consumer device, and the second key code corresponds to the same function of a second electronic consumer device (Specification, p. 15, lines 25-26). As illustrated in Figure 1, the corresponding structure includes remote control device 11.

#### E. Independent Claim 22

Claim 22 is directed to remote control device 11 comprising a key pad, RF receiver 21, IR transmitter 23, and a means for receiving a key code from RF receiver 21 and for sending the key code to IR transmitter 23. Claim 24 recites that the corresponding structure includes a microcontroller integrated circuit (Specification, p. 13, line 27).

#### F. Independent claim 25

Independent claim 25 is directed to a method for relaying a key code from key code generator 12 to an electronic consumer device through remote control device 11, and includes the steps 101 through 105 depicted in figure 2. Claim 25 recites a method of (a) receiving keystroke indicator signal 16 from remote control device 11 (Specification, p. 6, lines 26-28); (b) using keystroke indicator signal 16 to generate a key code within key code generator device 12 (Specification, p. 8, lines 14-16); (c) modulating the key code onto a carrier signal thereby generating first key code signal 19 (Specification, p. 8, lines 26-29); and (d) transmitting a key code signal from key code generator device 12 to remote control device 11 (Specification, p. 11, lines 4-7) and transmitting the key code

> Amended Appeal Brief Application Serial No. 10/737,029

signal to an electronic consumer device from remote control device 11.

Dependent claim 26 is directed to the method of claim 25 but includes the limitation that the key code is part of a codeset, and the codeset is not stored in remote control device 11 (Specification, p. 19, lines 11-13).

## VI. GROUNDS OF REJECTION TO BE REVIEWED ON APPEAL

The following are grounds of rejection to be reviewed on appeal:

1) Claims 13-16, 19, 22, and 24-26 stand rejected under 35 USC §102(e), as being anticipated by Wouters et al. (US Patent 6,915,109).

2) Claims 1, 3-4, 9 stand rejected under 35 USC §103(a) as being unpatentable over Pope (US Patent 5,963,624) in view of McNair et al. (US Patent 5,595,342).

3) Claim 2 stands rejected under 35 USC §103(a) as being unpatentable over Pope in view of McNair and further in view of Goldstein (US Patent 5,410,326).

4) Claim 5 and 10 stand rejected under 35 USC §103(a) as being unpatentable over Pope in view of McNair and further in view of Teskey (US Patent 6,747,568).

5) Claim 6 stands rejected under 35 USC §103(a) as being unpatentable over Pope in view of McNair and further in view of August et al. (US Patent 5,671,267).

6) Claim 7 stands rejected under 35 USC §103(a) as being unpatentable over Pope in view of McNair and further in view of Wouters.

7) Claim 8 stands rejected under 35 USC §103(a) as being unpatentable over Pope in view of McNair in view of Wouters and further in view of August.

Amended Appeal Brief Application Serial No. 10/737,029

. . .

8) Claim 18 stands rejected under 35 USC §103(a) as being unpatentable over Wouters in view of Teskey.

9) Claim 20-21 stand rejected under 35 USC §103(a) as being unpatentable over Wouters in view of August.

10) Claim 23 stands rejected under 35 USC §103(a) as being unpatentable over Wouters in view of Pope.

#### VII. ARGUMENT

#### A. <u>Claims 13-16, 19, 22, and 24-26 (1st ground of rejection)</u>

Claims 13-16, 19, 22 and 24-26 are rejected under 35 U.S.C. § 102(e) as being anticipated by Wouters et al. US Patent 6,915,109. (Office Action, p. 4, lines 1-2). "A rejection for anticipation under section 102 requires that each and every limitation of the claimed invention be disclosed in a single prior art reference." *In re Paulsen*, 30 F.3d 1475, 1478-79, 31 USPQ2d 1671, 1673 (Fed. Cir. 1994) citing *In re Spada*, 911 F.2d 705, 708, 15 USPQ2d 1655, 1657 (Fed. Cir. 1990).

#### 1. Independent claims 13 and 22

Claim 13 recites, "A remote control device comprising: <u>a receiver</u> that receives a first key code signal . . . within a radio frequency band; <u>a transmitter</u> that transmits a second key code signal . . . within an infrared frequency band; and a <u>keypad</u> . . ." (emphasis added). Claim 22 recites, "A remote control device, comprising: a <u>keypad</u>; an <u>RF receiver</u>; an <u>IR transmitter</u> ..." (emphasis added).

Wouters does not form the basis for a valid rejection under § 102(e) because Wouters does not disclose all of the limitations of either claim 13 or claim 22. Although Wouters discloses a system of devices including an IR remote control unit 3 in room 1 and an RF receiver 13 and an IR transmitter 14 in room 2, Wouters does not disclose a device with a keypad that both receives a

Amended Appeal Brief Application Serial No. 10/737,029

signal within a radio frequency band and transmits a signal within an infrared frequency band.

The Examiner has not alleged that Wouters discloses a single device with a keypad that both receives an RF signal and transmits an IR signal. Instead, the Examiner states, "Wouters et al. teaches a remote control which includes the system of devices 1 and 2 (figure 1) comprising a receiver receiving a RF modulated remote control signal (col. 4 lines 25-28) and a transmitter transmitting an infrared modulated signal generated from the received RF signal (col. 4 lines 28-33)." (Office Action, p. 4, lines 3-6). The Examiner's statement that Wouters discloses a system of devices 1 and 2 that comprise an RF receiver and an IR transmitter is insufficient to allege a prima facie case of anticipation of claims that recite a device comprising a keypad, a receiver and a transmitter. In fact, the only keypad disclosed in Wouters is on remote control unit 3, which is located in a separate room (room 1) from RF receiver 13 and IR transmitter 14 (room 2). The remote control unit 3 described at column 4, lines 48-57, includes IR transmitter 4 and RF transmitter 8, but does not include an RF receiver. Thus, the Examiner does not state that Wouters discloses a single device with a keypad, an RF receiver and an IR transmitter. Nor does Wouters disclose a device with all three of these elements.

In the Advisory Action, the Examiner states, "Regarding applicant's argument regarding the <u>system of devices</u> as disclosed by Wouters, it is the examiner's position that the remote control device as claimed, is not limited to a single housing" (Advisory Action, p. 2, lines 2-3) (emphasis added). The Examiner then again cites column 4, lines 25-28, column 4, lines 28-33 and column 4, lines 44-58, of Wouters as disclosing all of the elements of claims 13 and 22. The Examiner is improperly interpreting the claim term "remote control device" contrary to how that term is used in the claims and in the specification. Both claims 13 and 22 recite a "device" and not a "system". As the term "remote control device" is depicted in the drawings and used in the specification, such a

## Amended Appeal Brief Application Serial No. 10/737,029

"remote control device" does not describe a "system" with an RF receiver in one room of a house and an RF transmitter in another room of the house.

Finally, this statement that disavows any claim scope to a "remote control device" with an RF receiver in one room and an RF transmitter in another room is dispositive to claim interpretation. By virtue of this disclaimer of claim scope, the term a "remote control device" is to be interpreted as excluding a "system" with multiple components in separate rooms. <u>See Invitrogen Corporation v. Biocrest Manufacturing</u>, 327 F.3d 1364, 1368, 66 USPQ2d 1631, 1633 (Fed. Cir. 2003); *Inverness Med. Switz. GmbH v. Princeton Biomeditech Corp.*, 309 F.3d, 1365, 1372, 64 USPQ2d 1926, 1932 (Fed. Cir. 2002); *Rheox*, 276 F.3d at 1327, 61 USPQ2d at 1374; *CVI/Beta Ventures, Inc. v. Tura LP*, 112 F.3d 1146, 1159, 42 USPQ2d 1577, 1583 (Fed. Cir. 1997); *Southwall Techs. Corp. v. Cardinal IG Co.*, 54 F.3d 1570, 1576, 34 USPQ2d 1673, 1676 (Fed. Cir.), *cert. denied*, 116 S.Ct. 515 (1995).

Because Wouters does not disclose all of the elements of either claim 13 or claim 22, reversal of the improper §102(e) rejection of claims 13 and 22 by the Board is requested.

#### 2. Dependent claims 14-16

Claim 14 recites "<u>said key code</u> corresponds to a second function of a second electronic consumer device, as well as to said function of said electronic consumer device" (emphasis added). Wouters does not disclose one key code that corresponds to two separate functions of two different electronic consumer devices.

The Examiner has not stated that Wouters discloses a single key code that corresponds to two separate functions. Instead, the Examiner states, "A key code corresponding to <u>a second and third key code</u> is therefore transmitted based on the selected key." (Office Action, p. 4, lines 10-11) (emphasis added). In addition, the Examiner states that "Wouters teaches a key code generator (3) for generating <u>key codes</u> for controlling different function on various electrical

> Amended Appeal Brief Application Serial No. 10/737,029

appliances (col. 1 lines 24-26, col. 3 lines 21-35). The <u>key codes</u> for controlling the different devices inherently include <u>a first and second key code</u>." (Office Action, p. 2, lines 17-20) (emphasis added). However, claim 14 does not recite a first and second key code. Instead, claim 14 recites "said key code", "said function" and "a second function". The Examiner has not stated that Wouters discloses one key code that corresponds both to a function of an electronic consumer device as well as to a second function of a second electronic consumer device.

Claim 16 recites "<u>said key code</u> comprises a first binary number and a second binary number, said first binary number corresponding to said function, and said second binary number corresponding to said second function" (emphasis added). Wouters does not disclose a single key code that comprises two binary numbers, one corresponding to the function of one electronic consumer device, and the other corresponding to a second function of a second electronic consumer device.

The Examiner has not presented a *prima facie* argument of anticipation of claim 16 because the Examiner has not stated that Wouters discloses a key code comprising both (i) a first binary number that corresponds to a function of an electronic consumer device as well as (ii) a second binary number that corresponds to a second function of a second electronic consumer device. Instead, the Examiner simply states, "The data from the memory is inherently store as binary data. The key code therefore comprises binary data." (Office Action, p. 4, lines 13-14). The Examiner does not mention a first binary number of a key code corresponding to a first function, as well as a second binary number of the same key code corresponding to a second function.

Claims 14-16 depend directly or indirectly from claim 13. In addition to the reasons explained above, dependent claims 14-16 are allowable for at least the same reasons for which claim 13 is allowable. Reversal of the improper §102(e) rejection of claims 14-16 by the Board is requested.

Amended Appeal Brief Application Serial No. 10/737,029

#### 3. Dependent claim 24

Claim 24 recites that the means of claim 22 is a microcontroller. The means of claim 22 is a "means for receiving a key code from said RF receiver". The Examiner states that Wouters discloses "a microcontroller in the form of a microprocessor for receiving the key code (col. 4 lines 52-55)" (Office Action, p. 5, lines 1-2). The passage of Wouters cited by the Examiner, however, does not disclose a microprocessor for receiving a key code from an RF receiver.

The remote control unit disclosed in the passage cited by the Examiner does not include an RF receiver. Therefore, the central processing unit (CPU) that is inside remote control unit 3 of Wouters does not receive a key code from any RF receiver. Instead, Wouters discloses that the CPU determines which code needs transmitting based on which key is tapped by the user. (No keypad is included in the devices in room 2 of Wouters.) Wouters explains:

"In this case the user taps a key, the CPU (Central processing unit) inside the remote control determines which code (corresponding to the tapped key) needs transmitting (by IR or RF) and fetches the required data from its memory which comprises a data base or other means in which tapped codes are linked to data to be transmitted" (Wouters, col. 4, lines 57-62) (emphasis added).

Thus, Wouters does not disclose a microcontroller that receives a key code from an RF receiver.

Claim 24 depends from claim 22. In addition to the reasons explained above, dependent claim 24 is allowable for at least the same reasons for which claim 22 is allowable. Reversal of the § 102(e) rejection and allowance of claim 24 are requested.

#### 4. Independent claim 19

Claim 19 recites, "said codeset including said first key code and said second key code, wherein said first key code corresponds to <u>a selected function</u> of a first electronic consumer device, and wherein said second key code

Amended Appeal Brief Application Serial No. 10/737,029

corresponds to <u>said selected function of a second electronic consumer device</u>" (emphasis added). Wouters does not form the basis for a valid rejection under §102(e) because Wouters does not disclose a codeset that includes two key codes: one key code corresponding to a function of one electronic consumer device, and the other key code corresponding <u>to the same function</u> ("said selected function") of another electronic consumer device.

The Examiner has not presented a *prima facie* argument of anticipation of claim 19 because the Examiner has not stated that Wouters discloses the two recited key codes that correspond to the same function on different electronic consumer devices. Nor has the Examiner stated that Wouters discloses that those two key codes are included in a codeset stored on a key code generator device. In fact, Wouters does not mention key codes that correspond to the same function on separate electronic consumer devices.

Because Wouters does not disclose all of the elements of claim 19, reversal of the improper §102(e) rejection of claim 19 by the Board is requested.

## 5. Independent claim 25

Claim 25 recites, "receiving a keystroke indicator signal <u>from a remote</u> <u>control device;</u> . . . transmitting said key code signal from said key code generator device <u>to said remote control device</u>, wherein said remote control device transmits said key code signal to an electronic consumer device." (emphasis added). Wouters does not form the basis for a valid rejection of claim 25 under § 102(e) because Wouters does not disclose (i) receiving a keystroke indicator signal from a remote control device, (ii) transmitting a key code signal to the remote control device, and then (iii) transmitting the key code signal from the remote control device to an electronic consumer device.

The Examiner has not stated a *prima facie* case of anticipation because that Examiner has not alleged that Wouters discloses (i) receiving a signal <u>from a</u> <u>remote control device</u>, (ii) transmitting a second signal <u>to the remote control</u>

> Amended Appeal Brief Application Serial No. 10/737,029

<u>device</u>, and (iii) transmitting a third signal <u>from the remote control device</u>. Instead, the Examiner states that Wouters discloses:

"receiving a key stroke indicator signal (5) from <u>a remote control (3)</u> and the key code indicator signal is used by key code generator 8 to generate a key code (col. 3 lines 21-30); modulating the key code signal unto a carrier and transmitting the key code to <u>the</u> <u>remote control (12)</u> (col. 4 lines 28-33) and the remote control transmit the key code to the electronic device (col. 3 lines 31-34). Wouters et al. teaches the key code receive by the remote control is demodulated, decoded and transmitted to the appliance (col. 4 lines 25-37)." (Office Action, p. 5, lines 3-9) (emphasis added)

The Examiner argues that the recited "keystroke indicator signal" is disclosed by infrared signal 5 of Wouters. Moreover, the Examiner argues that the recited "remote control device" is infrared remote control unit 3 of Wouters. But then the Examiner improperly argues that the item labeled 12 in room 2 of Wouters is also the recited remote control device. This is improper. The Examiner has engaged in improper claim construction by arguing (i) that the recited remote control device from which a keystroke indicator signal is received is disclosed by item 3 in room 1 of Wouters for purposes of one claim limitation, and (ii) that the same recited remote control device is disclosed by item 12 in room 2 of Wouters for purposes of another limitation of the same claim. Alternatively, the Examiner is arguing that the recited remote control device is in two rooms of Wouters at the same time. Therefore, Wouters does not disclose the recited remote control device from which a first signal is received and to which a second signal is transmitted.

An additional reason why the Examiner's argument fails is that Wouters does not disclose that item 12 in figure 1 is a remote control device. The reference numeral 12 does not appear at all in the specification of Wouters.

Because Wouters does not disclose all of the elements of claim 25, reversal of the improper §102(e) rejection of claim 25 by the Board is requested.

## Amended Appeal Brief Application Serial No. 10/737,029

## 6. <u>Dependent claim 26</u>

Claim 26 recites, "wherein said codeset is not stored on said remote control device". The Examiner states that infrared remote control unit 3 of Wouters discloses the recited "remote control device". (Office Action, p. 5, line 4) The Examiner also states, "The key code is therefore not stored in the memory of the remote control" (Office Action, p. 5, lines 9-10). First, the Examiner has not stated a *prima facie* case of anticipation of claim 26 because claim 26 <u>does not</u> recite "wherein the key code is not stored on said remote control device". Second, Wouters does not disclose that a codeset is not stored on infrared remote control unit 3. In fact, Wouters suggests the contrary:

"In this system <u>a remote control unit</u> is used which comprises both an IR transmitter and an antenna for transmission of RF signals. In this case the user taps a key, <u>the CPU</u> (Central processing unit) <u>inside the remote control</u> determines which code (corresponding to the tapped key) needs transmitting (by IR or RF) and <u>fetches the required data</u> from its memory which comprises a data base or other means in which tapped codes are linked to data to be transmitted." (Wouters, col. 4, lines 54-62) (emphasis added).

Third, dependent claim 26 is allowable for at least the same reasons for which claim 25 is allowable because claim 26 depends from claim 25. Reversal of the improper §102(e) rejection of claim 26 by the Board is requested.

## B. Claims 1, 3-4 and 9 (2nd ground of rejection)

Claims 1, 3-4 and 9 are rejected under 35 U.S.C. § 103(a) as being unpatentable over Pope (USP 5,963,624) in view of McNair et al. (USP 5,595,342) (Office Action, p. 6, lines 1-2). To establish a *prima facie* case of obviousness, the Examiner must demonstrate that "the reference (or references when combined) must teach or suggest all the claimed limitations." MPEP § 2142.

> Amended Appeal Brief Application Serial No. 10/737,029

#### 1. Independent claim 1

Claim 1 recites, "(a) receiving a keystroke indicator signal from a remote control device; (b) generating a key code within a key code generator device . . . generating a key code signal". The combination of Pope and McNair does not form the basis for a valid rejection of claim 1 under § 103(a) because the references when combined do not teach (i) generating a key code within a key code generator device, (ii) a keystroke indicator signal as well as a key code signal, or (iii) modulating a key code.

# (i) <u>Neither Pope nor McNair teaches generating a key code within a</u> <u>key code generator device</u>.

The Examiner states that "Pope teaches receiving a keystroke indicator signal which contains an indication of a key on the remote control device 10 that was pressed (col. 2 lines 61-col. 3 line 19), generating a key code (codes for communicating the control function to the appliances) within the code generator 12 ..." (Office Action, p. 6, lines 3-6) (emphasis added). Pope does not, however, teach generating a key code within base unit 12. The appliance control code that is transmitted by base unit 12 of Pope is not generated within base unit 12. Instead, base unit 12 receives the appliance control codes from handset 10/50. In Pope, a digital cordless telephone handset 10/50 is used as a universal remote control device to control electrical appliances. Pope explains:

"The present invention uses a digital cordless telephone <u>handset to</u> <u>store a variety of appliance control codes</u>. These appliance control codes can be <u>transmitted to a base unit</u>. The base unit can translate the appliance control codes to control signals such as infrared control signals, to control an electrical appliance" (Pope, col. 1, lines 31-36) (emphasis added). *See also* Pope, col. 2, lines 48-52 and 63-65.

The appliance control codes are not generated within the base unit 12 of Pope. Instead, the appliance control codes are transmitted from the handset 10/50 to the base unit 12, where they are translated to control signals. Base unit 12 of Pope does not receive a keystroke indicator and then generate a key code.

> Amended Appeal Brief Application Serial No. 10/737,029

Thus, Pope does not teach the recited "receiving a keystroke indicator signal <u>from a remote control device</u>" (emphasis added). Pope states, "Once an <u>appliance control code is received by the base unit</u>, the base unit will know to <u>transfer the control code</u> to an appliance" (Pope, col. 4, lines 49-51) (emphasis added). Thus, in Pope, an appliance control code is received by base unit 12 and is then transferred to an appliance; the appliance control code is not generated within base unit 12.

# (ii) <u>Pope and McNair do not teach both a keystroke indicator signal</u> <u>and a key code signal</u>.

The Examiner states that "Pope teaches receiving a keystroke indicator signal which contains an indication of a key on the remote control device 10 that was pressed (col. 2 lines 61-col. 3 line 19), . . ." (Office Action, p. 6, lines 3-6). Nowhere, however, does Pope teach a keystroke indicator signal in the passage cited by the Examiner; which is reproduced below in its entirety:

"Keypad 30 includes the numbers 1-9, the "star" and the "pound" key. Additionally, "up arrow" key 30a and "down arrow" key 30b can be used to scroll through a menu. A "transmit" key 30c can be used to transmit the appliance control code once the appliance control has been selected. In one embodiment, the user gets into the menu by pressing an "up arrow" or a "down arrow" key. Alternately a "menu" button (not shown) is used. The keys for numbers 1-9 can have different meanings once the user is in the menu. Menu functions can be printed above the normal telephone control keys. FIG. 1 shows compact disc, television, cable and AC signal control menu-function buttons. The setup menu can be entered, one of these buttons pressed, and then using the up and down arrows, the specific controls for a given electrical appliance can be scrolled through. The different appliance controls can be listed in the order of frequency of use. For example, the "mute" function could be the first function listed in each menu selection.

Alternately, individual functions can be mapped with the associated buttons of the keypad, and a display 32 need not be used. Buttons similar to a "shift," "alt," and "control" on a normal computer keypad can be used to change the meanings of buttons "0" to "9," "star," and "pound." The different meanings associated with different buttons can be printed in different colors, which are

### Amended Appeal Brief Application Serial No. 10/737,029

the same colors of the associated buttons "shift," "alt," or "control."" (Pope, col. 2, line 61 – col. 3, line 19) (emphasis added)

Thus, the passage of Pope above teaches appliance controls and appliance control codes but does not teach a keystroke indicator signal as the Examiner maintains.

Moreover, it is improper to construe the appliance control codes of Pope to teach both a keystroke indicator signal and a key code signal. According to the tenets of claim differentiation, a "keystroke indicator signal" cannot be interpreted to be the same as a "key code signal". Such a claim interpretation is presumptively unreasonable. <u>See, e.g., Karlin Tech. Inc. v. Surgical Dynamics Inc.</u>, 177 F.3d 968, 50 USPQ2d 1465, 1468 (Fed. Cir. 1999). In addition, such a claim interpretation would render claim 1 internally inconsistent because "keystroke indicator/key code" information that was already received by the key code generator device would later be generated by the key code generator device. Thus, Pope does not teach both a keystroke indicator and a key code. The handset 10/50 of Pope transmits an appliance control code and not a keystroke indicator.

## (iii) Neither Pope nor McNair teaches modulating a key code.

The Examiner admits that Pope is silent on teaching modulating a key code onto a carrier signal. (Office Action, p. 6, line 7) Moreover, McNair does not teach modulating a key code. McNair does not teach a key code. And the Examiner does not state that McNair teaches <u>modulating a key code</u> onto a carrier signal. Instead, the Examiner states that McNair teaches "the control signal is modulated" (Office Action, p. 6, line 8). This is insufficient to establish a *prima facie* case of obviousness.

Moreover, there would be no motivation to combine McNair with Pope even if McNair did disclose a limitation of claim 1 (which it does not). McNair is directed to a control system for a gas-fired, central heating system and does not concern key code signals for electronic consumer devices.

> Amended Appeal Brief Application Serial No. 10/737,029

Therefore, Pope and McNair do not form the basis for a valid rejection under § 103(a) because neither Pope nor McNair teaches (i) generating a key code within a key code generator device, (ii) a keystroke indicator signal as well as a key code signal, or (iii) modulating a key code. In addition, there is no motivation to combine McNair with Pope to arrive at all of the limitations of claim 1. For these reasons, reconsideration of the § 103(a) rejection and allowance of claim 1 are requested.

#### 2. Dependent claims 3-4 and 9

Claim 9 recites, "said key code generated in (b) is part of a codeset, and wherein <u>said remote control device does not store said codeset</u>" (emphasis added). With respect to base claim 1, the Examiner states that "Pope teaches receiving a keystroke indicator signal which contains an indication of a key on the <u>remote control device 10</u>" (Office Action, p. 6, lines 3-4) (emphasis added). Thus, the Examiner considers that handset 10 of Pope teaches the remote control device recited in claim 9. The Examiner then states, "The code generated by the code generator is not store in the remote control because it is transmitted to the appliances" (Office Action, p. 6, lines 18-19). This incorrectly characterizes the teachings of Pope. The appliance control codes of Pope are indeed stored on handset 10 and are transmitted from handset 10 to base unit 12. Pope explains:

"The present <u>invention uses a digital cordless telephone handset to</u> <u>store a variety of appliance control codes</u>. These appliance control codes can be <u>transmitted to a base unit</u>. The base unit can translate the appliance control codes to control signals such as infrared control signals, to control an electrical appliance" (Pope, col. 1, lines 31-36) (emphasis added)

"The cordless digital telephone <u>handset</u> includes a memory 66 . . . used to <u>store the appliance control codes</u>. Preferably, the appliance control codes can be transmitted to the base unit 12 . . ." (Pope, col. 2, lines 48-52) (emphasis added).

Amended Appeal Brief Application Serial No. 10/737,029

> "Fig. 2 is a diagram of a handset 50 of the present invention.... The <u>appliance control codes are stored in a memory 66</u>" (Pope, col. 4, lines 17-28) (emphasis added).

Base unit 12 does not generate the appliance control codes. Instead, base unit 12 receives the appliance control codes, which were stored in memory 66 of handset 10, and then translates the appliance control codes into infrared control signals. Thus, Pope does not teach that handset 10 does not store a codeset.

Claims 3-4 and 9 depend from claim 1. In addition to the reasons explained above, dependent claims 3-4 and 9 are allowable for at least the same reason for which claim 1 is allowable. Reversal of the § 103(a) rejection and allowance of claims 3-4 and 9 by the Board is requested.

## C. <u>Dependent claim 2 (3rd ground of rejection)</u>

Claim 2 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Pope in view of McNair and further in view of Goldstein (USP 5,410,326) (Office Action, p. 7, lines 1-2).

Claim 2 includes the following limitations of base claim 1, "(a) receiving a keystroke indicator signal from a remote control device; (b) generating a key code within a key code generator device . . .." Claim 2 also recites "wherein said key code signal is transmitted in (d) from said key code generator device to said remote control device".

None of Pope, McNair or Goldstein teaches either (i) generating a key code within a key code generator device or (ii) both a keystroke indicator signal and a key code signal. Moreover, the Examiner seems to admit that Pope and McNair are silent on teaching that the key code generator transmits the key code signal to the remote control device. (Office Action, p. 7, lines 4-10). And Goldstein does not teach this limitation.

None of Pope, McNair or Goldstein teaches transmitting <u>a key code signal</u> from the key code generator device back to the remote control device. The fact that Goldstein may teach sending an IR code or an entire codeset from a cable

> Amended Appeal Brief Application Serial No. 10/737,029

television converter box to a remote control device to update the remote control device does not teach transmitting <u>a key code signal</u> from a key code generator device back to the remote control device. Indeed, Goldstein does not teach transmitting a key code signal as opposed to a key code or a codeset. The cable television converter box of Goldstein does not teach a key code generator because the cable television converter box of Goldstein receives complete codesets from a remote database or is loaded with complete codesets. (Goldstein, col. 15, lines 20-68; col. 17, lines 62-67). The television converter box of Goldstein is not a key code generator because the GLUE logic 95 in the universal remote control 5, as opposed to the television converter box, generates the IR sequences from the codes. Goldstein states:

"The glue logic 95 will supply the IR sequences from codes, stored in the RAM 90, upon command of the user. . . . These codes describe carrier frequencies, pulse widths and pulse duration to be generated to the glue logic 95 for producing infrared pulses from the infrared diode 97" (Goldstein, col. 13, lines 23-33) (emphasis added).

Thus, Goldstein does not teach transmitting a key code signal from a key code generator.

In addition, to establish obviousness, there must be "something in the prior art as a whole to suggest the desirability, and thus the obviousness of making the combination." *Interconnect Planning Corp. v. Feil*, 774 F.2d 1132, 1143, 227 USPQ 543, 551 (Fed. Cir. 1985) *quoting Lindemann Maschinenfabrik GMBH v. American Hoist Derrick Co.*, 730 F. 2d 1452, 1462, 221 USPQ 481, 488 (Fed. Cir. 1984). The motivation posited by the Examiner to combine Goldstein and Pope is non-existent. The Examiner states that Goldstein teaches "a cable box transmitting key codes to the remote control <u>in order to update the remote control</u> <u>with new control codes</u>." (Office Action, p. 7, lines 11-13) (emphasis added). But there would be no motivation to update the remote control device of claim 2 with new codesets, as allegedly taught by Goldstein, because claim 2 does not recite that any key code or codeset is ever stored on the remote control device. Claim

> Amended Appeal Brief Application Serial No. 10/737,029

2 recites transmitting a key code signal to the remote control device and does not recite transmitting a codeset to the remote control device. The motivation proposed by the Examiner would only result in a combination wherein codesets, or at least key codes, are stored on a remote control device.

The combination of Pope, McNair and Goldstein does not form the basis for a valid rejection of claim 2 under § 103(a) because the combination does not teach (i) generating a key code within a key code generator device, (ii) both a keystroke indicator signal and a key code signal, or (iii) transmitting a key code signal from the key code generator device back to the remote control device. Furthermore, there is no motivation to combine the teachings of Goldstein with the teachings of Pope and McNair in such a way as to obtain all of the limitations of claim 2. Therefore, reversal of the improper § 103(a) rejection of claim 2 by the Board is requested.

#### D. Dependent claims 5 and 10 (4th ground of rejection)

Claims 5 and 10 are rejected under 35 U.S.C. § 103(a) as being unpatentable over Pope in view of McNair and further in view of Teskey (USP 6,747,568) (Office Action, p. 7, lines 14-16).

Claims 5 and 10 depend directly or indirectly from claim 1 and include the following limitations of claim 1: "(a) receiving a keystroke indicator signal from a remote control device; (b) generating a key code within a key code generator device . . .." None of Pope, McNair or Teskey teaches (i) generating a key code within a key code generator device or (ii) both a keystroke indicator signal and a key code signal.

In addition, claim 10 recites that "said timing information describes a digital one and a digital zero". The Examiner admits that Pope "is silent on teaching the key code comprises timing information defining the binary number (ones and zeros) in modulated." But the Examiner states that Teskey "teaches the format of the remote control signal having the necessary timing and modulation information (col. line 60-col. 4 line 8)" (Office Action, p. 8, lines 7-10). Teskey

> Amended Appeal Brief Application Serial No. 10/737,029

does not, however, teach "the necessary timing and modulation information." The passage of Teskey cited by the Examiner does not teach timing information that defines a digital one or a digital zero. In fact, Teskey does not mention a digital one, a digital zero or any type of mark/space representation.

The combination of Pope, McNair and Teskey does not form the basis for a valid rejection of either claim 5 or claim 10 under § 103(a) because the combination does not teach (i) generating a key code within a key code generator device or (ii) both a keystroke indicator signal and a key code signal. And with regard to claim 10, Teskey does not teach timing information that defines a digital one or a digital zero. Therefore, reversal of the improper § 103(a) rejection of claims 5 and 10 by the Board is requested.

#### E. Dependent claim 6 (5th ground of rejection)

Claim 6 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Pope in view of McNair and further in view of August (USP 5,671,267) (Office Action, p. 8, lines 16-18).

Claim 6 includes the following limitations of base claim 1, "(a) receiving a keystroke indicator signal from a remote control device; (b) generating a key code within a key code generator device . . .." None of Pope, McNair or August teaches (i) generating a key code within a key code generator device or (ii) both a keystroke indicator signal and a key code signal.

In addition, claim 6 recites, "(e) pressing a power-on key of said remote control device causing said <u>remote control device to transmit said keystroke</u> <u>indicator signal</u> that is received in (a), wherein said <u>key code signal transmitted in</u> (d) is received onto an electronic consumer device, and wherein said pressing in (e) causes said electronic consumer device to turn on" (emphasis added). The Examiner states that Pope "is not explicit in teaching transmitting a keystroke indicator signal that cause the appliance to turn on. One skill in the art recognizes that a remote control is generally use in turning an appliance on/off and is further evidence by August et al. (col. 8 lines 3-5)" (Office Action, p. 8, line

> Amended Appeal Brief Application Serial No. 10/737,029

20 – p. 9, line 2). The Examiner has not presented a *prima facie* case of obviousness because the Examiner has not stated that August teaches a remote control device transmitting a keystroke indicator signal. Indeed, August does not teach a keystroke indicator signal. The passage of August cited by the Examiner teaches handset unit 10 of August using a key code signal, as opposed to a keystroke indicator signal, to turn a television set on and off. Interpreting a "keystroke indicator signal" to be the same as a "key code signal" would be contrary to the tenets of claim differentiation.

The combination of Pope, McNair and August does not teach (i) receiving a keystroke indicator signal from a remote control device, (ii) generating a key code within a key code generator, and (iii) transmitting a key code signal from the key code generator to an electronic consumer device to turn on the electronic consumer device. Nor does the combination teach both a keystroke indicator signal and a key code signal. Reversal of the improper § 103(a) rejection of claim 6 by the Board is requested.

## F. Dependent claim 7 (6th ground of rejection)

Claim 7 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Pope in view of McNair and further in view of Wouters (Office Action, p. 9, lines 8-10).

Claim 7 includes the following limitations of base claim 1, "(a) receiving a keystroke indicator signal from a remote control device; (b) generating a key code within a key code generator device . . .." The combination of Pope, McNair and Wouters teaches neither (i) generating a key code within a key code generator device nor (ii) both a keystroke indicator signal and a key code signal.

In addition, claim 7 recites "wherein said key code signal is received by said remote control device". The Examiner states that "Pope teaches the remote control receiving key code signals (infrared control signal) from a controller (col. 4 lines 52-56)" (Office Action, p. 9, lines 11-12). The Examiner has not presented a *prima facie* case of obviousness because the Examiner has not stated that

Amended Appeal Brief Application Serial No. 10/737,029

THURSDAY

Pope teaches a remote control device that receives a key code signal <u>from a key</u> <u>code generator device</u> that generated the key code. The passage of Pope cited by the Examiner teaches receiving an infrared signal from a controller, such as a television remote control. The cited passage does not teach receiving a key code signal from a key code generator device. Interpreting a "remote control device" to be the same as a "key code generator device" recited in the same claim would be contrary to the tenets of claim differentiation.

The combination of Pope, McNair and Wouters does not form the basis for a valid rejection of claim 7 under § 103(a) because the combination does not teach any of (i) generating a key code within a key code generator device, (ii) both a keystroke indicator signal and a key code signal, or (iii) receiving a key code signal from the key code generator device back on the remote control device. Therefore, reversal of the improper § 103(a) rejection of claim 7 by the Board is requested.

#### G. Dependent claim 8 (7th ground of rejection)

Claim 8 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Pope in view of McNair and in view of Wouters and further in view of August (Office Action, p. 10, lines 1-3).

The four-way combination of Pope, McNair, Wouters and August does not form the basis for a valid rejection of claim 8 under § 103(a) for the same reasons explained above with relation to claims 1 and 7. The 4-way combination does not teach any of (i) receiving a key code signal from the key code generator device back on the remote control device, (ii) both a keystroke indicator signal and a key code signal, or (iii) generating a key code within a key code generator device.

Furthermore, it is impermissible to "pick and choose" individual elements among the references to recreate the claimed invention because "[o]ne cannot use hindsight reconstruction to pick and choose among isolated disclosures in the prior art to deprecate the clamed invention." *In re Fritch*, 972 F.2d 1260,

> Amended Appeal Brief Application Serial No. 10/737,029

1266, 23 USPQ2d 1780, 1784 (Fed. Cir. 1992) *citing In re Fine*, 837 F.2d 1071,1075, 5 USPQ2d 1596,1600 (Fed. Cir. 1988). There is no motivation to combine the teachings of the four-way combination in such a way as to obtain all of the limitations of claim 8. For these reasons, reversal of the improper § 103(a) rejection of claim 8 by the Board is requested.

#### H. Dependent claim 18 (8th ground of rejection)

Claim 18 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Wouters in view of Teskey (Office Action, p. 10, lines 14-15).

The combination of Wouters and Teskey does not form the basis for a valid rejection of claim 18 under § 103(a) for the same reasons explained above with relation to claim 13. Neither Wouters nor Teskey discloses a device with a keypad that both transmits an IR signal and receives an RF signal.

Because combination of Wouters and Teskey does not disclose all of the elements of claim 18, reversal of the improper § 103(a) rejection of claim 18 by the Board is requested.

#### 1. Dependent claims 20-21 (9th ground of rejection)

Claims 20-21 are rejected under 35 U.S.C. § 103(a) as being unpatentable over Wouters in view of August (Office Action, p. 11, lines 6-7).

Both claim 20 and claim 21 depend from claim 19 and incorporate the limitations of claim 19. The combination of Wouters and August does not form the basis for a valid rejection of either claim 20 or claim 21 under § 103(a) for the same reasons explained above with relation to claim 19. Neither Wouters nor August discloses a codeset that includes two key codes: one key code corresponding to a function of one electronic consumer device, and the other key code corresponding to the same function of another electronic consumer device. The Examiner has not presented a *prima facie* argument of obviousness because the Examiner has not stated that the combination of Wouters and August discloses a codeset with two recited key codes that correspond to the

Amended Appeal Brief Application Serial No. 10/737,029

same function on different electronic consumer devices. Neither Wouters nor August teaches the recited codeset with key codes that correspond to the same function on separate electronic consumer devices. August does not mention a codeset.

Because combination of Wouters and August does not disclose a codeset with two key codes that correspond to the same function on two electronic consumer devices, reversal of the improper § 103(a) rejection of claims 20-21 by the Board is requested.

## J. Dependent claim 23 (10th ground of rejection)

Claim 23 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Wouters in view of Pope (Office Action, p. 11, lines 18-19).

Claim 23 depends from claim 22 and incorporates the limitations of claim 22. The combination of Wouters and Pope does not form the basis for a valid rejection of claim 23 under § 103(a) for the same reasons explained above with relation to claim 22. Neither Wouters nor Pope teaches a device with a keypad, a radio frequency receiver and an infrared transmitter.

The RF receiver, IR transmitter and keypad of Wouters are not on the same device. The remote control unit 3 of Wouters does not include an RF receiver. Pope does not teach an RF receiver. And Pope even teaches against including an IR transmitter on the handset. Pope explains:

"One advantage of having the infrared transmitter attached to the base unit 12 is that the base unit 12 can be typically powered by house current. <u>Since no battery is used, the infrared transmitter can</u> <u>draw more power</u> than is used in battery-type systems. For example, if a button is continuously pressed in a battery-type system, in order to conserve power the infrared signal is not continuously sent, but is sent intermittently. The base unit 12 connected to AC power need not be limited in this fashion. Additionally, <u>it is also possible to have the base unit 12 supply a</u> <u>greater amount of power to the infrared transmitter to transmit a</u> <u>greater amount of infrared energy</u>. In this manner, it may be

> Amended Appeal Brief Application Serial No. 10/737,029

possible for the infrared bulb to not be focused directly towards the appliance" (Pope, col. 3, lines 46-60) (emphasis added).

Thus, Pope teaches away from the limitation of claim 23 because "it suggests that the line of development flow from the reference's disclosure is unlikely to be productive of the result sought by the applicant." *In re Gurley*, 27 F.3d 551, 553, 31 USPQ2d 1130, 1131 (Fed. Cir. 1994).

Because the combination of Wouters and Pope does not disclose all of the limitations of claim 23 as explained above with relation to claim 22, reversal of the improper §103(a) rejection of claim 23 by the Board is requested.

#### VIII. CONCLUSION

The Examiner has not established a prima facie case of anticipation or obviousness. With regard to independent claims 13 and 22, Wouters does not disclose a device with a keypad that both receives a signal within a radio frequency band and transmits a signal within an infrared frequency band. With regard to independent claim 19, Wouters does not disclose a codeset that includes two key codes: one key code corresponding to a function of one electronic consumer device and the other key code corresponding to the same function of another electronic consumer device. With regard to independent claim 25, Wouters does not disclose (i) receiving a keystroke indicator signal form a remote control device, (ii) transmitting a key code signal to the remote control device, and then (iii) transmitting the key code signal from the remote control device to an electronic consumer device. With regard to independent claim 1, the combination of Pope and McNair does not teach (i) generating a key code within a key code generator device, (ii) a key stroke indicator signal as well

> Amended Appeal Brief Application Serial No. 10/737,029

as a key code signal, or (iii) modulating a key code. The Board is requested to reverse the §102 and §103 rejections of claims 1-10, 13-16, 18-26.

I hereby certify that this correspondence is being deposited with the United States Postal Service as First Class Mail in an envelope addressed to: Mail Stop Appeal Brief - Patents, Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.

## Amended Appeal Brief Application Serial No. 10/737,029

## IX. CLAIMS APPENDIX

1. (original): A method comprising:

(a) receiving a keystroke indicator signal from a remote control device;

(b) generating a key code within a key code generator device;

(c) modulating said key code onto a carrier signal, thereby generating a key code signal; and

(d) transmitting said key code signal from said key code generator device.

2. (original): The method of Claim 1, wherein said key code signal is transmitted in (d) from said key code generator device to said remote control device.

3. (original): The method of Claim 1, wherein said key code signal is transmitted in (d) from said key code generator device to an electronic consumer device.

4. (original): The method of Claim 1, wherein said key code consists of a binary number.

5. (original): The method of Claim 1, wherein said key code comprises a binary number and timing information, and wherein said timing information defines how said binary number is modulated in (c) onto said carrier signal.

6. (original): The method of Claim 1, further comprising:

(e) pressing a power-on key of said remote control device causing said remote control device to transmit said keystroke indicator signal that is received in (a), wherein said key code signal transmitted in (d) is received onto an electronic consumer device, and wherein said pressing in (e) causes said electronic consumer device to turn on.

32

7. (original): The method of Claim 1, wherein said carrier signal is in a radio frequency band, wherein said key code signal is received by said remote control device, and wherein said method further comprises:

(e) modulating said key code onto a second carrier signal, thereby generating a second key code signal, said modulating being performed on said remote control device wherein said second carrier signal is in an infrared frequency band; and

(f) transmitting said second key code signal from said remote control device to an electronic consumer device.

8. (original): The method of Claim 7, further comprising:

(g) pressing a power-on key of said remote control device causing said remote control device to transmit said keystroke indicator signal that is received in (a), wherein the pressing in (g) causes said electronic consumer device to turn on.

9. (original): The method of Claim 1, wherein said key code generated in (b) is part of a codeset, and wherein said remote control device does not store said codeset.

10. (original): The method of Claim 9, wherein said codeset comprises timing information and a plurality of key codes, and wherein said timing information describes a digital one and a digital zero.

11. (previously presented): A method comprising:

(a) receiving a keystroke indicator signal from a remote control device;

(b) generating a key code within a key code generator device;

(c) modulating said key code onto a carrier signal, thereby generating a key code signal; and

(d) transmitting said key code signal from said key code generator device, wherein a codeset comprises a plurality of key codes, each one of said plurality

33

of key codes corresponding to a function of an electronic consumer device, and wherein no more than a single one of said plurality of key codes is present on said remote control device at any given time.

12. (original): The method of Claim 11, wherein said function of said electronic consumer device is taken from the group consisting of: power on, power off, channel advance, channel back, volume up, volume down, cursor up, cursor down, cursor right, cursor left, select, play, record, stop, forward, back and pause.

13. (previously presented): A remote control device comprising:

a receiver that receives a first key code signal, wherein said first key code signal is generated by modulating a key code onto a first carrier signal, said first carrier signal falling within a radio frequency band;

a transmitter that transmits a second key code signal, wherein said second key code signal is generated by modulating said key code onto a second carrier signal, said second carrier signal falling within an infrared frequency band; and

a keypad that includes a key that corresponds to said key code, wherein said key code corresponds to a function of an electronic consumer device.

14. (original): The device of Claim 13, wherein said key code corresponds to a second function of a second electronic consumer device, as well as to said function of said electronic consumer device.

15. (original): The device of Claim 14, wherein said transmitter transmits a third key code signal, and wherein said third key code signal is generated by modulating said key code onto a third carrier signal.

16. (original): The device of Claim 14, wherein said key code comprises a first binary number and a second binary number, said first binary number

corresponding to said function, and said second binary number corresponding to said second function.

17. (previously presented): A device comprising:

a receiver that receives a first key code signal, wherein said first key code signal is generated by modulating a key code onto a first carrier signal, said first carrier signal falling within a radio frequency band;

a transmitter that transmits a second key code signal, wherein said second key code signal is generated by modulating said key code onto a second carrier signal, said second carrier signal falling within an infrared frequency band; and

a keypad that includes a key that corresponds to said key code, wherein said key code corresponds to a function of an electronic consumer device, wherein said keypad includes a second key that corresponds to a second key code, wherein a third key code signal is generated by modulating said second key code onto a third carrier signal, wherein said third key code signal is received by said receiver, and wherein both said first key code and said second key code are not both stored in said device at the same time.

18. (original): The device of Claim 13, wherein a codeset comprises timing information and a plurality of key codes, wherein each of said plurality of key codes corresponds to a different function of said electronic consumer device, wherein said key code is a binary number, and wherein said timing information defines how said binary number is modulated onto said first carrier signal.

19. (previously presented): A system comprising:

a key code generator device that generates a first key code and a second key code, wherein a codeset is stored on said key code generator device, said codeset including said first key code and said second key code, wherein said first key code corresponds to a selected function of a first electronic consumer

device, and wherein said second key code corresponds to said selected function of a second electronic consumer device; and

means for relaying said first key code and said second key code from said key code generator device through a remote control device to said first electronic consumer device and to said second electronic consumer device without simultaneously storing both said first key code and said second key code on said remote control device.

20. (original): The system of Claim 19, wherein said selected function is taken from the group consisting of: power on, power off, channel advance, channel back, volume up, volume down, cursor up, cursor down, cursor right, cursor left, select, play, record, stop, forward, back and pause.

21. (original): The system of Claim 19, wherein said selected function is power on, and wherein said system automatically determines when said first electronic consumer device powers on.

22. (previously presented): A remote control device, comprising:

a keypad;

an RF receiver;

an IR transmitter; and

means for receiving a key code from said RF receiver and for sending said key code to said IR transmitter such that said key code is modulated onto an IR carrier signal, said IR carrier signal with said key code modulated thereon being transmitted from said remote control device by said IR transmitter.

23. (original): The remote control device of Claim 22, wherein said key code is not stored on said remote control device immediately prior to said means receiving the key code.

#### 36

24. (original): The remote control device of Claim 22, wherein said means is a microcontroller.

25. (previously presented): A method comprising:

(a) receiving a keystroke indicator signal from a remote control device;

(b) using said keystroke indicator signal to generate a key code, wherein a key code generator device generates said key code;

(c) modulating said key code onto a carrier signal and thereby generating a key code signal; and

(d) transmitting said key code signal from said key code generator device to said remote control device, wherein said remote control device transmits said key code signal to an electronic consumer device.

26. (previously presented): The method of Claim 25, wherein said key code generated in (b) is part of a codeset, and wherein said codeset is not stored on said remote control device.

37

## X. EVIDENCE APPENDIX

No evidence has been submitted pursuant to 37 C.F.R. §§ 1.130, 1.131 or 1.132. No affidavit or declaration has been submitted under § 1.130 to disqualify a commonly owned patent or a published application as prior art. No affidavit or declaration of a prior invention has been submitted under § 1.131. No affidavit or declaration traversing rejections or objections has been submitted under § 1.132. No such evidence was entered by the Examiner and relied upon by Appellants in this appeal.

In the rejections that are to be reviewed in this appeal, the Examiner has not relied upon any non-patent documents.

## XI. RELATED PROCEEDINGS APPENDIX

No decision has yet been rendered by a court or the Board in this or any related proceeding.

## AMENDED APPEAL BRIEF TRANSMITTAL LETTER

July 23, 2007

MAIL STOP APPEAL BRIEF - PATENTS COMMISSIONER FOR PATENTS P.O. Box 1450 ALEXANDRIA, VA 22313-1450

Re: Applicant: Assignee: Title:

JUE **26**700

Daniel SauFu Mui ZiLOG, Inc. "Relaying Key Code Signals Through a Remote Control Device" 10/737,029 Filed: December 16, 2003 Vernal U. Brown Art Unit: 2612 Atty. Docket No.: ZIL-568

Dear Sir:

Transmitted herewith are the following documents:

- (1) twice amended appeal brief (38 pages);
- (2) return postcard; and

Serial No.:

Examiner:

(3) this transmittal sheet.

No additional Fee is required.

The fee has been calculated as shown below:

CLAIMS AS AMENDED						
	REMAINING AFTER AMENDMENT		HIGHEST NO. PREVIOUSLY PAID FOR	EXTRA CLAIMS PRESENT	RATE	ADDITIONAL FEE
TOTAL CLAIMS	26	minus	26	0	\$50	\$0.00
INDEP. CLAIMS	7	minus	7	0	\$200	\$0.00
Total Additional	\$0.00					
Fee for Appeal	\$0.00					
Fee for Request for Oral Hearing [§41.20(b)(3)]						\$0.00
Fee for Extension of Time ( month) [§1.17(a)(1)]						\$0.00
					TOTAL	\$0.00
A check is attached for the amount of:						\$0.00

I hereby certify that this correspondence is being deposited with the United States Postal Service as First Class Mail in an envelope addressed to: Mail Stop Appeal Brief - Patents, Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.

selace By Darien K. Wallace

July 23, 2007

Mail Stop Appeal Brief - Patents COMMISSIONER FOR PATENTS P.O. Box 1450 Alexandria, VA 22313-1450

## **APPEAL BRIEF**

This twice amended Appeal Brief is filed pursuant to 37 CFR § 41.37 in support of the appeal noticed on February 19, 2007.

## I. REAL PARTY IN INTEREST

The real party in interest is the assignee, ZiLOG, Inc., as named in the caption above.

## **II. RELATED APPEALS AND INTERFERENCES**

Based on information and belief, there are no appeals or interferences that could directly affect or be directly affected by or have a bearing on the decision by the Board of Patent Appeals and Interferences (the "Board") in the pending appeal.

## **III. STATUS OF CLAIMS**

The application at issue, filed on December 16, 2003, included 24 claims. In an amendment dated July 28, 2006, claims 25-26 were added. Claims 1-26 are subject to this Appeal.

## **IV. STATUS OF AMENDMENTS**

An amendment dated December 19, 2006, was filed subsequent to a final Office action dated October 19, 2006 ("Office Action"). An Advisory Action dated February 7, 2007 ("Advisory Action"), stated that the amendment was entered. The advisory action included an explanation of how the amended claims would be rejected.

#### V. SUMMARY OF CLAIMED SUBJECT MATTER

The following summary pursuant to 37 CFR 41.37(c)(1)(v) is a concise explanation of the claims and is to be read in light of the disclosure. This summary does not limit the claims. (See MPEP §1206).

An embodiment of Appellant's novel system 10 is illustrated in figure 1 (replicated below). System 10 relays a key code through a remote control device

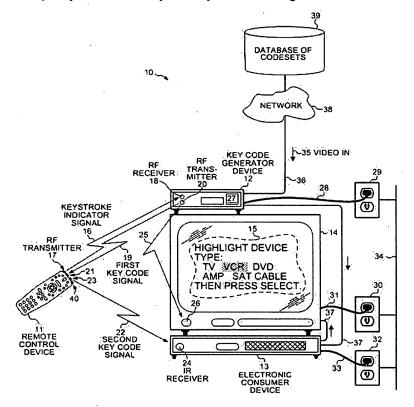

FIG. 1

## Amended Appeal Brief Application Serial No. 10/737,029

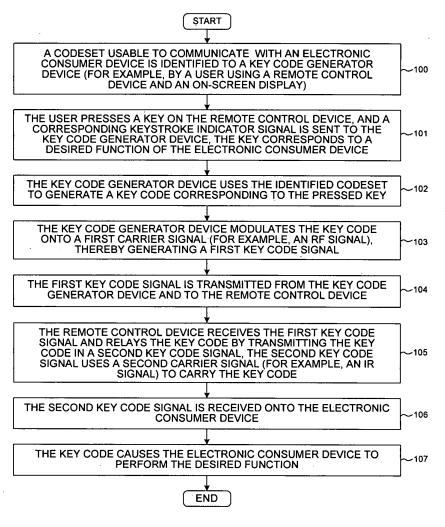

to an electronic consumer device. The key code is not stored in the remote control device in a permanent manner, but rather is relayed through the remote control device. System 10 includes a remote control device 11, a key code generator device 12, a first electronic consumer device 13 (a VCR) and a second electronic consumer device 14 (a TV).

Upon receiving a keystroke indicator signal from remote control 11, key code generator 12 identifies the particular codeset usable to communicate with the selected electronic consumer device. The keystroke indicator signal contains an indication of a key on the remote control that was pressed, which corresponds to a function of the selected electronic consumer device. Using the identified codeset and the indication of the pressed key, key code generator 12 generates a key code and modulates that key code onto a radio frequency carrier signal, thereby generating a first key code generator 12 and modulates the key code onto an infrared frequency carrier signal, thereby generating a second key code signal 22. Remote control 11 relays the key code to the selected electronic consumer device in second key code signal 22. The key code causes the selected electronic consumer device to perform the desired function.

#### A. Independent claim 1

Independent claim 1 is directed to a method of generating a key code within a key code generator device, as described in steps 101 through 104 in figure 2 (replicated below). As shown in figures 1 and 2, claim 1 recites a method of (a) receiving keystroke indicator signal 16 from remote control device 11 (Specification, p. 6, lines 26-28); (b) generating a key code within key code generator device 12 (Specification, p. 8, lines 14-16); (c) modulating the key code onto a carrier signal thereby generating first key code signal 19 (Specification, p. 8, lines 26-29); and (d) transmitting key code signal 19 from key code generator device 12 (Specification, p. 11, lines 4-5).

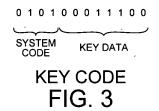

> Amended Appeal Brief Application Serial No. 10/737,029

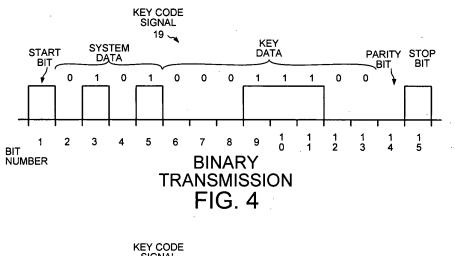

## FIG. 2

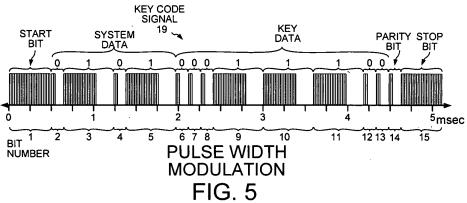

Dependent claim 2 is directed to the method of claim 1, but includes the limitation that first key code signal 19 is transmitted from key code generator device 12 to remote control device 11 (Specification, p. 11, lines 6-7). Dependent claim 3 includes a limitation that first key code signal 19 is transmitted from key code generator 12 to the selected electronic consumer device (Specification, p. 12, lines 13-15). Dependent claim 4 includes the limitation that the key code consists of a binary number (Specification, p. 8, lines 18-20) as depicted in figure 3 (replicated below).

Amended Appeal Brief Application Serial No. 10/737,029

Dependent claim 5 includes the limitation that the key code comprises a binary number and timing information. The timing information defines how said binary number is modulated onto the carrier signal to generate first key code signal 19 (Specification, p. 9, lines 9-11) as depicted in figures 4 and 5 (replicated below).

Dependent claim 6 includes the limitation that keystroke indicator signal 16 corresponds to a power-on function, and first key code signal 19 is received

> Amended Appeal Brief Application Serial No. 10/737,029

متفقد ديد

onto an electronic consumer device and causes the electronic consumer device to be powered on. Dependent claim 7 recites that first key code signal 19 is received by remote control device 11 and includes the further steps of (e) modulating the key code onto a second carrier signal, thereby generating second key code signal 22 (Specification, p. 11, lines 8-11) and (f) transmitting second key code signal 22 to the selected electronic consumer device (Specification, p. 12, lines1-3). Claim 7 also includes the limitation that the first carrier signal is in a radio frequency band and the second carrier signal is in an infrared frequency band.

Dependent claim 8 is directed to the method of claim 7, but includes a further limitation that keystroke indicator signal 16 corresponds to a power-on function, and second key code signal 22 causes the selected electronic consumer device to be powered on (Specification, p. 12, lines 4-7).

Dependent claim 9 includes the limitation that the key code is part of a codeset and that the codeset is not stored in remote control device 11 (Specification, p. 19, lines 11-13). Dependent claim 10 is directed to the method of claim 9, but includes a limitation that the codeset comprises timing information and a plurality of key codes. Furthermore, the timing information describes a digital one and a digital zero, as described at page 11, lines 26-28, of the Specification.

#### B. Independent claim 11

Independent claim 11 is directed to a method of relaying key codes through a remote control device to an electronic consumer device, wherein no more than a single key code is present on the remote control device at any given time. Figure 1 shows that a keystroke indicator signal 16 is received from a remote control device 11. (Specification, p. 6, lines 26-28). A key code generator device 12 then generates a key code. (Specification, p. 8, lines 14-16). Each key code corresponds to a function of an electronic consumer device 13. The key code is then modulated onto a carrier signal to generate a key code signal 19.

> Amended Appeal Brief Application Serial No. 10/737,029

(Specification, p. 8, lines 26-29). Examples of key code signal 19 are also shown in figures 4 and 5. Key code signal 19 is then transmitted from key code generator device 12 to remote control device 11. (Specification, p. 11, lines 4-5). No more than a single key code is present on remote control device 11 at any given time.

#### C. Independent claim 13

Independent claim 13 relates to remote control device 11 shown in figure 1. Remote control device 11 comprises: an RF receiver 21 that receives a first key code signal 19 (Specification, p. 11, lines 5-6); an IR transmitter 23 that transmits a second key code signal 22 (Specification, p. 11, lines 17-21); and a keypad that includes a key that corresponds to a key code. The key code corresponds to a function of an electronic consumer device. First key code signal 19 is generated by modulating the key code onto a first carrier signal having a radio frequency band. Second key code signal 22 is generated by modulating the key code onto a second carrier signal having an infrared frequency band.

Dependent claim 14 is directed to the remote control device of claim 13, but includes the limitation that the key code corresponds to the function and to a second function. The second function corresponds to a second electronic consumer device. Dependent claim 16 is directed to the remote control device of claim 14, but includes the limitation that the key code comprises a first binary number and a second binary number. The first binary number corresponds to the function, and the second binary number corresponds to the second function.

Dependent claim 18 is directed to the remote control device of claim 13, but includes the limitation that a codeset comprises timing information and a plurality of key codes. Each key code is a binary number and corresponds to a different function of the electronic consumer device. Furthermore, the timing information defines how the binary number is modulated onto the first carrier signal (Specification, p. 11, lines 26-28).

> Amended Appeal Brief Application Serial No. 10/737,029

7

#### D. Independent claim 17

Independent claim 17 relates to remote control device 11 shown in figure 1. Remote control device 11 comprises an RF receiver 21, an IR transmitter 23 and a keypad. (Specification, p. 11, lines 4-21). RF receiver 21 receives a first key code signal 19 (Specification, p. 11, lines 4-7), and IR transmitter 23 transmits a second key code signal 22 (Specification, p. 11, lines 20-21). The keypad includes a key that corresponds to a key code, which in turn corresponds to a function of an electronic consumer device. (Specification, p. 6, lines 21-25). First key code signal 19 is generated by modulating the key code onto a first carrier signal having a radio frequency band. Second key code signal 22 is generated by modulating the key code onto a second carrier signal having an infrared frequency band. (Specification, p. 8, lines 26-32; p. 11, lines 12-19).

The keypad also includes a second key that corresponds to a second key code. A third key code signal is generated by modulating the second key code onto a third carrier signal that is received by RF receiver 21. Both the first key code and the second key code are not both stored in remote control device 11 at the same time. (Specification, p. 3, lines 22-24; p. 19, lines 8-28).

#### E. Independent Claim 19

Claim 19 is directed to a key code generator device and a means for relaying key codes from the key code generator device through a remote control device. The key code generator device generates a first key code and a second key code. Claim 19 recites a "means for relaying said first key code and said second key code from said key code generator device through a remote control device." More specifically, the first key code corresponds to a function of a first electronic consumer device, and the second key code corresponds to the same function of a second electronic consumer device (Specification, p. 15, lines 25-26). As illustrated in Figure 1, the corresponding structure includes remote control device 11.

Amended Appeal Brief Application Serial No. 10/737,029

marph of

## F. Independent Claim 22

Claim 22 is directed to remote control device 11 comprising a key pad, RF receiver 21, IR transmitter 23, and a means for receiving a key code from RF receiver 21 and for sending the key code to IR transmitter 23. Claim 24 recites that the corresponding structure includes a microcontroller integrated circuit (Specification, p. 13, line 27).

#### G. Independent claim 25

Independent claim 25 is directed to a method for relaying a key code from key code generator 12 to an electronic consumer device through remote control device 11, and includes the steps 101 through 105 depicted in figure 2. Claim 25 recites a method of (a) receiving keystroke indicator signal 16 from remote control device 11 (Specification, p. 6, lines 26-28); (b) using keystroke indicator signal 16 to generate a key code within key code generator device 12 (Specification, p. 8, lines 14-16); (c) modulating the key code onto a carrier signal thereby generating first key code signal 19 (Specification, p. 8, lines 26-29); and (d) transmitting a key code signal from key code generator device 12 to remote control device 11 (Specification, p. 11, lines 4-7) and transmitting the key code signal to an electronic consumer device from remote control device 11.

Dependent claim 26 is directed to the method of claim 25 but includes the limitation that the key code is part of a codeset, and the codeset is not stored in remote control device 11 (Specification, p. 19, lines 11-13).

#### VI. GROUNDS OF REJECTION TO BE REVIEWED ON APPEAL

The following are grounds of rejection to be reviewed on appeal:

1) Claims 13-16, 19, 22 and 24-26 stand rejected under 35 USC §102(e) as being anticipated by Wouters et al. (US Patent 6,915,109).

Amended Appeal Brief Application Serial No. 10/737,029

2) Claims 1, 3-4 and 9 stand rejected under 35 USC §103(a) as being unpatentable over Pope (US Patent 5,963,624) in view of McNair et al. (US Patent 5,595,342).

3) Claim 2 stands rejected under 35 USC §103(a) as being unpatentable over Pope in view of McNair and further in view of Goldstein (US Patent 5,410,326).

4) Claim 5 and 10 stand rejected under 35 USC §103(a) as being unpatentable over Pope in view of McNair and further in view of Teskey (US Patent 6,747,568).

5) Claim 6 stands rejected under 35 USC §103(a) as being unpatentable over Pope in view of McNair and further in view of August et al. (US Patent 5,671,267).

6) Claim 7 stands rejected under 35 USC §103(a) as being unpatentable over Pope in view of McNair and further in view of Wouters.

7) Claim 8 stands rejected under 35 USC §103(a) as being unpatentable over Pope in view of McNair in view of Wouters and further in view of August.

8) Claim 18 stands rejected under 35 USC §103(a) as being unpatentable over Wouters in view of Teskey.

9) Claim 20-21 stand rejected under 35 USC §103(a) as being unpatentable over Wouters in view of August.

10) Claim 23 stands rejected under 35 USC §103(a) as being unpatentable over Wouters in view of Pope.

## Amended Appeal Brief Application Serial No. 10/737,029

#### VII. ARGUMENT

#### A. Claims 13-16, 19, 22 and 24-26 (1st ground of rejection)

Claims 13-16, 19, 22 and 24-26 are rejected under 35 U.S.C. § 102(e) as being anticipated by Wouters et al. US Patent 6,915,109. (Office Action, p. 4, lines 1-2). "A rejection for anticipation under section 102 requires that each and every limitation of the claimed invention be disclosed in a single prior art reference." *In re Paulsen*, 30 F.3d 1475, 1478-79, 31 USPQ2d 1671, 1673 (Fed. Cir. 1994) citing *In re Spada*, 911 F.2d 705, 708, 15 USPQ2d 1655, 1657 (Fed. Cir. 1990).

#### 1. Independent claims 13 and 22

Claim 13 recites, "A remote control device comprising: <u>a receiver</u> that receives a first key code signal . . . within a radio frequency band; <u>a transmitter</u> that transmits a second key code signal . . . within an infrared frequency band; and a <u>keypad</u> . . ." (emphasis added). Claim 22 recites, "A remote control device, comprising: a <u>keypad</u>; an <u>RF receiver</u>; an <u>IR transmitter</u> ..." (emphasis added).

Wouters does not form the basis for a valid rejection under § 102(e) because Wouters does not disclose all of the limitations of either claim 13 or claim 22. Although Wouters discloses a system of devices including an IR remote control unit 3 in room 1 and an RF receiver 13 and an IR transmitter 14 in room 2, Wouters does not disclose a device with a keypad that both receives a signal within a radio frequency band and transmits a signal within an infrared frequency band.

The Examiner has not alleged that Wouters discloses a single device with a keypad that both receives an RF signal and transmits an IR signal. Instead, the Examiner states, "Wouters et al. teaches a remote control which includes the <u>system of devices</u> 1 and 2 (figure 1) comprising a receiver receiving a RF modulated remote control signal (col. 4 lines 25-28) and a transmitter transmitting an infrared modulated signal generated from the received RF signal (col. 4 lines 28-33)." (Office Action, p. 4, lines 3-6). The Examiner's statement that Wouters

Amended Appeal Brief Application Serial No. 10/737,029

discloses <u>a system of devices</u> 1 and 2 that comprise an RF receiver and an IR transmitter is insufficient to allege a *prima facie* case of anticipation of claims that recite <u>a device comprising</u> a keypad, a receiver and a transmitter. In fact, the only keypad disclosed in Wouters is on remote control unit 3, which is located in a separate room (room 1) from RF receiver 13 and IR transmitter 14 (room 2). The remote control unit 3 described at column 4, lines 48-57, includes IR transmitter 4 and RF transmitter 8, but does not include an RF receiver. Thus, the Examiner does not state that Wouters discloses a single device with a keypad, an RF receiver and an IR transmitter. Nor does Wouters disclose a device with all three of these elements.

In the Advisory Action, the Examiner states, "Regarding applicant's argument regarding the <u>system of devices</u> as disclosed by Wouters, it is the examiner's position that the remote control device as claimed, is not limited to a single housing" (Advisory Action, p. 2, lines 2-3) (emphasis added). The Examiner then again cites column 4, lines 25-28, column 4, lines 28-33 and column 4, lines 44-58, of Wouters as disclosing all of the elements of claims 13 and 22. The Examiner is improperly interpreting the claim term "remote control device" contrary to how that term is used in the claims and in the specification. Both claims 13 and 22 recite a "device" and not a "system". As the term "remote control device" is depicted in the drawings and used in the specification, such a "remote control device" does not describe a "system" with an RF receiver in one room of a house and an RF transmitter in another room of the house.

Finally, this statement that disavows any claim scope to a "remote control device" with an RF receiver in one room and an RF transmitter in another room is dispositive to claim interpretation. By virtue of this disclaimer of claim scope, the term a "remote control device" is to be interpreted as excluding a "system" with multiple components in separate rooms. <u>See Invitrogen Corporation v. Biocrest Manufacturing</u>, 327 F.3d 1364, 1368, 66 USPQ2d 1631, 1633 (Fed. Cir. 2003); *Inverness Med. Switz. GmbH v. Princeton Biomeditech Corp.*, 309 F.3d, 1365, 1372, 64 USPQ2d 1926, 1932 (Fed. Cir. 2002); *Rheox*, 276 F.3d at 1327, 61

Amended Appeal Brief Application Serial No. 10/737,029

USPQ2d at 1374; *CVI/Beta Ventures, Inc. v. Tura LP*, 112 F.3d 1146, 1159, 42 USPQ2d 1577, 1583 (Fed. Cir. 1997); *Southwall Techs. Corp. v. Cardinal IG Co.*, 54 F.3d 1570, 1576, 34 USPQ2d 1673, 1676 (Fed. Cir.), *cert. denied*, 116 S.Ct. 515 (1995).

Because Wouters does not disclose all of the elements of either claim 13 or claim 22, reversal of the improper §102(e) rejection of claims 13 and 22 by the Board is requested.

#### 2. Dependent claims 14-16

Claim 14 recites "<u>said key code</u> corresponds to a second function of a second electronic consumer device, as well as to said function of said electronic consumer device" (emphasis added). Wouters does not disclose one key code that corresponds to two separate functions of two different electronic consumer devices.

The Examiner has not stated that Wouters discloses a single key code that corresponds to two separate functions. Instead, the Examiner states, "A key code corresponding to <u>a second and third key code</u> is therefore transmitted based on the selected key." (Office Action, p. 4, lines 10-11) (emphasis added). In addition, the Examiner states that "Wouters teaches a key code generator (3) for generating <u>key codes</u> for controlling different function on various electrical appliances (col. 1 lines 24-26, col. 3 lines 21-35). The <u>key codes</u> for controlling the different devices inherently include <u>a first and second key code</u>." (Office Action, p. 2, lines 17-20) (emphasis added). However, claim 14 does not recite a first and second key code. Instead, claim 14 recites "said key code", "said function" and "a second function". The Examiner has not stated that Wouters discloses one key code that corresponds both to a function of an electronic consumer device as well as to a second function of a second electronic consumer device.

Claim 16 recites "<u>said key code</u> comprises a first binary number and a second binary number, said first binary number corresponding to said function,

Amended Appeal Brief Application Serial No. 10/737,029

13

and said second binary number corresponding to said second function" (emphasis added). Wouters does not disclose a single key code that comprises two binary numbers, one corresponding to the function of one electronic consumer device, and the other corresponding to a second function of a second electronic consumer device.

The Examiner has not presented a *prima facie* argument of anticipation of claim 16 because the Examiner has not stated that Wouters discloses a key code comprising both (i) a first binary number that corresponds to a function of an electronic consumer device as well as (ii) a second binary number that corresponds to a second function of a second electronic consumer device. Instead, the Examiner simply states, "The data from the memory is inherently store as binary data. The key code therefore comprises binary data." (Office Action, p. 4, lines 13-14). The Examiner does not mention a first binary number of a key code corresponding to a first function, as well as a second binary number of the same key code corresponding to a second function.

Claims 14-16 depend directly or indirectly from claim 13. In addition to the reasons explained above, dependent claims 14-16 are allowable for at least the same reasons for which claim 13 is allowable. Reversal of the improper §102(e) rejection of claims 14-16 by the Board is requested.

#### 3. Dependent claim 24

Claim 24 recites that the means of claim 22 is a microcontroller. The means of claim 22 is a "means for receiving a key code from said RF receiver". The Examiner states that Wouters discloses "a microcontroller in the form of a microprocessor for receiving the key code (col. 4 lines 52-55)" (Office Action, p. 5, lines 1-2). The passage of Wouters cited by the Examiner, however, does not disclose a microprocessor for receiving a key code from an RF receiver.

The remote control unit disclosed in the passage cited by the Examiner does not include an RF receiver. Therefore, the central processing unit (CPU) that is inside remote control unit 3 of Wouters does not receive a key code from

Amended Appeal Brief Application Serial No. 10/737,029

14

encon con co

any RF receiver. Instead, Wouters discloses that the CPU determines which code needs transmitting based on which key is tapped by the user. (No keypad is included in the devices in room 2 of Wouters.) Wouters explains:

"In this case the user taps a key, the CPU (Central processing unit) inside the remote control determines which code (corresponding to the tapped key) needs <u>transmitting (by IR or RF</u>) and fetches the required data from its memory which comprises a data base or other means in <u>which tapped codes are linked to data to be transmitted</u>" (Wouters, col. 4, lines 57-62) (emphasis added).

Thus, Wouters does not disclose a microcontroller that receives a key code from an RF receiver.

Claim 24 depends from claim 22. In addition to the reasons explained above, dependent claim 24 is allowable for at least the same reasons for which claim 22 is allowable. Reversal of the § 102(e) rejection and allowance of claim 24 are requested.

#### 4. Independent claim 19

Claim 19 recites, "said codeset including said first key code and said second key code, wherein said first key code corresponds to <u>a selected function</u> <u>of a first electronic consumer device</u>, and wherein said second key code corresponds to <u>said selected function of a second electronic consumer device</u>" (emphasis added). Wouters does not form the basis for a valid rejection under §102(e) because Wouters does not disclose a codeset that includes two key codes: one key code corresponding to a function of one electronic consumer device, and the other key code corresponding <u>to the same function</u> ("said selected function") of another electronic consumer device.

The Examiner has not presented a *prima facie* argument of anticipation of claim 19 because the Examiner has not stated that Wouters discloses the two recited key codes that correspond to the same function on different electronic consumer devices. Nor has the Examiner stated that Wouters discloses that

Amended Appeal Brief Application Serial No. 10/737,029

15

ويتعارجان موتراوات

those two key codes are included in a codeset stored on a key code generator device. In fact, Wouters does not mention key codes that correspond to the same function on separate electronic consumer devices.

Because Wouters does not disclose all of the elements of claim 19, reversal of the improper §102(e) rejection of claim 19 by the Board is requested.

#### 5. Independent claim 25

Claim 25 recites, "receiving a keystroke indicator signal <u>from a remote</u> <u>control device</u>; . . . transmitting said key code signal from said key code generator device <u>to said remote control device</u>, wherein said remote control device transmits said key code signal to an electronic consumer device." (emphasis added). Wouters does not form the basis for a valid rejection of claim 25 under § 102(e) because Wouters does not disclose (i) receiving a keystroke indicator signal from a remote control device, (ii) transmitting a key code signal to the remote control device, and then (iii) transmitting the key code signal from the remote control device to an electronic consumer device.

The Examiner has not stated a *prima facie* case of anticipation because that Examiner has not alleged that Wouters discloses (i) receiving a signal <u>from a</u> <u>remote control device</u>, (ii) transmitting a second signal <u>to the remote control</u> <u>device</u>, and (iii) transmitting a third signal <u>from the remote control device</u>. Instead, the Examiner states that Wouters discloses:

"receiving a key stroke indicator signal (5) from <u>a remote control (3)</u> and the key code indicator signal is used by key code generator 8 to generate a key code (col. 3 lines 21-30); modulating the key code signal unto a carrier and transmitting the key code to <u>the</u> <u>remote control (12)</u> (col..4 lines 28-33) and the remote control transmit the key code to the electronic device (col. 3 lines 31-34). Wouters et al. teaches the key code receive by the remote control is demodulated, decoded and transmitted to the appliance (col. 4 lines 25-37)." (Office Action, p. 5, lines 3-9) (emphasis added)

The Examiner argues that the recited "keystroke indicator signal" is disclosed by infrared signal 5 of Wouters. Moreover, the Examiner argues that the recited

Amended Appeal Brief Application Serial No. 10/737,029

"remote control device" is infrared remote control unit 3 of Wouters. But then the Examiner improperly argues that the item labeled 12 in room 2 of Wouters is also the recited remote control device. This is improper. The Examiner has engaged in improper claim construction by arguing (i) that the recited remote control device from which a keystroke indicator signal is received is disclosed by item 3 in room 1 of Wouters for purposes of one claim limitation, and (ii) that the same recited remote control device is disclosed by item 12 in room 2 of Wouters for purposes of another limitation of the same claim. Alternatively, the Examiner is arguing that the recited remote control device is in two rooms of Wouters at the same time. Therefore, Wouters does not disclose the recited remote control device from which a first signal is received and to which a second signal is transmitted.

An additional reason why the Examiner's argument fails is that Wouters does not disclose that item 12 in figure 1 is a remote control device. The reference numeral 12 does not appear at all in the specification of Wouters.

Because Wouters does not disclose all of the elements of claim 25, reversal of the improper §102(e) rejection of claim 25 by the Board is requested.

#### 6. Dependent claim 26

Claim 26 recites, "wherein said codeset is not stored on said remote control device". The Examiner states that infrared remote control unit 3 of Wouters discloses the recited "remote control device". (Office Action, p. 5, line 4) The Examiner also states, "The key code is therefore not stored in the memory of the remote control" (Office Action, p. 5, lines 9-10). First, the Examiner has not stated a *prima facie* case of anticipation of claim 26 because claim 26 <u>does not</u> recite "wherein the key code is not stored on said remote control device". Second, Wouters does not disclose that a codeset is not stored on infrared remote control unit 3. In fact, Wouters suggests the contrary:

> Amended Appeal Brief Application Serial No. 10/737,029

"In this system <u>a remote control unit</u> is used which comprises both an IR transmitter and an antenna for transmission of RF signals. In this case the user taps a key, <u>the CPU</u> (Central processing unit) <u>inside the remote control</u> determines which code (corresponding to the tapped key) needs transmitting (by IR or RF) and <u>fetches the required data</u> from its memory which comprises a data base or other means in which tapped codes are linked to data to be transmitted." (Wouters, col. 4, lines 54-62) (emphasis added).

Third, dependent claim 26 is allowable for at least the same reasons for which claim 25 is allowable because claim 26 depends from claim 25. Reversal of the improper §102(e) rejection of claim 26 by the Board is requested.

## B. Claims 1, 3-4 and 9 (2nd ground of rejection)

Claims 1, 3-4 and 9 are rejected under 35 U.S.C. § 103(a) as being unpatentable over Pope (USP 5,963,624) in view of McNair et al. (USP 5,595,342) (Office Action, p. 6, lines 1-2). To establish a *prima facie* case of obviousness, the Examiner must demonstrate that "the reference (or references when combined) must teach or suggest all the claimed limitations." MPEP § 2142.

## 1. Independent claim 1

Claim 1 recites, "(a) receiving a keystroke indicator signal from a remote control device; (b) generating a key code within a key code generator device . . . generating a key code signal". The combination of Pope and McNair does not form the basis for a valid rejection of claim 1 under § 103(a) because the references when combined do not teach (i) generating a key code within a key code generator device, (ii) a keystroke indicator signal as well as a key code signal, or (iii) modulating a key code.

Amended Appeal Brief Application Serial No. 10/737,029

# (i) <u>Neither Pope nor McNair teaches generating a key code within a</u> <u>key code generator device</u>.

The Examiner states that "Pope teaches receiving a keystroke indicator signal which contains an indication of a key on the remote control device 10 that was pressed (col. 2 lines 61-col. 3 line 19), generating a key code (codes for communicating the control function to the appliances) within the code generator 12 ..." (Office Action, p. 6, lines 3-6) (emphasis added). Pope does not, however, teach generating a key code within base unit 12. The appliance control code that is transmitted by base unit 12 of Pope is not generated within base unit 12. Instead, base unit 12 receives the appliance control codes from handset 10/50. In Pope, a digital cordless telephone handset 10/50 is used as a universal remote control device to control electrical appliances. Pope explains:

"The present invention uses a digital cordless telephone <u>handset to</u> <u>store a variety of appliance control codes</u>. These appliance control codes can be <u>transmitted to a base unit</u>. The base unit can translate the appliance control codes to control signals such as infrared control signals, to control an electrical appliance" (Pope, col. 1, lines 31-36) (emphasis added). *See also* Pope, col. 2, lines 48-52 and 63-65.

The appliance control codes are not generated within the base unit 12 of Pope. Instead, the appliance control codes are transmitted from the handset 10/50 to the base unit 12, where they are translated to control signals. Base unit 12 of Pope does not receive a keystroke indicator and then generate a key code. Thus, Pope does not teach the recited "receiving a keystroke indicator signal from a remote control device" (emphasis added). Pope states, "Once an appliance control code is received by the base unit, the base unit will know to transfer the control code to an appliance" (Pope, col. 4, lines 49-51) (emphasis added). Thus, in Pope, an appliance control code is received by base unit 12 and is then transferred to an appliance; the appliance control code is not generated within base unit 12.

> Amended Appeal Brief Application Serial No. 10/737,029

# (ii) <u>Pope and McNair do not teach both a keystroke indicator signal</u> <u>and a key code signal</u>.

The Examiner states that "Pope teaches receiving a keystroke indicator signal which contains an indication of a key on the remote control device 10 that was pressed (col. 2 lines 61-col. 3 line 19), . . ." (Office Action, p. 6, lines 3-6). Nowhere, however, does Pope teach a keystroke indicator signal in the passage cited by the Examiner, which is reproduced below in its entirety:

"Keypad 30 includes the numbers 1-9, the "star" and the "pound" key. Additionally, "up arrow" key 30a and "down arrow" key 30b can be used to scroll through a menu. A "transmit" key 30c can be used to transmit the appliance control code once the appliance control has been selected. In one embodiment, the user gets into the menu by pressing an "up arrow" or a "down arrow" key. Alternately a "menu" button (not shown) is used. The keys for numbers 1-9 can have different meanings once the user is in the menu. Menu functions can be printed above the normal telephone control keys. FIG. 1 shows compact disc, television, cable and AC signal control menu-function buttons. The setup menu can be entered, one of these buttons pressed, and then using the up and down arrows, the specific controls for a given electrical appliance can be scrolled through. The different appliance controls can be listed in the order of frequency of use. For example, the "mute" function could be the first function listed in each menu selection.

Alternately, individual functions can be mapped with the associated buttons of the keypad, and a display 32 need not be used. Buttons similar to a "shift," "alt," and "control" on a normal computer keypad can be used to change the meanings of buttons "0" to "9," "star," and "pound." The different meanings associated with different buttons can be printed in different colors, which are the same colors of the associated buttons "shift," "alt," alt," or "control."" (Pope, col. 2, line 61 – col. 3, line 19) (emphasis added)

Thus, the passage of Pope above teaches appliance controls and appliance control codes but does not teach a keystroke indicator signal as the Examiner maintains.

Moreover, it is improper to construe the appliance control codes of Pope to teach both a keystroke indicator signal and a key code signal. According to the tenets of claim differentiation, a "keystroke indicator signal" cannot be

> Amended Appeal Brief Application Serial No. 10/737,029

ganan sa sa sa sa

interpreted to be the same as a "key code signal". Such a claim interpretation is presumptively unreasonable. <u>See, e.g., Karlin Tech. Inc. v. Surgical Dynamics</u> *Inc.*, 177 F.3d 968, 50 USPQ2d 1465, 1468 (Fed. Cir. 1999). In addition, such a claim interpretation would render claim 1 internally inconsistent because "keystroke indicator/key code" information that was already received by the key code generator device would later be generated by the key code generator device. Thus, Pope does not teach both a keystroke indicator and a key code. The handset 10/50 of Pope transmits an appliance control code and not a keystroke indicator.

#### (iii) Neither Pope nor McNair teaches modulating a key code.

The Examiner admits that Pope is silent on teaching modulating a key code onto a carrier signal. (Office Action, p. 6, line 7) Moreover, McNair does not teach modulating a key code. McNair does not teach a key code. And the Examiner does not state that McNair teaches <u>modulating a key code</u> onto a carrier signal. Instead, the Examiner states that McNair teaches "the control signal is modulated" (Office Action, p. 6, line 8). This is insufficient to establish a *prima facie* case of obviousness.

Moreover, there would be no motivation to combine McNair with Pope even if McNair did disclose a limitation of claim 1 (which it does not). McNair is directed to a control system for a gas-fired, central heating system and does not concern key code signals for electronic consumer devices.

Therefore, Pope and McNair do not form the basis for a valid rejection under § 103(a) because neither Pope nor McNair teaches (i) generating a key code within a key code generator device, (ii) a keystroke indicator signal as well as a key code signal, or (iii) modulating a key code. In addition, there is no motivation to combine McNair with Pope to arrive at all of the limitations of claim 1. For these reasons, reconsideration of the § 103(a) rejection and allowance of claim 1 are requested.

## Amended Appeal Brief Application Serial No. 10/737,029

## 2. Dependent claims 3-4 and 9

Claim 9 recites, "said key code generated in (b) is part of a codeset, and wherein <u>said remote control device does not store said codeset</u>" (emphasis added). With respect to base claim 1, the Examiner states that "Pope teaches receiving a keystroke indicator signal which contains an indication of a key on the <u>remote control device 10</u>" (Office Action, p. 6, lines 3-4) (emphasis added). Thus, the Examiner considers that handset 10 of Pope teaches the remote control device recited in claim 9. The Examiner then states, "The code generated by the code generator is not store in the remote control because it is transmitted to the appliances" (Office Action, p. 6, lines 18-19). This incorrectly characterizes the teachings of Pope. The appliance control codes of Pope are indeed stored on handset 10 and are transmitted from handset 10 to base unit 12. Pope explains:

"The present <u>invention uses a digital cordless telephone handset to</u> <u>store a variety of appliance control codes</u>. These appliance control codes can be <u>transmitted to a base unit</u>. The base unit can translate the appliance control codes to control signals such as infrared control signals, to control an electrical appliance" (Pope, col. 1, lines 31-36) (emphasis added)

"The cordless digital telephone <u>handset</u> includes a memory 66 . . . used to <u>store the appliance control codes</u>. Preferably, the appliance control codes can be transmitted to the base unit 12 . . ." (Pope, col. 2, lines 48-52) (emphasis added).

"Fig. 2 is a diagram of a handset 50 of the present invention.... The <u>appliance control codes are stored in a memory 66</u>" (Pope, col. 4, lines 17-28) (emphasis added).

Base unit 12 does not generate the appliance control codes. Instead, base unit 12 receives the appliance control codes, which were stored in memory 66 of handset 10, and then translates the appliance control codes into infrared control signals. Thus, Pope does not teach that handset 10 does not store a codeset.

> Amended Appeal Brief Application Serial No. 10/737,029

Claims 3-4 and 9 depend from claim 1. In addition to the reasons explained above, dependent claims 3-4 and 9 are allowable for at least the same reason for which claim 1 is allowable. Reversal of the § 103(a) rejection and allowance of claims 3-4 and 9 by the Board is requested.

## C. Dependent claim 2 (3rd ground of rejection)

Claim 2 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Pope in view of McNair and further in view of Goldstein (USP 5,410,326) (Office Action, p. 7, lines 1-2).

Claim 2 includes the following limitations of base claim 1, "(a) receiving a keystroke indicator signal from a remote control device; (b) generating a key code within a key code generator device . . .." Claim 2 also recites "wherein said key code signal is transmitted in (d) from said key code generator device to said remote control device".

None of Pope, McNair or Goldstein teaches either (i) generating a key code within a key code generator device or (ii) both a keystroke indicator signal and a key code signal. Moreover, the Examiner seems to admit that Pope and McNair are silent on teaching that the key code generator transmits the key code signal to the remote control device. (Office Action, p. 7, lines 4-10). And Goldstein does not teach this limitation.

None of Pope, McNair or Goldstein teaches transmitting <u>a key code signal</u> from the key code generator device back to the remote control device. The fact that Goldstein may teach sending an IR code or an entire codeset from a cable television converter box to a remote control device to update the remote control device does not teach transmitting <u>a key code signal</u> from a key code generator device back to the remote control device. Indeed, Goldstein does not teach transmitting a key code signal as opposed to a key code or a codeset. The cable television converter box of Goldstein does not teach a key code generator because the cable television converter box of Goldstein receives complete codesets from a remote database or is loaded with complete codesets.

> Amended Appeal Brief Application Serial No. 10/737,029

(Goldstein, col. 15, lines 20-68; col. 17, lines 62-67). The television converter box of Goldstein is not a key code generator because the GLUE logic 95 in the universal remote control 5, as opposed to the television converter box, generates the IR sequences from the codes. Goldstein states:

"The glue logic 95 will supply the IR sequences from codes, stored in the RAM 90, upon command of the user. . . . These codes describe carrier frequencies, pulse widths and pulse duration to be generated to the glue logic 95 for producing infrared pulses from the infrared diode 97" (Goldstein, col. 13, lines 23-33) (emphasis added).

Thus, Goldstein does not teach transmitting a key code signal from a key code generator.

In addition, to establish obviousness, there must be "something in the prior art as a whole to suggest the desirability, and thus the obviousness of making the combination." Interconnect Planning Corp. v. Feil, 774 F.2d 1132, 1143, 227 USPQ 543, 551 (Fed. Cir. 1985) quoting Lindemann Maschinenfabrik GMBH v. American Hoist Derrick Co., 730 F. 2d 1452, 1462, 221 USPQ 481, 488 (Fed. Cir. 1984). The motivation posited by the Examiner to combine Goldstein and Pope is non-existent. The Examiner states that Goldstein teaches "a cable box transmitting key codes to the remote control in order to update the remote control with new control codes." (Office Action, p. 7, lines 11-13) (emphasis added). But there would be no motivation to update the remote control device of claim 2 with new codesets, as allegedly taught by Goldstein, because claim 2 does not recite that any key code or codeset is ever stored on the remote control device. Claim 2 recites transmitting a key code signal to the remote control device and does not recite transmitting a codeset to the remote control device. The motivation proposed by the Examiner would only result in a combination wherein codesets, or at least key codes, are stored on a remote control device.

The combination of Pope, McNair and Goldstein does not form the basis for a valid rejection of claim 2 under § 103(a) because the combination does not teach (i) generating a key code within a key code generator device, (ii) both a

> Amended Appeal Brief Application Serial No. 10/737,029

keystroke indicator signal and a key code signal, or (iii) transmitting a key code signal from the key code generator device back to the remote control device. Furthermore, there is no motivation to combine the teachings of Goldstein with the teachings of Pope and McNair in such a way as to obtain all of the limitations of claim 2. Therefore, reversal of the improper § 103(a) rejection of claim 2 by the Board is requested.

#### D. Dependent claims 5 and 10 (4th ground of rejection)

Claims 5 and 10 are rejected under 35 U.S.C. § 103(a) as being unpatentable over Pope in view of McNair and further in view of Teskey (USP 6,747,568) (Office Action, p. 7, lines 14-16).

Claims 5 and 10 depend directly or indirectly from claim 1 and include the following limitations of claim 1: "(a) receiving a keystroke indicator signal from a remote control device; (b) generating a key code within a key code generator device . . .." None of Pope, McNair or Teskey teaches (i) generating a key code within a key code generator device or (ii) both a keystroke indicator signal and a key code signal.

In addition, claim 10 recites that "said timing information describes a digital one and a digital zero". The Examiner admits that Pope "is silent on teaching the key code comprises timing information defining the binary number (ones and zeros) in modulated." But the Examiner states that Teskey "teaches the format of the remote control signal having the necessary timing and modulation information (col. line 60-col. 4 line 8)" (Office Action, p. 8, lines 7-10). Teskey does not, however, teach "the necessary timing and modulation information." The passage of Teskey cited by the Examiner does not teach timing information that defines a digital one or a digital zero. In fact, Teskey does not mention a digital one, a digital zero or any type of mark/space representation.

The combination of Pope, McNair and Teskey does not form the basis for a valid rejection of either claim 5 or claim 10 under § 103(a) because the combination does not teach (i) generating a key code within a key code

> Amended Appeal Brief Application Serial No. 10/737,029

n carrent surviv

generator device or (ii) both a keystroke indicator signal and a key code signal. And with regard to claim 10, Teskey does not teach timing information that defines a digital one or a digital zero. Therefore, reversal of the improper § 103(a) rejection of claims 5 and 10 by the Board is requested.

### E. Dependent claim 6 (5th ground of rejection)

Claim 6 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Pope in view of McNair and further in view of August (USP 5,671,267) (Office Action, p. 8, lines 16-18).

Claim 6 includes the following limitations of base claim 1, "(a) receiving a keystroke indicator signal from a remote control device; (b) generating a key code within a key code generator device . . .." None of Pope, McNair or August teaches (i) generating a key code within a key code generator device or (ii) both a keystroke indicator signal and a key code signal.

In addition, claim 6 recites, "(e) pressing a power-on key of said remote control device causing said <u>remote control device to transmit said keystroke</u> <u>indicator signal</u> that is received in (a), wherein said <u>key code signal transmitted in</u> (d) is received onto an electronic consumer device, and wherein said pressing in (e) causes said electronic consumer device to turn on" (emphasis added). The Examiner states that Pope "is not explicit in teaching transmitting a keystroke indicator signal that cause the appliance to turn on. One skill in the art recognizes that a remote control is generally use in turning an appliance on/off and is further evidence by August et al. (col. 8 lines 3-5)" (Office Action, p. 8, line 20 - p. 9, line 2). The Examiner has not presented a *prima facie* case of obviousness because the Examiner has not stated that August teaches a remote control device transmitting a keystroke indicator signal. Indeed, August does not teach a keystroke indicator signal. The passage of August cited by the Examiner teaches handset unit 10 of August using a key code signal, as opposed to a keystroke indicator signal, to turn a television set on and off. Interpreting a

## Amended Appeal Brief Application Serial No. 10/737,029

"keystroke indicator signal" to be the same as a "key code signal" would be contrary to the tenets of claim differentiation.

The combination of Pope, McNair and August does not teach (i) receiving a keystroke indicator signal from a remote control device, (ii) generating a key code within a key code generator, and (iii) transmitting a key code signal from the key code generator to an electronic consumer device to turn on the electronic consumer device. Nor does the combination teach both a keystroke indicator signal and a key code signal. Reversal of the improper § 103(a) rejection of claim 6 by the Board is requested.

## F. Dependent claim 7 (6th ground of rejection)

Claim 7 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Pope in view of McNair and further in view of Wouters (Office Action, p. 9, lines 8-10).

Claim 7 includes the following limitations of base claim 1, "(a) receiving a keystroke indicator signal from a remote control device; (b) generating a key code within a key code generator device . . .." The combination of Pope, McNair and Wouters teaches neither (i) generating a key code within a key code generator device indicator signal and a key code signal.

In addition, claim 7 recites "wherein said key code signal is received by said remote control device". The Examiner states that "Pope teaches the remote control receiving key code signals (infrared control signal) from a controller (col. 4 lines 52-56)" (Office Action, p. 9, lines 11-12). The Examiner has not presented a *prima facie* case of obviousness because the Examiner has not stated that Pope teaches a remote control device that receives a key code signal from a key code generator device that generated the key code. The passage of Pope cited by the Examiner teaches receiving an infrared signal from a controller, such as a television remote control. The cited passage does not teach receiving a key code signal from a key code generator device. Interpreting a "remote control

## Amended Appeal Brief Application Serial No. 10/737,029

device" to be the same as a "key code generator device" recited in the same claim would be contrary to the tenets of claim differentiation.

The combination of Pope, McNair and Wouters does not form the basis for a valid rejection of claim 7 under § 103(a) because the combination does not teach any of (i) generating a key code within a key code generator device, (ii) both a keystroke indicator signal and a key code signal, or (iii) receiving a key code signal from the key code generator device back on the remote control device. Therefore, reversal of the improper § 103(a) rejection of claim 7 by the Board is requested.

#### G. <u>Dependent claim 8 (7th ground of rejection)</u>

Claim 8 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Pope in view of McNair and in view of Wouters and further in view of August (Office Action, p. 10, lines 1-3).

The four-way combination of Pope, McNair, Wouters and August does not form the basis for a valid rejection of claim 8 under § 103(a) for the same reasons explained above with relation to claims 1 and 7. The 4-way combination does not teach any of (i) receiving a key code signal from the key code generator device back on the remote control device, (ii) both a keystroke indicator signal and a key code signal, or (iii) generating a key code within a key code generator device.

Furthermore, it is impermissible to "pick and choose" individual elements among the references to recreate the claimed invention because "[o]ne cannot use hindsight reconstruction to pick and choose among isolated disclosures in the prior art to deprecate the clamed invention." *In re Fritch*, 972 F.2d 1260, 1266, 23 USPQ2d 1780, 1784 (Fed. Cir. 1992) *citing In re Fine*, 837 F.2d 1071,1075, 5 USPQ2d 1596,1600 (Fed. Cir. 1988). There is no motivation to combine the teachings of the four-way combination in such a way as to obtain all of the limitations of claim 8. For these reasons, reversal of the improper § 103(a) rejection of claim 8 by the Board is requested.

> Amended Appeal Brief Application Serial No. 10/737,029

28

#### H. Dependent claim 18 (8th ground of rejection)

Claim 18 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Wouters in view of Teskey (Office Action, p. 10, lines 14-15).

The combination of Wouters and Teskey does not form the basis for a valid rejection of claim 18 under § 103(a) for the same reasons explained above with relation to claim 13. Neither Wouters nor Teskey discloses a device with a keypad that both transmits an IR signal and receives an RF signal.

Because combination of Wouters and Teskey does not disclose all of the elements of claim 18, reversal of the improper § 103(a) rejection of claim 18 by the Board is requested.

#### I. Dependent claims 20-21 (9th ground of rejection)

Claims 20-21 are rejected under 35 U.S.C. § 103(a) as being unpatentable over Wouters in view of August (Office Action, p. 11, lines 6-7).

Both claim 20 and claim 21 depend from claim 19 and incorporate the limitations of claim 19. The combination of Wouters and August does not form the basis for a valid rejection of either claim 20 or claim 21 under § 103(a) for the same reasons explained above with relation to claim 19. Neither Wouters nor August discloses a codeset that includes two key codes: one key code corresponding to a function of one electronic consumer device, and the other key code corresponding to the same function of another electronic consumer device. The Examiner has not presented a *prima facie* argument of obviousness because the Examiner has not stated that the combination of Wouters and August discloses a codeset with two recited key codes that correspond to the same function on different electronic consumer devices. Neither Wouters nor August teaches the recited codeset with key codes that correspond to the same function on separate electronic consumer devices. August does not mention a codeset.

Because combination of Wouters and August does not disclose a codeset with two key codes that correspond to the same function on two electronic consumer devices, reversal of the improper § 103(a) rejection of claims 20-21 by the Board is requested.

#### J. Dependent claim 23 (10th ground of rejection)

Claim 23 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Wouters in view of Pope (Office Action, p. 11, lines 18-19).

Claim 23 depends from claim 22 and incorporates the limitations of claim 22. The combination of Wouters and Pope does not form the basis for a valid rejection of claim 23 under § 103(a) for the same reasons explained above with relation to claim 22. Neither Wouters nor Pope teaches a device with a keypad, a radio frequency receiver and an infrared transmitter.

The RF receiver, IR transmitter and keypad of Wouters are not on the same device. The remote control unit 3 of Wouters does not include an RF receiver. Pope does not teach an RF receiver. And Pope even teaches against including an IR transmitter on the handset. Pope explains:

"One advantage of having the infrared transmitter attached to the base unit 12 is that the base unit 12 can be typically powered by house current. Since no battery is used, the infrared transmitter can draw more power than is used in battery-type systems. For example, if a button is continuously pressed in a battery-type system, in order to conserve power the infrared signal is not continuously sent, but is sent intermittently. The base unit 12 connected to AC power need not be limited in this fashion. Additionally, it is also possible to have the base unit 12 supply a greater amount of power to the infrared transmitter to transmit a greater amount of infrared energy. In this manner, it may be possible for the infrared bulb to not be focused directly towards the appliance" (Pope, col. 3, lines 46-60) (emphasis added).

Thus, Pope teaches away from the limitation of claim 23 because "it suggests that the line of development flow from the reference's disclosure is unlikely to be

Amended Appeal Brief Application Serial No. 10/737,029

productive of the result sought by the applicant." *In re Gurley*, 27 F.3d 551, 553, 31 USPQ2d 1130, 1131 (Fed. Cir. 1994).

-----

Because the combination of Wouters and Pope does not disclose all of the limitations of claim 23 as explained above with relation to claim 22, reversal of the improper §103(a) rejection of claim 23 by the Board is requested.

#### **VIII. CONCLUSION**

The Examiner has not established a prima facie case of anticipation or obviousness. With regard to independent claims 13 and 22, Wouters does not disclose a device with a keypad that both receives a signal within a radio frequency band and transmits a signal within an infrared frequency band. With regard to independent claim 19, Wouters does not disclose a codeset that includes two key codes: one key code corresponding to a function of one electronic consumer device and the other key code corresponding to the same function of another electronic consumer device. With regard to independent claim 25, Wouters does not disclose (i) receiving a keystroke indicator signal form a remote control device, (ii) transmitting a key code signal to the remote control device, and then (iii) transmitting the key code signal from the remote control device to an electronic consumer device. With regard to independent claim 1, the combination of Pope and McNair does not teach (i) generating a key code within a key code generator device, (ii) a key stroke indicator signal as well as a key code signal, or (iii) modulating a key code. The Board is requested to reverse the §102 and §103 rejections of claims 1-10, 13-16 and 18-26.

I hereby certify that this correspondence is being deposited with the United States Postal Service as First Class Mail in an envelope addressed to: Mail Stop Appeal Brief - Patents, Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450. By

Amended Appeal Brief Application Serial No. 10/737,029

## IX. CLAIMS APPENDIX

1. (original): A method comprising:

(a) receiving a keystroke indicator signal from a remote control device;

(b) generating a key code within a key code generator device;

(c) modulating said key code onto a carrier signal, thereby generating a key code signal; and

(d) transmitting said key code signal from said key code generator device.

2. (original): The method of Claim 1, wherein said key code signal is transmitted in (d) from said key code generator device to said remote control device.

3. (original): The method of Claim 1, wherein said key code signal is transmitted in (d) from said key code generator device to an electronic consumer device.

4. (original): The method of Claim 1, wherein said key code consists of a binary number.

5. (original): The method of Claim 1, wherein said key code comprises a binary number and timing information, and wherein said timing information defines how said binary number is modulated in (c) onto said carrier signal.

6. (original): The method of Claim 1, further comprising:

(e) pressing a power-on key of said remote control device causing said remote control device to transmit said keystroke indicator signal that is received in (a), wherein said key code signal transmitted in (d) is received onto an electronic consumer device, and wherein said pressing in (e) causes said electronic consumer device to turn on.

7. (original): The method of Claim 1, wherein said carrier signal is in a radio frequency band, wherein said key code signal is received by said remote control device, and wherein said method further comprises:

(e) modulating said key code onto a second carrier signal, thereby generating a second key code signal, said modulating being performed on said remote control device wherein said second carrier signal is in an infrared frequency band; and

(f) transmitting said second key code signal from said remote control device to an electronic consumer device.

8. (original): The method of Claim 7, further comprising:

Capper memory sectors and a sector sector

(g) pressing a power-on key of said remote control device causing said remote control device to transmit said keystroke indicator signal that is received in (a), wherein the pressing in (g) causes said electronic consumer device to turn on.

9. (original): The method of Claim 1, wherein said key code generated in (b) is part of a codeset, and wherein said remote control device does not store said codeset.

10. (original): The method of Claim 9, wherein said codeset comprises timing information and a plurality of key codes, and wherein said timing information describes a digital one and a digital zero.

11. (previously presented): A method comprising:

(a) receiving a keystroke indicator signal from a remote control device;

(b) generating a key code within a key code generator device;

(c) modulating said key code onto a carrier signal, thereby generating a key code signal; and

(d) transmitting said key code signal from said key code generator device, wherein a codeset comprises a plurality of key codes, each one of said plurality

33

of key codes corresponding to a function of an electronic consumer device, and wherein no more than a single one of said plurality of key codes is present on said remote control device at any given time.

12. (original): The method of Claim 11, wherein said function of said electronic consumer device is taken from the group consisting of: power on, power off, channel advance, channel back, volume up, volume down, cursor up, cursor down, cursor right, cursor left, select, play, record, stop, forward, back and pause.

13. (previously presented): A remote control device comprising:

a receiver that receives a first key code signal, wherein said first key code signal is generated by modulating a key code onto a first carrier signal, said first carrier signal falling within a radio frequency band;

a transmitter that transmits a second key code signal, wherein said second key code signal is generated by modulating said key code onto a second carrier signal, said second carrier signal falling within an infrared frequency band; and

a keypad that includes a key that corresponds to said key code, wherein said key code corresponds to a function of an electronic consumer device.

14. (original): The device of Claim 13, wherein said key code corresponds to a second function of a second electronic consumer device, as well as to said function of said electronic consumer device.

15. (original): The device of Claim 14, wherein said transmitter transmits a third key code signal, and wherein said third key code signal is generated by modulating said key code onto a third carrier signal.

16. (original): The device of Claim 14, wherein said key code comprises a first binary number and a second binary number, said first binary number

34

corresponding to said function, and said second binary number corresponding to said second function.

17. (previously presented): A device comprising:

a receiver that receives a first key code signal, wherein said first key code signal is generated by modulating a key code onto a first carrier signal, said first carrier signal falling within a radio frequency band;

a transmitter that transmits a second key code signal, wherein said second key code signal is generated by modulating said key code onto a second carrier signal, said second carrier signal falling within an infrared frequency band; and

a keypad that includes a key that corresponds to said key code, wherein said key code corresponds to a function of an electronic consumer device, wherein said keypad includes a second key that corresponds to a second key code, wherein a third key code signal is generated by modulating said second key code onto a third carrier signal, wherein said third key code signal is received by said receiver, and wherein both said first key code and said second key code are not both stored in said device at the same time.

18. (original): The device of Claim 13, wherein a codeset comprises timing information and a plurality of key codes, wherein each of said plurality of key codes corresponds to a different function of said electronic consumer device, wherein said key code is a binary number, and wherein said timing information defines how said binary number is modulated onto said first carrier signal.

19. (previously presented): A system comprising:

a key code generator device that generates a first key code and a second key code, wherein a codeset is stored on said key code generator device, said codeset including said first key code and said second key code, wherein said first key code corresponds to a selected function of a first electronic consumer

device, and wherein said second key code corresponds to said selected function of a second electronic consumer device; and

means for relaying said first key code and said second key code from said key code generator device through a remote control device to said first electronic consumer device and to said second electronic consumer device without simultaneously storing both said first key code and said second key code on said remote control device.

20. (original): The system of Claim 19, wherein said selected function is taken from the group consisting of: power on, power off, channel advance, channel back, volume up, volume down, cursor up, cursor down, cursor right, cursor left, select, play, record, stop, forward, back and pause.

21. (original): The system of Claim 19, wherein said selected function is power on, and wherein said system automatically determines when said first electronic consumer device powers on.

22. (previously presented): A remote control device, comprising:

a keypad;

an RF receiver;

an IR transmitter; and

means for receiving a key code from said RF receiver and for sending said key code to said IR transmitter such that said key code is modulated onto an IR carrier signal, said IR carrier signal with said key code modulated thereon being transmitted from said remote control device by said IR transmitter.

23. (original): The remote control device of Claim 22, wherein said key code is not stored on said remote control device immediately prior to said means receiving the key code.

36

24. (original): The remote control device of Claim 22, wherein said means is a microcontroller.

25. (previously presented): A method comprising:

(a) receiving a keystroke indicator signal from a remote control device;

(b) using said keystroke indicator signal to generate a key code, wherein a key code generator device generates said key code;

(c) modulating said key code onto a carrier signal and thereby generating a key code signal; and

(d) transmitting said key code signal from said key code generator device to said remote control device, wherein said remote control device transmits said key code signal to an electronic consumer device.

26. (previously presented): The method of Claim 25, wherein said key code generated in (b) is part of a codeset, and wherein said codeset is not stored on said remote control device.

### X. EVIDENCE APPENDIX

No evidence has been submitted pursuant to 37 C.F.R. §§ 1.130, 1.131 or 1.132. No affidavit or declaration has been submitted under § 1.130 to disqualify a commonly owned patent or a published application as prior art. No affidavit or declaration of a prior invention has been submitted under § 1.131. No affidavit or declaration traversing rejections or objections has been submitted under § 1.132. No such evidence was entered by the Examiner and relied upon by Appellants in this appeal.

In the rejections that are to be reviewed in this appeal, the Examiner has not relied upon any non-patent documents.

### XI. RELATED PROCEEDINGS APPENDIX

No decision has yet been rendered by a court or the Board in this or any related proceeding.

### BEFORE THE BOARD OF PATENT APPEALS AND INTERFERENCES

Application Number: 10/737,029 Filing Date: December 16, 2003 Appellant(s): MUI, DANIEL SAUFU

MAILED

Darien K. Wallace For Appellant NOV 0 1 2007 GROUP 2600

## **EXAMINER'S ANSWER**

This is in response to the appeal brief filed 7/26/2007 appealing from the Office action mailed 2/07/07.

٠•.

## (1) Real Party in Interest

A statement identifying by name the real party in interest is contained in the brief.

Page 2

### (2) Related Appeals and Interferences

The examiner is not aware of any related appeals, interferences, or judicial proceedings which will directly affect or be directly affected by or have a bearing on the Board's decision in the pending appeal.

### (3) Status of Claims

The statement of the status of claims contained in the brief is correct.

#### (4) Status of Amendments After Final

The appellant's statement of the status of amendments after final rejection contained in

the brief is correct.

### (5) Summary of Claimed Subject Matter

The summary of claimed subject matter contained in the brief is correct.

The appellant's statement of the grounds of rejection to be reviewed on appeal is correct.

#### (6) Grounds of Rejection to be Reviewed on Appeal

The appellant's statement of the grounds of rejection to be reviewed on appeal is correct.

#### (7) Claims Appendix

The copy of the appealed claims contained in the Appendix to the brief is correct.

#### (8) Evidence Relied Upon

5595342

McNair et al.

01-1997

6915109	Wouters et al.	07-2005
5963624	Pope	10-1999
5410326	Goldstein	04-1995
6747568	Teskey	6-2004
5671267	August et al.	09-1997

#### (9) Grounds of Rejection

The following ground(s) of rejection are applicable to the appealed claims:

#### Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the

basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claim 13-16, 19, 22, and 24-26 are rejected under 35 U.S.C. 102(e) as being anticipated by Wouters et al. US Patent 6915109.

Regarding claims 13 and 22, Wouters et al. teaches a remote control which includes the system of devices 1 and 2 (figure 1) comprising a receiver receiving a RF modulated remote control signal (col. 4 lines 25-28) and a transmitter transmitting an infrared modulated signal

generated from the received RF signal (col. 4 lines 28-33). Wouters et al. also teaches the key code corresponding to the key of keypad is transmitted when the key is selected (col. 4 lines 4 lines 48-57).

Regarding claims 14-16, Wouters et al. teaches the key code corresponding to the key of keypad is transmitted when the key is selected (col. 4 lines 4 lines 48-57). A key code corresponding to a second and third key code is therefore transmitted based on the selected key. Wouters et al. teaches fetching the data from memory corresponding to the key code (col. 4 lines 55-58). The data from the memory is inherently store as binary data. The key code therefore comprises binary data.

Regarding claims 19, Wouters et al. teaches a key code generator (3) for generating key codes for controlling different function on various electrical appliances (col. 1 lines 24-26, col. 3 lines 21-35). The key codes for controlling the different devices inherently include a first and second key code. Wouters et al. teaches an antenna (9) for transmitting the key code from the key code generator to a remote control (12) and the remote control 12 transmit the key code to the selected appliances (col. 3 lines 31-34). Wouters et al. teaches the key code receive by the remote control is demodulated, decoded and transmitted to the appliance (col. 4 lines 25-37). The key code is therefore not stored in the memory of the remote control .

Regarding claim 24, Wouters teaches a radio receiver (13) that is a microcontroller for receiving the radio frequency signal (col. 3 lines 31-32).

Regarding claim 25, Wouters et al. teaches receiving a keystroke indicator signal (5) from a remote control (3) and the key code indicator signal is use by key code generator 8 to generate a key code (col. 3 lines 21-30);

modulating the key code signal unto a carrier and transmitting the key code to the remote control (12) (col. 4 lines 28-33) and the remote control transmit the key code to the electronic device (col. 3 lines 31-34). Wouters et al. teaches the key code receive by the remote control is demodulated, decoded and transmitted to the appliance (col. 4 lines 25-37).

### Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1, 3-4, 9 are rejected under 35 U.S.C. 103(a) as being unpatentable over Pope US

Patent 5963624 in view of McNair et al. US Patent 5595342.

Regarding claim 1, Pope teaches receiving a keystroke indicator signal which contains an indication of a key on the remote control device 10 that was pressed (col. 2 lines 61-col. 3 line

19), generating a key code (codes for communicating the control function to the appliances)

within the code generator 12 and transmitting the key codes to the appliances (col. 3 lines 35-40). Pope is however silent on teaching modulating the key code onto a carrier signal. McNair et al. in an art related control system teaches the control signal is modulated and transmitted to the controlled apparatus as a conventional practice (col. 2 lines 61-65).

It would have been obvious to one of ordinary skill in the art to modulate the key code onto a carrier signal in Pope because modulation of the key code enables the key code signal to be transmitted wirelessly to the appliances and this also represents a conventional practice of providing means for wireless transmission from a remote control.

Regarding claim 3, Pope teaches the key code generator 12 transmitting key code signal (control codes) to the consumer devices (col. 3 lines 35-40).

Regarding claim 4, Pope teaches the key code is indicated by low and high (col. 3 lines 45-47) implying the key code signal include ones and zeroes.

Regarding claim 9, Pope teaches the code generated by the code generator 12 is transmitted to the appliances (col. 3 lines 36-40). The code generated by the code generator is not store in the remote control because it is transmitted to the appliances.

Claim 2 is rejected under 35 U.S.C. 103(a) as being unpatentable over Pope US Patent 5963624 in view of McNair et al. US Patent 5595342 and further in view of Goldstein US Patent 5410326.

Regarding claim 2, Pope teaches the remote control receiving key code signals (infrared control signal) from a controller (col. 4 lines 52-56) but is silent on teaching the key code generator transmit key codes to the remote control device. Goldstein in an art related

Page 6

programmable remote control invention teaches a key code generator in the form of a cable box (cable box is considered a key code generator, see page 3 lines 4-5 of the applicant's specification) transmitting key codes to the remote control (col. 13 lines 50-57) in order to update the remote control with new control codes.

It would have been obvious to one of ordinary skill in the art for the key code generator to transmit the key code to the remote control in Pope in view of McNair et al. because this provides the means for updating the remote control with new codes.

Claims 5 and 10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Pope US Patent 5963624 in view of McNair et al. US Patent 5595342 and further in view of Teskey US Patent 6747568.

Regarding claim 5, Pope teaches generating a key code for controlling the consumer appliances (col. 3 lines 35-40) but is silent on teaching the key code comprises timing information defining the binary number is modulated. Teskey in an art related remote control system teaches the format of the remote control signal having the necessary timing and modulation information (col. 3 line 60-col. 4 line 8).

It would have been obvious to one of ordinary skill in the art for the key code to include comprises timing information defining the binary number is modulated in Pope in view of McNair because the timing information defining the binary number is modulated represent information regarding the format of the remote control signal that enables the decoding and demodulating of the receive key code signals.

Regarding claim 10, Pope teaches generating a key code for controlling the consumer appliances (col. 3 lines 35-40) but is silent on teaching the key code comprises timing

Page 7

information defining the binary number (ones and zeroes) is modulated. Teskey in an art related remote control system teaches the format of the remote control signal having the necessary timing and modulation information (col. 3 line 60-col. 4 line 8).

It would have been obvious to one of ordinary skill in the art for the key code to include comprises timing information defining the binary number is modulated in Pope in view of McNair because the timing information defining the binary number is modulated represent information regarding the format of the remote control signal that enables the decoding and demodulating of the receive key code signals.

Claim 6 is rejected under 35 U.S.C. 103(a) as being unpatentable over Pope US Patent 5963624 in view of McNair et al. US Patent 5595342 and further in view of August et al. US Patent 5671267.

Regarding claim 6, Pope teaches the use of the remote control to control the functions of the appliances (col. 2 line 61-col. 3 line 22) but is not explicit in teaching transmitting a keystroke indicator signal that cause the appliance to turn on. One skill in the art recognizes that a remote control is generally use in turning an appliance on/off and is further evidenced by August et al. (col. 8 lines 3-5).

It would have been obvious to one of ordinary skill in the art for the remote control to transmit a keystroke signal for turning the appliance on in Pope in view of McNair because Pope suggests the use of the remote control to control the functions of the appliances and one skill in the art recognizes that a remote control is generally use in turning an appliance on/off and is further evidenced by August et al.

Claim 7 is rejected under 35 U.S.C. 103(a) as being unpatentable over Pope US Patent 5963624 in view of McNair et al. US Patent 5595342 and further in view of Wouster et al. US Patent 6915109

Regarding claim 7, Pope teaches the remote control receiving key code signals (infrared control signal) from a controller (col. 4 lines 52-56) and the remote control transmits control signal to the appliances (figure 1) but is silent on teaching modulating the key code onto carrier signal that is in the infrared frequency band. Wouters et al. in an art related remote control invention teaches a remote control receiving a RF modulated remote control signal (col. 4 lines 25-28) and a transmitter transmitting an infrared modulated signal generated from the received RF signal (col. 4 lines 28-33).

It would have been obvious to one of ordinary skill in the art to modulate the key code onto carrier signal that is in the infrared frequency band in Pope in view of McNair because infrared signal represents an alternative to radio signal used in the transmission of remote control signal.

Claim 8 is rejected under 35 U.S.C. 103(a) as being unpatentable over Pope US Patent 5963624 in view of McNair et al. US Patent 5595342 in view of Wouster et al. US Patent 6915109 and further in view of August et al. US Patent 5671267.

Regarding claim 8, Pope teaches the use of the remote control to control the functions of the appliances (col. 2 line 61-col. 3 line 22) but is not explicit in teaching transmitting a keystroke indicator signal that cause the appliance to turn on. One skill in the art recognizes that

Page 9

a remote control is generally use in turning an appliance on/off and is further evidenced by August et al. (col. 8 lines 3-5).

It would have been obvious to one of ordinary skill in the art for the remote control to transmit a keystroke signal for turning the appliance on in Pope in view of McNair in view of Yamaguchi because Pope suggests the use of the remote control to control the functions of the appliances and one skilled in the art recognizes that a remote control is generally use in turning an appliance on/off and is further evidenced by August et al.

Claim 18 is rejected under 35 U.S.C. 103(a) as being unpatentable over Wouters et al. US Patent 6915109 in view of Teskey US Patent 6747568.

Regarding claim 18, Wouters et al. teaches the remote control transmit command codes to perform various functions (col. 4 lines 4 lines 48-57). Wouters is silent on teaching the key code comprises timing information defining the binary number is modulated. Teskey in an art related remote control system teaches the format of the remote control signal having the necessary timing and modulation information (col. 3 line 60-col. 4 line 8).

It would have been obvious to one of ordinary skill in the art for the key code to include timing information defining the binary number is modulated in Wouters et al. because the timing information defining the binary number represents information regarding the format of the remote control signal that enables the decoding and demodulating of the receive key code signals.

Claims 20-21 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wouters et al. US Patent 6915109 in view of August et al. US Patent 5671267.

Page 10

. .

Regarding claims 20-21, Wouters teaches the use of the remote control to control the functions of the appliances (col. 3 lines 31-35) but is not explicit in teaching transmitting a keystroke indicator signal that cause the appliance to turn on. One skill in the art recognizes that a remote control is generally use in turning an appliance on/off and is further evidenced by August et al. (col. 8 lines 3-5).

It would have been obvious to one of ordinary skill in the art for the remote control to transmit a keystroke signal for turning the appliance on in Wouters because Wouters suggests the use of the remote control to control the functions of the appliances and one skill in the art recognizes that a remote control is generally use in turning an appliance on/off and is further evidenced by August et al.

Claim 23 is rejected under 35 U.S.C. 103(a) as being unpatentable over Wouters et al. US Patent 6915109 in view of Pope US Patent 5963624.

Regarding claim 23, Wouters teaches transmitting key codes to remote control (see response to claim 13) but is not explicit in teaching the key code is not store on the remote control prior to the remote control receiving the key code. Pope in an art related remote control teaches the remote control receiving control codes updates (col. 4 lines 52-60). The receipt of the code update by the remote control implies that the code was not previously stored in the remote control prior transmitting the updates to the remote controller.

It would have been obvious to one of ordinary skill in the art for the key code is not store on the remote control prior to the remote control receiving the key code because the key codes

transmitted to the remote control is used as a means of programming the remote control with new codes.

### (10) Response to Argument

Appellant argues on page 11 that the reference of Wouters fails to teach a single device with a keypad that both receives a RF signal and transmit an IR signal. It is the examiner position that the claims recites no limitation of a single device, the limitation of a remote control device is only recited in the preamble. The preamble is generally not accorded any patentable weight where it merely recites the purpose of a process or the intended use of a structure, and where the body of the claim does not depend on the preamble for completeness but, instead, the process steps or structural limitations are able to stand alone. See In re Hirao, 535 F.2d 67, 190 USPQ 15 (CCPA 1976) and Kropa v. Robie, 187 F.2d 150, 152, 88 USPQ 478, 481 (CCPA 1951).

Appellant argues on page 11-12 that the system of devices as disclose by the reference of Wouters is insufficient to allege a prima facie case of anticipation. It is the examiner's position that a system and device are not mutually exclusive terms because a device generally comprises a plurality of other devices

Appellant argues on page 13 that the reference of Wouters does not disclose a single key code that corresponds to two separate functions. It is the examiner's position that Wouters teaches the key code corresponding to the key of keypad is transmitted when the key is selected (col. 4 lines 4 lines 48-57) and teaches transmitting an infrared signal to a device such as a VCR to be controlled (col. 3 lines 33-35). When the remote control is used to activate two devices of

the same kind (e.g. VCR of the same brand name) the same key code is used for separate functions of turning on different electronic consumer devices.

Appellant argues on page 14 that the reference of Wouters does not teach a first binary number of a key code corresponding to a first function as well as a second binary number corresponding to a second function. It is the examiner's position that Wouters teaches fetching the data (key code) from memory corresponding to the tapped key (col. 4 lines 55-58). The data from the memory is inherently store as binary data and the data representative of each key tapped includes a first and second binary number.

Regarding appellant argument on pages 14-15 regarding the microcontroller for receiving the key code, it is the examiner's position that the reference of Wouters teaches a radio receiver (13) that is a microcontroller for receiving the radio frequency signal (col. 3 lines 31-32).

Appellant argues on page 15 that the reference of Wouters does not disclose a code set that includes one key code corresponding to a function of one electronic consumer device and the other code corresponding to the same function of another electronic consumer device. It is the examiner's position that Wouters teaches a key code generator (3) for generating key codes for controlling different function on various electrical appliances (col. 1 lines 24-26, col. 3 lines 21-35). The key codes for controlling the different devices inherently includes a first and second key code e.g. the turning on of two different brand of TV requires two different signals.

Appellant argues on page 17 that the examiner improperly argues that the item labeled 12 in room 2 is the remote control device as taught by the reference of Wouters. It is the examiner's position that in a method claim no weight is given to the structure, it has been held that that to be entitled to weight in a method claim, the recited structure limitations therein must affect the

method in a manipulative sense, and not to amount to the mere claiming of a use of a particular structure. Ex parte Pfeiffer, 1962 C.D. 408 (1961).

Appellant argues on page 17 that the reference of Wouters does not disclose a reference numeral 12 in the specification. It is the examiner's position that the reference 12 represents the receiving subsystem of the remote control as claimed in claim 5 of Wouters.

Appellant argues on pages 18-19, that the combination of the references of Pope and McNair does not teach generating a key code within a key code generating device, a keystroke indicator and a key code signal. It is the examiner's position that Pope teaches receiving a keystroke indicator signal which is the RF signal transmitted from the remote control containing an indication of a key on the remote control device 10 that was pressed (col. 2 lines 61-col. 3 line 19). Pope teaches based on the received RF signal, generating a key code (codes for communicating the control function to the appliances) within the code generator 12 and transmitting the key codes to the appliances (col. 3 lines 35-40). The key code generated is the IR signal that is transmitted through IR window 36. The conversion of the RF signal received from the remote control into IR codes (col. 3 lines 36-40) is considered the generation of the key code.

Appellant argues on page 20 that a keystroke indicator signal cannot be interpreted as the same as a key code signal. It is the examiner's position that the key code signal is considered as the RF signal and the key code is the IR signal generated by key code generator 84 (col. 5 lines 2-10) and therefore does not interpret the keystroke indicator signal as the same as a key code signal.

Appellant argues on page 21 argues that McNair does not teach modulating a key code. It is the examiner's position that the reference of McNair is relied upon for teaching the modulating of a wireless transmission from a remote controller (col. 2 lines 61-65).

Appellant argues on page 21 that there is no motivation to combine the reference of McNair with the reference of Pope. It is the examiner's position that Pope teaches the transmission of a wireless signal from a remote control and the reference of McNair provides the teaching on how to transmit a wireless signal from the remote control device to the electronic apparatus to be controlled.

Appellant argues on page 22 that the reference of Pope does not teach not storing a code set in the remote control. It is the examiner's position that the code set is use for generating the IR signal in the base unit (12) (col. 5 lines 5-14) and is therefore clearly not stored in the handheld unit. The limitation of not storing the code set in the remote control is not recited in claims 3-4. The argument relating to claims 3-4 on pages 22-23 is therefore mute.

Appellant argues on pages 23-24 that the reference of Goldstein does not teach transmitting a key code signal from a key code generator to the remote control. It is the examiner's position that Goldstein teaches a code generator provided by a cable box for responding to a request for key code by transmitting the key code to the remote control (col. 13 lines 50-57). The examiner consider the responding to the request for key code by the cable box as the generation of key code and satisfy the claim limitation of a key code generator because the generation of key code is broadly claimed with no specific given to the means of generating the key codes.

Appellant argues on page 25 that the combination of the references of Pope, McNair and Goldstein would result in the code set or the key codes being stored in the remote control. It is the examiner's position that the reference of Goldstein is relied upon for teaching the transmission of key codes to the remote control and the reference of Pope is relied upon for teaching the limitation of not storing the code set in the remote control.

Appellant argues on page 25 that the reference of Pope, McNair, and Tesky teaches generating a key code within a key code generator and the reference of Teskey does not teach the necessary timing and modulation information. It is the examiner's position that Pope teaches receiving a keystroke indicator signal which is the RF signal transmitted from the remote containing an indication of a key on the remote control device 10 that was pressed (col. 2 lines 61-col. 3 line 19). Pope teaches based on the received RF signal generating a key code (codes for communicating the control function to the appliances) within the code generator 12 and transmitting the key codes to the appliances (col. 3 lines 35-40). The reference of Teskey teaches the key code signal includes timing information such as pulse width and the overall signal timing information for describing the digital "1" and "0".

Appellant argues on page 26 that the reference of August does not teach a key stroke signal transmitted from the remote control to turn on the electronic consumer device. It is the examiner's position that the reference of Pope teaches transmitting the key code signal (control code) to the remote control devices (col. 3 lines 36-40) and the reference of August is relied upon for teaching the conventional practice of a remote control transmitting key codes (control codes) for turning on an electrical consumer apparatus (col. 8 lines 3-5).

Regarding Appellant argument on pages 27-28 regarding the rejection of claim 7, it is the examiner's position that the reference of Pope teaches an embodiment in which the remote control receives the key code signal (infrared signal) from a controller (col. 4 lines 52-56) and transmits the control signal to the electronic consumer devices (figure 1). The reference of Wouters is relied upon for teaching a remote control receiving a RF modulated remote control signal (col. 4 lines 25-28) and a transmitter transmitting an infrared modulated signal generated from the received RF signal (col. 4 lines 28-33).

Regarding Appellant argument on pages 27-28 regarding the rejection of claim 8, it is the examiner's position that the August is relied upon for teaching the conventional practice of a remote control transmitting key codes (control codes) for turning on an electrical consumer apparatus (col. 8 lines 3-5).

Appellant argues on page 29 that the reference of Wouters and Teskey fail to disclose a device with a keypad that transmit an IR signal and receive and RF signal. The response for this argument is already stated on page 12.

Regarding appellant argument on page 29 regarding claims 20-21, the response to this argument is already stated on page 13

Appellant argues on page 30 that the remote control of Wouters does not teach RF receiver, IR transmitter and keypad on the same device. The response for this argument is already stated on page 12.

# (11) Related Proceeding(s) Appendix

No decision rendered by a court or the Board is identified by the examiner in the Related Appeals and Interferences section of this examiner's answer.

For the above reasons, it is believed that the rejections should be sustained.

Respectfully submitted, Vernal

## I. STATUS OF CLAIMS

The application at issue, filed on December 16, 2003, included 24 claims. In an amendment dated July 28, 2006, claims 25-26 were added. Claims 1-26 are subject to this Appeal.

> Reply Brief Application Serial No. 10/737,029

II. GROUNDS OF REJECTION TO BE REVIEWED ON APPEAL

The following are grounds of rejection to be reviewed on appeal:

1) Claims 13-16, 19, 22 and 24-26 stand rejected under 35 USC §102(e) as being anticipated by Wouters et al. (US Patent 6,915,109).

2) Claims 1, 3-4 and 9 stand rejected under 35 USC §103(a) as being unpatentable over Pope (US Patent 5,963,624) in view of McNair et al. (US Patent 5,595,342).

3) Claim 2 stands rejected under 35 USC §103(a) as being unpatentable over Pope in view of McNair and further in view of Goldstein (US Patent 5,410,326).

4) Claim 5 and 10 stand rejected under 35 USC §103(a) as being unpatentable over Pope in view of McNair and further in view of Teskey (US Patent 6,747,568).

5) Claim 6 stands rejected under 35 USC §103(a) as being unpatentable over Pope in view of McNair and further in view of August et al. (US Patent 5,671,267).

6) Claim 7 stands rejected under 35 USC §103(a) as being unpatentable over Pope in view of McNair and further in view of Wouters.

7) Claim 8 stands rejected under 35 USC §103(a) as being unpatentable over Pope in view of McNair in view of Wouters and further in view of August.

8) Claim 18 stands rejected under 35 USC §103(a) as being unpatentable over Wouters in view of Teskey.

9) Claim 20-21 stand rejected under 35 USC §103(a) as being unpatentable over Wouters in view of August.

### Reply Brief Application Serial No. 10/737,029

10) Claim 23 stands rejected under 35 USC §103(a) as being unpatentable over Wouters in view of Pope.

## Reply Brief Application Serial No. 10/737,029

### **III. ARGUMENT**

#### A. Introduction

The claims on appeal stand rejected because the Examiner has failed to read claim terms in light of the specification, and because many of the rejections are based on conclusory statements about the references, and not based on material actually found in the references. For these reasons, as further explained below and in the briefs already on file, the rejections of the claims should be reversed. The Examiner's Answer does not include any rejection designated as a new ground of rejection.

### B. The Claims

The Claims on appeal include a few important terms. The terms should be interpreted in light of the specification, rather than the Patent Office's proposed interpretation, which is inconsistent with how the terms are used in the Specification.

As explained in the summary section of the Appeal Brief, the Specification describes a system 10 as including a remote control device 11, a key code generator device 12, and at least one electronic consumer device 13. As clearly identified and illustrated in Figure 2 of the Specification, the key code generator device holds a codeset usable to communicate with an electronic consumer device. A user presses a key on the remote control, and a corresponding keystroke indicator signal is sent to the key code generator device. The key code generator device uses information in the codeset to generate a key code corresponding to the pressed key. The key code generator device modulates the key code onto a first carrier signal, thereby generating a first key code signal. The key code signal is transmitted from the key code generator device back to the remote control device. The remote control device receives the key code signal, and then relays the key code by transmitting the key code in a second key code signal. The second key code signal is received by the electronic consumer

Reply Brief Application Serial No. 10/737,029

5

## device.

The Specification uses all of the key claim terms. It clearly indicates that a <u>system</u> is a collection of different devices, and that <u>a remote control device</u> is something with a keypad that is used to operate the consumer electronic devices. The Specification also indicates what a <u>keystroke</u> is and what a keystroke indicator signal is. The Specification indicates what a <u>codeset</u> is, what <u>a key code generator</u> is and what a <u>key code</u> is. It also indicates quite clearly what a <u>key code signal</u> is. All of these terms are clearly defined by the Specification, and these terms should be interpreted in light of the Specification in connection with any comparison of prior art to the Claims.

### C. The Prior Art

Two pieces of prior art are principally at issue in this appeal. The first is Wouters (U.S. Patent No. 6915109), and the other is Pope (U.S. Patent No. 5963624). Wouters is directed to taking information from an infrared remote control device and converting the infrared signal from the infrared remote control device into a radio frequency signal so that the information can be transferred to a second room, where it is then received by a consumer device.

As clearly explained in the Appeal Brief, Wouters discloses that all codeset and key code information is held within the Wouters remote control device.

In Pope, a digital cordless phone 10 communicates with a base unit 12. Pope clearly states, as already explained in the Appeal Brief, that the digital cordless phone 10 holds all of the codeset and key codes used by any consumer electronic devices. The base unit 12 only takes the information from the digital cordless phone 10 and translates it into an infrared signal. Both references thus are directed to devices completely different than the methods and devices at issue in this Appeal.

### D. <u>Rejection of claims 13 and 22</u>

Independent claims 13 and 22 are directed to a remote control device. A remote control device is not a "system" as that term is used in the Specification. As used in the Specification and as is generally understood, a "system" is a collection of different devices. A remote control device is a single item, and is clearly understood to be such when one refers to the Specification. Furthermore, each of claims 13 and 22 begins with the statement that the subject matter of the claim is: "A remote control device." This is not preamble language that explains how the remote control device will be used or in what environment the remote control device will be used, as the Examiner suggests. (Examiner's Answer, p. 12, lines 8-9) Consequently, the claim language "A remote control device" cannot be ignored as being superfluous preamble language.

Claims 13 and 22 define the remote control device as including a receiver, a transmitter and a keypad. The Examiner has rejected the claims based on descriptions of various components from a reference. The rejection does not rely on a device disclosed in the reference, but instead relies on what the Examiner calls a "system of devices" that includes such components. (See, e.g., Examiner's Answer, p. 3, line 23). A system is not the same as a remote control device, as explained above. Claims 13 and 22 do not read on various components distributed throughout various rooms of a house, as disclosed by Wouters. Claims 13 and 22 could not successfully be asserted against such a "system". This further demonstrates that it is improper to ignore that the claim is directed to a device and not a system, so the rejection should be reversed.

The Examiner comments that the terms "system" and "device" are not mutually exclusive because a device generally comprises a plurality of other devices. (Examiner's Answer, p. 12, lines 12-15). The Examiner's comment does not support the Examiner's argument that the claim limitation "remote control device" can be interpreted to comprise a plurality of other devices distributed throughout various rooms of a house. It is clear from the wording of claims and from the Specification that the recited "remote control device" cannot

> Reply Brief Application Serial No. 10/737,029

be interpreted as multiple devices that are physically located in multiple rooms. A remote control device is a single remote control.

### E. <u>Rejection of claim 14</u>

Claim 14, which depends from claim 13, states that a key code corresponds to a function of electronic consumer device and that the key code also corresponds to a second function of a second electronic consumer device. As explained in the Appeal Brief, Wouters does not disclose this claim limitation. Moreover, the Examiner did not stated that Wouters discloses one key code that corresponds both to a function of an electronic consumer device as well as to <u>a</u> <u>second function</u> of a second electronic consumer device.

In the Examiner's Answer, the Examiner now suggests that Wouters discloses that "the same key code is used for separate functions of turning on different electronic consumer devices" when the remote control is used to activate two devices of the same kind, such as two VCRs of the same brand. (Examiner's Answer, p. 12, line 20 – p. 13, line 2). So the Examiner now argues that when the same key code is used to turn on two electronic consumer devices of the same kind, "turning on" the first device constitutes one function, whereas "turning on" the second of the identical devices constitutes a second function. Interpreting the "turning on" function of two identical devices to be two separate functions is a semantic slight of hand that is inconsistent with the tenets of claim interpretation and the use of the claim term "a second function" in the claims and the Specification. Under the tenets of claim differentiation, the terms "said function" and "a second function" used in the same claim cannot be interpreted to be the same "turning on" function. For these reasons, the rejection of claim 14 should be withdrawn.

### F. <u>Rejection of claim 16</u>

In the Appeal Brief, Appellant pointed out that the Examiner has not presented a *prima facie* argument of anticipation of claim 16 because the

Reply Brief Application Serial No. 10/737,029

Examiner does not state that Wouters discloses a first binary number of a key code corresponding to a first function, as well as a second binary number of the same key code corresponding to a second function. The Examiner's response in the Answer Brief does not address where Wouters discloses a second binary number of the same key code that corresponds to a second function. Instead, the Examiner states, "The data from the memory is inherently store as binary data and the data representative of each key tapped includes a first and second binary number" (Examiner's Answer, p. 13, lines 6-8). The fact that data representative of a tapped key includes both a first binary number and a second binary number does not address whether the first binary number corresponds to a first function, and the second binary number corresponds to a second function. No *prima facie* argument of anticipation of claim 16 has been presented.

### G. <u>Rejection of claim 24</u>

Dependent claim 24 recites that the remote control device includes a means for receiving a key code from an RF receiver and that the means is a microcontroller. Appellant has argued that Wouters does not disclose a microcontroller for receiving a key code from an RF receiver. The Examiner now responds that "Wouters teaches a radio receiver (13) that is a microcontroller" (Examiner's Answer, p. 13, lines 10-11). Appellant respectfully disagrees. Wouters does not disclose that "radio receiver 13" is a microcontroller. In fact, Wouters does not mention a microcontroller, a microprocessor, or a processor of any kind.

#### H. <u>Rejection of claim 19</u>

Claim 19 recites, "a <u>codeset</u> is <u>stored on</u> said <u>key code generator device</u>, said <u>codeset including</u> said <u>first key code</u> and said <u>second key code</u>, wherein said first key code corresponds to a selected function of a first electronic consumer device, and wherein said second key code corresponds to said selected function of a second electronic consumer device" (emphasis added).

> Reply Brief Application Serial No. 10/737,029

9

Appellants have argued that the Examiner has not presented a *prima facie* argument of anticipation of claim 19 because the Examiner has not stated that Wouters discloses a codeset including the two key codes recited in claim 19 that correspond to the same function on different electronic consumer devices. Nor has the Examiner stated that Wouters discloses that those two key codes are included in a codeset stored on the key code generator device.

In fact, Wouters does not mention key codes that correspond to the same function on separate electronic consumer devices. The Examiner now argues that the two recited key codes are inherently present if the system of Wouters can turn on two different brands of television. The Examiner argues that the remote control unit 3 of Wouters discloses the recited key code generator. The Examiner states, "Wouters teaches a key code generator (3) for generating key codes for controlling different function on various electrical appliances (col. 1 lines 24-26, col. 3 lines 21-35). The key codes for controlling the different devices inherently includes a first and second key code e.g. the turning on of two different brand of TV requires two different signals." (Examiner's Answer, p. 13, lines 15-18).

Even if this were true, the Examiner has not stated that Wouters discloses that the two recited key codes are included in a codeset stored on remote control unit 3 of Wouters. The Examiner's statement still does not establish a *prima facie* argument of anticipation of claim 19 because the Examiner has not alleged that a codeset is stored on remote control unit 3 of Wouters that includes the two recited key codes. For this reason, as well as the other reasons identified in the Appeal Brief, the reversal of the rejection of claim 19 is requested.

#### I. Rejection of claim 25

Appellant has maintained that the Examiner has improperly argued that the "remote control device" recited in claim 25 is disclosed by remote control unit 3 of Wouters for purposes of one limitation in claim 25 and by item 12 in room 2 of Wouters for purposes of another limitation in claim 25. The Examiner

### Reply Brief Application Serial No. 10/737,029

responds that caselaw from 1961 prevents any weight to be given to structure in a method claim that does not "affect the method in a manipulative sense". (Examiner's Answer, p. 13, line 20 - p. 14, line 2). Thus, the Examiner maintains that it is proper to ignore the structure of the "remote control device" recited in claim 25. Appellant respectfully disagrees with the Examiner's interpretation of the law. It is improper to ignore the structure of the claim limitation "remote control device" and thereby find that the recited "remote control device" is disclosed by separate structures for purposes of separate claim limitations within a single claim. The method of claim 25 describes how structures interact. The structures cannot be ignored for purposes of claim interpretation.

Moreover, Wouters does not disclose that item 12 in room 2 is a remote control device. The Examiner states that his position is that "the reference 12 represents the receiving subsystem of the remote control as claimed in claim 5 of Wouters" (Examiner's Answer, p. 14, lines 3-5). In order to be valid, however, the Examiner's position must be supported by the prior art disclosure. Nowhere does Wouters disclose that item 12 is a remote control device. In fact, item 12 has not keypad or user input mechanism.

### J. Rejection of claim 26

As explained in the Appeal Brief, the rejection of claim 26 should also be reversed. The Examiner's Answer does not address this argument, so the reversal of this rejection is requested.

### K. Rejection of claim 1

Claim 1 recites, "receiving a keystroke indicator signal from a remote control device". The Examiner argues that Pope teaches "receiving a keystroke indicator signal which is the RF signal transmitted from the remote control containing an indication of a key on the remote control device 10 that was pressed (col. 2 lines 61-col. 3 line 19)" (Examiner's Answer, p. 14, lines 8-11). Appellant respectfully disagrees. Pope does not teach that remote control device

> Reply Brief 11 Application Serial No. 10/737,029

10 sends a keystroke indicator signal to base unit 12. In fact, the passage of Pope cited by the Examiner states that "appliance control codes" are transmitted as opposed to keystroke indicators. Pope does not teach that remote control device 10 transmits an indication of a selected key to base unit 12. The keystroke indicator has already been used to generate the appliance control code within remote control device 10 of Pope.

Appellant has argued that it is improper to construe a signal of Pope containing an "appliance control code" as teaching both a keystroke indicator signal as well as a key code signal. The Examiner responds that "the key code signal is considered as the RF signal and the key code is the IR signal" (Examiner's Answer, p. 14, lines 18-19). The Examiner's statement appears to admit that the "RF signal" of Pope (Pope does not mention RF or radio frequency) from remote control device 10 to base unit 12 is not a keystroke indicator signal but rather a key code signal containing an appliance control code.

In addition, the Examiner's rejection is also based on the recited key code being the IR signal of Pope. (Examiner's Answer, p. 14, line 13-14, 18). As explained in the Specification, a key code is not the same as a key code signal (which is often transmitted in an IR signal). Thus, the recited "code" cannot be taught by a "signal".

Finally, Appellant has argued that McNair does not teach modulating a key code onto a carrier signal. McNair does not teach a key code at all. The Examiner has previously admitted that Pope is silent on teaching modulating a key code onto a carrier signal. (10/19/06 Office Action, p. 6, line 7) Now the Examiner states that "McNair is relied upon for teaching the modulating of a wireless transmission from a remote controller" (Examiner's Answer, p. 15, lines 2-3). Thus, the Examiner has admitted that neither Pope nor McNair teaches modulating a key code onto a carrier signal. For this reason as well, the Examiner has failed to establish a prima facie case of obviousness of claim 1 over the combination of Pope and McNair.

### Reply Brief Application Serial No. 10/737,029

12

The rejection of claim 1 should therefore be reversed.

#### L. Rejection of claim 9

Claim 9, which depends from claim 1, further states that the remote control device does not store a codeset. The Examiner's Answer states that it is the Examiner's position that a codeset is used for generating an infrared signal in the base unit 12, and therefore a codeset is clearly not stored in the handheld unit 10. (Examiner's Answer, p. 15, lines 9-13). This statement is contrary to the clear language of Pope, as quoted in the Appeal Brief. Pope actually states that <u>the codeset is stored in the handheld unit</u>. Reversal of the rejection of claim 9 is respectfully requested.

#### M. <u>Rejection of claim 2</u>

Claim 2 recites "said key code signal is transmitted in (d) from said key code generator device to said remote control device". Appellant has argued that Goldstein does not teach transmitting a <u>key code signal</u> from the key code generator device back to the remote control device. The fact that Goldstein may teach sending an IR code from a cable television converter box to a remote control device does not teach transmitting a <u>key code signal</u> from a key code generator device back to the remote control device.

The Examiner states that he considers "the responding to the request for key code by the cable box as the generation of key code and satisfy the claim limitation of a key code generator because the generation of key code is broadly claimed with no specific given to the means of generating the key codes" (Examiner's Answer, p. 15, lines 18-21). The Examiner's rebuttal does not refute that codes, as opposed to key code signals, are sent from the cable television converter box of Goldstein to the remote control device. Thus, Goldstein does not teach the recited transmitting a key code signal.

#### Reply Brief Application Serial No. 10/737,029

#### N. Rejection of claims 5 and 10

As with regard to claim 1, for the rejection of claims 5 and 10, the Examiner relies on an "RF signal" of Pope for containing an indication of a key on the remote control device 10 that was pressed. (Examiner's Answer, p. 16, lines 8-11). Pope does not teach, however, that remote control device 10 sends a keystroke indicator signal to base unit 12. The passage of Pope cited by the Examiner states instead that "appliance control codes" are transmitted. Pope does not teach that remote control device 10 transmits an indication of a selected key to base unit 12. The keystroke indicator has already been used to generate the appliance control code within remote control device 10 of Pope.

#### O. Rejection of claims 6-8, 18, 20-21 and 23

As to the remaining dependent claims 6-8, 18-21 and 23, the limitations included therein have already been discussed in the Appeal Brief and earlier in this Reply, so the reversal of the rejections is again respectfully requested.

Appellant requests that the Board reverse the §102 and §103 rejections of claims 1-26.

I hereby certify that this correspondence is being deposited with the United States Postal Service as First Class Mail in an envelope addressed to: Mail Stop Appeal Brief - Patents, Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.

Appeal 2008-4830 Application 10/737,029 Technology Center 2600

Decided: November 14, 2008

Before JAMESON LEE, RICHARD TORCZON and SALLY C. MEDLEY, *Administrative Patent Judges*.

MEDLEY, Administrative Patent Judge.

#### **DECISION ON APPEAL**

A. Statement of the Case

ZiLOG, Inc. ("Zilog"), the real party in interest, seeks review under 35 U.S.C. § 134(a) of a Final Rejection of claims 1-10, 13-16 and 18-26. We have jurisdiction under 35 U.S.C. § 6(b). We affirm-in-part and enter a new ground of rejection.

Zilog's invention is related to a system and associated method that includes a key code generator that receives a keystroke from a remote

control device. The key code generator generates a key code and transmits the key code. Spec. 2-3, 6-8, 11-12.

Representative claim 1, reproduced from the Claim Appendix of the

Appeal Brief, reads as follows:

A method comprising:

(a) receiving a keystroke indicator signal from a remote control device;

(b) generating a key code within a key code generator device;

(c) modulating said key code onto a carrier signal, thereby generating a key code signal; and

(d) transmitting said key code signal from said key code generator device.

The Examiner relies on the following prior art in rejecting the claims on

appeal:
11

Goldstein	5,410,326	Apr. 25, 1995
McNair et al. ("McNair")	5,595,342	Jan. 21, 1997
August et al. ("August")	5,671,267	Sep. 23, 1997
Pope	5,963,624	Oct. 5, 1999
Teskey	6,747,568	Jun. 8, 2004
Wouters et al. ("Wouters")	6,915,109	Jul. 5, 2005

The Examiner rejected claims 13-16, 19, 22 and 24-26 under

35 U.S.C. § 102(e) as anticipated by Wouters.

The Examiner rejected claims 1-10, 18, 20-21 and 23 under

35 U.S.C. § 103(a) as follows:

- 1. Claim 18 as unpatentable over Wouters and Teskey;
- 2. Claims 20 and 21 as unpatentable over Wouters and August;
- 3. Claim 23 as unpatentable over Wouters and Pope;
- 4. Claims 1, 3-4 and 9 as unpatentable over Pope and McNair;
- 5. Claim 2 as unpatentable over Pope, McNair and Goldstein;
- 6. Claims 5 and 10 as unpatentable over Pope, McNair and Teskey;

- 7. Claim 6 as unpatentable over Pope, McNair and August;
- 8. Claim 7 as unpatentable over Pope, McNair and Wouters;
- 9. Claim 8 as unpatentable over Pope, McNair, Wouters and August.
- B. Findings of Fact ("FF")

## Zilog's Specification

1. Zilog's specification describes "[i]n one embodiment, the indication of a pressed key is a keycode . . . . . . Spec. 7.

## <u>Wouters</u>

- Wouters depicts a remote control unit 3 including an infrared (IR) transmitter 4; and a radio frequency (RF) transmission system 6 including an IR receiver 7 and a radio transmitter 8 in a first room 1. Fig. 1; col. 3, ll. 23-30.
- 3. In a second room 2, there is a RF receiving system 12 which includes radio receiver 13 and IR transmitter 14; and an IR receiver 16 coupled to a device such as a VCR in room 2. Fig. 1; col. 3, ll. 31-36; claim 1.
- A radio signal 10 is received via antenna 11 by radio receiver 13, which is coupled to IR transmitter 14 for generating IR signal 15. Fig. 1, col. 3, ll. 31-32.
- 5. When a user taps a key on the remote control device 3, the central processing unit (CPU) inside the remote control device determines which code needs transmitting and fetches the required data from its memory that comprises a database. Col. 4, 11. 53-58.
- The invention may be used in a variety of systems and devices such as systems comprising or using remote control, VCR, TV, Internet-enabled TV, Set-top boxes, PC-TV, PC and home control. Col. 1, ll. 23-26.

## Pope

- Pope describes transmitting appliance control codes from a cordless digital telephone handset 10, 50 to base unit 12 in response to selection of the appliance control via the handset keypad 30. Figs. 1, 2; col. 2, ll. 48-col. 3, ll. 19.
- The base unit processor 84 gets an infrared control code from memory 86 based on a received appliance control code. Fig. 3, col. 4, l. 62col. 5, l. 11.
- 9. Base unit 12 transmits infrared control code through outer window 36 to electrical appliances 14-22. Fig. 1, col. 3, ll. 35-41.

<u>McNair</u>

 McNair describes that wireless transmission between a room temperature sensor and a receiver can be around 173 MHz using frequency modulation techniques including frequency shift keying. Col. 2, ll. 9-18, 61-65.

## Graham<sup>1</sup>

- 11. Graham describes modulating a digital code or binary code onto a carrier signal. Abs., Col. 2, ll. 11-16.
- 12. Modulating a digital code onto a carrier signal precludes unauthorized or accidental activation of a control of the receiving means. Spec. Abs.
- 13. Modulating a digital code or a binary code onto a carrier signal provides an exceptional degree of security and privacy. Col. 2, ll. 7-11.
- C. Principles of Law

"It would be inconsistent with the role assigned to the PTO in issuing a patent to require it to interpret claims in the same manner as judges who,

<sup>&</sup>lt;sup>1</sup> Graham, U.S. Patent No. 4,005,428 (issued Jan. 25, 1977).

post-issuance, operate under the assumption the patent is valid." *In re Morris*, 127 F.3d 1048, 1054 (Fed. Cir. 1997). "[A]s an initial matter, the PTO applies to the verbiage of the proposed claims the broadest reasonable meaning of the words in their ordinary usage as they would be understood by one of ordinary skill in the art, taking into account whatever enlightenment by way of definitions or otherwise that may be afforded by the written description contained in the applicant's specification." *Id*.

A claim undergoing examination is given its broadest reasonable construction consistent with the specification. *In re Prater*, 415 F.2d 1393, 1404-05 (CCPA 1969). But, "limitations are not to be read into the claims from the specification." *In re Van Geuns*, 988 F.2d 1181, 1184 (Fed. Cir. 1993) (citation omitted).

"[A]n indefinite article 'a' or 'an' in patent parlance carries the meaning of 'one or more' in open-ended claims containing the transitional phrase 'comprising.'" *KCJ Corp. v. Kinetic Concepts, Inc.*, 223 F.3d 1351, 1356 (Fed. Cir. 2000) (citations omitted).

"Anticipation under 35 U.S.C. § 102(e) requires that 'each and every element as set forth in the claim is found, either expressly or inherently described, in a single prior art reference."" *In re Robertson*, 169 F.3d. 743, 745 (Fed. Cir. 1999) (quoting *Verdegaal Bros., Inc. v. Union Oil Co.,* 814 F.2d 628, 631 (Fed. Cir. 1987)).

D. Analysis

Rejection of claims 13-16, 19, 22 and 24-26 as anticipated by Wouters Claims 13 and 22

Independent claims 13 and 22 stand or fall together. App. Br. 11. Representative claim 13 recites "A remote control device comprising: a receiver . . . a transmitter . . .". App. Br. 34.

The Examiner finds that Wouters' system of devices depicted in room 1 and room 2 comprising an RF receiver, and an IR transmitter meets the claim limitations. Final Rejection 4, Ans. 3-4; citing Wouters col. 4, ll. 25-33, 48-57; fig. 1; FF<sup>2</sup>s 2-3.

Zilog argues that Wouters' system of devices depicted in room 1 and room 2 is not a single device. App. Br. 11-12; Reply Br. 7-8. Zilog argues that the Examiner's interpretation is improper and is contrary to how the term is used in the claims and specification. App. Br. 12; Reply Br. 7-8. Zilog asserts that it disavows the claim scope of a remote control so as to exclude a system and cites case law in support of its position. App. Br. 12

We are unpersuaded by Zilog's arguments. As made clear in *Morris*, the PTO does not interpret claims in the same manner as judges who operate under the assumption that the patent is valid. Instead, during patent prosecution before the PTO, the broadest reasonable interpretation applies. We broadly interpret "[a] remote control device" as an apparatus that includes one or more components. The claim does not require the components to be contained or housed within a single structure. Therefore, the Examiner's finding that Wouters' system of devices meets Zilog's "[a]

<sup>&</sup>lt;sup>2</sup> FF denotes Finding of Fact.

remote control device" is consistent with the broadest reasonable interpretation of a remote control device.

For all these reasons we find that Zilog has not sustained its burden of showing that the Examiner erred in rejecting claims 13 and 22 as anticipated by Wouters.

#### <u>Claims 14-16</u>

Claim 14 is dependent on claim 13 and recites "said keycode corresponds to a second function of a second electronic consumer device, as well as to said function of said electronic consumer device." App. Br. 34.

The Examiner finds that when a remote control is used to activate two devices of the same kind (e.g., VCRs of the same brand name) the same key code is used for separate functions of turning on different electronic consumer devices. Ans. 12-13.

Zilog argues that Wouters does not describe one key code that corresponds to two separate functions of two different electronic consumer devices. App. Br. 13. Zilog further argues that the Examiner's interpretation is inconsistent with the tenets of claim interpretation and the use of the term "second function" in the claims and specification. Reply Br. 8. Zilog argues that under the tenets of claim interpretation "said function" and "a second function" used in the same claim cannot be interpreted to be the same function.

We agree with Zilog. Within the same claim, the Examiner interprets "said function" and "a second function" as the same function, yet interprets "said electronic consumer device" and "a second electronic consumer device" as different devices. The Examiner's interpretation of the claim terms within a single claim is inconsistent. To be consistent, both "a second

function" and "a second electronic consumer device" must either be the same as or different from both "said function" and "said electronic consumer device". Moreover, it would be counterintuitive for a claim drafter to use the term "a second function" if the intent was for it to be interpreted the same as "said function". For these reasons, we find that the Examiner's interpretation of "said function" and "a second function" as the same function to be unreasonable. We therefore find that the Examiner erred in finding claim 14 anticipated by Wouters.

Claims 15 and 16 are dependent on claim 14. App. Br. 34-35. For the same reasons explained above regarding claim 14, we find that the Examiner erred in rejecting claims 15 and 16 as anticipated by Wouters.

#### <u>Claim 24</u>

Claim 24 is dependent on claim 22 which recites "means for receiving a key code from said RF receiver and for sending said keycode to said IR transmitter. . .". App. Br. 14, 37. Claim 24 further recites "said means in a microcontroller." Both Zilog and the Examiner interpret a microcontroller as a processor. Reply Br. 9, Final Rejection 5.

Zilog argues that Wouters does not disclose that radio receiver 13 is a microcontroller and does not mention a microcontroller, microprocessor or processor of any kind. Reply Br. 9.

We agree with Zilog's arguments. The Examiner has not directed us to, and we can not find, where Wouters explicitly or inherently discloses that radio receiver 13 is a microcontroller or a processor. Instead, the Examiner relies on a citation to Wouters which describes that radio receiver 13 receives a radio signal via antenna 11. Ans. 4, 13; citing Wouters col. 3, ll. 31-32; FF 4.

For this reason, we find that the Examiner erred in rejecting claim 24 as anticipated over Wouters.

#### <u>Claim 19</u>

Independent claim 19 recites "a codeset is stored on said key code generator device, said codeset including said first key code and said second key code, wherein said first key code corresponds to a selected function of a first electronic consumer device, and wherein said second key code corresponds to said selected function of a second electronic consumer device . . .". App. Br. 35-36.

Zilog argues that Wouters does not describe two key codes included in a codeset stored on a key code generator (i.e., remote control unit 3). App. Br. 15-16; Reply Br. 10.

While Wouters describes that a set of codes are stored in the memory of the remote control device 3 (FF 5), the Examiner has not sufficiently explained how Wouters' stored codeset includes a first key code corresponding to a selected function of a first electronic consumer device and a second key code corresponding to said selected function of a second consumer device. The Examiner also has not sufficiently explained how Wouters explicitly or inherently describes the disputed claim limitations. Instead, the Examiner relies on Wouters description that IR receiver 16 is coupled to a VCR and the general statement that the invention can be used with a variety of systems and devices comprising or using a remote control, VCR, TV, etc. Final Rejection 4; Ans. 4, 13; citing Wouters col. 1, ll. 24-26; col. 3, ll. 21-35; FFs 3, 6. This is insufficient to establish a prima facie case of anticipation.

For these reasons we find that the Examiner erred in erred in rejecting claim 19 as anticipated over Wouters.

#### Claims 25 and 26

Independent claim 25 recites "receiving a keystroke indicator from a remote control device . . . transmitting said key code signal from said key code generator device to said remote control device . . .". App. Br. 16, 37. We interpret "said remote control device" to refer to, and be the same as, the aforesaid "a remote control device".

Zilog argues that Wouters does not describe (1) receiving a signal from a remote control device and (2) transmitting a second signal to the remote control device. App. Br. 16. Zilog argues that it is improper to ignore the structure of the "remote control device" and find that the claimed "remote control device" is met by separate structures for separate limitations within a claim. Reply Br. 11.

Zilog's arguments are persuasive and consistent with our interpretation that "said remote control device" is the same as the aforesaid "a remote control device". The Examiner has not directed us to, and we can not find, where Wouters describes receiving a keystroke indicator from a remote control device and transmitting a keycode signal to the *same* remote control device. Instead, the Examiner has directed us to Wouters' description of sending a keystroke indicator signal from one device (i.e., remote control unit 3) and transmitting the keycode to a different device (i.e., RF receiving system 12). Final Rejection 5, Ans. 5; citing Wouters col. 3, ll. 21-34; col. 4, ll. 25-37; fig 1.

For these reasons, we find that the Examiner erred in rejecting claim 25 as anticipated over Wouters.

Our interpretation of claim 25 may appear to be inconsistent with our interpretation of claims 13 and 22 because with respect to claim 25 we interpret the remote control as a singular device. However, claim 25 is a method claim that requires receiving a keystroke indicator from the remote control and also sending a keycode to the *same* remote control. In contrast, claims 13 and 22 are apparatus claims that do not include any additional structural recitations that require the remote control to be a single device or require the components to be encased in a single housing.

Claim 26 is dependent on claim 25. App. Br. 37. For the same reason as explained above regarding claim 25, we find that the Examiner erred in rejecting claim 26 as anticipated over Wouters.

#### <u>Rejection of claim 18 as unpatentable over Wouters and Teskey</u>

Claim 18 is dependent on claim 13. App. Br. 34. Claim 18 stands or falls with claim 13 since Zilog did not argue the limitations of claim 18 separately. App. Br. 29. For the same reasons explained above with respect to claim 13, we find that Zilog has not sustained its burden of showing that the Examiner erred in rejecting claim 18 as unpatentable over Wouters and Teskey.

#### Rejection of claims 20 and 21 as unpatentable over Wouters and August

Claims 20 and 21 are dependent on claim 19. Zilog does not argue the specific limitations of claims 20 or 21, but instead argues the limitations of claim 19. App. Br. 29. As applied by the Examiner, August does not remedy the deficiencies of Wouters. For the same reasons as explained above with respect to claim 19, we find that the Examiner erred in rejecting claims 20 and 21 as unpatentable over Wouters and August.

#### Rejection of claim 23 as unpatentable over Wouters and Pope

Claim 23 is dependent on claim 22. App. Br. 36. Zilog does not argue the specific limitations of claim 23, but, instead, argues the limitations of claim 22.

Zilog argues that Wouters' RF receiver, IR transmitter and keypad are not on the same device. App. Br. 30. Zilog further argues that Wouters' remote control unit 3 does not include an RF receiver. App. Br. 30. Zilog also argues that Pope teaches against including an IR transmitter on the handset. App. Br. 30.

As explained above with respect to claims 13 and 22, the broadest reasonable interpretation of "[a] remote control device" is an apparatus that includes one or more components or devices. The Examiner's finding that Wouters' remote control device comprises a system of devices is consistent with the broadest reasonable interpretation of the claims. Since "[a] remote control device" can include more than one device, Zilog's arguments that Wouters' remote control unit 3 (i.e., single unit) does not include an RF receiver is not commensurate in scope with the limitations of claims 22 and 23. Pope's teaching against including an IR transmitter on a handset is irrelevant since the claim language does not require all the components to be included in a single remote control device.

For all these reasons, we find that Zilog has not sustained its burden of showing that the Examiner erred in rejecting claim 23 as unpatentable over Wouters and Pope.

Rejection of claims 1, 3-4 and 9 as unpatentable over Pope and McNair

Representative claim 1 is independent and recites "modulating said key code onto a carrier signal . . .". App. Br. 32.

Zilog argues that McNair does not teach modulating a key code onto a carrier signal. App. Br. 21.

The Examiner finds that Pope does not describe modulating a key code onto a carrier signal, but instead relies on McNair for describing modulation of a carrier signal. Final Rejection 6; Ans. 6, 15; citing McNair col. 2, ll. 61-65.

We agree that McNair does not describe modulating a key code, or any code, onto a carrier signal. McNair merely describes frequency modulation including frequency shift keying modulation. FF 10.

For this reason, we find that the Examiner erred in determining that claims 1, 3, 4 and 9 are unpatentable over Pope and McNair.

## Rejection of claim 2 as unpatentable over Pope, McNair and Goldstein

Claim 2 is dependent on and includes all of the limitations of claim 1. App. Br. 32. As applied by the Examiner, Goldstein does not make up for the deficiencies of the Pope and McNair references. For the same reasons as explained with respect to claim 1, we find that the Examiner has erred in determining that claim 2 is unpatentable over Pope, McNair and Goldstein. <u>Rejection of claims 5 and 10 as unpatentable over Pope, McNair and Teskey</u>

Claims 5 and 10 are directly or indirectly dependent on and include all of the limitations of claim 1. App. Br. 32-33. As applied by the Examiner, Teskey does not make up for the deficiencies of the Pope and McNair references. For the same reasons as explained with respect to claim 1, we find that the Examiner has erred in determining that claims 5 and 10 are unpatentable over Pope, McNair and Teskey.

#### Rejection of claim 6 as unpatentable over Pope, McNair and August

Claim 6 is dependent on and includes all of the limitations of claim 1. App. Br. 32. As applied by the Examiner, August does not make up for the deficiencies of the Pope and McNair references. For the same reasons as explained with respect to claim 1, we find that the Examiner has erred in determining that claim 6 is unpatentable over Pope, McNair and August. Rejection of claim 7 as unpatentable over Pope, McNair and Wouters

Claim 7 is dependent on and includes all of the limitations of claim 1. App. Br. 32. As applied by the Examiner, Wouters does not make up for the deficiencies of the Pope and McNair references. For the same reasons as explained with respect to claim 1, we find that the Examiner has erred in determining that claim 7 is unpatentable over Pope, McNair and Wouters. <u>Rejection of claim 8 as unpatentable over Pope, McNair, Wouters and August</u>

Claim 8 is dependent on and includes all of the limitations of claim 1. App. Br. 32. As applied by the Examiner, Wouters and August do not make up for the deficiencies of the Pope and McNair references. For the same reasons as explained with respect to claim 1, we find that the Examiner has erred in determining that claim 8 is unpatentable over Pope, McNair, Wouters and August.

#### New Ground of Rejection

The following is a quotation of 35 U.S.C. § 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a

> person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claim 1 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Pope in view of Graham.

Pope's description of transmitting appliance control codes (i.e., keystroke indicator) from handset 10, 50 (i.e., remote control) to base unit 12 (i.e., key code generator) in response to selection of the appliance control via keypad 30 meets the limitation of "receiving a keystroke indicator signal from a remote control device. . . ". FF 7. Pope's description that base unit (i.e., key code generator) processor 84 gets an infrared control code (i.e., key code) from memory 86 based on a received appliance control code (key stroke indicator signal) meets the limitation of "generating a key code within a key code generator device . . .". FF 8. Pope's description of base unit 12 (i.e., key code generator) transmitting infrared control code (i.e., key code) through outer window 36 to electrical appliances 14-22 meets the limitation of "transmitting said key code signal from said key code generator device". FF 9.

Although Pope does not describe modulating the keycode onto a carrier signal, attention is directed to Graham which describes modulating a digital code or binary code onto a carrier signal. FF 11. Graham describes that doing so offers the advantages of precluding unauthorized or accidental activation of a control associated with the receiving means and provides an exceptional degree of security and privacy. FFs 12-13. It would have been obvious to one with ordinary skill in the art at the time the invention was made to modify the method of Pope to include modulating the key code onto a carrier signal since doing so offers the advantages of precluding

unauthorized or accidental activation and provides an exceptional degree of security and privacy.

Zilog argues that Pope's appliance control codes transmitted by handset 10, 50 are not a keystroke indicator signal. App. Br. 20-21, Reply Br. 11-12. Zilog urges a narrow interpretation of the term "keystroke indicator signal" to mean an indication of a selected key while precluding a control code. App. Br. 20-21, Reply Br. 11-12. During prosecution, claims are subject to the broadest reasonable interpretation consistent with the specification. Zilog's narrow interpretation is inconsistent with its specification. Zilog's specification describes "[i]n one embodiment, the indicator of a pressed key is a keycode . . .". FF 1. Since Zilog's own specification indicates that the keystroke indicator can be a code (i.e. a key code), the finding that Pope's appliance control codes meet the limitation of a keystroke indicator signal is consistent with the broadest reasonable interpretation.

#### E. Decision

Upon consideration of the appeal, and for the reasons given herein, it is

ORDERED that the decision of the Examiner rejecting claims 13 and 22 under 35 U.S.C. § 102(e) as anticipated by Wouters is affirmed.

ORDERED that the decision of the Examiner rejecting claims 14-16, 19 and 24-26 under 35 U.S.C. § 102(e) as anticipated by Wouters is reversed.

ORDERED that the decision of the Examiner rejecting claim 18 under 35 U.S.C. § 103(a) as unpatentable over Wouters and Teskey is affirmed.

ORDERED that the decision of the Examiner rejecting claims 20-21 under 35 U.S.C. § 103(a) as unpatentable over Wouters and August reversed.

ORDERED that the decision of the Examiner rejecting claim 23 under 35 U.S.C. § 103(a) as unpatentable over Wouters and Pope is affirmed.

ORDERED that the decision of the Examiner rejecting claims 1, 3, 4 and 9 under 35 U.S.C. § 103(a) as unpatentable over Pope and McNair is reversed.

ORDERED that the decision of the Examiner rejecting claim 2 under 35 U.S.C. § 103(a) as unpatentable over Pope, McNair and Goldstein is reversed.

ORDERED that the decision of the Examiner rejecting claims 5 and 10 under 35 U.S.C. § 103(a) as unpatentable over Pope, McNair and Teskey is reversed.

ORDERED that the decision of the Examiner rejecting claim 6 under 35 U.S.C. § 103(a) as unpatentable over Pope, McNair and August is reversed.

ORDERED that the decision of the Examiner rejecting claim 7 under 35 U.S.C. § 103(a) as unpatentable over Pope, McNair and Wouters is reversed.

ORDERED that the decision of the Examiner rejecting claim 8 under 35 U.S.C. § 103(a) as unpatentable over Pope, McNair, Wouters and August is reversed.

This decision contains a new ground of rejection pursuant to 37 C.F.R. § 41.50(b). 37 C.F.R. § 41.50(b) provides "[a] new ground of rejection pursuant to this paragraph shall not be considered final for judicial review."

37 CFR § 41.50(b) also provides that the appellant, <u>WITHIN TWO</u> <u>MONTHS FROM THE DATE OF THE DECISION</u>, must exercise one of the following two options with respect to the new ground of rejection to avoid termination of the appeal as to the rejected claims:

(1) *Reopen prosecution*. Submit an appropriate amendment of the claims so rejected or new evidence relating to the claims so rejected, or both, and have the matter reconsidered by the examiner, in which event the proceeding will be remanded to the examiner. . . .

(2) *Request rehearing*. Request that the proceeding be reheard under § 41.52 by the Board upon the same record. . . .

## AFFIRMED IN-PART New Ground of Rejection - 37 C.F.R. § 41.50(b)

#### AMENDMENT

Dear Sir:

In response to the decision of the Board of Patent Appeals and Interferences dated November 14, 2008, Applicant hereby reopens prosecution by submitting this Amendment. Applicant requests the Examiner to amend the above-identified application as follows.

There are no amendments to the specification in this Amendment.

Amendments to the Claims are reflected in the listing of claims that begins on page 2 of this Amendment.

There are no amendments to the drawings in this Amendment.

The **Remarks** begin on page 8 of this Amendment.

#### Amendments to the Claims:

This listing of claims replaces all prior versions and listings of claims in the application.

#### Listing of Claims

1. (currently amended): A method comprising:

(a) receiving a keystroke indicator signal from a remote control device, wherein the keystroke indicator signal indicates a key on said remote control device that a user has selected;

(b) generating a key code within a key code generator device <u>using the</u> <u>keystroke indictor signal;</u>

(c) modulating said key code onto a carrier signal, thereby generating a key code signal; and

(d) transmitting said key code signal from said key code generator device.

2. (original): The method of Claim 1, wherein said key code signal is transmitted in (d) from said key code generator device to said remote control device.

3. (original): The method of Claim 1, wherein said key code signal is transmitted in (d) from said key code generator device to an electronic consumer device.

4. (original): The method of Claim 1, wherein said key code consists of a binary number.

5. (original): The method of Claim 1, wherein said key code comprises a binary number and timing information, and wherein said timing information defines how said binary number is modulated in (c) onto said carrier signal.

6. (original): The method of Claim 1, further comprising:

(e) pressing a power-on key of said remote control device causing said remote control device to transmit said keystroke indicator signal that is received in (a), wherein said key code signal transmitted in (d) is received onto an electronic consumer device, and wherein said pressing in (e) causes said electronic consumer device to turn on.

7. (original): The method of Claim 1, wherein said carrier signal is in a radio frequency band, wherein said key code signal is received by said remote control device, and wherein said method further comprises:

(e) modulating said key code onto a second carrier signal, thereby generating a second key code signal, said modulating being performed on said remote control device wherein said second carrier signal is in an infrared frequency band; and

(f) transmitting said second key code signal from said remote control device to an electronic consumer device.

8. (original): The method of Claim 7, further comprising:

(g) pressing a power-on key of said remote control device causing said remote control device to transmit said keystroke indicator signal that is received in (a), wherein the pressing in (g) causes said electronic consumer device to turn on.

9. (original): The method of Claim 1, wherein said key code generated in (b) is part of a codeset, and wherein said remote control device does not store said codeset.

10. (original): The method of Claim 9, wherein said codeset comprises timing information and a plurality of key codes, and wherein said timing information describes a digital one and a digital zero.

11. (previously presented): A method comprising:

(a) receiving a keystroke indicator signal from a remote control device;

(b) generating a key code within a key code generator device;

(c) modulating said key code onto a carrier signal, thereby generating a key code signal; and

(d) transmitting said key code signal from said key code generator device, wherein a codeset comprises a plurality of key codes, each one of said plurality of key codes corresponding to a function of an electronic consumer device, and wherein no more than a single one of said plurality of key codes is present on said remote control device at any given time.

12. (original): The method of Claim 11, wherein said function of said electronic consumer device is taken from the group consisting of: power on, power off, channel advance, channel back, volume up, volume down, cursor up, cursor down, cursor right, cursor left, select, play, record, stop, forward, back and pause.

13. (currently amended): A remote control device comprising:

a receiver that receives a first key code signal, wherein said first key code signal is generated by modulating a key code onto a first carrier signal, said first carrier signal falling within a radio frequency band;

a transmitter that transmits a second key code signal, wherein said second key code signal is generated by modulating said key code onto a second carrier signal, said second carrier signal falling within an infrared frequency band; and

a keypad that includes a key that corresponds to said key code, wherein said key code corresponds to a function of an electronic consumer device, and wherein said remote control device is contained within a single structure.

14. (original): The device of Claim 13, wherein said key code corresponds to a second function of a second electronic consumer device, as well as to said function of said electronic consumer device.

15. (original): The device of Claim 14, wherein said transmitter transmits a third key code signal, and wherein said third key code signal is generated by modulating said key code onto a third carrier signal.

16. (original): The device of Claim 14, wherein said key code comprises a first binary number and a second binary number, said first binary number corresponding to said function, and said second binary number corresponding to said second function.

17. (previously presented): A device comprising:

a receiver that receives a first key code signal, wherein said first key code signal is generated by modulating a key code onto a first carrier signal, said first carrier signal falling within a radio frequency band;

a transmitter that transmits a second key code signal, wherein said second key code signal is generated by modulating said key code onto a second carrier signal, said second carrier signal falling within an infrared frequency band; and

a keypad that includes a key that corresponds to said key code, wherein said key code corresponds to a function of an electronic consumer device, wherein said keypad includes a second key that corresponds to a second key code, wherein a third key code signal is generated by modulating said second key code onto a third carrier signal, wherein said third key code signal is received by said receiver, and wherein both said first key code and said second key code are not both stored in said device at the same time.

18. (original): The device of Claim 13, wherein a codeset comprises timing information and a plurality of key codes, wherein each of said plurality of key codes corresponds to a different function of said electronic consumer device, wherein said key code is a binary number, and wherein said timing information defines how said binary number is modulated onto said first carrier signal.

19. (previously presented): A system comprising:

a key code generator device that generates a first key code and a second key code, wherein a codeset is stored on said key code generator device, said codeset including said first key code and said second key code, wherein said first key code corresponds to a selected function of a first electronic consumer device, and wherein said second key code corresponds to said selected function of a second electronic consumer device; and

means for relaying said first key code and said second key code from said key code generator device through a remote control device to said first electronic consumer device and to said second electronic consumer device without simultaneously storing both said first key code and said second key code on said remote control device.

20. (original): The system of Claim 19, wherein said selected function is taken from the group consisting of: power on, power off, channel advance, channel back, volume up, volume down, cursor up, cursor down, cursor right, cursor left, select, play, record, stop, forward, back and pause.

21. (original): The system of Claim 19, wherein said selected function is power on, and wherein said system automatically determines when said first electronic consumer device powers on.

22. (currently amended): A remote control device, comprising: a keypad;

an RF receiver;

an IR transmitter; and

means for receiving a key code from said RF receiver and for sending said key code to said IR transmitter such that said key code is modulated onto an IR carrier signal, said IR carrier signal with said key code modulated thereon being transmitted from said remote control device by said IR transmitter, wherein said remote control device by said IR transmitter.

23. (original): The remote control device of Claim 22, wherein said key code is not stored on said remote control device immediately prior to said means receiving the key code.

24. (original): The remote control device of Claim 22, wherein said means is a microcontroller.

25. (previously presented): A method comprising:

(a) receiving a keystroke indicator signal from a remote control device;

(b) using said keystroke indicator signal to generate a key code, wherein a key code generator device generates said key code;

(c) modulating said key code onto a carrier signal and thereby generating a key code signal; and

(d) transmitting said key code signal from said key code generator device to said remote control device, wherein said remote control device transmits said key code signal to an electronic consumer device.

26. (previously presented): The method of Claim 25, wherein said key code generated in (b) is part of a codeset, and wherein said codeset is not stored on said remote control device.

#### **REMARKS**

Reconsideration and allowance of claims 1, 13, 18 and 22-23 are respectfully requested.

Claims 1-10, 13-16, and 18-26 were the subject of the recent appeal. Claims 11-12 and 17 were allowed before the appeal. In the decision of the Board of Patent Appeals and Interferences (the "Board") dated November 14, 2008, the rejections of claims 1-10, 14-16, 19-21 and 24-26 were reversed, and the rejections of claims 13, 18 and 22-23 was sustained. In the present amendment, claims 1, 13 and 22 are amended. After entry of the amendment, claims 1-26 are pending.

#### I. <u>Claims 13 and 22</u>

In the decision of the Board, the Examiner's rejection of claims 13 and 22 was sustained. (Decision, p. 7, lines 3-5) As a basis for sustaining the Examiner's rejection, the decision states, "The claim does not require the components to be contained or housed within a single structure. Therefore, the Examiner's finding that <u>Wouters' system of devices</u> meets Zilog's '[a] remote <u>control device</u>' is consistent with the broadest reasonable interpretation of <u>a</u> remote control device." (Decision, p. 6, line 22 - p. 7, line 2) (emphasis added)

Applicant amends claims 13 and 22 to recite that "said remote control device is contained within a single structure". Thus, the recited "a remote control device" cannot reasonably be interpreted as reading on Wouters' system of devices. Allowance of claims 13 and 22 is requested.

#### II. Dependent claim 18

Claim 18 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Wouters in view of Teskey (10/19/06 Office Action, p. 10, lines 14-15). The combination of Wouters and Teskey does not form the basis for a valid rejection of claim 18 under § 103(a) for the same reasons explained above with relation to

claim 13. Neither Wouters nor Teskey discloses a single structure with a keypad that both transmits an IR signal and receives an RF signal. Thus, claim 18 is allowable for at least the same reasons for which claim 13 is allowable. Allowance of claim 18 is requested.

#### III. Dependent claim 23

Claim 23 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Wouters in view of Pope (10/19/06 Office Action, p. 11, lines 18-19). Claim 23 depends from claim 22 and incorporates the limitations of claim 22. The combination of Wouters and Pope does not form the basis for a valid rejection of claim 23 under § 103(a) for the same reasons explained above with relation to claim 22. Neither Wouters nor Pope teaches a single structure with a keypad, a radio frequency receiver and an infrared transmitter. Pope even teaches against including an IR transmitter on the handset. Pope explains:

"One advantage of having the infrared transmitter attached to the base unit 12 is that the base unit 12 can be typically powered by house current. Since no battery is used, the infrared transmitter can draw more power than is used in battery-type systems. For example, if a button is continuously pressed in a battery-type system, in order to conserve power the infrared signal is not continuously sent, but is sent intermittently. The base unit 12 connected to AC power need not be limited in this fashion. Additionally, it is also possible to have the base unit 12 supply a greater amount of power to the infrared transmitter to transmit a greater amount of infrared energy. In this manner, it may be possible for the infrared bulb to not be focused directly towards the appliance" (Pope, col. 3, lines 46-60) (emphasis added).

Thus, claim 23 is allowable for at least the same reasons for which claim 22 is allowable. Allowance of claim 23 is requested.

#### IV. New rejection of Claim 1

In the Decision dated November 14, 2008, the Board presents a new ground of rejection of claim 1. Claim 1 is rejected under 35 U.S.C. § 103(a) as

being unpatentable over Pope in view of Graham. (Decision, p. 15, lines 4-5).

The Board bases its new rejection of claim 1 on a broad interpretation of the claim term "keystroke indicator signal". The Board states, "Zilog urges a narrow interpretation of the term 'keystroke indicator signal' to mean an indication of a selected key while precluding a control code." (Decision, p. 16, lines 5-7). Instead, the Board interpreted the recited "keystroke indicator signal" to have a broad meaning that covers Pope's appliance control codes.

Applicants overcomes the new rejection by amending claim 1 explicitly to limit the scope of the term "keystroke indictor signal" to indicate a key on a remote control device that a user has selected. The appliance control codes of Pope are not keystroke indicator signals that indicate the key on a remote control device that a user has selected. Thus, amended claim 1 is not rendered unpatentable by the combination of Pope in view of Graham.

#### V. Conclusion

In view of the foregoing amendments and remarks, Applicant respectfully submits that the entire application (claims 1-26 are pending) is in condition for allowance. Applicant respectfully requests that a timely Notice of Allowance be issued in this case. If the Examiner would like to discuss any aspect of this application, the Examiner is requested to contact the undersigned at (925) 550-5067.

I hereby certify that this correspondence is being deposited with the United States Postal Service as First Class Mail in an envelope addressed to: Mail Stop Amendment, Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.

Application/Control Number: 10/737,029 Art Unit: 2612

#### **DETAILED ACTION**

This action is responsive to communication filed on January 09, 2009.

#### **Response to Amendment**

The amendment of claims 13 and 22 is not entered because the prosecution of these

claims is closed ..

#### Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all

obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1 are rejected under 35 U.S.C. 103(a) as being unpatentable over Pope US Patent

5963624 in view Graham US Patent 4005428.

Regarding claim 1, Pope teaches transmitting appliance control codes (i.e., keystroke indicator) from handset 10, 50 (i.e., remote near control) to base unit 12 (i.e., key code generator). The base unit (12) which the examiner considers as the key code generator therefore receives the keystroke indicator indicating a key on the remote control. Pope teaches generating a key code within a key code generator device using the keystroke indicator signal by the base unit processor retrieving an infrared control code from memory (86) base on the appliance control code (keystroke indicator signal) and transmitting the key code from the key code generator device to the appliance (col. 3 lines 35-40). Pope is however silent on teaching modulating the key code onto a carrier signal. Graham in an analogous art discloses modulating a digital code or binary code onto a carrier signal (col. 2 lines 7-21). Graham describes that doing

Application/Control Number: 10/737,029 Art Unit: 2612

so offers the advantages of precluding unauthorized or accidental activation of a control associated with the receiving means and provides an exceptional degree of security and privacy (abstract).

It would have been obvious to one with ordinary skill in the art at the time the invention was made to modify the method of Pope to include modulating the key code onto a carrier signal since doing so offers the advantages of precluding

Claims 13, 18, 22, 23 stand rejected based on the decision by the Board of Patent Appeal and Interference.

#### Allowable Subject Matter

Claims 11-12, 17, 19-21, 24, 25-26 are allowed.

Claims 2-10, 14-16 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

#### Conclusion

THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period

# Application/Control Number: 10/737,029 Art Unit: 2612

will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to VERNAL U. BROWN whose telephone number is (571)272-3060. The examiner can normally be reached on 8:30-7:00 Monday-Thursday.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Brian Zimmerman can be reached on 571-272-3059. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

# AMENDMENT

Dear Sir:

In response to the final office action dated March 11, 2009 ("Office Action"), Applicant responds as follows and requests the Examiner to amend the above-identified application as follows.

There are no amendments to the specification in this Amendment.

Amendments to the Claims are reflected in the listing of claims that

begins on page 2 of this Amendment.

There are no amendments to the drawings in this Amendment.

The **Remarks** begin on page 9 of this Amendment.

05/12/2009 SDENBOB3 00000048 10737029 01 FC:1201 220.00 OP

#### Amendments to the Claims:

This listing of claims replaces all prior versions and listings of claims in the application.

## Listing of Claims

1. (canceled)

2. (currently amended): The method of Claim 1, wherein said key code signal is transmitted in (d) from said key code generator device<u>A method comprising:</u>

(a) receiving a keystroke indicator signal from a remote control device, wherein the keystroke indicator signal indicates a key on said remote control device that a user has selected;

(b) generating a key code within a key code generator device using the keystroke indictor signal;

(c) modulating said key code onto a carrier signal, thereby generating a key code signal; and

(d) transmitting said key code signal from said key code generator device to said remote control device.

3. (currently amended): The method of Claim 1, wherein said key code signal is transmitted in (d) from said key code generator device<u>A method comprising:</u>

(a) receiving a keystroke indicator signal from a remote control device, wherein the keystroke indicator signal indicates a key on said remote control device that a user has selected;

(b) generating a key code within a key code generator device using the keystroke indictor signal;

(c) modulating said key code onto a carrier signal, thereby generating a key code signal; and

(d) transmitting said key code signal from said key code generator device to an electronic consumer device.

4. (currently amended): The method of Claim [[1]]2, wherein said key code consists of a binary number.

5. (currently amended): The method of Claim [[1]]2, wherein said key code comprises a binary number and timing information, and wherein said timing information defines how said binary number is modulated in (c) onto said carrier signal.

6. (currently amended): The method of Claim [[1]]3, further comprising:

(e) pressing a power-on key of said remote control device causing said remote control device to transmit said keystroke indicator signal that is received in (a), wherein said key code signal transmitted in (d) is received onto [[an]]said electronic consumer device, and wherein said pressing in (e) causes said electronic consumer device to turn on.

7. (currently amended): The method of Claim [[1]]2, wherein said carrier signal is in a radio frequency band, wherein said key code signal is received by said remote control device, and wherein said method further comprises:

(e) modulating said key code onto a second carrier signal, thereby generating a second key code signal, said modulating being performed on said remote control device wherein said second carrier signal is in an infrared frequency band; and

(f) transmitting said second key code signal from said remote control device to an electronic consumer device.

8. (original): The method of Claim 7, further comprising:

(g) pressing a power-on key of said remote control device causing said remote control device to transmit said keystroke indicator signal that is received in (a), wherein the pressing in (g) causes said electronic consumer device to turn on.

9. (currently amended): The method of Claim [[1]]2, wherein said key code generated in (b) is part of a codeset, and wherein said remote control device does not store said codeset.

10. (original): The method of Claim 9, wherein said codeset comprises timing information and a plurality of key codes, and wherein said timing information describes a digital one and a digital zero.

11. (previously presented): A method comprising:

(a) receiving a keystroke indicator signal from a remote control device;

(b) generating a key code within a key code generator device;

(c) modulating said key code onto a carrier signal, thereby generating a key code signal; and

(d) transmitting said key code signal from said key code generator device, wherein a codeset comprises a plurality of key codes, each one of said plurality of key codes corresponding to a function of an electronic consumer device, and wherein no more than a single one of said plurality of key codes is present on said remote control device at any given time.

12. (original): The method of Claim 11, wherein said function of said electronic consumer device is taken from the group consisting of: power on, power off, channel advance, channel back, volume up, volume down, cursor up, cursor down, cursor right, cursor left, select, play, record, stop, forward, back and pause.

13. (canceled)

14. (currently amended): The device of Claim 13, A remote control device comprising:

a receiver that receives a first key code signal, wherein said first key code signal is generated by modulating a key code onto a first carrier signal, said first carrier signal falling within a radio frequency band;

a transmitter that transmits a second key code signal, wherein said second key code signal is generated by modulating said key code onto a second carrier signal, said second carrier signal falling within an infrared frequency band; and

<u>a keypad that includes a key that corresponds to said key code, wherein</u> <u>said key code corresponds to a function of an electronic consumer device, and</u> wherein said key code corresponds to a second function of a second electronic consumer device, as well as to said function of said electronic consumer device.

15. (original): The device of Claim 14, wherein said transmitter transmits a third key code signal, and wherein said third key code signal is generated by modulating said key code onto a third carrier signal.

16. (original): The device of Claim 14, wherein said key code comprises a first binary number and a second binary number, said first binary number corresponding to said function, and said second binary number corresponding to said second function.

17. (previously presented): A device comprising:

a receiver that receives a first key code signal, wherein said first key code signal is generated by modulating a key code onto a first carrier signal, said first carrier signal falling within a radio frequency band;

a transmitter that transmits a second key code signal, wherein said second key code signal is generated by modulating said key code onto a second carrier signal, said second carrier signal falling within an infrared frequency band; and

a keypad that includes a key that corresponds to said key code, wherein said key code corresponds to a function of an electronic consumer device, wherein said keypad includes a second key that corresponds to a second key code, wherein a third key code signal is generated by modulating said second key code onto a third carrier signal, wherein said third key code signal is received by said receiver, and wherein both said first key code and said second key code are not both stored in said device at the same time.

18. (canceled)

19. (previously presented): A system comprising:

a key code generator device that generates a first key code and a second key code, wherein a codeset is stored on said key code generator device, said codeset including said first key code and said second key code, wherein said first key code corresponds to a selected function of a first electronic consumer device, and wherein said second key code corresponds to said selected function of a second electronic consumer device; and

means for relaying said first key code and said second key code from said key code generator device through a remote control device to said first electronic consumer device and to said second electronic consumer device without simultaneously storing both said first key code and said second key code on said remote control device.

20. (original): The system of Claim 19, wherein said selected function is taken from the group consisting of: power on, power off, channel advance, channel

back, volume up, volume down, cursor up, cursor down, cursor right, cursor left, select, play, record, stop, forward, back and pause.

21. (original): The system of Claim 19, wherein said selected function is power on, and wherein said system automatically determines when said first electronic consumer device powers on.

Claims 22 – 23 (canceled)

24. (currently amended): The remote control device of Claim 22, A remote control device, comprising:

<u>a keypad;</u>

an RF receiver;

an IR transmitter; and

means for receiving a key code from said RF receiver and for sending said key code to said IR transmitter such that said key code is modulated onto an IR carrier signal, said IR carrier signal with said key code modulated thereon being transmitted from said remote control device by said IR transmitter, wherein said means is a microcontroller.

25. (previously presented): A method comprising:

(a) receiving a keystroke indicator signal from a remote control device;

(b) using said keystroke indicator signal to generate a key code, wherein a key code generator device generates said key code;

(c) modulating said key code onto a carrier signal and thereby generating a key code signal; and

(d) transmitting said key code signal from said key code generator device to said remote control device, wherein said remote control device transmits said key code signal to an electronic consumer device.

26. (previously presented): The method of Claim 25, wherein said key code generated in (b) is part of a codeset, and wherein said codeset is not stored on said remote control device.

27. (new): The method of Claim 3, wherein said key code consists of a binary number.

28. (new): The method of Claim 3, wherein said key code comprises a binary number and timing information, and wherein said timing information defines how said binary number is modulated in (c) onto said carrier signal.

29. (new): The method of Claim 3, wherein said key code generated in (b) is part of a codeset, and wherein said remote control device does not store said codeset.

30. (new): The method of Claim 29, wherein said codeset comprises timing information and a plurality of key codes, and wherein said timing information describes a digital one and a digital zero.

.

÷

### REMARKS

Before entry of this amendment, claims 1-26 were pending. In the Office Action, claims 11-12, 17, 19-21 and 24-26 were allowed, claims 2-10 and 14-16 were objected to, and claims 1, 13, 18 and 22-23 were rejected. In the present amendment, claims 1, 13, 18 and 22-23 are canceled, claims 2-7, 9, 14 and 24 are amended, and claims 27-30 are added. After entry of the amendment, claims 2-12, 14-17, 19-21 and 24-30 are pending.

## I. Rejection of claims 1, 13, 18 and 22-23

Claims 1, 13, 18 and 22-23 are finally rejected in the Office Action. Applicant cancels claims 1, 13, 18 and 22-23 in order to present these claims for examination in a continuation application.

#### II. New dependent claims 41-45

Applicant adds new claims 27-30, each of which depends from allowable base claim 3.

#### III. Conclusion

In view of the foregoing amendments and remarks, Applicant respectfully submits that the entire application (claims 2-12, 14-17, 19-21 and 24-30 are pending) is in condition for allowance. Applicant respectfully requests that a timely Notice of Allowance be issued in this case. If the Examiner would like to

discuss any aspect of this application, the Examiner is requested to contact the undersigned at (925) 550-5067.

I hereby certify that this correspondence is being deposited with the United States Postal Service as First Class Mail in an envelope addressed to: Mail Stop AF, Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.

TITLE OF INVENTION: RELAYING KEY CODE SIGNALS THROUGH A REMOTE CONTROL DEVICE

APPLN. TYPE	SMALL ENTITY	ISSUE FEE DUE	PUBLICATION FEE DUE	PREV. PAID ISSUE FEE	TOTAL FEE(S) DUE	DATE DUE
nonprovisional	NO	\$1510	\$0	\$0	\$1510	09/28/2009

THE APPLICATION IDENTIFIED ABOVE HAS BEEN EXAMINED AND IS ALLOWED FOR ISSUANCE AS A PATENT. <u>PROSECUTION ON THE MERITS IS CLOSED</u>. THIS NOTICE OF ALLOWANCE IS NOT A GRANT OF PATENT RIGHTS. THIS APPLICATION IS SUBJECT TO WITHDRAWAL FROM ISSUE AT THE INITIATIVE OF THE OFFICE OR UPON PETITION BY THE APPLICANT. SEE 37 CFR 1.313 AND MPEP 1308.

THE ISSUE FEE AND PUBLICATION FEE (IF REQUIRED) MUST BE PAID WITHIN <u>THREE MONTHS</u> FROM THE MAILING DATE OF THIS NOTICE OR THIS APPLICATION SHALL BE REGARDED AS ABANDONED. <u>THIS STATUTORY PERIOD CANNOT BE EXTENDED</u>. SEE 35 U.S.C. 151. THE ISSUE FEE DUE INDICATED ABOVE DOES NOT REFLECT A CREDIT FOR ANY PREVIOUSLY PAID ISSUE FEE IN THIS APPLICATION. IF AN ISSUE FEE HAS PREVIOUSLY BEEN PAID IN THIS APPLICATION (AS SHOWN ABOVE), THE RETURN OF PART B OF THIS FORM WILL BE CONSIDERED A REQUEST TO REAPPLY THE PREVIOUSLY PAID ISSUE FEE TOWARD THE ISSUE FEE NOW DUE.

#### HOW TO REPLY TO THIS NOTICE:

I. Review the SMALL ENTITY status shown above.

If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:	If the SMALL ENTITY is shown as NO:
A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.	A. Pay TOTAL FEE(S) DUE shown above, or
B. If the status above is to be removed, check box 5b on Part B - Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and twice the amount of the ISSUE FEE shown above, or	B. If applicant claimed SMALL ENTITY status before, or is now claiming SMALL ENTITY status, check box 5a on Part B - Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and 1/2 the ISSUE FEE shown above.

II. PART B - FEE(S) TRANSMITTAL, or its equivalent, must be completed and returned to the United States Patent and Trademark Office (USPTO) with your ISSUE FEE and PUBLICATION FEE (if required). If you are charging the fee(s) to your deposit account, section "4b" of Part B - Fee(s) Transmittal should be completed and an extra copy of the form should be submitted. If an equivalent of Part B is filed, a request to reapply a previously paid issue fee must be clearly made, and delays in processing may occur due to the difficulty in recognizing the paper as an equivalent of Part B.

III. All communications regarding this application must give the application number. Please direct all communications prior to issuance to Mail Stop ISSUE FEE unless advised to the contrary.

IMPORTANT REMINDER: Utility patents issuing on applications filed on or after Dec. 12, 1980 may require payment of maintenance fees. It is patentee's responsibility to ensure timely payment of maintenance fees when due.

### PART B - FEE(S) TRANSMITTAL

## Determination of Patent Term Adjustment under 35 U.S.C. 154 (b)

(application filed on or after May 29, 2000)

The Patent Term Adjustment to date is 1076 day(s). If the issue fee is paid on the date that is three months after the mailing date of this notice and the patent issues on the Tuesday before the date that is 28 weeks (six and a half months) after the mailing date of this notice, the Patent Term Adjustment will be 1076 day(s).

If a Continued Prosecution Application (CPA) was filed in the above-identified application, the filing date that determines Patent Term Adjustment is the filing date of the most recent CPA.

Applicant will be able to obtain more detailed information by accessing the Patent Application Information Retrieval (PAIR) WEB site (http://pair.uspto.gov).

Any questions regarding the Patent Term Extension or Adjustment determination should be directed to the Office of Patent Legal Administration at (571)-272-7702. Questions relating to issue and publication fee payments should be directed to the Customer Service Center of the Office of Patent Publication at 1-(888)-786-0101 or (571)-272-4200.

The projected patent number and issue date are specified above.

## Determination of Patent Term Adjustment under 35 U.S.C. 154 (b)

(application filed on or after May 29, 2000)

The Patent Term Adjustment is 1076 day(s). Any patent to issue from the above-identified application will include an indication of the adjustment on the front page.

If a Continued Prosecution Application (CPA) was filed in the above-identified application, the filing date that determines Patent Term Adjustment is the filing date of the most recent CPA.

Applicant will be able to obtain more detailed information by accessing the Patent Application Information Retrieval (PAIR) WEB site (http://pair.uspto.gov).

Any questions regarding the Patent Term Extension or Adjustment determination should be directed to the Office of Patent Legal Administration at (571)-272-7702. Questions relating to issue and publication fee payments should be directed to the Customer Service Center of the Office of Patent Publication at (571)-272-4200.

APPLICANT(s) (Please see PAIR WEB site http://pair.uspto.gov for additional applicants):

Daniel SauFu Mui, San Jose, CA;

# REQUEST FOR CERTIFICATE OF CORRECTION of Correction

Pursuant to 37 CFR 1.322, Applicant requests that the Director issue a certificate of correction to correct a mistake in the printing of the above-identified patent incurred through the fault of the Patent Office. The mistake in the printing of claim 2 is apparent when the attached page of USP 7,589,642 (marked to show the mistake) is compared to the attached page of the Listing of Claims that was submitted with an amendment on May 7, 2009.

The requested correction is submitted on the attached Certificate of Correction form, PTO/SB/44.

I hereby certify that this correspondence is being deposited with the United States Postal Service as First Class Mail in an envelope addressed to: ATTN: Certificate of Correction Branch, Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450. Bν

Date of Deposit: September 21, 2009

arien K. Wallace

Respectfully submitted,

nin K. Wallace

MAILING ADDRESS OF SENDER (Please do not use customer number below):

Darien K. Wallace, Imperium Patent Works LLP P.O. Box 607 Pleasanton, CA 94566

This collection of information is required by 37 CFR 1.322, 1.323, and 1.324. The information is required to obtain or retain a benefit by the public which is to file (and by the USPTO to process) an application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.14. This collection is estimated to take 1.0 hour to complete, including gathering, preparing, and submitting the completed application form to the USPTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, VA 22313-1450. DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. SEND TO: Attention Certificate of Corrections Branch, Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.

If you need assistance in completing the form, call 1-800-PTO-9199 and select option 2.

US 7,589,642 B1

11, are automatically transmitted from learning remote control device 11 in the form of RF signals to key code generator device 12. Key code generator device 12 in turn communicates the captured strings of timing information through coaxial cable 36 and network 38 to database of codesets 39. 5 Personnel maintaining database of codesets 39 then analyze the timing information and generate a codeset that describes the key codes captured by learning remote control device 11. In this way, a new codeset containing key data, systems codes and timing information is added to database of codesets 39. 10 Rather than storing the information as a new codeset that includes separate key codes and timing information, the information for each keystroke can be stored in database of codesets 39 in the form of interval times.

A single system 10 is therefore described that can support 15 numerous different types of electronic consumer devices that can use multiple different codesets. The remote control device 11 of the system need not include a large memory and stored many codesets. Rather, the remote control device 11 need only relay individual key codes. Remote control device 20 11 can therefore be a relatively inexpensive device that includes only a small amount of memory. In addition to requiring only a small amount of memory, the very same remote control device 11 can control an electronic consumer device that uses a codeset or protocol that was not in existence 25 at the time the remote control device 11 was delivered to the user. The amount of writable memory (for example, random access memory (RAM) or flash memory) on the remote control device 11 may be so little that it may not be adequate to store a conventional codeset. The bulk of the memory of the 30 remote control device 11 may be relatively inexpensive maskprogrammable read only memory (ROM). By reducing the amount of writable memory on remote control device 11, the cost of remote control device 11 is reduced.

Although the present invention has been described in con- 35 nection with certain specific embodiments for instructional purposes, the present invention is not limited thereto. Although the method is described above in connection with an inexpensive remote control device whose primary purpose is to control an electronic consumer device, the method can be 40 employed in connection with other types of devices. Due to the limited amount of memory and intelligence required of the remote control device in the present method, the functionality of remote control device 11 can be incorporated into an RF-enabled device (such as a cell phone or RF-enabled per- 45 sonal digital assistant (PDA) or RE-enabled wrist watch or RF-enabled keyboard) without significantly increasing the cost of the device. The first carrier signal used to communicate between the remote control device and the key code carrier signal used to communicate between the remote control device and the electronic consumer device need not be an IR signal. Both the first and second carrier signals can be the same type of signals, for example IR signals. The key code generator device can transmit key codes to the electronic 55 consumer device to be controlled via a hardwired connection rather than a wireless link. The type of key code signal relayed through the remote control device is not limited to any particular protocol.

Although key code generator device 12 is a set-top box in 60 the embodiment of FIG. 1 above, in other embodiments the key code generator device 12 is another type of electronic consumer device such as, for example, a television, a sterco radio, a digital video disk player, a video cassette recorder, a personal computer, a set-top cable television box or a set-top 65 satellite box. Although the keystroke indicator signal can be an indication of a pressed key where there is a one-to-one

10

relationship between the key and a function to be performed, in other embodiments a keystroke indicator signal indicates a selected function that is not associated with a specific key on the remote control device. For example, a function can be selected choosing a function from a menu that is displayed on the remote control device. Accordingly, various modifications, adaptations, and combinations of various features of the described embodiments can be practiced without departing from the scope of the invention as set forth in the claims.

What is claimed is:

- 1. A method comprising:
- (a) receiving a keystroke indicator signal from a remote control device, wherein the keystroke indicator signal indicates a key on said remote control device that a user has selected;
- (b) generating a key code within a key code generator device using the keystroke indictor signal;
- (c) modulating said key code onto a carrier signal, thereby generating a key code signal; and
- (d) transmitting said key code signal from said key code generator device to said remote control device.
- 2. A method comprising:
- (a) receiving a keystroke indicator signal from a remote control device, wherein the keystroke indicator signal indicates a keyson said remote control device that a user has selected;
- (b) generating a key code within a key code generator device using the keystroke indictor signal;
- (c) modulating said key code onto a carrier signal, thereby generating a key code signal; and
- (d) transmitting said key code signal from said key code generator device to an electronic consumer device.

3. The method of claim 1, wherein said key code consists of a binary number.

4. The method of claim 1, wherein said key code comprises a binary number and timing information, and wherein said timing information defines how said binary number is modulated in (c) onto said carrier signal.

5. The method of claim 2, further comprising:

(e) pressing a power-on key of said remote control device causing said remote control device to transmit said keystroke indicator signal that is received in (a), wherein said key code signal transmitted in (d) is received onto said electronic consumer device, and wherein said pressing in (e) causes said electronic consumer device to turn on.

6. The method of claim 1, wherein said carrier signal is in a radio frequency band, wherein said key code signal is generator device need not be an RF signal, and the second 50 received by said remote control device, and wherein said method further comprises:

- (e) modulating said key code onto a second carrier signal, thereby generating a second key code signal, said modulating being performed on said remote control device wherein said second carrier signal is in an infrared frequency band; and
- (f) transmitting said second key code signal from said remote control device to an electronic consumer device.

7. The method of claim 6, further comprising:

(g) pressing a power-on key of said remote control device causing said remote control device to transmit said keystroke indicator signal that is received in (a), wherein the pressing in (g) causes said electronic consumer device to turn on.

8. The method of claim 1, wherein said key code generated in (b) is part of a codeset, and wherein said remote control device does not store said codeset.

<u>Trials@uspto.gov</u> 571-272-7822 Paper 9 Entered: December 18, 2014

### UNITED STATES PATENT AND TRADEMARK OFFICE

### BEFORE THE PATENT TRIAL AND APPEAL BOARD

### UNIVERSAL REMOTE CONTROL, INC., Petitioner,

v.

### UNIVERSAL ELECTRONICS, INC.,<sup>1</sup> Patent Owner.

Case IPR2014-01082 Patent 7,589,642 B1

Before HOWARD B. BLANKENSHIP, SALLY C. MEDLEY, and LYNNE E. PETTIGREW, *Administrative Patent Judges*.

PETTIGREW, Administrative Patent Judge.

DECISION Denying Institution of *Inter Partes* Review 37 C.F.R. § 42.108

<sup>1</sup> Patent Owner represents that the owner of the patent and real party-ininterest is Universal Electronics, Inc. Paper 4. Office assignment records indicate, however, that UEI Cayman, Inc. is the owner of the patent. Patent Owner should update Office assignment records to be consistent with its representations made in Paper 4 of this proceeding.

### I. INTRODUCTION

Petitioner, Universal Remote Control, Inc., filed a Petition for *inter partes* review of claims 2, 5, 22, and 23 of U.S. Patent No. 7,589,642 B1 (Ex. 1001, "the '642 patent"). Paper 2 ("Pet."). Patent Owner, Universal Electronics, Inc., filed a Preliminary Response. Paper 8 ("Prelim. Resp."). We have jurisdiction under 35 U.S.C. § 314(a), which provides that an *inter partes* review may not be instituted "unless . . . the information presented in the petition . . . and any response . . . shows that there is a reasonable likelihood that the petitioner would prevail with respect to at least 1 of the claims challenged in the petition."

Upon consideration of the Petition and the Preliminary Response, we conclude the information presented does not show there is a reasonable likelihood that Petitioner would prevail in establishing the unpatentability of claims 2, 5, 22, and 23. Accordingly, we do not authorize an *inter partes* review.

### A. The '642 Patent

The '642 patent relates generally to remote control devices for operating electronic consumer devices. Ex. 1001, 1:6–9. As background, a remote control device typically controls a selected electronic consumer device by transmitting to the electronic consumer device infrared signals that contain key codes of a codeset associated with the electronic consumer device. *Id.* at 1:21–25. Each key code corresponds to a function of the selected electronic consumer device, such as power on or off, volume up or down, or channel up or down. *Id.* at 1:25–28. Different manufacturers use distinct codesets, so a single remote control device that may be used to

operate multiple electronic devices must store a large number of different codesets. *Id.* at 1:39–47.

The system and method described in the '642 patent enable a single remote control device to operate multiple electronic consumer devices without requiring the codeset associated with each device to be stored on the remote control device. Id. at 1:59-62. A key code generator device, such as a set-top box, receives a keystroke indicator signal from a remote control device. *Id.* at 1:62–64. The keystroke indicator signal contains an indication of a key on the remote control device that was pressed by a user and that corresponds to a function of the selected electronic consumer device. Id. at 1:66–2:2. The key code generator device identifies the particular codeset for communicating with the selected electronic consumer device. Id. at 1:63-66. Using the codeset and the pressed key indication, the key code generator device generates a key code and modulates that key code onto a radio frequency carrier signal, thereby creating a key code signal. Id. at 2:2-5. In one embodiment, the key code generator device transmits the key code signal to the electronic consumer device, causing the electronic consumer device to perform the desired function. Id. at 2:16-21.

### B. Illustrative Claim

Claim 2, the only independent claim challenged by Petitioner, is illustrative of the claimed subject matter of the '642 patent:

2. A method comprising:

(a) receiving a keystroke indicator signal from a remote control device, wherein the keystroke indicator signal indicates a key on said remote control device that a user has selected;

(b) generating a key code within a key code generator device using the keystroke indic[a]tor signal;

(c) modulating said key code onto a carrier signal, thereby generating a key code signal; and

(d) transmitting said key code signal from said key code generator device to an electronic consumer device.

*Id.* at 10:22–32.

### C. Asserted Grounds of Unpatentability

Petitioner asserts that the challenged claims are unpatentable based on

### II. ANALYSIS

### A. Anticipation Grounds

Petitioner contends that independent claim 2 is anticipated by six different references: Geiger, Levine, Niles, Sato, Sasaki, and Cohen. Pet. 28–31, 35–36, 39–41, 44–47, 50–52, 55–57. Thus, Petitioner contends that each of the six references discloses, explicitly or inherently, each and every limitation of claim 2. *Id*.

In its Preliminary Response, Patent Owner argues that each reference fails to disclose one or more limitations of claim 2. Prelim. Resp. 9–12, 19– 21, 27–29, 37–41, 48–49, 54–56. In particular, Patent Owner asserts that the following limitation is missing from each allegedly anticipatory reference: "modulating said key code onto a carrier signal, thereby generating a key code signal." *Id.* at 10–12, 20–21, 28–29, 40–41, 48–49, 55–56. As explained below, we find this issue to be dispositive, and, therefore, we need not address Patent Owner's additional arguments regarding anticipation.

We begin with Petitioner's argument regarding anticipation of claim 2 by Geiger. In the method recited in claim 2, a key code signal is generated by modulating the key code onto a carrier signal, after which the key code signal is transmitted from the key code generator device to an electronic

<sup>&</sup>lt;sup>8</sup> U.S. Patent No. 5,235,414, issued Aug. 10, 1993 (Ex. 1008, "Cohen").

<sup>0373</sup> 

consumer device. Ex. 1001, 10:30–33 (claim 2). Petitioner asserts that Geiger discloses transmitting a key code signal to an electronic consumer device via a wireless, infrared (IR) link. Pet. 30–31 (citing Ex. 1003, 5:11–17). With respect to the modulating limitation, Petitioner argues only that transmission of a key code via an infrared link "*requires* modulation of the code onto a carrier [signal]."- Pet. 30 (citing Ex. 1010 ¶¶ 38–39) (emphasis added). In other words, Petitioner argues that Geiger inherently discloses modulating the key code onto a carrier signal because it discloses transmission of the key code via an infrared link.

"To establish inherency, the extrinsic evidence must make clear that the missing descriptive matter is *necessarily present* in the thing described in the reference, and that it would be so recognized by persons of ordinary skill." *In re Robertson*, 169 F.3d 743, 745 (Fed. Cir. 1999) (emphasis added) (citation and internal quotation marks omitted). Here, Petitioner supports its inherency assertion with citation to the Declaration of Mr. James T. Geier. Pet. 30 (citing Ex. 1010 ¶¶ 38–39). The relevant statement from Mr. Geier's Declaration reads: "Transmission of a wireless signal, and in particular, an IR signal necessarily requires modulation of the code data on a carrier signal. Indeed, this is acknowledged in the '642 patent itself." Ex. 1010 ¶ 39 (citing Ex. 1001, 4:34–38).

Petitioner's argument and evidence do not show sufficiently that transmission of a key code via an infrared link necessarily requires modulation of the key code. The section of the '642 patent cited by Mr. Geier merely describes an embodiment in which a key code generator device modulates a key code onto a carrier signal. Ex. 1001, 4:35–38. Nothing in the cited passage suggests, much less demonstrates, that infrared

transmission requires modulating a key code onto a carrier signal. Beyond his citation to the '642 patent, Mr. Geier provides only a conclusory statement that is without factual or evidentiary support. Such a statement is insufficient to support Petitioner's contention that transmission of a key code via an infrared link requires modulation of the code onto a carrier signal. *See* 37 C.F.R. § 42.65(a) ("Expert testimony that does not disclose the underlying facts or data on which the opinion is based is entitled to little or no weight."). As Petitioner relies only on Mr. Geier's conclusory declaration testimony, Petitioner has not shown sufficiently that Geiger inherently discloses "modulating said key code onto a carrier signal," as recited in claim 2.

Petitioner makes similar arguments for the other allegedly anticipatory references. For example, Petitioner asserts that each of Levine, Niles, and Cohen describes infrared transmission of a key code signal from a key code generator device to an electronic consumer device. Pet. 36 (citing Ex. 1004, 3:42-49);<sup>9</sup> *id.* at 41 (citing Ex. 1005, 5); *id.* at 57 (citing Ex. 1008, 4:62-64). Again, citing only conclusory statements from Mr. Geier's declaration testimony, Petitioner contends infrared transmission of a code inherently requires modulation of the code onto a carrier signal. *Id.* at 36, 41, 57 (citing Ex. 1010 ¶¶ 54–55, 65, 91–92). For the same reasons discussed above, Petitioner has not shown sufficiently that Levine, Niles, or Cohen inherently discloses "modulating said key code onto a carrier signal," as recited in claim 2.

As for the remaining two references, Petitioner asserts that Sato discloses transmitting a key code signal through an IEEE 1394 interface,

<sup>&</sup>lt;sup>9</sup> Petitioner mistakenly cites Exhibit 1004, 2:42–49.

<sup>7</sup> 

Pet. 47 (citing Ex. 1006 ¶ 55), and Sasaki discloses transmitting key code signals from optical communication transmitting units, Pet. 52 (citing Ex. 1007 ¶ 10). With respect to the modulating limitation of claim 2, Petitioner asserts that transmission of key code signals requires modulation onto a carrier signal, citing similarly conclusory statements by Mr. Geier. Pet. 47, 51–52 (citing Ex. 1010 ¶¶ 78, 102–103). Mr. Geier provides no support for his broad statements that transmission of codes requires modulation onto a carrier signal. *See* Ex. 1010 ¶¶ 78, 102. As with the references that disclose infrared transmission, Petitioner has not shown sufficiently that either Sato or Sasaki inherently discloses "modulating said key code onto a carrier signal."

For these reasons, the information presented does not show a reasonable likelihood that Petitioner would prevail in establishing that claim 2 is anticipated by Geiger, Levine, Niles, Sato, Sasaki, or Cohen or that claim 5, which depends from claim 2, is anticipated by Geiger, Sasaki, or Cohen.

### B. Single-Reference Obviousness Grounds

As an alternative to each anticipation ground, Petitioner asserts that claim 2 (or claims 2 and 5) would have been obvious over the allegedly anticipatory reference. *E.g.*, Pet. 28 ("Claims 2 and 5 are anticipated by [Geiger] under 35 U.S.C. § 102(b), and if not anticipated, are obvious in light of [Geiger] under 35 U.S.C. § 103." (emphasis omitted)). Petitioner, however, provides no substantive analysis for these single-reference obviousness grounds. In particular, the Petition does not identify differences between the prior art references and the claimed subject matter or explain why any such differences would have been obvious to a person of ordinary

8

skill in the art. See Graham v. John Deere Co., 383 U.S. 1, 17–18 (1966) (holding that obviousness is resolved on the basis of underlying factual determinations, including any differences between the claimed subject matter and the prior art). Indeed, for most of the single-reference grounds, the Petition refers to obviousness or 35 U.S.C. § 103 only in the headings. When Petitioner does address obviousness based on a single reference in a detailed discussion section, Petitioner appears to conflate obviousness with inherent anticipation and fails to provide a sufficient obviousness based on Levine, "[t]ransmission of a code *inherently or obviously* requires modulation of the code onto a carrier signal" (emphasis added)).

Accordingly, the information presented does not show a reasonable likelihood that Petitioner would prevail in establishing that claim 2 is unpatentable for obviousness based on Geiger, Levine, Niles, Sato, Sasaki, or Cohen alone, or that claim 5 is unpatentable for obviousness based on Geiger, Sasaki, or Cohen alone.

### C. Obviousness Grounds Based on Combinations of References

Petitioner contends that claims 5, 22, and 23, which depend from claim 2, are unpatentable for obviousness over various combinations of references, each including one or more of the six references discussed above in combination with Teskey and prior art allegedly admitted in the '642 patent. *See* Pet. 6–7. Petitioner does not argue that Teskey or the admitted prior art teaches any of the limitations of claim 2, relying on the additional references only for the additional limitations recited in claims 5, 22, and 23. *See* Pet. 32–34, 37–39, 42–44, 47–50, 53–55, 58–59. As discussed above, Petitioner has not shown sufficiently that Geiger, Levine, Niles, Sato,

Sasaki, or Cohen teaches "modulating said key code onto a carrier signal, thereby generating a key code signal," as recited in claim 2. Nor does Petitioner contend that Teskey or the admitted prior art cures this deficiency of Geiger, Levine, Niles, Sato, Sasaki, and Cohen. Therefore, on this record, the information presented does not show a reasonable likelihood that Petitioner would prevail in establishing that claims 5, 22, and 23 are unpatentable for obviousness over the combinations of references that include Teskey and allegedly admitted prior art.

### III. CONCLUSION

For the foregoing reasons, we determine that the information presented does not show a reasonable likelihood that Petitioner would prevail in establishing that claims 2, 5, 22, and 23 of the '642 patent are unpatentable.

### IV. ORDER

Accordingly, it is:

ORDERED that the petition is denied and no trial is instituted.
