mation that

Solving for x, we have $x^2 = (0.0037)(4.3 \times 10^{-7}) = 1.6 \times 10^{-9}$ $x = [H^+] = [HCO_3^-] = \sqrt{1.6 \times 10^{-9}} = 4.0 \times 10^{-5} M$

The small value of x indicates that our simplifying assumption was justified. The pH is therefore

$$pH = -log[H^+] = -log(4.0 \times 10^{-5}) = 4.40$$

If we were asked to solve for $[CO_3^{2-}]$, we would need to use K_{n2} . Let's illustrate at calculation. Using the values of $[HCO_3^{-}]$ and $[H^+]$ calculated above, and setting $[CO_3^{2-}] = y$, we have the following initial and equilibrium concentration values:

	$HCO_3^-(aq)$	\Longrightarrow H ⁺ (aq) +	$CO_3^{2-}(aq)$
Initial	$4.0 \times 10^{-5} M$ $4.0 \times 10^{-5} M$		0
Change	-y M	+y M	+y M
Equilibrium	$(4.0 \times 10^{-5} - y) M$	$(4.0 \times 10^{-5} + y) M$	y M

Assuming that y is small compared to 4.0×10^{-5} , we have

$$K_{a2} = \frac{[\text{H}^+][\text{CO}_3^{2-}]}{[\text{HCO}_3^{-}]} = \frac{(4.0 \times 10^{-5})(y)}{4.0 \times 10^{-5}} = 5.6 \times 10^{-11}$$

$$y = 5.6 \times 10^{-11} M = [\text{CO}_3^{2-}]$$

evalue calculated for y is indeed very small in comparison to 4.0×10^{-5} , showing our assumption was justified. It also shows that the ionization of HCO_3^- is negble in comparison to that of H_2CO_3 as far as production of H^+ is concerned. Howe, it is the *only* source of CO_3^{2-} , which has a very low concentration in the solution.

Our calculations thus tell us that in a solution of carbon dioxide in water most of CO_2 is in the form of CO_2 or H_2CO_3 , a small fraction ionizes to form H^+ and HCO_3^- , and an even smaller fraction ionizes to give CO_3^{2-} .

PRACTICE EXERCISE

culate the pH and concentration of oxalate ion, $[C_2O_4^{\ 2^-}]$, in a 0.020 M solution of oxacid, $H_2C_2O_4$ (see Table 16.3). Answers: pH = 1.80; $[C_2O_4^{\ 2^-}] = 6.4 \times 10^{-5} M$

15.7 Weak Bases

substances behave as weak bases in water. Such substances react with removing protons from H₂O, thereby forming the conjugate acid of the and OH⁻ ions:

Weak base
$$+ H_2O \Longrightarrow \text{conjugate acid} + OH^-$$
 [16.30]

most commonly encountered weak base is ammonia:

$$NH_3(aq) + H_2O(l) \Longrightarrow NH_4^+(aq) + OH^-(aq)$$
 [16.31]

The equilibrium-constant expression for this reaction can be written as

$$K = \frac{[NH_4^+][OH^-]}{[NH_3][H_2O]}$$
 [16.32]

wase the concentration of water is essentially constant, the [H₂O] term is insporated into the equilibrium constant, giving

$$K_b = K[H_2O] = \frac{[NH_4^+][OH^-]}{[NH_3]}$$
 [16.33]

The constant K_b is called the **base-dissociation constant**, by analogy with the dissociation constant, K_{ar} for weak acids. The constant K_b always refers to the equi-

librium in which a base reacts with H_2O to form the conjugate acid and OH^- . Table 16.4 \blacktriangle lists the names, formulas, Lewis structures, equilibrium reactions, and values of K_b for several weak bases in water. Appendix D includes a more extensive list Notice that these bases contain one or more lone pairs of electrons. A lone pair is necessary to form the bond with H^+ . Notice also that in the neutral molecules the lone pairs are on nitrogen atoms and that the other bases are anions derived from weak acids.

SAMPLE EXERCISE 16.14

Calculate the concentration of OH in a 0.15 M solution of NH3.

Solution We use essentially the same procedure here as used in solving problems involving the ionization of weak acids. The first step is to write the ionization reaction and the corresponding equilibrium-constant (K_b) expression:

$$NH_3(aq) + H_2O(l) \Longrightarrow NH_4^+(aq) + OH^-(aq)$$

$$K_b = \frac{[NH_4^+][OH^-]}{[NH_3]} = 1.8 \times 10^{-5}$$

We then tabulate the equilibrium concentrations involved in the equilibrium:

 $NH_3(aq)$ + $H_2O(l) \Longrightarrow NH_4^+(aq) + OH^-(aq)$

	3. 1.	2	4

Explore Litigation Insights

Docket Alarm provides insights to develop a more informed litigation strategy and the peace of mind of knowing you're on top of things.

Real-Time Litigation Alerts

Keep your litigation team up-to-date with **real-time** alerts and advanced team management tools built for the enterprise, all while greatly reducing PACER spend.

Our comprehensive service means we can handle Federal, State, and Administrative courts across the country.

Advanced Docket Research

With over 230 million records, Docket Alarm's cloud-native docket research platform finds what other services can't. Coverage includes Federal, State, plus PTAB, TTAB, ITC and NLRB decisions, all in one place.

Identify arguments that have been successful in the past with full text, pinpoint searching. Link to case law cited within any court document via Fastcase.

Analytics At Your Fingertips

Learn what happened the last time a particular judge, opposing counsel or company faced cases similar to yours.

Advanced out-of-the-box PTAB and TTAB analytics are always at your fingertips.

API

Docket Alarm offers a powerful API (application programming interface) to developers that want to integrate case filings into their apps.

LAW FIRMS

Build custom dashboards for your attorneys and clients with live data direct from the court.

Automate many repetitive legal tasks like conflict checks, document management, and marketing.

FINANCIAL INSTITUTIONS

Litigation and bankruptcy checks for companies and debtors.

E-DISCOVERY AND LEGAL VENDORS

Sync your system to PACER to automate legal marketing.
