ENHANCEMENT OF THE EFFICACY OF DRUGS BY DEUTERATION

REFERENCE TO A RELATED APPLICATION

5 This is a continuation-in-part of our copending U.S. Patent Application
Serial No. 08/217,897 filed March 25, 1994 which is relied on and incorporated herein
by reference in its entirety.

BACKGROUND OF THE INVENTION

10 The present invention relates to a process for enhancing the efficacy of
known pharmaceuticals or drugs, and to the enhanced drugs so produced, by changing
the isotopic form of the molecular structure of the known drug. More particularly, the
present invention relates to the modification of the molecular structure of known drugs
containing one or more hydrogen atoms by deuterating one or more of the hydrogen
atoms to deuterium atoms. The resulting drug is significantly altered and has greatly
15 improved activity over the known drug. Most particularly this invention relates to a
method of deuterating a dihydropyridine (e.g., nifedipine) whereby the deuterated
nifedipine has an increased hypotensive effect and an increased duration of action on
mammals at lower concentration than does nifedipine.

20 When pharmaceuticals are synthesized, a carbon back-bone is assembled
having various substituents including carbon, hydrogen, oxygen, nitrogen, etc.
Pharmaceuticals have been designed and synthesized by a number of modes including,
for example, serendipity and molecular modification. These and other methods have
generated a vast number of drugs over the course of time. As such modifications have
allowed individual companies to keep a competitive edge in the marketplace, a

25

significant part of the industry's time and resources is spent searching for novel agents within certain pharmacologic classifications, e.g., antihypertensives. Such novel agents often have different activities from the prototype compounds, thus justifying the monies spent for their development.

5

SUMMARY OF THE INVENTION

It is known that virtually all drugs now marketed include a number of hydrogen atoms, each of which has a molecular mass of one. It has now been found that when one or more of the hydrogen atoms on a drug are modified so that their molecular mass becomes two, the activity of the drug is significantly altered and is even greatly improved. Thus, for example, isotopic modification of a dihydropyridine, e.g., such as nifedipine, has resulted in an unexpected change in the hypotensive (blood pressure lowering) effect in mammals compared to nifedipine *per se*, and such effects should also be achieved with humans.

10

15

Nifedipine is marketed worldwide as an important drug used in the treatment of angina and hypertension. Its structure is as follows:

20

By modifying nifedipine by replacing one or more hydrogens of the methyl groups with deuterium or by replacing one or more of the methyl groups with CD₃, the therapeutic properties of nifedipine can be altered and can even be significantly improved. For example, by modifying the nifedipine by replacing the two methyl groups at the 2 and 6 positions on the ring with two deuterated groups (CD₃), i.e.,

replacing 6 hydrogen atoms with six deuterium atoms, the structure of the deuterated nifedipine is as follows:

5

Both of the above molecules are nifedipine and the latter structure is an isotopic form of the former.

BRIEF DESCRIPTION OF THE DRAWING

The present invention will be further understood with reference to the drawings, wherein:

10

Figure 1 shows the hypotensive effect of the various concentrations of the deuterated nifedipines on the treated rats as compared with nifedipine *per se*;

Figures 2 and 3 show use dependent inhibition of control nifedipine (Nifedipine B) and deuterated nifedipine (Nifedipine D) on T type calcium channels;

15

Figure 4 shows the effect of control nifedipine and deuterated nifedipine on calcium current inhibition as a function of pulse frequency;

Figure 5 shows the effect of control nifedipine and deuterated nifedipine on use dependency;

20

Figures 6(a) and (b) show the effect of control and deuterated nifedipine on mean arterial pressure;

Figures 7(a) and (b) show concentration-effect relationships for control (Figure 7(a)) and deuterated (Figure 7(b)) nifedipine fitted using an asymmetric sigmoidal model;

Explore Litigation Insights

Docket Alarm provides insights to develop a more informed litigation strategy and the peace of mind of knowing you're on top of things.

Real-Time Litigation Alerts

Keep your litigation team up-to-date with **real-time alerts** and advanced team management tools built for the enterprise, all while greatly reducing PACER spend.

Our comprehensive service means we can handle Federal, State, and Administrative courts across the country.

Advanced Docket Research

With over 230 million records, Docket Alarm's cloud-native docket research platform finds what other services can't. Coverage includes Federal, State, plus PTAB, TTAB, ITC and NLRB decisions, all in one place.

Identify arguments that have been successful in the past with full text, pinpoint searching. Link to case law cited within any court document via Fastcase.

Analytics At Your Fingertips

Learn what happened the last time a particular judge, opposing counsel or company faced cases similar to yours.

Advanced out-of-the-box PTAB and TTAB analytics are always at your fingertips.

API

Docket Alarm offers a powerful API (application programming interface) to developers that want to integrate case filings into their apps.

LAW FIRMS

Build custom dashboards for your attorneys and clients with live data direct from the court.

Automate many repetitive legal tasks like conflict checks, document management, and marketing.

FINANCIAL INSTITUTIONS

Litigation and bankruptcy checks for companies and debtors.

E-DISCOVERY AND LEGAL VENDORS

Sync your system to PACER to automate legal marketing.
