CERTIFICATION OF TRANSLATION ACCURACY

I, Michael Fletcher, declare:

1. I am well versed in both the Japanese and English languages and have over 13 years of experience translating Japanese technical documents into English.

2. The following translation of this Japanese patent document to English is accurate and complete to the best of my knowledge.

I declare under penalty of perjury under the laws of the United States of America that the foregoing is true and accurate.

Executed this 31st day of October 2017, at Parowan, UT

(57) Abstract

The present invention provides a multi-color light emission apparatus wherein a transparent glass substrate 4 is disposed between an organic EL element 1 and a fluorescent layer 3 in such a manner as to arrange the fluorescent layer 3 with a gap with the organic EL element 1 and the organic EL element 1 is sealed by sealing means 5 between the transparent glass substrate 4 and a support substrate 2. The invention provides also a multi-color light emission apparatus wherein a transparent insulating inorganic oxide layer 12 having a thickness of 0.01 to 200 \Box m is disposed between the fluorescent layer 3 and the organic EL element 1.

1	SPECIFICATION
2	Multi-color light emission apparatus and a method for producing thereof.
3	
4	FIELD OF THE INVENTION
5	This invention relates to a multi-color light emission apparatus and a method for producing
6	thereof. More specifically, this invention relates to a multi-color light emission apparatus
7	suitable for use in multi-color or full-color thin-type displays and a method for producing the
8	multi-color light emission apparatus.
9	
10	BACKGROUND TECHNOLOGY
11	An electroluminescence element (hereinafter called "EL element") is characterized in
12	exhibiting high visibility due to self-emission and in having excellent impact resistance
13	because of being completely solid. At present, various EL elements using an inorganic or an
14	organic compound as the emitting layer have been proposed and attempts have been made
15	to put them to practical use. One of the EL elements that has been put to practical use is
16	applied as a multi-color light emission apparatus.
17	
18	Such a multi-color light emission apparatus includes an apparatus produced by arranging a
19	color filter of three primary colors (red, green, and blue) with a white-light emitting inorganic
20	EL element and an apparatus produced by patterning inorganic EL elements of three primary
21	colors in order to position the EL elements of three primary colors separately on the same
22	plane and thereby emit light (Semicond. Sci. Technol. 6 (1991) 305-323). However, there is
23	the problem that the light emission efficiency for each color is limited to 33% of the white light
24	at most if the white color is decomposed by the color filter of three primary colors. Further,
25	elements that can efficiently emit white light have still not been attained at present.
26	
27	On the other hand, a photolithography process is used for patterning EL elements.
28	However, it is known that the efficiency and stability of EL elements are greatly reduced in
29	this type of wet process.
30	
31	It is common knowledge that of EL elements, organic EL elements are promising as high
32	luminance and efficient light emitting devices. In particular, because the light emitting layer is

DOCKET A L A R M Find authenticated court documents without watermarks at <u>docketalarm.com</u>.

1

1 an organic layer, it is highly probable that various color emissions are produced by the 2 molecular design of organic compounds. Such an organic EL element is expected to be one 3 device which can be used in practice in a multi-color light emission apparatus. 4 5 However, these organic EL elements have the drawback that chemical factors such as 6 external water vapor, oxygen, organic compound gas, and the like cause deterioration such 7 as reduction in luminance accompanied by the occurrence of dark spots and the like and

these devices are damaged relatively readily from physical (mechanical) factors such as 9 heat, impact, or the like since the element structure is composed of a laminate of low

- 10 molecular organic compounds.
- 11

8

12 Therefore, the method for separately disposing each of the organic EL elements, which 13 emit light in three primary colors (RGB), on the same plane was difficult to use in a wet 14 process or a process including heat treatment such as a photolithography process.

15

16 In order to solve such a problem, disclosed is a color EL display apparatus (see Japanese 17 Patent Application S65-40888). This apparatus is, as shown in FIG. 8, characterized in that 18 an EL emitting layer 1b sandwiched between a lower electrode 1c and a light transmitting 19 upper electrode is provided on a substrate 2, the EL light which is output via the light 20 transmitting electrode 1a is externally output from a transmitting substrate 8 via a color filter 9 21 provided on the transmitting substrate 8 with the color filter 9 facing the transmitting electrode 22 1a (Japanese Unexamined Patent Application S64-40888).

23

24 This apparatus has, however, the disadvantage that the luminance of the light of each color 25 is reduced to one third of the EL light by the color filter. Also, because the EL element faces 26 the color filter, the light emission life span of the EL element is invariably reduced by water 27 vapor, oxygen, gas from organic monomers, low molecular components, and the like 28 generated by the color filter.

29

DOCKET

30 To solve these problems, recently disclosed is a technique in which a fluorescent layer that

31 absorbs light emitted from an organic EL element and emits visible fluorescent light is

32 installed in the position (laminated or in parallel) corresponding to the emitting part of an

Explore Litigation Insights

Docket Alarm provides insights to develop a more informed litigation strategy and the peace of mind of knowing you're on top of things.

Real-Time Litigation Alerts

Keep your litigation team up-to-date with **real-time** alerts and advanced team management tools built for the enterprise, all while greatly reducing PACER spend.

Our comprehensive service means we can handle Federal, State, and Administrative courts across the country.

Advanced Docket Research

With over 230 million records, Docket Alarm's cloud-native docket research platform finds what other services can't. Coverage includes Federal, State, plus PTAB, TTAB, ITC and NLRB decisions, all in one place.

Identify arguments that have been successful in the past with full text, pinpoint searching. Link to case law cited within any court document via Fastcase.

Analytics At Your Fingertips

Learn what happened the last time a particular judge, opposing counsel or company faced cases similar to yours.

Advanced out-of-the-box PTAB and TTAB analytics are always at your fingertips.

API

Docket Alarm offers a powerful API (application programming interface) to developers that want to integrate case filings into their apps.

LAW FIRMS

Build custom dashboards for your attorneys and clients with live data direct from the court.

Automate many repetitive legal tasks like conflict checks, document management, and marketing.

FINANCIAL INSTITUTIONS

Litigation and bankruptcy checks for companies and debtors.

E-DISCOVERY AND LEGAL VENDORS

Sync your system to PACER to automate legal marketing.
