Box Patent Application

Re:

U.S. Non-Provisional Utility Patent Application under 37 C.F.R. § 1.53(b)

Appl. No. To be assigned; Filed: August 4, 2000

For:

Wireless Local Area Network (WLAN) Using Universal Frequency Translation Technology Including Multi-Phase Embodiments and

Circuit Implementations

Inventors:

David F. Sorrells, Michael J. Bultman, Robert W. Cook,

Richard C. Looke, Charley D. Moses, Jr., Gregory S. Rawlins,

and Michael W. Rawlins

Our Ref

1744.0630003

Sir:

The following documents are forwarded herewith for appropriate action by the U.S. Patent and Trademark Office:

- 1. USPTO Utility Patent Application Transmittal Form PTO/SB/05;
- 2. U.S. Utility Patent Application entitled:

Wireless Local Area Network (WLAN) Using Universal Frequency Translation Technology Including Multi-Phase Embodiments and Circuit Implementations

and naming as inventors:

David F. Sorrells, Michael J. Bultman, Robert W. Cook, Richard C. Looke, Charley D. Moses, Jr., Gregory S. Rawlins, and Michael W. Rawlins

Commissioner for Patents August 4, 2000 Page 2

the application comprising:

- a. specification containing:
 - i. <u>98</u> pages of description prior to the claims;
 - ii. 7 pages of claims (40 claims);
 - iii. a one (1) page abstract;
- b. Two-hundred and eight (208) sheets of drawings: (Figures 1A-D, 2A, 2B, 3-14, 15A-F, 16-19, 20A, 20A-1, 20B-F, 21, 22A-F, 23A, 24A-J, 25-45, 46A, 46B, 47, 48, 49A, 49B, 50, 51, 52A-C, 53-55, 56A, 56B, 57-60, 61A, 61B, 62-66, 67A, 67B, 68A, 68B, 69A, 69B, 70A-S, 71A-D, 72A-J, 73A, 73B, 74, 75A-C, 76A, 76B, 77, 78, 79A-D, 80, 81A-C, 82-88, 89A-E, 90A-D, 91-94, 95A-C, 96-161);
- 3. 37 C.F.R. § 1.136(a)(3) Authorization to Treat a Reply As Incorporating An Extension of Time (in duplicate); and
- 4. Two (2) return postcards.

It is respectfully requested that, of the two attached postcards, one be stamped with the filing date of these documents and returned to our courier, and the other, prepaid postcard, be stamped with the filing date and unofficial application number and returned as soon as possible.

This patent application is being submitted under 37 C.F.R. § 1.53(b) without Declaration and without filing fee.

STERNE, KESSLER, GOLDSTEIN & FOX P.L.L.C.

And the state of t

Commissioner for Patents August 4, 2000 Page 3

This application claims priority to U.S. Provisional Application No. 60/147,129, filed August 4, 1999; U.S. Application No. 09/525,615, filed on March 14, 2000; and U.S. Application No. 09/526,041, filed on March 14, 2000.

Respectfully submitted,

STERNE, KESTLER, GOLDSTEIN & FOX P.L.L.C.

"Wireless Local Area Network (WLAN) Technology and Applications Including Techniques of Universal Frequency Translation", Attorney Docket No. 1744.0630002, filed on August 4, 2000.

Background of the Invention

Field of the Invention

The present invention is generally related to wireless local area networks (WLANs), and more particularly, to WLANs that utilize universal frequency translation technology for frequency translation, and applications of same.

Related Art

Wireless LANs exist for receiving and transmitting information to/from mobile terminals using electromagnetic (EM) signals. Conventional wireless communications circuitry is complex and has a large number of circuit parts. This complexity and high parts count increases overall cost. Additionally, higher part counts result in higher power

20

25

consumption, which is undesirable, particularly in battery powered wireless units. Additionally, various communication components exist for performing frequency down-conversion, frequency up-conversion, and filtering. Also, schemes exist for signal reception in the face of potential jamming signals.

Summary of the Invention

The present invention is directed to a wireless local area network (WLAN) that includes one or more WLAN devices (also called stations, terminals, access points, client devices, or infrastructure devices) for effecting wireless communications over the WLAN. The WLAN device includes at least an antenna, a receiver, and a transmitter for effecting wireless communications over the WLAN. Additionally, the WLAN device may also include a LNA/PA module, a control signal generator, a demodulation/modulation facilitation module, and a media access control (MAC) interface. The WLAN receiver includes at least one universal frequency translation module that frequency down-converts a received electromagnetic (EM) signal. In embodiments, the UFT based receiver is configured in a multi-phase embodiment to reduce or eliminate re-radiation that is caused by DC offset. The WLAN transmitter includes at least one universal frequency translation module that frequency up-converts a baseband signal in preparation for transmission over the WLAN. In embodiments, the UFT based transmitter is configured in a differential and/or multi-phase embodiment to reduce carrier insertion and spectral growth in the transmitted signal.

WLANs exhibit multiple advantages by using UFT modules for frequency translation. These advantages include, but are not limited to: lower power consumption, longer battery life, fewer parts, lower cost, less tuning, and more effective signal transmission and reception. These advantages are possible because the UFT module enables direct frequency conversion in an efficient manner with minimal signal distortion.

20

25

The structure and operation of embodiments of the UFT module, and various applications of the same are described in detail in the following sections.

Further features and advantages of the invention, as well as the structure and operation of various embodiments of the invention, are described in detail below with reference to the accompanying drawings. The drawing in which an element first appears is typically indicated by the leftmost character(s) and/or digit(s) in the corresponding reference number.

Brief Description of the Figures

The present invention will be described with reference to the accompanying drawings, wherein:

- FIG. 1A is a block diagram of a universal frequency translation (UFT) module according to an embodiment of the invention;
- FIG. 1B is a more detailed diagram of a universal frequency translation (UFT) module according to an embodiment of the invention;
- FIG. 1C illustrates a UFT module used in a universal frequency down-conversion (UFD) module according to an embodiment of the invention;
- FIG. 1D illustrates a UFT module used in a universal frequency up-conversion (UFU) module according to an embodiment of the invention;
- FIG. 2A-2B illustrate block diagrams of universal frequency translation (UFT) modules according to an embodiment of the invention;
- FIG. 3 is a block diagram of a universal frequency up-conversion (UFU) module according to an embodiment of the invention;
- FIG. 4 is a more detailed diagram of a universal frequency up-conversion (UFU) module according to an embodiment of the invention;
- FIG. 5 is a block diagram of a universal frequency up-conversion (UFU) module according to an alternative embodiment of the invention;

- FIGS. 6A-6I illustrate example waveforms used to describe the operation of the UFU module;
- FIG. 7 illustrates a UFT module used in a receiver according to an embodiment of the invention;
- FIG. 8 illustrates a UFT module used in a transmitter according to an embodiment of the invention;
- FIG. 9 illustrates an environment comprising a transmitter and a receiver, each of which may be implemented using a UFT module of the invention;
 - FIG. 10 illustrates a transceiver according to an embodiment of the invention;
- FIG. 11 illustrates a transceiver according to an alternative embodiment of the invention;
- FIG. 12 illustrates an environment comprising a transmitter and a receiver, each of which may be implemented using enhanced signal reception (ESR) components of the invention;
- FIG. 13 illustrates a UFT module used in a unified down-conversion and filtering (UDF) module according to an embodiment of the invention;
- FIG. 14 illustrates an example receiver implemented using a UDF module according to an embodiment of the invention;
- FIGS. 15A-15F illustrate example applications of the UDF module according to embodiments of the invention:
- FIG. 16 illustrates an environment comprising a transmitter and a receiver, each of which may be implemented using enhanced signal reception (ESR) components of the invention, wherein the receiver may be further implemented using one or more UFD modules of the invention;
- FIG. 17 illustrates a unified down-converting and filtering (UDF) module according to an embodiment of the invention;
 - FIG. 18 is a table of example values at nodes in the UDF module of FIG. 19;
- FIG. 19 is a detailed diagram of an example UDF module according to an embodiment of the invention;

30

5

- FIGS. 20A and 20A-1 are example aliasing modules according to embodiments of the invention;
- FIGS. 20B-20F are example waveforms used to describe the operation of the aliasing modules of FIGS. 20A and 20A-1;
- FIG. 21 illustrates an enhanced signal reception system according to an embodiment of the invention;
 - FIGS. 22A-22F are example waveforms used to describe the system of FIG. 21;
- FIG. 23A illustrates an example transmitter in an enhanced signal reception system according to an embodiment of the invention;
- FIGS. 23B and 23C are example waveforms used to further describe the enhanced signal reception system according to an embodiment of the invention;
- FIG. 23D illustrates another example transmitter in an enhanced signal reception system according to an embodiment of the invention;
- FIGS. 23E and 23F are example waveforms used to further describe the enhanced signal reception system according to an embodiment of the invention;
- FIG. 24A illustrates an example receiver in an enhanced signal reception system according to an embodiment of the invention;
- FIGS. 24B-24J are example waveforms used to further describe the enhanced signal reception system according to an embodiment of the invention;
 - FIG. 25 illustrates a block diagram of an example computer network;
 - FIG. 26 illustrates a block diagram of an example computer network;
 - FIG. 27 illustrates a block diagram of an example wireless interface;
- FIG. 28 illustrates an example heterodyne implementation of the wireless interface illustrated in FIG. 27;
- FIG. 29 illustrates an example in-phase/quadrature-phase (I/Q) heterodyne implementation of the interface illustrated in FIG. 27;
- FIG. 30 illustrates an example high level block diagram of the interface illustrated in FIG. 27, in accordance with the present invention;
- FIG. 31 illustrates a example block diagram of the interface illustrated in FIG. 29, in accordance with the invention;

5

- FIG. 32 illustrates an example I/Q implementation of the interface illustrated in FIG.31;
 - FIGS. 33-38 illustrate example environments encompassed by the invention;
- FIG. 39 illustrates a block diagram of a WLAN interface according to an embodiment of the invention;
 - FIG. 40 illustrates a WLAN receiver according to an embodiment of the invention;
- FIG. 41 illustrates a WLAN transmitter according to an embodiment of the invention;
 - FIGS. 42-44 are example implementations of a WLAN interface;
- FIGS. 45, 46A, and 46B relate to an example MAC interface for an example WLAN interface embodiment;
- FIGS. 47, 48, 49A, and 49B relate to an example demodulator/modulator facilitation module for an example WLAN interface embodiment;
- FIGS. 50, 51, 52A, 52B, and 52C relate to an example alternate demodulator/modulator facilitation module for an example WLAN interface embodiment;
- FIGS. 53 and 54 relate to an example receiver for an example WLAN interface embodiment;
- FIGS. 55, 56A, and 56B relate to an example synthesizer for an example WLAN interface embodiment;
- FIGS. 57, 58, 59, 60, 61A, and 61B relate to an example transmitter for an example WLAN interface embodiment;
- FIGS. 62 and 63 relate to an example motherboard for an example WLAN interface embodiment;
- FIGS. 64-66 relate to example LNAs for an example WLAN interface embodiment;
- FIGS. 67A-B illustrate IQ receivers having UFT modules in a series and shunt configurations, according to embodiments of the invention;
- FIGS. 68A-B illustrate IQ receivers having UFT modules with delayed control signals for quadrature implementation, according to embodiments of the present invention;

30

5

10

- FIGS. 69A-B illustrate IQ receivers having FET implementations, according to embodiments of the invention;
- FIG. 70A illustrates an IQ receiver having shunt UFT modules according to embodiments of the invention:
- FIG. 70B illustrates control signal generator embodiments for receiver 7000 according to embodiments of the invention;
- FIGS. 70C-D illustrate various control signal waveforms according to embodiments of the invention;
- FIG. 70E illustrates an example IQ modulation receiver embodiment according to embodiments of the invention;
- FIGS. 70F-P illustrate example waveforms that are representative of the IQ receiver in FIG. 70E;
- FIGS. 70Q-R illustrate single channel receiver embodiments according to embodiments of the invention;
- FIG. 70S illustrates a FET configuration of an IQ receiver embodiment according to embodiments of the invention;
- FIG. 71A illustrate a balanced transmitter 7102, according to an embodiment of the present invention;
- FIGs. 71B-C illustrate example waveforms that are associated with the balanced transmitter 7102, according to an embodiment of the present invention;
- FIG. 71D illustrates example FET configurations of the balanced transmitter 7102, according to embodiments of the present invention;
- FIGs. 72A-I illustrate various example timing diagrams that are associated with the transmitter 7102, according to embodiments of the present invention;
- FIG. 72J illustrates an example frequency spectrum that is associated with a modulator 7104, according to embodiments of the present invention;
- FIG. 73A illustrate a transmitter 7302 that is configured for carrier insertion, according to embodiments of the present invention;
- FIG. 73B illustrates example signals associated with the transmitter 7302, according to embodiments of the invention;

10

- FIG. 74 illustrates an IQ balanced transmitter 7420, according to embodiments of the present invention;
- FIGs. 75A-C illustrate various example signal diagrams associated with the balanced transmitter 7420 in FIG. 74;
- FIG. 76A illustrates an IQ balanced transmitter 7608 according to embodiments of the invention;
- FIG. 76B illustrates an IQ balanced modulator 7618 according to embodiments of the invention;
- FIG. 77 illustrates an IQ balanced modulator 7702 configured for carrier insertion according to embodiments of the invention;
- FIG. 78 illustrates an IQ balanced modulator 7802 configured for carrier insertion according to embodiments of the invention;
- FIG. 79A illustrate a transmitter 7900, according to embodiments of the present invention;
- FIGs. 79B-C illustrate various frequency spectrums that are associated with the transmitter 7900;
- FIG. 79D illustrates a FET configuration for the transmitter 7900, according to embodiments of the present invention;
- FIG. 80 illustrates an IQ transmitter 8000, according to embodiments of the present invention;
- FIGs. 81A-C illustrate various frequency spectrums that are associated with the IQ transmitter 8000, according to embodiments of the present invention;
- FIG. 82 illustrates an IQ transmitter 8200, according to embodiments of the present invention;
- FIG. 83 illustrates an IQ transmitter 8300, according to embodiments of the invention;
- FIG. 84 illustrates a flowchart 8400 that is associated with the transmitter 7102 in the FIG. 71A, according to embodiments of the invention;

5

FIG. 86 illustrates a flowchart 8600 that is associated with the transmitter 7900 and further defines the flowchart 8400 in the FIG. 84, according to embodiments of the invention;

FIG. 87 illustrates a flowchart 8700, that is associated with the transmitter 7420 in the FIG. 74, according to embodiments of the invention;

FIG. 88 illustrates a flowchart 8800 that is associated with the transmitter 8000, according to embodiments of the invention;

FIG. 89A illustrate a pulse generator according to embodiments of the invention; FIGS. 89B-C illustrate various example signal diagrams associated with the pulse generator in FIG. 89A, according to embodiments of the invention;

FIG. 89D-E illustrate various example pulse generators according to embodiments of the present invention;

FIGS. 90A-D illustrates various implementation circuits for the modulator 7410, according to embodiments of the present invention;

FIG. 91 illustrates an IQ transceiver 9100 according to embodiments of the present invention;

1. Universal Frequency Translation

The present invention is related to frequency translation, and applications of same. Such applications include, but are not limited to, frequency down-conversion, frequency up-conversion, enhanced signal reception, unified down-conversion and filtering, and combinations and applications of same.

FIG. 1A illustrates a universal frequency translation (UFT) module 102 according to embodiments of the invention. (The UFT module is also sometimes called a universal frequency translator, or a universal translator.)

As indicated by the example of FIG. 1A, some embodiments of the UFT module 102 include three ports (nodes), designated in FIG. 1A as Port 1, Port 2, and Port 3. Other UFT embodiments include other than three ports.

Generally, the UFT module 102 (perhaps in combination with other components) operates to generate an output signal from an input signal, where the frequency of the output signal differs from the frequency of the input signal. In other words, the UFT module 102 (and perhaps other components) operates to generate the output signal from the input signal by translating the frequency (and perhaps other characteristics) of the input signal to the frequency (and perhaps other characteristics) of the output signal.

An example embodiment of the UFT module 103 is generally illustrated in FIG. 1B. Generally, the UFT module 103 includes a switch 106 controlled by a control signal 108. The switch 106 is said to be a controlled switch.

As noted above, some UFT embodiments include other than three ports. For example, and without limitation, FIG. 2 illustrates an example UFT module 202. The example UFT module 202 includes a diode 204 having two ports, designated as Port 1 and Port 2/3. This embodiment does not include a third port, as indicated by the dotted line around the "Port 3" label.

The UFT module is a very powerful and flexible device. Its flexibility is illustrated, in part, by the wide range of applications in which it can be used. Its power is illustrated, in part, by the usefulness and performance of such applications.

10

The state of the s

20

25

For example, a UFT module 115 can be used in a universal frequency down-conversion (UFD) module 114, an example of which is shown in FIG. 1C. In this capacity, the UFT module 115 frequency down-converts an input signal to an output signal.

As another example, as shown in FIG. 1D, a UFT module 117 can be used in a universal frequency up-conversion (UFU) module 116. In this capacity, the UFT module 117 frequency up-converts an input signal to an output signal.

These and other applications of the UFT module are described below. Additional applications of the UFT module will be apparent to persons skilled in the relevant art(s) based on the teachings contained herein. In some applications, the UFT module is a required component. In other applications, the UFT module is an optional component.

2. Frequency Down-Conversion

The present invention is directed to systems and methods of universal frequency down-conversion, and applications of same.

In particular, the following discussion describes down-converting using a Universal Frequency Translation Module. The down-conversion of an EM signal by aliasing the EM signal at an aliasing rate is fully described in co-pending U.S. Patent Application entitled "Method and System for Down-Converting Electromagnetic Signals," Ser. No. 09/176,022, filed October 21, 1998, issued as U.S. Patent No. 6,061,551 on May 9, 2000, the full disclosure of which is incorporated herein by reference. A relevant portion of the above mentioned patent application is summarized below to describe down-converting an input signal to produce a down-converted signal that exists at a lower frequency or a baseband signal.

FIG. 20A illustrates an aliasing module 2000 (also called a universal frequency down-conversion module) for down-conversion using a universal frequency translation (UFT) module 2002 which down-converts an EM input signal 2004. In particular embodiments, aliasing module 2000 includes a switch 2008 and a capacitor 2010. The electronic alignment of the circuit components is flexible. That is, in one implementation,

10

The first there, and there are the transitions are a first that the transitions are th

25

30

the switch 2008 is in series with input signal 2004 and capacitor 2010 is shunted to ground (although it may be other than ground in configurations such as differential mode). In a second implementation (see FIG. 20A-1), the capacitor 2010 is in series with the input signal 2004 and the switch 2008 is shunted to ground (although it may be other than ground in configurations such as differential mode). Aliasing module 2000 with UFT module 2002 can be easily tailored to down-convert a wide variety of electromagnetic signals using aliasing frequencies that are well below the frequencies of the EM input signal 2004.

In one implementation, aliasing module 2000 down-converts the input signal 2004 to an intermediate frequency (IF) signal. In another implementation, the aliasing module 2000 down-converts the input signal 2004 to a demodulated baseband signal. In yet another implementation, the input signal 2004 is a frequency modulated (FM) signal, and the aliasing module 2000 down-converts it to a non-FM signal, such as a phase modulated (PM) signal or an amplitude modulated (AM) signal. Each of the above implementations is described below.

In an embodiment, the control signal 2006 includes a train of pulses that repeat at an aliasing rate that is equal to, or less than, twice the frequency of the input signal 2004. In this embodiment, the control signal 2006 is referred to herein as an aliasing signal because it is below the Nyquist rate for the frequency of the input signal 2004. Preferably, the frequency of control signal 2006 is much less than the input signal 2004.

A train of pulses 2018 as shown in FIG. 20D controls the switch 2008 to alias the input signal 2004 with the control signal 2006 to generate a down-converted output signal 2012. More specifically, in an embodiment, switch 2008 closes on a first edge of each pulse 2020 of FIG. 20D and opens on a second edge of each pulse. When the switch 2008 is closed, the input signal 2004 is coupled to the capacitor 2010, and charge is transferred from the input signal to the capacitor 2010. The charge stored during successive pulses forms down-converted output signal 2012.

Exemplary waveforms are shown in FIGS. 20B-20F.

FIG. 20B illustrates an analog amplitude modulated (AM) carrier signal 2014 that is an example of input signal 2004. For illustrative purposes, in FIG. 20C, an analog AM

carrier signal portion 2016 illustrates a portion of the analog AM carrier signal 2014 on an expanded time scale. The analog AM carrier signal portion 2016 illustrates the analog AM carrier signal 2014 from time t_0 to time t_1 .

FIG. 20D illustrates an exemplary aliasing signal 2018 that is an example of control signal 2006. Aliasing signal 2018 is on approximately the same time scale as the analog AM carrier signal portion 2016. In the example shown in FIG. 20D, the aliasing signal 2018 includes a train of pulses 2020 having negligible apertures that tend towards zero (the invention is not limited to this embodiment, as discussed below). The pulse aperture may also be referred to as the pulse width as will be understood by those skilled in the art(s). The pulses 2020 repeat at an aliasing rate, or pulse repetition rate of aliasing signal 2018. The aliasing rate is determined as described below, and further described in co-pending U.S. Patent Application entitled "Method and System for Down-converting Electromagnetic Signals," Application No. 09/176,022, Attorney Docket Number 1744.0010000, issued as U.S. Patent No. 6,061,551 on May 9, 2000.

As noted above, the train of pulses 2020 (i.e., control signal 2006) control the switch 2008 to alias the analog AM carrier signal 2016 (i.e., input signal 2004) at the aliasing rate of the aliasing signal 2018. Specifically, in this embodiment, the switch 2008 closes on a first edge of each pulse and opens on a second edge of each pulse. When the switch 2008 is closed, input signal 2004 is coupled to the capacitor 2010, and charge is transferred from the input signal 2004 to the capacitor 2010. The charge transferred during a pulse is referred to herein as an under-sample. Exemplary under-samples 2022 form down-converted signal portion 2024 (FIG. 20E) that corresponds to the analog AM carrier signal portion 2016 (FIG. 20C) and the train of pulses 2020 (FIG. 20D). The charge stored during successive under-samples of AM carrier signal 2014 form the downconverted signal 2024 (FIG. 20E) that is an example of down-converted output signal 2012 (FIG. 20A). In FIG. 20F, a demodulated baseband signal 2026 represents the demodulated baseband signal 2024 after filtering on a compressed time scale. As illustrated, down-converted signal 2026 has substantially the same "amplitude envelope" as AM carrier signal 2014. Therefore, FIGS. 20B-20F illustrate down-conversion of AM carrier signal 2014.

1744.0630003

5

25

30

10

and a sure and the sure and the

20

25

The waveforms shown in FIGS. 20B-20F are discussed herein for illustrative purposes only, and are not limiting. Additional exemplary time domain and frequency domain drawings, and exemplary methods and systems of the invention relating thereto, are disclosed in co-pending U.S. Patent Application entitled "Method and System for Down-converting Electromagnetic Signals," Application No.09/176,022, Attorney Docket Number 1744.0010000, issued as U.S. Patent No. 6,061,551 on May 9, 2000.

The aliasing rate of control signal 2006 determines whether the input signal 2004 is down-converted to an IF signal, down-converted to a demodulated baseband signal, or down-converted from an FM signal to a PM or an AM signal. Generally, relationships between the input signal 2004, the aliasing rate of the control signal 2006, and the down-converted output signal 2012 are illustrated below:

(Freq. of input signal 2004) =
$$n^{\bullet}$$
 (Freq. of control signal 2006) \pm (Freq. of down-converted output signal 2012)

For the examples contained herein, only the "+" condition will be discussed. The value of n represents a harmonic or sub-harmonic of input signal 2004 (e.g., n = 0.5, 1, 2, 3, ...).

When the aliasing rate of control signal 2006 is off-set from the frequency of input signal 2004, or off-set from a harmonic or sub-harmonic thereof, input signal 2004 is down-converted to an IF signal. This is because the under-sampling pulses occur at different phases of subsequent cycles of input signal 2004. As a result, the under-samples form a lower frequency oscillating pattern. If the input signal 2004 includes lower frequency changes, such as amplitude, frequency, phase, etc., or any combination thereof, the charge stored during associated under-samples reflects the lower frequency changes, resulting in similar changes on the down-converted IF signal. For example, to down-convert a 901 MHZ input signal to a 1 MHZ IF signal, the frequency of the control signal 2006 would be calculated as follows:

$$(Freq_{input} - Freq_{ip})/n = Freq_{control}$$

25

5

$$(901 \text{ MHZ} - 1 \text{ MHZ})/n = 900/n$$

For n = 0.5, 1, 2, 3, 4, etc., the frequency of the control signal 2006 would be substantially equal to 1.8 GHz, 900 MHZ, 450 MHZ, 300 MHZ, 225 MHZ, etc.

Exemplary time domain and frequency domain drawings, illustrating down-conversion of analog and digital AM, PM and FM signals to IF signals, and exemplary methods and systems thereof, are disclosed in co-pending U.S. Patent Application entitled "Method and System for Down-converting Electromagnetic Signals," Application No. 09/176,022, Attorney Docket Number 1744.0010000, issued as U.S. Patent No. 6,061,551 on May 9, 2000.

Alternatively, when the aliasing rate of the control signal 2006 is substantially equal to the frequency of the input signal 2004, or substantially equal to a harmonic or sub-harmonic thereof, input signal 2004 is directly down-converted to a demodulated baseband signal. This is because, without modulation, the under-sampling pulses occur at the same point of subsequent cycles of the input signal 2004. As a result, the under-samples form a constant output baseband signal. If the input signal 2004 includes lower frequency changes, such as amplitude, frequency, phase, etc., or any combination thereof, the charge stored during associated under-samples reflects the lower frequency changes, resulting in similar changes on the demodulated baseband signal. For example, to directly down-convert a 900 MHZ input signal to a demodulated baseband signal (i.e., zero IF), the frequency of the control signal 2006 would be calculated as follows:

$$(Freq_{input} - Freq_{IF})/n = Freq_{control}$$

(900 MHZ - 0 MHZ)/n = 900 MHZ/n

For n = 0.5, 1, 2, 3, 4, etc., the frequency of the control signal 2006 should be substantially equal to 1.8 GHz, 900 MHZ, 450 MHZ, 300 MHZ, 225 MHZ, etc.

Exemplary time domain and frequency domain drawings, illustrating direct down-conversion of analog and digital AM and PM signals to demodulated baseband signals, and exemplary methods and systems thereof, are disclosed in the co-pending U.S. Patent

10

The State stand than the stand the stands and the stands than the stands than the stands than m THE RESIDENCE OF THE PARTY OF T

20

25

Application entitled "Method and System for Down-converting Electromagnetic Signals," Application No. 09/176,022, issued as U.S. Patent No. 6,061,551 on May 9, 2000.

Alternatively, to down-convert an input FM signal to a non-FM signal, a frequency within the FM bandwidth must be down-converted to baseband (i.e., zero IF). As an example, to down-convert a frequency shift keying (FSK) signal (a sub-set of FM) to a phase shift keying (PSK) signal (a subset of PM), the mid-point between a lower frequency F_1 and an upper frequency F_2 (that is, $[(F_1 + F_2) \div 2]$) of the FSK signal is down-converted to zero IF. For example, to down-convert an FSK signal having F₁ equal to 899 MHZ and F₂ equal to 901 MHZ, to a PSK signal, the aliasing rate of the control signal 2006 would be calculated as follows:

Frequency of the input
$$= (F_1 + F_2) \div 2$$

= $(899 \text{ MHZ} + 901 \text{ MHZ}) \div 2$
= 900 MHZ

Frequency of the down-converted signal = 0 (i.e., baseband)

$$(Freq_{input} - Freq_{IF})/n = Freq_{control}$$

(900 MHZ - 0 MHZ)/n = 900 MHZ/n

For n = 0.5, 1, 2, 3, etc., the frequency of the control signal 2006 should be substantially equal to 1.8 GHz, 900 MHZ, 450 MHZ, 300 MHZ, 225 MHZ, etc. The frequency of the down-converted PSK signal is substantially equal to one half the difference between the lower frequency F_1 and the upper frequency F_2 .

As another example, to down-convert a FSK signal to an amplitude shift keying (ASK) signal (a subset of AM), either the lower frequency F_1 or the upper frequency F_2 of the FSK signal is down-converted to zero IF. For example, to down-convert an FSK signal having F₁ equal to 900 MHZ and F₂ equal to 901 MHZ, to an ASK signal, the aliasing rate of the control signal 2006 should be substantially equal to:

25

20

(900 MHZ - 0 MHZ)/n = 900 MHZ/n, or (901 MHZ - 0 MHZ)/n = 901 MHZ/n.

For the former case of 900 MHZ/n, and for n = 0.5, 1, 2, 3, 4, etc., the frequency of the control signal 2006 should be substantially equal to 1.8 GHz, 900 MHZ, 450 MHZ, 300 MHZ, 225 MHZ, etc. For the latter case of 901 MHZ/n, and for n = 0.5, 1, 2, 3, 4, etc., the frequency of the control signal 2006 should be substantially equal to 1.802 GHz, 901 MHZ, 450.5 MHZ, 300.333 MHZ, 225.25 MHZ, etc. The frequency of the down-converted AM signal is substantially equal to the difference between the lower frequency F_1 and the upper frequency F_2 (i.e., 1 MHZ).

Exemplary time domain and frequency domain drawings, illustrating down-conversion of FM signals to non-FM signals, and exemplary methods and systems thereof, are disclosed in the co-pending U.S. Patent Application entitled "Method and System for Down-converting Electromagnetic Signals," Application No. 09/176,022, issued as U.S. Patent No. 6,061,551 on May 9, 2000.

In an embodiment, the pulses of the control signal 2006 have negligible apertures that tend towards zero. This makes the UFT module 2002 a high input impedance device. This configuration is useful for situations where minimal disturbance of the input signal may be desired.

In another embodiment, the pulses of the control signal 2006 have non-negligible apertures that tend away from zero. This makes the UFT module 2002 a lower input impedance device. This allows the lower input impedance of the UFT module 2002 to be substantially matched with a source impedance of the input signal 2004. This also improves the energy transfer from the input signal 2004 to the down-converted output signal 2012, and hence the efficiency and signal to noise (s/n) ratio of UFT module 2002.

Exemplary systems and methods for generating and optimizing the control signal 2006, and for otherwise improving energy transfer and s/n ratio, are disclosed in the copending U.S. Patent Application entitled "Method and System for Down-converting Electromagnetic Signals," Application No. 09/176,022, issued as U.S. Patent No. 6,061,551 on May 9, 2000.

3. Frequency Up-Conversion

The present invention is directed to systems and methods of frequency upconversion, and applications of same.

An example frequency up-conversion system 300 is illustrated in FIG. 3. The frequency up-conversion system 300 is now described.

An input signal 302 (designated as "Control Signal" in FIG. 3) is accepted by a switch module 304. For purposes of example only, assume that the input signal 302 is a FM input signal 606, an example of which is shown in FIG. 6C. FM input signal 606 may have been generated by modulating information signal 602 onto oscillating signal 604 (FIGS. 6A and 6B). It should be understood that the invention is not limited to this embodiment. The information signal 602 can be analog, digital, or any combination thereof, and any modulation scheme can be used.

The output of switch module 304 is a harmonically rich signal 306, shown for example in FIG. 6D as a harmonically rich signal 608. The harmonically rich signal 608 has a continuous and periodic waveform.

FIG. 6E is an expanded view of two sections of harmonically rich signal 608, section 610 and section 612. The harmonically rich signal 608 may be a rectangular wave, such as a square wave or a pulse (although, the invention is not limited to this embodiment). For ease of discussion, the term "rectangular waveform" is used to refer to waveforms that are substantially rectangular. In a similar manner, the term "square wave" refers to those waveforms that are substantially square and it is not the intent of the present invention that a perfect square wave be generated or needed.

Harmonically rich signal 608 is comprised of a plurality of sinusoidal waves whose frequencies are integer multiples of the fundamental frequency of the waveform of the harmonically rich signal 608. These sinusoidal waves are referred to as the harmonics of the underlying waveform, and the fundamental frequency is referred to as the first harmonic. FIG. 6F and FIG. 6G show separately the sinusoidal components making up the first, third, and fifth harmonics of section 610 and section 612. (Note that in theory there may be an infinite number of harmonics; in this example, because harmonically rich

10

25

30

signal 608 is shown as a square wave, there are only odd harmonics). Three harmonics are shown simultaneously (but not summed) in FIG. 6H.

The relative amplitudes of the harmonics are generally a function of the relative widths of the pulses of harmonically rich signal 306 and the period of the fundamental frequency, and can be determined by doing a Fourier analysis of harmonically rich signal 306. According to an embodiment of the invention, the input signal 606 may be shaped to ensure that the amplitude of the desired harmonic is sufficient for its intended use (e.g., transmission).

A filter 308 filters out any undesired frequencies (harmonics), and outputs an electromagnetic (EM) signal at the desired harmonic frequency or frequencies as an output signal 310, shown for example as a filtered output signal 614 in FIG. 6I.

FIG. 4 illustrates an example universal frequency up-conversion (UFU) module 401. The UFU module 401 includes an example switch module 304, which comprises a bias signal 402, a resistor or impedance 404, a universal frequency translator (UFT) 450, and a ground 408. The UFT 450 includes a switch 406. The input signal 302 (designated as "Control Signal" in FIG. 4) controls the switch 406 in the UFT 450, and causes it to close and open. Harmonically rich signal 306 is generated at a node 405 located between the resistor or impedance 404 and the switch 406.

Also in FIG. 4, it can be seen that an example filter 308 is comprised of a capacitor 410 and an inductor 412 shunted to a ground 414. The filter is designed to filter out the undesired harmonics of harmonically rich signal 306.

The invention is not limited to the UFU embodiment shown in FIG. 4.

For example, in an alternate embodiment shown in FIG. 5, an unshaped input signal 501 is routed to a pulse shaping module 502. The pulse shaping module 502 modifies the unshaped input signal 501 to generate a (modified) input signal 302 (designated as the "Control Signal" in FIG. 5). The input signal 302 is routed to the switch module 304, which operates in the manner described above. Also, the filter 308 of FIG. 5 operates in the manner described above.

The purpose of the pulse shaping module 502 is to define the pulse width of the input signal 302. Recall that the input signal 302 controls the opening and closing of the

20

25

switch 406 in switch module 304. During such operation, the pulse width of the input signal 302 establishes the pulse width of the harmonically rich signal 306. As stated above, the relative amplitudes of the harmonics of the harmonically rich signal 306 are a function of at least the pulse width of the harmonically rich signal 306. As such, the pulse width of the input signal 302 contributes to setting the relative amplitudes of the harmonics of harmonically rich signal 306.

Further details of up-conversion as described in this section are presented in pending U.S. application "Method and System for Frequency Up-Conversion," Ser. No. 09/176,154, filed October 21, 1998, incorporated herein by reference in its entirety.

4. Enhanced Signal Reception

The present invention is directed to systems and methods of enhanced signal reception (ESR), and applications of same.

Referring to FIG. 21, transmitter 2104 accepts a modulating baseband signal 2102 and generates (transmitted) redundant spectrums 2106a-n, which are sent over communications medium 2108. Receiver 2112 recovers a demodulated baseband signal 2114 from (received) redundant spectrums 2110a-n. Demodulated baseband signal 2114 is representative of the modulating baseband signal 2102, where the level of similarity between the modulating baseband signal 2114 and the modulating baseband signal 2102 is application dependent.

Modulating baseband signal 2102 is preferably any information signal desired for transmission and/or reception. An example modulating baseband signal 2202 is illustrated in FIG. 22A, and has an associated modulating baseband spectrum 2204 and image spectrum 2203 that are illustrated in FIG. 22B. Modulating baseband signal 2202 is illustrated as an analog signal in FIG. 22a, but could also be a digital signal, or combination thereof. Modulating baseband signal 2202 could be a voltage (or current) characterization of any number of real world occurrences, including for example and without limitation, the voltage (or current) representation for a voice signal.

10

He had been one and the been the been to be the been the 20

25

Each transmitted redundant spectrum 2106a-n contains the necessary information to substantially reconstruct the modulating baseband signal 2102. In other words, each redundant spectrum 2106a-n contains the necessary amplitude, phase, and frequency information to reconstruct the modulating baseband signal 2102.

FIG. 22C illustrates example transmitted redundant spectrums 2206b-d. Transmitted redundant spectrums 2206b-d are illustrated to contain three redundant spectrums for illustration purposes only. Any number of redundant spectrums could be generated and transmitted as will be explained in following discussions.

Transmitted redundant spectrums 2206b-d are centered at f_1 , with a frequency spacing f_2 between adjacent spectrums. Frequencies f_1 and f_2 are dynamically adjustable in real-time as will be shown below. FIG. 22D illustrates an alternate embodiment, where redundant spectrums 2208c,d are centered on unmodulated oscillating signal 2209 at f_1 (Hz). Oscillating signal 2209 may be suppressed if desired using, for example, phasing techniques or filtering techniques. Transmitted redundant spectrums are preferably above baseband frequencies as is represented by break 2205 in the frequency axis of FIGS. 22C and 22D.

Received redundant spectrums 2110a-n are substantially similar to transmitted redundant spectrums 2106a-n, except for the changes introduced by the communications medium 2108. Such changes can include but are not limited to signal attenuation, and signal interference. FIG. 22E illustrates example received redundant spectrums 2210b-d. Received redundant spectrums 2210b-d are substantially similar to transmitted redundant spectrums 2206b-d, except that redundant spectrum 2210c includes an undesired jamming signal spectrum 2211 in order to illustrate some advantages of the present invention. Jamming signal spectrum 2211 is a frequency spectrum associated with a jamming signal. For purposes of this invention, a "jamming signal" refers to any unwanted signal, regardless of origin, that may interfere with the proper reception and reconstruction of an intended signal. Furthermore, the jamming signal is not limited to tones as depicted by spectrum 2211, and can have any spectral shape, as will be understood by those skilled in the art(s).

10

and deal that and the first that the

20

25

30

As stated above, demodulated baseband signal 2114 is extracted from one or more of received redundant spectrums 2210b-d. FIG. 22F illustrates example demodulated baseband signal 2212 that is, in this example, substantially similar to modulating baseband signal 2202 (FIG. 22A); where in practice, the degree of similarity is application dependent.

An advantage of the present invention should now be apparent. The recovery of modulating baseband signal 2202 can be accomplished by receiver 2112 in spite of the fact that high strength jamming signal(s) (e.g. jamming signal spectrum 2211) exist on the communications medium. The intended baseband signal can be recovered because multiple redundant spectrums are transmitted, where each redundant spectrum carries the necessary information to reconstruct the baseband signal. At the destination, the redundant spectrums are isolated from each other so that the baseband signal can be recovered even if one or more of the redundant spectrums are corrupted by a jamming signal.

Transmitter 2104 will now be explored in greater detail. FIG. 23A illustrates transmitter 2301, which is one embodiment of transmitter 2104 that generates redundant spectrums configured similar to redundant spectrums 2206b-d. Transmitter 2301 includes generator 2303, optional spectrum processing module 2304, and optional medium interface module 2320. Generator 2303 includes: first oscillator 2302, second oscillator 2309, first stage modulator 2306, and second stage modulator 2310.

Transmitter 2301 operates as follows. First oscillator 2302 and second oscillator 2309 generate a first oscillating signal 2305 and second oscillating signal 2312, respectively. First stage modulator 2306 modulates first oscillating signal 2305 with modulating baseband signal 2202, resulting in modulated signal 2308. First stage modulator 2306 may implement any type of modulation including but not limited to: amplitude modulation, frequency modulation, phase modulation, combinations thereof, or any other type of modulation. Second stage modulator 2310 modulates modulated signal 2308 with second oscillating signal 2312, resulting in multiple redundant spectrums 2206a-n shown in FIG. 23B. Second stage modulator 2310 is preferably a phase modulator, or a frequency modulator, although other types of modulation may be implemented including but not limited to amplitude modulation. Each redundant spectrum

2206a-n contains the necessary amplitude, phase, and frequency information to substantially reconstruct the modulating baseband signal 2202.

Redundant spectrums 2206a-n are substantially centered around f_1 , which is the characteristic frequency of first oscillating signal 2305. Also, each redundant spectrum 2206a-n (except for 2206c) is offset from f_1 by approximately a multiple of f_2 (Hz), where f_2 is the frequency of the second oscillating signal 2312. Thus, each redundant spectrum 2206a-n is offset from an adjacent redundant spectrum by f_2 (Hz). This allows the spacing between adjacent redundant spectrums to be adjusted (or tuned) by changing f_2 that is associated with second oscillator 2309. Adjusting the spacing between adjacent redundant spectrums allows for dynamic real-time tuning of the bandwidth occupied by redundant spectrums 2206a-n.

In one embodiment, the number of redundant spectrums 2206a-n generated by transmitter 2301 is arbitrary and may be unlimited as indicated by the "a-n" designation for redundant spectrums 2206a-n. However, a typical communications medium will have a physical and/or administrative limitations (i.e. FCC regulations) that restrict the number of redundant spectrums that can be practically transmitted over the communications medium. Also, there may be other reasons to limit the number of redundant spectrums transmitted. Therefore, preferably, the transmitter 2301 will include an optional spectrum processing module 2304 to process the redundant spectrums 2206a-n prior to transmission over communications medium 2108.

In one embodiment, spectrum processing module 2304 includes a filter with a passband 2207 (FIG. 23C) to select redundant spectrums 2206b-d for transmission. This will substantially limit the frequency bandwidth occupied by the redundant spectrums to the passband 2207. In one embodiment, spectrum processing module 2304 also up converts redundant spectrums and/or amplifies redundant spectrums prior to transmission over the communications medium 2108. Finally, medium interface module 2320 transmits redundant spectrums over the communications medium 2108. In one embodiment, communications medium 2108 is an over-the-air link and medium interface module 2320 is an antenna. Other embodiments for communications medium 2108 and medium interface module 2320 will be understood based on the teachings contained herein.

FIG. 23D illustrates transmitter 2321, which is one embodiment of transmitter 2104 that generates redundant spectrums configured similar to redundant spectrums 2208c-d and unmodulated spectrum 2209. Transmitter 2321 includes generator 2311, spectrum processing module 2304, and (optional) medium interface module 2320. Generator 2311 includes: first oscillator 2302, second oscillator 2309, first stage modulator 2306, and second stage modulator 2310.

As shown in FIG. 23D, many of the components in transmitter 2321 are similar to those in transmitter 2301. However, in this embodiment, modulating baseband signal 2202 modulates second oscillating signal 2312. Transmitter 2321 operates as follows. First stage modulator 2306 modulates second oscillating signal 2312 with modulating baseband signal 2202, resulting in modulated signal 2322. As described earlier, first stage modulator 2306 can effect any type of modulation including but not limited to: amplitude modulation frequency modulation, combinations thereof, or any other type of modulation. Second stage modulator 2310 modulates first oscillating signal 2304 with modulated signal 2322, resulting in redundant spectrums 2208a-n, as shown in FIG. 23E. Second stage modulator 2310 is preferably a phase or frequency modulator, although other modulators could used including but not limited to an amplitude modulator.

Redundant spectrums 2208a-n are centered on unmodulated spectrum 2209 (at f₁ Hz), and adjacent spectrums are separated by f₂ Hz. The number of redundant spectrums 2208a-n generated by generator 2311 is arbitrary and unlimited, similar to spectrums 2206a-n discussed above. Therefore, optional spectrum processing module 2304 may also include a filter with passband 2325 to select, for example, spectrums 2208c,d for transmission over communications medium 2108. In addition, optional spectrum processing module 2304 may also include a filter (such as a bandstop filter) to attenuate unmodulated spectrum 2209. Alternatively, unmodulated spectrum 2209 may be attenuated by using phasing techniques during redundant spectrum generation. Finally, (optional) medium interface module 2320 transmits redundant spectrums 2208c,d over communications medium 2108.

Receiver 2112 will now be explored in greater detail to illustrate recovery of a demodulated baseband signal from received redundant spectrums. FIG. 24A illustrates

H has been here force

10

the property of the contract of the property o

20

25

30

receiver 2430, which is one embodiment of receiver 2112. Receiver 2430 includes optional medium interface module 2402, down-converter 2404, spectrum isolation module 2408, and data extraction module 2414. Spectrum isolation module 2408 includes filters 2410a-c. Data extraction module 2414 includes demodulators 2416a-c, error check modules 2420a-c, and arbitration module 2424. Receiver 2430 will be discussed in relation to the signal diagrams in FIGS. 24B-24J.

In one embodiment, optional medium interface module 2402 receives redundant spectrums 2210b-d (FIG. 22E, and FIG. 24B). Each redundant spectrum 2210b-d includes the necessary amplitude, phase, and frequency information to substantially reconstruct the modulating baseband signal used to generated the redundant spectrums. However, in the present example, spectrum 2210c also contains jamming signal 2211, which may interfere with the recovery of a baseband signal from spectrum 2210c. Downconverter 2404 down-converts received redundant spectrums 2210b-d to lower intermediate frequencies, resulting in redundant spectrums 2406a-c (FIG. 24C). Jamming signal 2211 is also down-converted to jamming signal 2407, as it is contained within redundant spectrum 2406b. Spectrum isolation module 2408 includes filters 2410a-c that isolate redundant spectrums 2406a-c from each other (FIGS. 24D-24F, respectively). Demodulators 2416a-c independently demodulate spectrums 2406a-c, resulting in demodulated baseband signals 2418a-c, respectively (FIGS. 24G-24I). Error check modules 2420a-c analyze demodulate baseband signal 2418a-c to detect any errors. In one embodiment, each error check module 2420a-c sets an error flag 2422a-c whenever an error is detected in a demodulated baseband signal. Arbitration module 2424 accepts the demodulated baseband signals and associated error flags, and selects a substantially errorfree demodulated baseband signal (FIG. 24J). In one embodiment, the substantially errorfree demodulated baseband signal will be substantially similar to the modulating baseband signal used to generate the received redundant spectrums, where the degree of similarity is application dependent.

Referring to FIGS. 24G-I, arbitration module 2424 will select either demodulated baseband signal 2418a or 2418c, because error check module 2420b will set the error flag 2422b that is associated with demodulated baseband signal 2418b.

20

25

The error detection schemes implemented by the error detection modules include but are not limited to: cyclic redundancy check (CRC) and parity check for digital signals, and various error detections schemes for analog signal.

Further details of enhanced signal reception as described in this section are presented in pending U.S. application "Method and System for Ensuring Reception of a Communications Signal," Ser. No. 09/176,415, filed October 21, 1998, issued as U.S. Patent No. 6,061,555 on May 9, 2000.

5. Unified Down-Conversion and Filtering

The present invention is directed to systems and methods of unified downconversion and filtering (UDF), and applications of same.

In particular, the present invention includes a unified down-converting and filtering (UDF) module that performs frequency selectivity and frequency translation in a unified (i.e., integrated) manner. By operating in this manner, the invention achieves high frequency selectivity prior to frequency translation (the invention is not limited to this embodiment). The invention achieves high frequency selectivity at substantially any frequency, including but not limited to RF (radio frequency) and greater frequencies. It should be understood that the invention is not limited to this example of RF and greater frequencies. The invention is intended, adapted, and capable of working with lower than radio frequencies.

FIG. 17 is a conceptual block diagram of a UDF module 1702 according to an embodiment of the present invention. The UDF module 1702 performs at least frequency translation and frequency selectivity.

The effect achieved by the UDF module 1702 is to perform the frequency selectivity operation prior to the performance of the frequency translation operation. Thus, the UDF module 1702 effectively performs input filtering.

According to embodiments of the present invention, such input filtering involves a relatively narrow bandwidth. For example, such input filtering may represent channel select filtering, where the filter bandwidth may be, for example, 50 KHz to 150 KHz. It

30

should be understood, however, that the invention is not limited to these frequencies. The invention is intended, adapted, and capable of achieving filter bandwidths of less than and greater than these values.

In embodiments of the invention, input signals 1704 received by the UDF module 1702 are at radio frequencies. The UDF module 1702 effectively operates to input filter these RF input signals 1704. Specifically, in these embodiments, the UDF module 1702 effectively performs input, channel select filtering of the RF input signal 1704. Accordingly, the invention achieves high selectivity at high frequencies.

The UDF module 1702 effectively performs various types of filtering, including but not limited to bandpass filtering, low pass filtering, high pass filtering, notch filtering, all pass filtering, band stop filtering, etc., and combinations thereof.

Conceptually, the UDF module 1702 includes a frequency translator 1708. The frequency translator 1708 conceptually represents that portion of the UDF module 1702 that performs frequency translation (down conversion).

The UDF module 1702 also conceptually includes an apparent input filter 1706 (also sometimes called an input filtering emulator). Conceptually, the apparent input filter 1706 represents that portion of the UDF module 1702 that performs input filtering.

In practice, the input filtering operation performed by the UDF module 1702 is integrated with the frequency translation operation. The input filtering operation can be viewed as being performed concurrently with the frequency translation operation. This is a reason why the input filter 1706 is herein referred to as an "apparent" input filter 1706.

The UDF module 1702 of the present invention includes a number of advantages. For example, high selectivity at high frequencies is realizable using the UDF module 1702. This feature of the invention is evident by the high Q factors that are attainable. For example, and without limitation, the UDF module 1702 can be designed with a filter center frequency f_C on the order of 900 MHZ, and a filter bandwidth on the order of 50 KHz. This represents a Q of 18,000 (Q is equal to the center frequency divided by the bandwidth).

It should be understood that the invention is not limited to filters with high Q factors. The filters contemplated by the present invention may have lesser or greater Qs,

10

The drift for one was the first firs

25

depending on the application, design, and/or implementation. Also, the scope of the invention includes filters where Q factor as discussed herein is not applicable.

The invention exhibits additional advantages. For example, the filtering center frequency $f_{\rm C}$ of the UDF module 1702 can be electrically adjusted, either statically or dynamically.

Also, the UDF module 1702 can be designed to amplify input signals.

Further, the UDF module 1702 can be implemented without large resistors, capacitors, or inductors. Also, the UDF module 1702 does not require that tight tolerances be maintained on the values of its individual components, i.e., its resistors, capacitors, inductors, etc. As a result, the architecture of the UDF module 1702 is friendly to integrated circuit design techniques and processes.

The features and advantages exhibited by the UDF module 1702 are achieved at least in part by adopting a new technological paradigm with respect to frequency selectivity and translation. Specifically, according to the present invention, the UDF module 1702 performs the frequency selectivity operation and the frequency translation operation as a single, unified (integrated) operation. According to the invention, operations relating to frequency translation also contribute to the performance of frequency selectivity, and vice versa.

According to embodiments of the present invention, the UDF module generates an output signal from an input signal using samples/instances of the input signal and samples/instances of the output signal.

More particularly, first, the input signal is under-sampled. This input sample includes information (such as amplitude, phase, etc.) representative of the input signal existing at the time the sample was taken.

As described further below, the effect of repetitively performing this step is to translate the frequency (that is, down-convert) of the input signal to a desired lower frequency, such as an intermediate frequency (IF) or baseband.

Next, the input sample is held (that is, delayed).

10

I I shall the same man and from the food that the same man and the first that the food that the food that the same man and the food that the food the food that the food that the food that the food that the food t

20

25

Then, one or more delayed input samples (some of which may have been scaled) are combined with one or more delayed instances of the output signal (some of which may have been scaled) to generate a current instance of the output signal.

Thus, according to a preferred embodiment of the invention, the output signal is generated from prior samples/instances of the input signal and/or the output signal. (It is noted that, in some embodiments of the invention, current samples/instances of the input signal and/or the output signal may be used to generate current instances of the output signal.). By operating in this manner, the UDF module preferably performs input filtering and frequency down-conversion in a unified manner.

FIG. 19 illustrates an example implementation of the unified down-converting and filtering (UDF) module 1922. The UDF module 1922 performs the frequency translation operation and the frequency selectivity operation in an integrated, unified manner as described above, and as further described below.

In the example of FIG. 19, the frequency selectivity operation performed by the UDF module 1922 comprises a band-pass filtering operation according to EQ. 1, below, which is an example representation of a band-pass filtering transfer function.

$$VO = \alpha_1 z^{-1}VI - \beta_1 z^{-1}VO - \beta_0 z^{-2}VO$$
 EQ. 1

It should be noted, however, that the invention is not limited to band-pass filtering. Instead, the invention effectively performs various types of filtering, including but not limited to bandpass filtering, low pass filtering, high pass filtering, notch filtering, all pass filtering, band stop filtering, etc., and combinations thereof. As will be appreciated, there are many representations of any given filter type. The invention is applicable to these filter representations. Thus, EQ. 1 is referred to herein for illustrative purposes only, and is not limiting.

The UDF module 1922 includes a down-convert and delay module 1924, first and second delay modules 1928 and 1930, first and second scaling modules 1932 and 1934, an output sample and hold module 1936, and an (optional) output smoothing module

10

The last control and control a

25

1938. Other embodiments of the UDF module will have these components in different configurations, and/or a subset of these components, and/or additional components. For example, and without limitation, in the configuration shown in FIG. 19, the output smoothing module 1938 is optional.

As further described below, in the example of FIG. 19, the down-convert and delay module 1924 and the first and second delay modules 1928 and 1930 include switches that are controlled by a clock having two phases, ϕ_1 and ϕ_2 . ϕ_1 and ϕ_2 preferably have the same frequency, and are non-overlapping (alternatively, a plurality such as two clock signals having these characteristics could be used). As used herein, the term "non-overlapping" is defined as two or more signals where only one of the signals is active at any given time. In some embodiments, signals are "active" when they are high. In other embodiments, signals are active when they are low.

Preferably, each of these switches closes on a rising edge of ϕ_1 or ϕ_2 , and opens on the next corresponding falling edge of ϕ_1 or ϕ_2 . However, the invention is not limited to this example. As will be apparent to persons skilled in the relevant art(s), other clock conventions can be used to control the switches.

In the example of FIG. 19, it is assumed that α_1 is equal to one. Thus, the output of the down-convert and delay module 1924 is not scaled. As evident from the embodiments described above, however, the invention is not limited to this example.

The example UDF module 1922 has a filter center frequency of 900.2 MHZ and a filter bandwidth of 570 KHz. The pass band of the UDF module 1922 is on the order of 899.915 MHZ to 900.485 MHZ. The Q factor of the UDF module 1922 is approximately 1879 (i.e., 900.2 MHZ divided by 570 KHz).

The operation of the UDF module 1922 shall now be described with reference to a Table 1802 (FIG. 18) that indicates example values at nodes in the UDF module 1922 at a number of consecutive time increments. It is assumed in Table 1802 that the UDF module 1922 begins operating at time t-1. As indicated below, the UDF module 1922 reaches steady state a few time units after operation begins. The number of time units necessary for a given UDF module to reach steady state depends on the configuration of

the UDF module, and will be apparent to persons skilled in the relevant art(s) based on the teachings contained herein.

At the rising edge of ϕ_1 at time t-1, a switch 1950 in the down-convert and delay module 1924 closes. This allows a capacitor 1952 to charge to the current value of an input signal, VI_{t-1} , such that node 1902 is at VI_{t-1} . This is indicated by cell 1804 in FIG. 18. In effect, the combination of the switch 1950 and the capacitor 1952 in the down-convert and delay module 1924 operates to translate the frequency of the input signal VI to a desired lower frequency, such as IF or baseband. Thus, the value stored in the capacitor 1952 represents an instance of a down-converted image of the input signal VI.

The manner in which the down-convert and delay module 1924 performs frequency down-conversion is further described elsewhere in this application, and is additionally described in pending U.S. application "Method and System for Down-Converting Electromagnetic Signals," Ser. No. 09/176,022, filed October 21, 1998, issued as U.S. Patent No. 6,061,551 on May 9, 2000, which is herein incorporated by reference in its entirety.

Also at the rising edge of ϕ_1 at time t-1, a switch 1958 in the first delay module 1928 closes, allowing a capacitor 1960 to charge to VO_{t-1} , such that node 1906 is at VO_{t-1} . This is indicated by cell 1806 in Table 1802. (In practice, VO_{t-1} is undefined at this point. However, for ease of understanding, VO_{t-1} shall continue to be used for purposes of explanation.)

Also at the rising edge of ϕ_1 at time t-1, a switch 1966 in the second delay module 1930 closes, allowing a capacitor 1968 to charge to a value stored in a capacitor 1964. At this time, however, the value in capacitor 1964 is undefined, so the value in capacitor 1968 is undefined. This is indicated by cell 1807 in table 1802.

At the rising edge of ϕ_2 at time t-1, a switch 1954 in the down-convert and delay module 1924 closes, allowing a capacitor 1956 to charge to the level of the capacitor 1952. Accordingly, the capacitor 1956 charges to VI_{t-1} , such that node 1904 is at VI_{t-1} . This is indicated by cell 1810 in Table 1802.

25

30

5

The UDF module 1922 may optionally include a unity gain module 1990A between capacitors 1952 and 1956. The unity gain module 1990A operates as a current source to enable capacitor 1956 to charge without draining the charge from capacitor 1952. For a similar reason, the UDF module 1922 may include other unity gain modules 1990B-1990G. It should be understood that, for many embodiments and applications of the invention, these unity gain modules 1990A-1990G are optional. The structure and operation of the unity gain modules 1990 will be apparent to persons skilled in the relevant art(s).

Also at the rising edge of ϕ_2 at time t-1, a switch 1962 in the first delay module 1928 closes, allowing a capacitor 1964 to charge to the level of the capacitor 1960. Accordingly, the capacitor 1964 charges to VO_{t-1} , such that node 1908 is at VO_{t-1} . This is indicated by cell 1814 in Table 1802.

Also at the rising edge of ϕ_2 at time t-1, a switch 1970 in the second delay module 1930 closes, allowing a capacitor 1972 to charge to a value stored in a capacitor 1968. At this time, however, the value in capacitor 1968 is undefined, so the value in capacitor 1972 is undefined. This is indicated by cell 1815 in table 1802.

At time t, at the rising edge of ϕ_1 , the switch 1950 in the down-convert and delay module 1924 closes. This allows the capacitor 1952 to charge to VI_t, such that node 1902 is at VI_t. This is indicated in cell 1816 of Table 1802.

Also at the rising edge of ϕ_1 at time t, the switch 1958 in the first delay module 1928 closes, thereby allowing the capacitor 1960 to charge to VO_t. Accordingly, node 1906 is at VO_t. This is indicated in cell 1820 in Table 1802.

Further at the rising edge of ϕ_1 at time t, the switch 1966 in the second delay module 1930 closes, allowing a capacitor 1968 to charge to the level of the capacitor 1964. Therefore, the capacitor 1968 charges to VO_{t-1} , such that node 1910 is at VO_{t-1} . This is indicated by cell 1824 in Table 1802.

At the rising edge of ϕ_2 at time t, the switch 1954 in the down-convert and delay module 1924 closes, allowing the capacitor 1956 to charge to the level of the capacitor 1952. Accordingly, the capacitor 1956 charges to VI_t, such that node 1904 is at VI_t. This is indicated by cell 1828 in Table 1802.

10

25

30

Also at the rising edge of ϕ_2 at time t, the switch 1962 in the first delay module 1928 closes, allowing the capacitor 1964 to charge to the level in the capacitor 1960. Therefore, the capacitor 1964 charges to VO_t , such that node 1908 is at VO_t . This is indicated by cell 1832 in Table 1802.

Further at the rising edge of ϕ_2 at time t, the switch 1970 in the second delay module 1930 closes, allowing the capacitor 1972 in the second delay module 1930 to charge to the level of the capacitor 1968 in the second delay module 1930. Therefore, the capacitor 1972 charges to VO_{t-1} , such that node 1912 is at VO_{t-1} . This is indicated in cell 1836 of FIG. 18.

At time t+1, at the rising edge of ϕ_1 , the switch 1950 in the down-convert and delay module 1924 closes, allowing the capacitor 1952 to charge to VI_{t+1}. Therefore, node 1902 is at VI_{t+1}, as indicated by cell 1838 of Table 1802.

Also at the rising edge of ϕ_1 at time t+1, the switch 1958 in the first delay module 1928 closes, allowing the capacitor 1960 to charge to VO_{t+1} . Accordingly, node 1906 is at VO_{t+1} , as indicated by cell 1842 in Table 1802.

Further at the rising edge of ϕ_1 at time t+1, the switch 1966 in the second delay module 1930 closes, allowing the capacitor 1968 to charge to the level of the capacitor 1964. Accordingly, the capacitor 1968 charges to VO_b, as indicated by cell 1846 of Table 1802.

In the example of FIG. 19, the first scaling module 1932 scales the value at node 1908 (i.e., the output of the first delay module 1928) by a scaling factor of -0.1. Accordingly, the value present at node 1914 at time t+1 is -0.1 * VO_t. Similarly, the second scaling module 1934 scales the value present at node 1912 (i.e., the output of the second scaling module 1930) by a scaling factor of -0.8. Accordingly, the value present at node 1916 is -0.8 * VO_{t-1} at time t+1.

At time t+1, the values at the inputs of the summer 1926 are: VI_t at node 1904, $-0.1 * VO_t$ at node 1914, and $-0.8 * VO_{t-1}$ at node 1916 (in the example of FIG. 19, the values at nodes 1914 and 1916 are summed by a second summer 1925, and this sum is presented to the summer 1926). Accordingly, at time t+1, the summer generates a signal equal to $VI_t - 0.1 * VO_t - 0.8 * VO_{t-1}$.

15

At the rising edge of ϕ_1 at time t+1, a switch 1991 in the output sample and hold module 1936 closes, thereby allowing a capacitor 1992 to charge to VO_{t+1} . Accordingly, the capacitor 1992 charges to VO_{t+1} , which is equal to the sum generated by the adder 1926. As just noted, this value is equal to: $VI_t - 0.1 * VO_t - 0.8 * VO_{t-1}$. This is indicated in cell 1850 of Table 1802. This value is presented to the optional output smoothing module 1938, which smooths the signal to thereby generate the instance of the output signal VO_{t+1} . It is apparent from inspection that this value of VO_{t+1} is consistent with the band pass filter transfer function of EQ. 1.

Further details of unified down-conversion and filtering as described in this section are presented in pending U.S. application "Integrated Frequency Translation And Selectivity," Ser. No. 09/175,966, filed October 21, 1998, issued as U.S. Patent No. 6,049,706 on April 11, 2000, incorporated herein by reference in its entirety.

6. Example Application Embodiments of the Invention

As noted above, the UFT module of the present invention is a very powerful and flexible device. Its flexibility is illustrated, in part, by the wide range of applications in which it can be used. Its power is illustrated, in part, by the usefulness and performance of such applications.

Example applications of the UFT module were described above. In particular, frequency down-conversion, frequency up-conversion, enhanced signal reception, and unified down-conversion and filtering applications of the UFT module were summarized above, and are further described below. These applications of the UFT module are discussed herein for illustrative purposes. The invention is not limited to these example applications. Additional applications of the UFT module will be apparent to persons skilled in the relevant art(s), based on the teachings contained herein.

For example, the present invention can be used in applications that involve frequency down-conversion. This is shown in FIG. 1C, for example, where an example UFT module 115 is used in a down-conversion module 114. In this capacity, the UFT module 115 frequency down-converts an input signal to an output signal. This is also

30

5

shown in FIG. 7, for example, where an example UFT module 706 is part of a down-conversion module 704, which is part of a receiver 702.

The present invention can be used in applications that involve frequency upconversion. This is shown in FIG. 1D, for example, where an example UFT module 117 is used in a frequency up-conversion module 116. In this capacity, the UFT module 117 frequency up-converts an input signal to an output signal. This is also shown in FIG. 8, for example, where an example UFT module 806 is part of up-conversion module 804, which is part of a transmitter 802.

The present invention can be used in environments having one or more transmitters 902 and one or more receivers 906, as illustrated in FIG. 9. In such environments, one or more of the transmitters 902 may be implemented using a UFT module, as shown for example in FIG. 8. Also, one or more of the receivers 906 may be implemented using a UFT module, as shown for example in FIG. 7.

The invention can be used to implement a transceiver. An example transceiver 1002 is illustrated in FIG. 10. The transceiver 1002 includes a transmitter 1004 and a receiver 1008. Either the transmitter 1004 or the receiver 1008 can be implemented using a UFT module. Alternatively, the transmitter 1004 can be implemented using a UFT module 1006, and the receiver 1008 can be implemented using a UFT module 1010. This embodiment is shown in FIG. 10.

Another transceiver embodiment according to the invention is shown in FIG. 11. In this transceiver 1102, the transmitter 1104 and the receiver 1108 are implemented using a single UFT module 1106. In other words, the transmitter 1104 and the receiver 1108 share a UFT module 1106.

As described elsewhere in this application, the invention is directed to methods and systems for enhanced signal reception (ESR). Various ESR embodiments include an ESR module (transmit) in a transmitter 1202, and an ESR module (receive) in a receiver 1210. An example ESR embodiment configured in this manner is illustrated in FIG. 12.

The ESR module (transmit) 1204 includes a frequency up-conversion module 1206. Some embodiments of this frequency up-conversion module 1206 may be implemented using a UFT module, such as that shown in FIG. 1D.

10

The first over their their their terms than their terms the terms their terms the terms

25

30

The ESR module (receive) 1212 includes a frequency down-conversion module 1214. Some embodiments of this frequency down-conversion module 1214 may be implemented using a UFT module, such as that shown in FIG. 1C.

As described elsewhere in this application, the invention is directed to methods and systems for unified down-conversion and filtering (UDF). An example unified down-conversion and filtering module 1302 is illustrated in FIG. 13. The unified down-conversion and filtering module 1302 includes a frequency down-conversion module 1304 and a filtering module 1306. According to the invention, the frequency down-conversion module 1304 and the filtering module 1306 are implemented using a UFT module 1308, as indicated in FIG. 13.

Unified down-conversion and filtering according to the invention is useful in applications involving filtering and/or frequency down-conversion. This is depicted, for example, in FIGS. 15A-15F. FIGS. 15A-15C indicate that unified down-conversion and filtering according to the invention is useful in applications where filtering precedes, follows, or both precedes and follows frequency down-conversion. FIG. 15D indicates that a unified down-conversion and filtering module 1524 according to the invention can be utilized as a filter 1522 (i.e., where the extent of frequency down-conversion by the down-converter in the unified down-conversion and filtering module 1524 is minimized). FIG. 15E indicates that a unified down-conversion and filtering module 1528 according to the invention can be utilized as a down-converter 1526 (i.e., where the filter in the unified down-conversion and filtering module 1532 can be used as an amplifier. It is noted that one or more UDF modules can be used in applications that involve at least one or more of filtering, frequency translation, and amplification.

For example, receivers, which typically perform filtering, down-conversion, and filtering operations, can be implemented using one or more unified down-conversion and filtering modules. This is illustrated, for example, in FIG. 14.

The methods and systems of unified down-conversion and filtering of the invention have many other applications. For example, as discussed herein, the enhanced signal

10

:II (T1

31 20

25

30

reception (ESR) module (receive) operates to down-convert a signal containing a plurality of spectrums. The ESR module (receive) also operates to isolate the spectrums in the down-converted signal, where such isolation is implemented via filtering in some embodiments. According to embodiments of the invention, the ESR module (receive) is implemented using one or more unified down-conversion and filtering (UDF) modules. This is illustrated, for example, in FIG. 16. In the example of FIG. 16, one or more of the UDF modules 1610, 1612, 1614 operates to down-convert a received signal. The UDF modules 1610, 1612, 1614 also operate to filter the down-converted signal so as to isolate the spectrum(s) contained therein. As noted above, the UDF modules 1610, 1612, 1614 are implemented using the universal frequency translation (UFT) modules of the invention.

The invention is not limited to the applications of the UFT module described above. For example, and without limitation, subsets of the applications (methods and/or structures) described herein (and others that would be apparent to persons skilled in the relevant art(s) based on the herein teachings) can be associated to form useful combinations.

For example, transmitters and receivers are two applications of the UFT module. FIG. 10 illustrates a transceiver 1002 that is formed by combining these two applications of the UFT module, i.e., by combining a transmitter 1004 with a receiver 1008.

Also, ESR (enhanced signal reception) and unified down-conversion and filtering are two other applications of the UFT module. FIG. 16 illustrates an example where ESR and unified down-conversion and filtering are combined to form a modified enhanced signal reception system.

The invention is not limited to the example applications of the UFT module discussed herein. Also, the invention is not limited to the example combinations of applications of the UFT module discussed herein. These examples were provided for illustrative purposes only, and are not limiting. Other applications and combinations of such applications will be apparent to persons skilled in the relevant art(s) based on the teachings contained herein. Such applications and combinations include, for example and without limitation, applications/combinations comprising and/or involving one or more of: (1) frequency translation; (2) frequency down-conversion; (3) frequency up-conversion;

(4) receiving; (5) transmitting; (6) filtering; and/or (7) signal transmission and reception in environments containing potentially jamming signals.

Additional example applications are described below.

6.1 Data Communication

5

The invention is directed to data communication among data processing devices. For example, and without limitation, the invention is directed to computer networks such as, for example, local area networks (LANs), wide area networks (WANs), including wireless LANs (WLANs) and wireless WANs, modulator/demodulators (modems), including wireless modems, etc.

FIG. 25 illustrates an example environment 2502 wherein computers 2504, 2512, and 2526 communicate with one another via a computer network 2534. It is noted that the invention is not limited to computers, but encompasses any data processing and/or communications device or other device where communications with external devices is desired. Also, the invention includes but si not limited to WLAN client (also called mobile terminals, and/or stations) and infrastructure devices (also called access points). In the example of FIG. 25, computer 2504 is communicating with the network 2534 via a wired link, whereas computers 2512 and 2526 are communicating with the network 2534 via wireless links.

In the teachings contained herein, for illustrative purposes, a link may be designated as being a wired link or a wireless link. Such designations are for example purposes only, and are not limiting. A link designated as being wireless may alternatively be wired. Similarly, a link designated as being wired may alternatively be wireless. This is applicable throughout the entire application.

25

20

The computers 2504, 2512 and 2526 each include an interface 2506, 2514, and 2528, respectively, for communicating with the network 2534. The interfaces 2506, 2514, and 2528 include transmitters 2508, 2516, and 2530 respectively. Also, the interfaces 2506, 2514 and 2528 include receivers 2510, 2518, and 2532 respectively. In embodiments of the invention, the transmitters 2508, 2516 and 2530 are implemented

5

25

20

30

using UFT modules for performing frequency up-conversion operations (see, for example, FIG. 8). In embodiments, the receivers 2510, 2518 and 2532 are implemented using UFT modules for performing frequency down-conversion operations (see, for example, FIG. 7).

As noted above, the computers 2512 and 2526 interact with the network 2534 via wireless links. In embodiments of the invention, the interfaces 2514, 2528 in computers 2512, 2526 represent modulator/demodulators (modems).

In embodiments, the network 2534 includes an interface or modem 2520 for communicating with the modems 2514, 2528 in the computers 2512, 2526. In embodiments, the interface 2520 includes a transmitter 2522, and a receiver 2524. Either or both of the transmitter 2522, and the receiver 2524 are implemented using UFT modules for performing frequency translation operations (see, for example, FIGS. 7 and 8).

In alternative embodiments, one or more of the interfaces 2506, 2514, 2520, and 2528 are implemented using transceivers that employ one or more UFT modules for performing frequency translation operations (see, for example, FIGS. 10 and 11).

FIG. 26 illustrates another example data communication embodiment 2602. Each of a plurality of computers 2604, 2612, 2614 and 2616 includes an interface, such as an interface 2606 shown in the computer 2604. It should be understood that the other computers 2612, 2614, 2616 also include an interface such as an interface 2606. The computers 2604, 2612, 2614 and 2616 communicate with each other via interfaces 2606 and wireless or wired links, thereby collectively representing a data communication network.

The interfaces 2606 may represent any computer interface or port, such as but not limited to a high speed internal interface, a wireless serial port, a wireless PS2 port, a wireless USB port, PCMCIA port, etc.

The interface 2606 includes a transmitter 2608 and a receiver 2610. In embodiments of the invention, either or both of the transmitter 2608 and the receiver 2610 are implemented using UFT modules for frequency up-conversion and down-conversion (see, for example, FIGS. 7 and 8). Alternatively, the interfaces 2806 can be

implemented using a transceiver having one or more UFT modules for performing frequency translation operations (see, for example, FIGS. 10 and 11).

FIGS. 33-38 illustrate other scenarios envisioned and encompassed by the invention. FIG. 33 illustrates a data processing environment 3302 wherein a wired network, such as an Ethernet network 3304, is linked to another network, such as a WLAN 3306, via a wireless link 3308. The wireless link 3308 is established via interfaces 3310, 3312 which are preferably implemented using universal frequency translation modules.

FIGS 35-38 illustrate that the present invention supports WLANs that are located in one or more buildings or over any defined geographical area, as shown in FIGs. 35-38.

The invention includes multiple networks linked together. The invention also envisions wireless networks conforming to any known or custom standard or specification. This is shown in FIG. 34, for example, where any combination of WLANs conforming to any WLAN standard or configuration, such as IEEE 802.11 and Bluetooth (or other relatively short range communication specification or standard), any WAN cellular or telephone standard or specification, any type of radio links, any custom standard or specification, etc., or combination thereof, can be implemented using the universal frequency translation technology described herein. Also, any combination of these networks may be coupled together, as illustrated in FIG. 34.

The invention supports WLANs that are located in one or multiple buildings, as shown in FIGS. 35 and 36. The invention also supports WLANs that are located in an area including and external to one or more buildings, as shown in FIG. 37. In fact, the invention is directed to networks that cover any defined geographical area, as shown in FIG. 38. In the embodiments described above, wireless links are preferably established using WLAN interfaces as described herein.

More generally, the invention is directed to WLAN client devices and WLAN infrastructure devices. "WLAN Client Devices" refers to, for example, any data processing and/or communication devices in which wired or wireless communication functionality is desired, such as but not limited to computers, personal data assistants (PDAs), automatic identification data collection devices (such as bar code

30

1744.0630003

5

10

25

scanners/readers, electronic article surveillance readers, and radio frequency identification readers), telephones, network devices, etc., and combinations thereof. Infrastructure Devices" refers to, for example, Access Points and other devices used to provide the ability for WLAN Client Devices (as well as potentially other devices) to connect to wired and/or wireless networks and/or to provide the network functionality of a WLAN. "WLAN" refers to, for example, a Wireless Local Area Network that is implemented according to and that operates within WLAN standards and/or specifications, such as but not limited to IEEE 802.11, IEEE 802.11a, IEEE 802.11b, HomeRF, Proxim Range LAN, Proxim Range LAN2, Symbol Spectrum 1, Symbol Spectrum 24 as it existed prior to adoption of IEEE 802.11, HiperLAN1, or HiperLAN2. WLAN client devices and/or WLAN infrastructure devices may operate in a multi-mode capacity. For example, a device may include WLAN and WAN functionality. Another device may include WLAN and short range communication (such as but not limited to Blue Tooth) functionality. Another device may include WLAN and WAN and short range communication functionality. It is noted that the above definitions and examples are provided for illustrative purposes, and are not limiting. Equivalents to that described above will be apparent to persons skilled in the relevant art(s) based on the teachings contained herein.

6.1.1. Example Implementations: Interfaces, Wireless Modems, Wireless LANs, etc.

The present invention is now described as implemented in an interface, such as a wireless modem or other device (such as client or infrastructure device), which can be utilized to implement or interact with a wireless local area network (WLAN) or wireless wide area network (WWAN), for example. In an embodiment, the present invention is implemented in a WLAN to support IEEE WLAN Standard 802.11, but this embodiment is mentioned for illustrative purposes only. The invention is not limited to this standard.

Conventional wireless modems are described in, for example, U.S. Patent 5,764,693, titled, "Wireless Radio Modem with Minimal Inter-Device RF Interference,"

10

25

30

incorporated herein by reference in its entirety. The present invention replaces a substantial portion of conventional wireless modems with one or more universal frequency translators (UFTs). The resultant improved wireless modem consumes less power that conventional wireless modems and is easier and less expensive to design and build. A wireless modem in accordance with the present invention can be implemented in a PC-MCIA card or within a main housing of a computer, for example.

FIG. 27 illustrates an example block diagram of a computer system 2710, which can be wirelessly coupled to a LAN, as illustrated in FIGS. 25 and 26. The computer system 2710 includes an interface 2714 and an antenna 2712. The interface 2714 includes a transmitter module 2716 that receives information from a digital signal processor (DSP) 2720, and modulates and up-converts the information for transmission from the antenna 2712. The interface 2714 also includes a receiver module 2718 that receives modulated carrier signals via the antenna 2712. The receiver module 2718 down-converts and demodulates the modulated carrier signals to baseband information, and provides the baseband information to the DSP 2720. The DSP 2720 can include a central processing unit (CPU) and other components of the computer 2712. Conventionally, the interface 2714 is implemented with heterodyne components.

FIG. 28 illustrates an example interface 2810 implemented with heterodyne components. The interface 2810 includes a transmitter module 2812 and a receiver module 2824. The receiver module 2824 includes an RF section 2830, one or more IF sections 2828, a demodulator section 2826, an optional analog to digital (A/D) converter 2834, and a frequency generator/synthesizer 2832. The transmitter module 2812 includes an optional digital to analog (D/A) converter 2822, a modulator \section 2818, one or more IF sections 2816, an RF section 2814, and a frequency generator/synthesizer 2820. Operation of the interface 2810 will be apparent to one skilled in the relevant art(s), based on the description herein.

FIG. 29 illustrates an example in-phase/quadrature-phase (I/Q) interface 2910 implemented with heterodyne components. I/Q implementations allow two channels of information to be communicated on a carrier signal and thus can be utilized to increase data transmission.

10

| First party party many many party pa

5

The interface 2910 includes a transmitter module 2912 and a receiver module 2934. The receiver module 2934 includes an RF section 2936, one or more IF sections 2938, an I/Q demodulator section 2940, an optional A/D converter 2944, and a frequency generator/synthesizer 2942. The I/Q demodulator section 2940 includes a signal splitter 2946, mixers 2948, and a phase shifter 2950. The signal splitter 2946 provides a received signal to the mixers 2948. The phase shifter 2950 operates the mixers 2948 ninety degrees out of phase with one another to generate I and Q information channels 2952 and 2954, respectively, which are provided to a DSP 2956 through the optional A/D converter 2944.

The transmitter module 2912 includes an optional D/A converter 2922, an I/Q modulator section 2918, one or more IF sections 2916, an RF section 2914, and a frequency generator/synthesizer 2920. The I/Q modulator section 2918 includes mixers 2924, a phase shifter 2926, and a signal combiner 2928. The phase shifter 2926 operates the mixers 2924 ninety degrees out of phase with one another to generate I and Q modulated information signals 2930 and 2932, respectively, which are combined by the signal combiner 2928. The IF section(s) 2916 and RF section 2914 up-convert the combined I and Q modulated information signals 2930 and 2932 to RF for transmission by the antenna, in a manner well known in the relevant art(s).

Heterodyne implementations, such as those illustrated in FIGS. 28 and 29, are expensive and difficult to design, manufacture and tune. In accordance with the present invention, therefore, the interface 2714 (FIG. 27) is preferably implemented with one or more universal frequency translation (UFT) modules, such as the UFT module 102 (FIG. 1A). Thus previously described benefits of the present invention are obtained in wireless modems, WLANs, etc.

FIG. 30 illustrates an example block diagram embodiment of the interface 2714 that is associated with a computer or any other data processing and/or communications device. In FIG. 30, the receiver module 2718 includes a universal frequency down-converter (UFD) module 3014 and an optional analog to digital (A/D) converter 3016, which converts an analog output from the UFD 3014 to a digital format for the DSP 2720. The transmitter module 2716 includes an optional modulator 3012 and a universal

30

25

5

10

25

30

frequency up-converter (UFU) module 3010. The optional modulator 3012 can be a variety of types of modulators, including conventional modulators. Alternatively, the UFU module 3010 includes modulator functionality. The example implementation of FIG. 30 operates substantially as described above and in co-pending U.S. Patent Applications titled, "Method and System for Down-Converting Electromagnetic Signals," Ser. No. 09/176,022, filed October 21, 1998, issued as U.S. Patent No. 6,061,551 on May 9, 2000, and "Method and System for Frequency Up-Conversion," Ser. No. 09/176,154, filed October 21, 1998, issued as U.S. Patent No. 6,091,940 on July 18, 2000, as well as other cited documents.

FIG. 31 illustrates an example implementation of the interface 2714 illustrated in FIG. 30, wherein the receiver UFD 3014 includes a UFT module 3112, and the transmitter UFU 3010 includes a universal frequency translation (UFT) module 3110. This example implementation operates substantially as described above and in co-pending U.S. Patent Applications titled, "Method and System for Down-Converting Electromagnetic Signals," Ser. No. 09/176,022, filed October 21, 1998, issued as U.S. Patent No. 6,061,551 on May 9, 2000, and "Method and System for Frequency Up-Conversion," Ser. No. 09/176,154, filed October 21, 1998, "Method and System for Frequency Up-Conversion," Ser. No. 09/176,154, filed October 21, 1998, issued as U.S. Patent No. 6,091,940 on July 18, 2000, as well as other cited documents.

FIG. 32 illustrates an example I/Q implementation of the interface module 2710. Other I/Q implementations are also contemplated and are within the scope of the present invention.

In the example of FIG. 32, the receiver UFD module 3014 includes a signal divider 3228 that provides a received I/Q modulated carrier signal 3230 between a third UFT module 3224 and a fourth UFT module 3226. A phase shifter 3232, illustrated here as a 90 degree phase shifter, controls the third and fourth UFT modules 3224 and 3226 to operate 90 degrees out of phase with one another. As a result, the third and fourth UFT modules 3224 and 3226 down-convert and demodulate the received I/Q modulated carrier signal 3230, and output I and Q channels 3234 and 3236, respectively, which are provided to the DSP 2720 through the optional A/D converter 3016.

In the example of FIG. 32, the transmitter UFU module 3010 includes first and second UFT modules 3212 and 3214 and a phase shifter 3210, which is illustrated here as a 90 degree phase shifter. The phase shifter 3210 receives a lower frequency modulated carrier signal 3238 from the modulator 3012. The phase shifter 3210 controls the first and second UFT modules 3212 and 3214 to operate 90 degrees out of phase with one another. The first and second UFT modules 3212 and 3214 up-convert the lower frequency modulated carrier signal 3238, which are output as higher frequency modulated I and Q carrier channels 3218 and 3220, respectively. A signal combiner 3216 combines the higher frequency modulated I and Q carrier channels 3218 and 3220 into a single higher frequency modulated I/Q carrier signal 3222 for transmitting by the antenna 2712.

The example implementations of the interfaces described above, and variations thereof, can also be used to implement network interfaces, such as the network interface 2520 illustrated in FIG. 25.

6.1.2. Example Modifications

The RF modem applications, WLAN applications, etc., described herein, can be modified by incorporating one or more of the enhanced signal reception (ESR) techniques described herein. Use of ESR embodiments with the network embodiments described herein will be apparent to persons skilled in the relevant art(s) based on the teachings contained herein.

The RF modem applications, WLAN applications, etc., described herein can be enhanced by incorporating one or more of the unified down-conversion and filtering (UDF) techniques described herein. Use of UDF embodiments with the network embodiments described herein will be apparent to persons skilled in the relevant art(s) based on the teachings contained herein.

20

25

6.2. Other Example Applications

The application embodiments described above are provided for purposes of illustration. These applications and embodiments are not intended to limit the invention. Alternate and additional applications and embodiments, differing slightly or substantially from those described herein, will be apparent to persons skilled in the relevant art(s) based on the teachings contained herein. For example, such alternate and additional applications and embodiments include combinations of those described above. Such combinations will be apparent to persons skilled in the relevant art(s) based on the herein teachings.

7.0. Example WLAN Implementation Embodiments

7.1 Architecture

FIG. 39 is a block diagram of a WLAN interface 3902 (also referred to as a WLAN modem herein) according to an embodiment of the invention. The WLAN interface/modem 3902 includes an antenna 3904, a low noise amplifier or power amplifier (LNA/PA) 3904, a receiver 3906, a transmitter 3910, a control signal generator 3908, a demodulator/modulator facilitation module 3912, and a media access controller (MAC) interface 3914. Other embodiments may include different elements. The MAC interface 3914 couples the WLAN interface/modem 3902 to a computer 3916 or other data processing device. The computer 3916 preferably includes a MAC 3918.

The WLAN interface/modem 3902 represents a transmit and receive application that utilizes the universal frequency translation technology described herein. It also represents a zero IF (or direct-to-data) WLAN architecture.

The WLAN interface/modem 3902 also represents a vector modulator and a vector demodulator using the universal frequency translation (UFT) technology described herein. Use of the UFT technology enhances the flexibility of the WLAN application (i.e., makes it universal).

In the embodiment shown in FIG. 39, the WLAN interface/modem 3902 is compliant with WLAN standard IEEE 802.11. However, the invention is not limited to this standard. The invention is applicable to any communication standard or specification, as will be appreciated by persons skilled in the relevant art(s) based on the teachings contained herein. Any modifications to the invention to operate with other standards or specifications will be apparent to persons skilled in the relevant art(s) based on the teachings contained herein.

In the embodiment shown in FIG. 39, the WLAN interface/modem 3902 provides half duplex communication. However, the invention is not limited to this communication mode. The invention is applicable and directed to other communication modes, as will be appreciated by persons skilled in the relevant art(s) based on the teachings contained herein.

In the embodiment shown in FIG. 39, the modulation/demodulation performed by the WLAN interface/modem 3902 is preferably direct sequence spread spectrum QPSK (quadrature phase shift keying) with differential encoding. However, the invention is not limited to this modulation/demodulation mode. The invention is applicable and directed to other modulation and demodulation modes, such as but not limited to those described herein, as well as frequency hopping according to IEEE 802.11, OFDM (orthogonal frequency division multiplexing), as well as others. These modulation/demodulation modes will be appreciated by persons skilled in the relevant art(s) based on the teachings contained herein.

The operation of the WLAN interface/modem 3902 when receiving shall now be described.

Signals 3922 received by the antenna 3903 are amplified by the LNA/PA 3904. The amplified signals 3924 are down-converted and demodulated by the receiver 3906. The receiver 3906 outputs I signal 3926 and Q signal 3928.

FIG. 40 illustrates an example receiver 3906 according to an embodiment of the invention. It is noted that the receiver 3906 shown in FIG. 40 represents a vector modulator. The "receiving" function performed by the WLAN interface/modem 3902 can

be considered to be all processing performed by the WLAN interface/modem 3902 from the LNA/PA 3904 to generation of baseband information.

Signal 3924 is split by a 90 degree splitter 4001 to produce an I signal 4006A and Q signal 4006B that are preferably 90 degrees apart in phase. I and Q signals 4006A, 4006B are down-converted by UFD (universal frequency down-conversion) modules 4002A, 4002B. The UDF modules 4002A, 4002B output down-converted I and Q signals 3926, 3928. The UFD modules 4002A, 4002B each includes at least one UFT (universal frequency translation) module 4004A. UFD and UFT modules are described above. An example implementation of the receiver 3906 (vector demodulator) is shown in FIG. 53. An example BOM list for the receiver 3906 of FIG. 53 is shown in FIG. 54.

The demodulator/modulator facilitation module 3912 receives the I and Q signals 3926, 3928. The demodulator/modulator facilitation module 3912 amplifies and filters the I and Q signals 3926, 3928. The demodulator/modulator facilitation module 3912 also performs automatic gain control (AGC) functions. The AGC function is coupled with the universal frequency translation technology described herein. The demodulator/modulator facilitation module 3912 outputs processed I and Q signals 3930, 3932.

The MAC interface 3914 receives the processed I and Q signals 3930, 3932. The MAC interface 3914 preferably includes a baseband processor. The MAC interface 3914 preferably performs functions such as combining the I and Q signals 3930, 3932, and arranging the data according to the protocol/file formal being used. Other functions performed by the MAC interface 3914 and the baseband processor contained therein will be apparent to persons skilled in the relevant art(s) based on the teachings contained herein. The MAC interface 3914 outputs the baseband information signal, which is received and processed by the computer 3916 in an implementation and application specific manner.

In the example embodiment of FIG. 39, the demodulation function is distributed among the receiver 3906, the demodulator/modulator facilitation module 3912, and a baseband processor contained in the MAC interface 3914. The functions collectively performed by these components include, but are not limited to, despreading the information, differentially decoding the information, tracking the carrier phase,

descrambling, recreating the data clock, and combining the I and Q signals. The invention is not limited to this arrangement. These demodulation-type functions can be centralized in a single component, or distributed in other ways.

The operation of the WLAN interface/modem 3902 when transmitting shall now be described.

A baseband information signal 3936 is received by the MAC interface 3914 from the computer 3916. The MAC interface 3914 preferably performs functions such as splitting the baseband information signal to form I and Q signals 3930, 3932, and arranging the data according to the protocol/file formal being used. Other functions performed by the MAC interface 3914 and the baseband processor contained therein will be apparent to persons skilled in the relevant art(s) based on the teachings contained herein.

The demodulator/modulator facilitation module 3912 filters and amplifies the I and Q signals 3930, 3932. The demodulator/modulator facilitation module 3912 outputs processed I and Q signals 3942, 3944. Preferably, at least some filtering and/or amplifying components in the demodulator/modulator facilitation module 3912 are used for both the transmit and receive paths.

The transmitter 3910 up-converts the processed I and Q signals 3942, 3944, and combines the up-converted I and Q signals. This up-converted/combined signal is amplified by the LNA/PA 3904, and then transmitted via the antenna 3904.

FIG. 41 illustrates an example transmitter 3910 according to an embodiment of the invention. The device in FIG. 41 can also be called a vector modulator. In an embodiment, the "transmit" function performed by the WLAN interface/modem 3902 can be considered to be all processing performed by the WLAN interface/modem 3902 from receipt of baseband information through the LNA/PA 3904. An example implementation of the transmitter 3910 (vector modulator) is shown in FIGS. 57-60. The data conditioning interfaces 5802 in FIG. 58 effectively pre-process the I and Q signals 3942, 3944 before being received by the UFU modules 4102. An example BOM list for the transmitter 3910 of FIGS. 57-60 is shown in FIGS. 61A and 61B.

10

The last trans and the proof of the last trans and trans and

25

30

I and Q signals 3942, 3944 are received by UFU (universal frequency upconversion) modules 4102A, 4102B. The UFU modules 4102A, 4102B each includes at least one UFT module 4104A, 4104B. The UFU modules 4102A, 4102B up-convert I and Q signals 3942, 3944. The UFU modules 4102A, 4102B output up-converted I and Q signals 4106, 4108. The 90 degree combiner 4110 effectively phase shifts either the I signal 4106 or the Q signal 4108 by 90 degrees, and then combines the phase shifted signal with the unshifted signal to generate a combined, up-converted I/Q signal 3946.

In the example embodiment of FIG. 39, the modulation function is distributed among the transmitter 3910, the demodulator/modulator facilitation module 3912, and a baseband processor contained in the MAC interface 3914. The functions collectively performed by these components include, but are not limited to, differentially encoding data, splitting the baseband information signal into I and Q signals, scrambling data, and data spreading. The invention is not limited to this arrangement. These modulation-type functions can be centralized in a single component, or distributed in other ways.

An example implementation of the transmitter 3910 (vector modulator) is shown in FIGS. 57-60. The data conditioning interfaces 5802 in FIG. 58 effectively pre-process the I and Q signals 3942, 3944 before being received by the UFU modules 4102. An example BOM list for the transmitter 3910 of FIGS. 57-60 is shown in FIGS. 61A and 61B.

The components in the WLAN interface/modem 3902 are preferably controlled by the MAC interface 3914 in operation with the MAC 3918 in the computer 3916. This is represented by the distributed control arrow 3940 in FIG. 39. Such control includes setting the frequency, data rate, whether receiving or transmitting, and other communication characteristics/modes that will be apparent to persons skilled in the relevant art(s) based on the teachings contained herein. In embodiments, control signals are sent over the corresponding wireless medium and received by the antenna 3904, and sent to the MAC 3918.

FIG. 42 illustrates an example implementation of the WLAN interface/modem 3902. It is noted that in this implementation example, the MAC interface 3914 is located on a different board. FIG. 62 is an example motherboard corresponding to FIG. 42. FIG.

63 is an example bill-of-materials (BOM) list for the motherboard of FIG. 62. This and other implementations are provided herein for example purposes only. Other implementations will be apparent to persons skilled in the relevant art(s), and the invention is directed to such other implementations.

FIG. 102 illustrates an alternate example PCMCIA test bed assembly for a WLAN interface/modem 3902 according to an embodiment of the invention. In this embodiment, the baseband processor 10202 is separate from the MAC interface 3914.

In some applications, it is desired to separate the receive path and the transmit path. FIG. 43 illustrates an example receive implementation, and FIG. 44 illustrates an example transmit implementation.

7.2 Receiver

Example embodiments and implementations of the IQ receiver 3906 will be discussed as follows. The example embodiments and implementations include multi-phase embodiments that are useful for reducing or eliminating unwanted DC offsets and circuit re-radiation. The invention is not limited to these example receiver embodiments. Other receiver embodiments will be understood by those skilled in the relevant arts based on the discussion given herein. These other embodiments are within the scope and spirit of the present invention.

7.2.1 IQ Receiver

20

An example embodiment of the receiver 3906 is shown in FIG. 67A. Referring to FIG. 67A, the UFD module 4002A (FIG. 40) is configured so that the UFT module 4004A is coupled to a storage module 6704A. The UFT module 4004A is a controlled switch 6702A that is controlled by the control signal 3920A. The storage module 6704A is a capacitor 6706A. However, other storage modules could be used including an inductor, as will be understood by those skilled in the relevant arts. Likewise, the UFD module 4002B (FIG. 40) is configured so that the UFT module 4004B is coupled to a

25

25

20

30

storage module 6704B. The UFT module 4004B is a controlled switch 6702B that is controlled by the control signal 3920B. The storage module 6704B is a capacitor 6706B. However, other storage modules could be used including an inductor, as will be understood by those skilled in the relevant arts. The operation of the receiver 3906 is discussed as follows.

The 90 degree splitter 4001 receives the received signal 3924 from the LNA/PA module 3904. The 90 degree splitter 4001 divides the signal 3924 into an I signal 4006A and a Q signal 4006B.

The UFD module 4002A receives the I signal 4006A and down-converts the I signal 4006A using the control signal 3920A to a lower frequency signal I 3926. More specifically, the controlled switch 6702A samples the I signal 4006A according to the control signal 3920A, transferring charge (or energy) to the storage module 6704A. The charge stored during successive samples of the I signal 4006A, results in the down-converted signal I signal 3926. Likewise, UFD module 4002B receives the Q signal 4006B and down-converts the Q signal 4006B using the control signal 3920B to a lower frequency signal Q 3928. More specifically, the controlled switch 6702B samples the Q signal 4006B according to the control signal 3920B, resulting in charge (or energy) that is stored in the storage module 6704B. The charge stored during successive samples of the I signal 4006A, results in the down-converted signal Q signal 3928.

Down-conversion utilizing a UFD module (also called an aliasing module) is further described in the above referenced applications, such as "Method and System for Down-converting Electromagnetic Signals," Ser. No. 09/176,022, now U.S. Patent No. 6,061,551. As discussed in the '551 patent, the control signals 3920A,B can be configured as a plurality of pulses that are established to improve energy transfer from the signals 4006A,B to the down-converted signals 3926 and 3928, respectively. In other words, the pulse widths of the control signals 3920 can be adjusted to increase and/or optimize the energy transfer from the signals 4006 to the down-converted output signals 3926 and 3938, respectively. Additionally, matched filter principles can be implemented to shape the sampling pulses of the control signal 3920, and therefore further improve energy transfer to the down-converted output signal 3106. Matched filter principle and energy transfer

are further described in the above referenced applications, such as U.S. patent application titled, "Method and System for Down-Converting an Electromagnetic Signal, Transforms For Same, and Aperture Relationships", Ser. No. 09/550,644, filed on April 14, 2000.

The configuration of the UFT based receiver 3906 is flexible. In FIG. 67A, the controlled switches 6702 are in a series configuration relative to the signals 4006. Alternatively, FIG 67B illustrates the controlled switches 6702 in a shunt configuration so that the switches 6702 shunt the signals 4006 to ground.

Additionally in FIGs. 67A-B, the 90 degree phase shift between the I and Q channels is realized with the 90 degree splitter 4001. Alternatively, FIG. 68A illustrates a receiver 6806 in series configuration, where the 90 degree phase shift is realized by shifting the control signal 3920B by 90 degrees relative to the control signal 3920A. More specifically, the 90 degree shifter 6804 is added to shift the control signal 3920B by 90 degrees relative to the control signal 3920B by 90 degrees relative to the control signal 3920A. As such, the splitter 6802 is an in-phase (i.e. 0 degree) signal splitter. FIG. 68B illustrates an embodiment of the receiver 3906 of the receiver 3906 in a shunt configuration with 90 degree delays on the control signal.

Furthermore, the configuration of the controlled switch 6702 is also flexible. More specifically, the controlled switches 6702 can be implemented in many different ways, including transistor switches. FIG. 69A illustrates the UFT modules 6702 in a series configuration and implemented as FETs 6902, where the gate of each FET 6902 is controlled by the respective control signal 3920. As such, the FET 6902 samples the respective signal 4006, according to the respective control signal 3920. FIG. 69B illustrates the shunt configuration.

7.2.2 Multi-Phase IQ Receiver

25

FIG. 70A illustrates an exemplary I/Q modulation receiver 7000, according to an embodiment of the present invention. I/Q modulation receiver 7000 has additional advantages of reducing or eliminating unwanted DC offsets and circuit re-radiation. As will be apparent, the IQ receiver 7000 can be described as a multi-phase receiver to those skilled in the arts.

30⁻

I/Q modulation receiver 7000 comprises a first UFD module 7002, a first optional filter 7004, a second UFD module 7006, a second optional filter 7008, a third UFD module 7010, a third optional filter 7012, a fourth UFD module 7014, a fourth filter 7016, an optional LNA 7018, a first differential amplifier 7020, a second differential amplifier 7022, and an antenna 7072.

I/Q modulation receiver 7000 receives, down-converts, and demodulates a I/Q modulated RF input signal 7082 to an I baseband output signal 7084, and a Q baseband output signal 7086. I/Q modulated RF input signal 7082 comprises a first information signal and a second information signal that are I/Q modulated onto an RF carrier signal. I baseband output signal 7084 comprises the first baseband information signal. Q baseband output signal 7086 comprises the second baseband information signal.

Antenna 7072 receives I/Q modulated RF input signal 7082. I/Q modulated RF input signal 7082 is output by antenna 7072 and received by optional LNA 7018. When present, LNA 7018 amplifies I/Q modulated RF input signal 7082, and outputs amplified I/Q signal 7088.

First UFD module 7002 receives amplified I/Q signal 7088. First UFD module 7002 down-converts the I-phase signal portion of amplified input I/Q signal 7088 according to an I control signal 7090. First UFD module 7002 outputs an I output signal 7098.

In an embodiment, first UFD module 7002 comprises a first storage module 7024, a first UFT module 7026, and a first voltage reference 7028. In an embodiment, a switch contained within first UFT module 7026 opens and closes as a function of I control signal 7090. As a result of the opening and closing of this switch, which respectively couples and de-couples first storage module 7024 to and from first voltage reference 7028, a down-converted signal, referred to as I output signal 7098, results. First voltage reference 7028 may be any reference voltage, and is preferably ground. I output signal 7098 is stored by first storage module 7024.

In an embodiment, first storage module 7024 comprises a first capacitor 7074. In addition to storing I output signal 7098, first capacitor 7074 reduces or prevents a DC offset voltage resulting from charge injection from appearing on I output signal 7098.

30

I output signal 7098 is received by optional first filter 7004. When present, first filter 7004 is in some embodiments a high pass filter to at least filter I output signal 7098 to remove any carrier signal "bleed through". In a preferred embodiment, when present, first filter 7004 comprises a first resistor 7030, a first filter capacitor 7032, and a first filter voltage reference 7034. Preferably, first resistor 7030 is coupled between I output signal 7098 and a filtered I output signal 7007, and first filter capacitor 7032 is coupled between filtered I output signal 7007 and first filter voltage reference 7034. Alternately, first filter 7004 may comprise any other applicable filter configuration as would be understood by persons skilled in the relevant art(s). First filter 7004 outputs filtered I output signal 7007.

Second UFD module 7006 receives amplified I/Q signal 7088. Second UFD module 7006 down-converts the inverted I-phase signal portion of amplified input I/Q signal 7088 according to an inverted I control signal 7092. Second UFD module 7006 outputs an inverted I output signal 7001.

In an embodiment, second UFD module 7006 comprises a second storage module 7036, a second UFT module 7038, and a second voltage reference 7040. In an embodiment, a switch contained within second UFT module 7038 opens and closes as a function of inverted I control signal 7092. As a result of the opening and closing of this switch, which respectively couples and de-couples second storage module 7036 to and from second voltage reference 7040, a down-converted signal, referred to as inverted I output signal 7001, results. Second voltage reference 7040 may be any reference voltage, and is preferably ground. Inverted I output signal 7001 is stored by second storage module 7036.

In an embodiment, second storage module 7036 comprises a second capacitor 7076. In addition to storing inverted I output signal 7001, second capacitor 7076 reduces or prevents a DC offset voltage resulting from charge injection from appearing on inverted I output signal 7001.

Inverted I output signal 7001 is received by optional second filter 7008. When present, second filter 7008 is a high pass filter to at least filter inverted I output signal 7001 to remove any carrier signal "bleed through". In a preferred embodiment, when present, second filter 7008 comprises a second resistor 7042, a second filter capacitor

5

7044, and a second filter voltage reference 7046. Preferably, second resistor 7042 is coupled between inverted I output signal 7001 and a filtered inverted I output signal 7009, and second filter capacitor 7044 is coupled between filtered inverted I output signal 7009 and second filter voltage reference 7046. Alternately, second filter 7008 may comprise any other applicable filter configuration as would be understood by persons skilled in the relevant art(s). Second filter 7008 outputs filtered inverted I output signal 7009.

First differential amplifier 7020 receives filtered I output signal 7007 at its non-inverting input and receives filtered inverted I output signal 7009 at its inverting input. First differential amplifier 7020 subtracts filtered inverted I output signal 7009 from filtered I output signal 7007, amplifies the result, and outputs I baseband output signal 7084. Because filtered inverted I output signal 7009 is substantially equal to an inverted version of filtered I output signal 7007, I baseband output signal 7084 is substantially equal to filtered I output signal 7009, with its amplitude doubled. Furthermore, filtered I output signal 7007 and filtered inverted I output signal 7009 may comprise substantially equal noise and DC offset contributions from prior down-conversion circuitry, including first UFD module 7002 and second UFD module 7006, respectively. When first differential amplifier 7020 subtracts filtered inverted I output signal 7009 from filtered I output signal 7007, these noise and DC offset contributions substantially cancel each other.

Third UFD module 7010 receives amplified I/Q signal 7088. Third UFD module 7010 down-converts the Q-phase signal portion of amplified input I/Q signal 7088 according to an Q control signal 7094. Third UFD module 7010 outputs an Q output signal 7003.

In an embodiment, third UFD module 7010 comprises a third storage module 7048, a third UFT module 7050, and a third voltage reference 7052. In an embodiment, a switch contained within third UFT module 7050 opens and closes as a function of Q control signal 7094. As a result of the opening and closing of this switch, which respectively couples and de-couples third storage module 7048 to and from third voltage reference 7052, a down-converted signal, referred to as Q output signal 7003, results.

5

20

30

Third voltage reference 7052 may be any reference voltage, and is preferably ground. Q output signal 7003 is stored by third storage module 7048.

In an embodiment, third storage module 7048 comprises a third capacitor 7078. In addition to storing Q output signal 7003, third capacitor 7078 reduces or prevents a DC offset voltage resulting from charge injection from appearing on Q output signal 7003.

Q output signal 7003 is received by optional third filter 7012. When present, in an embodiment, third filter 7012 is a high pass filter to at least filter Q output signal 7003 to remove any carrier signal "bleed through". In an embodiment, when present, third filter 7012 comprises a third resistor 7054, a third filter capacitor 7056, and a third filter voltage reference 7058. Preferably, third resistor 7054 is coupled between Q output signal 7003 and a filtered Q output signal 7011, and third filter capacitor 7056 is coupled between filtered Q output signal 7011 and third filter voltage reference 7058. Alternately, third filter 7012 may comprise any other applicable filter configuration as would be understood by persons skilled in the relevant art(s). Third filter 7012 outputs filtered Q output signal 7011.

Fourth UFD module 7014 receives amplified I/Q signal 7088. Fourth UFD module 7014 down-converts the inverted Q-phase signal portion of amplified input I/Q signal 7088 according to an inverted Q control signal 7096. Fourth UFD module 7014 outputs an inverted Q output signal 7005.

In an embodiment, fourth UFD module 7014 comprises a fourth storage module 7060, a fourth UFT module 7062, and a fourth voltage reference 7064. In an embodiment, a switch contained within fourth UFT module 7062 opens and closes as a function of inverted Q control signal 7096. As a result of the opening and closing of this switch, which respectively couples and de-couples fourth storage module 7060 to and from fourth voltage reference 7064, a down-converted signal, referred to as inverted Q output signal 7005, results. Fourth voltage reference 7064 may be any reference voltage, and is preferably ground. Inverted Q output signal 7005 is stored by fourth storage module 7060.

In an embodiment, fourth storage module 7060 comprises a fourth capacitor 7080. In addition to storing inverted Q output signal 7005, fourth capacitor 7080 reduces or

30

prevents a DC offset voltage resulting from charge injection from appearing on inverted Q output signal 7005.

Inverted Q output signal 7005 is received by optional fourth filter 7016. When present, fourth filter 7016 is a high pass filter to at least filter inverted Q output signal 7005 to remove any carrier signal "bleed through". In a preferred embodiment, when present, fourth filter 7016 comprises a fourth resistor 7066, a fourth filter capacitor 7068, and a fourth filter voltage reference 7070. Preferably, fourth resistor 7066 is coupled between inverted Q output signal 7005 and a filtered inverted Q output signal 7013, and fourth filter capacitor 7068 is coupled between filtered inverted Q output signal 7013 and fourth filter voltage reference 7070. Alternately, fourth filter 7016 may comprise any other applicable filter configuration as would be understood by persons skilled in the relevant art(s). Fourth filter 7016 outputs filtered inverted Q output signal 7013.

Second differential amplifier 7022 receives filtered Q output signal 7011 at its non-inverting input and receives filtered inverted Q output signal 7013 at its inverting input. Second differential amplifier 7022 subtracts filtered inverted Q output signal 7013 from filtered Q output signal 7011, amplifies the result, and outputs Q baseband output signal 7086. Because filtered inverted Q output signal 7013 is substantially equal to an inverted version of filtered Q output signal 7011, Q baseband output signal 7086 is substantially equal to filtered Q output signal 7013, with its amplitude doubled. Furthermore, filtered Q output signal 7011 and filtered inverted Q output signal 7013 may comprise substantially equal noise and DC offset contributions of the same polarity from prior down-conversion circuitry, including third UFD module 7010 and fourth UFD module 7014, respectively. When second differential amplifier 7022 subtracts filtered inverted Q output signal 7013 from filtered Q output signal 7011, these noise and DC offset contributions substantially cancel each other.

Additional embodiments relating to addressing DC offset and re-radiation concerns, applicable to the present invention, are described in co-pending Patent Application No. 09/526,041,entitled "DC Offset, Re-radiation, and I/Q Solutions Using Universal Frequency Translation Technology," Attorney Docket No. 1744.0880000, which is herein incorporated by reference in its entirety.

25

7.2.2.1 Example I/Q Modulation Control Signal Generator Embodiments

FIG. 70B illustrates an exemplary block diagram for I/Q modulation control signal generator 7023, according to an embodiment of the present invention. I/Q modulation control signal generator 7023 generates I control signal 7090, inverted I control signal 7092, Q control signal 7094, and inverted Q control signal 7096 used by I/Q modulation receiver 7000 of FIG. 70A. I control signal 7090 and inverted I control signal 7092 operate to down-convert the I-phase portion of an input I/Q modulated RF signal. Q control signal 7094 and inverted Q control signal 7096 act to down-convert the Q-phase portion of the input I/Q modulated RF signal. Furthermore, I/Q modulation control signal generator 7023 has the advantage of generating control signals in a manner such that resulting collective circuit re-radiation is radiated at one or more frequencies outside of the frequency range of interest. For instance, potential circuit re-radiation is radiated at a frequency substantially greater than that of the input RF carrier signal frequency.

I/Q modulation control signal generator 7023 comprises a local oscillator 7025, a first divide-by-two module 7027, a 180 degree phase shifter 7029, a second divide-by-two module 7031, a first pulse generator 7033, a second pulse generator 7035, a third pulse generator 7037, and a fourth pulse generator 7039.

Local oscillator 7025 outputs an oscillating signal 7015. FIG. 70C shows an exemplary oscillating signal 7015.

First divide-by-two module 7027 receives oscillating signal 7015, divides oscillating signal 7015 by two, and outputs a half frequency LO signal 7017 and a half frequency inverted LO signal 7041. FIG. 70C shows an exemplary half frequency LO signal 7017. Half frequency inverted LO signal 7041 is an inverted version of half frequency LO signal 7017. First divide-by-two module 7027 may be implemented in circuit logic, hardware, software, or any combination thereof, as would be known by persons skilled in the relevant art(s).

10

And bear it is that had been the special properties of the proof that the proof t

25

20

30

180 degree phase shifter 7029 receives oscillating signal 7015, shifts the phase of oscillating signal 7015 by 180 degrees, and outputs phase shifted LO signal 7019. 180 degree phase shifter 7029 may be implemented in circuit logic, hardware, software, or any combination thereof, as would be known by persons skilled in the relevant art(s). In alternative embodiments, other amounts of phase shift may be used.

Second divide-by two module 7031 receives phase shifted LO signal 7019, divides phase shifted LO signal 7019 by two, and outputs a half frequency phase shifted LO signal 7021 and a half frequency inverted phase shifted LO signal 7043. FIG. 70C shows an exemplary half frequency phase shifted LO signal 7021. Half frequency inverted phase shifted LO signal 7043 is an inverted version of half frequency phase shifted LO signal 7021. Second divide-by-two module 7031 may be implemented in circuit logic, hardware, software, or any combination thereof, as would be known by persons skilled in the relevant art(s).

First pulse generator 7033 receives half frequency LO signal 7017, generates an output pulse whenever a rising edge is received on half frequency LO signal 7017, and outputs I control signal 7090. FIG. 70C shows an exemplary I control signal 7090.

Second pulse generator 7035 receives half frequency inverted LO signal 7041, generates an output pulse whenever a rising edge is received on half frequency inverted LO signal 7041, and outputs inverted I control signal 7092. FIG. 70C shows an exemplary inverted I control signal 7092.

Third pulse generator 7037 receives half frequency phase shifted LO signal 7021, generates an output pulse whenever a rising edge is received on half frequency phase shifted LO signal 7021, and outputs Q control signal 7094. FIG. 70C shows an exemplary Q control signal 7094.

Fourth pulse generator 7039 receives half frequency inverted phase shifted LO signal 7043, generates an output pulse whenever a rising edge is received on half frequency inverted phase shifted LO signal 7043, and outputs inverted Q control signal 7096. FIG. 70C shows an exemplary inverted Q control signal 7096.

In an embodiment, control signals 7090, 7021, 7041 and 7043 include pulses having a width equal to one-half of a period of I/Q modulated RF input signal 7082. The

25

5

invention, however, is not limited to these pulse widths, and control signals 7090, 7021, 7041, and 7043 may comprise pulse widths of any fraction of, or multiple and fraction of, a period of I/Q modulated RF input signal 7082.

First, second, third, and fourth pulse generators 7033, 7035, 7037, and 7039 may be implemented in circuit logic, hardware, software, or any combination thereof, as would be known by persons skilled in the relevant art(s).

As shown in FIG. 70C, in an embodiment, control signals 7090, 7021, 7041, and 7043 comprise pulses that are non-overlapping in other embodiments the pulses may overlap. Furthermore, in this example, pulses appear on these signals in the following order: I control signal 7090, Q control signal 7094, inverted I control signal 7092, and inverted Q control signal 7096. Potential circuit re-radiation from I/Q modulation receiver 7000 may comprise frequency components from a combination of these control signals.

For example, FIG. 70D shows an overlay of pulses from I control signal 7090, Q control signal 7094, inverted I control signal 7092, and inverted Q control signal 7096. When pulses from these control signals leak through first, second, third, and/or fourth UFD modules 7002, 7006, 7010, and 7014 to antenna 7072 (shown in FIG. 70A), they may be radiated from I/Q modulation receiver 7000, with a combined waveform that appears to have a primary frequency equal to four times the frequency of any single one of control signals 7090, 7021, 7041, and 7043. FIG. 70 shows an example combined control signal 7045.

FIG. 70D also shows an example I/Q modulation RF input signal 7082 overlaid upon control signals 7090, 7094, 7092, and 7096. As shown in FIG. 70D, pulses on I control signal 7090 overlay and act to down-convert a positive I-phase portion of I/Q modulation RF input signal 7082. Pulses on inverted I control signal 7092 overlay and act to down-convert a negative I-phase portion of I/Q modulation RF input signal 7082. Pulses on Q control signal 7094 overlay and act to down-convert a rising Q-phase portion of I/Q modulation RF input signal 7082. Pulses on inverted Q control signal 7096 overlay and act to down-convert a falling Q-phase portion of I/Q modulation RF input signal 7082.

5

20

25

As FIG. 70D further shows in this example, the frequency ratio between the combination of control signals 7090, 7021, 7041, and 7043 and I/Q modulation RF input signal 7082 is approximately 4:3. Because the frequency of the potentially re-radiated signal, i.e., combined control signal 7045, is substantially different from that of the signal being down-converted, i.e., I/Q modulation RF input signal 7082, it does not interfere with signal down-conversion as it is out of the frequency band of interest, and hence may be filtered out. In this manner, I/Q modulation receiver 7000 reduces problems due to circuit re-radiation. As will be understood by persons skilled in the relevant art(s) from the teachings herein, frequency ratios other than 4:3 may be implemented to achieve similar reduction of problems of circuit re-radiation.

It should be understood that the above control signal generator circuit example is provided for illustrative purposes only. The invention is not limited to these embodiments. Alternative embodiments (including equivalents, extensions, variations, deviations, etc., of the embodiments described herein) for I/Q modulation control signal generator 7023 will be apparent to persons skilled in the relevant art(s) from the teachings herein, and are within the scope of the present invention.

FIG. 70S illustrates the receiver 7000, where the UFT modules 7028, 7038, 7050, and 7062 are configured with FETs 7099a-d.

Additional embodiments relating to addressing DC offset and re-radiation concerns, applicable to the present invention, are described in co-pending patent application no. 09/526, 041, entitled "DC Offset, Re-radiation, and I/Q Solutions Using Universal Frequency Translation Technology," which is herein incorporated by reference in its entirety.

7.2.2.2 Implementation of Multi-phase I/Q Modulation Receiver Embodiment with Exemplary Waveforms

FIG. 70E illustrates a more detailed example circuit implementation of I/Q modulation receiver 7000, according to an embodiment of the present invention. FIGS.

70F-P show example waveforms related to an example implementation of I/Q modulation receiver 7000 of FIG. 70E.

FIGS. 70F and 70G show first and second input data signals 7047 and 7049 to be I/Q modulated with a RF carrier signal frequency as the I-phase and Q-phase information signals, respectively.

FIGS. 70I and 70J show the signals of FIG. 70F and 70G after modulation with a RF carrier signal frequency, respectively, as I-modulated signal 7051 and Q-modulated signal 7053.

FIG. 70H shows an I/Q modulation RF input signal 7082 formed from I-modulated signal 7051 and Q-modulated signal 7053 of FIGS. 70I and 70J, respectively.

FIG. 70O shows an overlaid view of filtered I output signal 7007 and filtered inverted I output signal 7009.

FIG. 70P shows an overlaid view of filtered Q output signal 7011 and filtered inverted Q output signal 7013.

FIGS. 70K and 70L show I baseband output signal 7084 and Q baseband output signal 7086, respectfully. A data transition 7055 is indicated in both I baseband output signal 7084 and Q baseband output signal 7086. The corresponding data transition 7055 is indicated in I-modulated signal 7051 of FIG. 70I, Q-modulated signal 7053 of FIG. 70J, and I/Q modulation RF input signal 7082 of FIG. 70H.

FIGS. 70M and 70N show I baseband output signal 7084 and Q baseband output signal 7086 over a wider time interval.

7.2.2.3 Example Single Channel Receiver Embodiment

FIG. 70Q illustrates an example single channel receiver 7091, corresponding to either the I or Q channel of I/Q modulation receiver 7000, according to an embodiment of the present invention. Single channel receiver 7091 can down-convert an input RF signal 7097 modulated according to AM, PM, FM, and other modulation schemes. Refer to section 7.2.1 above for further description on the operation of single channel receiver

25

5

7091. In other words, the single channel receiver 7091 is a one channel of the IQ receiver 7000 that was discussed in section 7.2.1.

7.2.2.4 Alternative Example I/Q Modulation Receiver Embodiment

FIG. 70R illustrates an exemplary I/Q modulation receiver 7089, according to an embodiment of the present invention. I/Q modulation receiver 7089 receives, down-converts, and demodulates an I/Q modulated RF input signal 7082 to an I baseband output signal 7084, and a Q baseband output signal 7086. I/Q modulation receiver 7089 has additional advantages of reducing or eliminating unwanted DC offsets and circuit re-

radiation, in a similar fashion to that of I/Q modulation receiver 7000 described above.

7.3 Transmitter

Example embodiments and implementations of the IQ transmitter 3910 will be discussed as follows. The example embodiments and implementations include multi-phase embodiments that are useful for reducing or eliminating unwanted DC offsets that can result in unwanted carrier insertion.

7.3.1 Universal Transmitter with 2 UFT Modules

FIG. 71A illustrates a transmitter 7102 according to embodiments of the present invention. Transmitter 7102 includes a balanced modulator/up-converter 7104, a control signal generator 7142, an optional filter 7106, and an optional amplifier 7108. Transmitter 7102 up-converts a baseband signal 7110 to produce an output signal 7140 that is conditioned for wireless or wire line transmission. In doing so, the balanced modulator 7104 receives the baseband signal 7110 and samples the baseband signal in a differential and balanced fashion to generate a harmonically rich signal 7138. The harmonically rich signal 7138 includes multiple harmonic images, where each image contains the baseband

25

information in the baseband signal 7110. The optional bandpass filter 7106 may be included to select a harmonic of interest (or a subset of harmonics) in the signal 7138 for transmission. The optional amplifier 7108 may be included to amplify the selected harmonic prior to transmission. The universal transmitter is further described at a high level by the flowchart 8400 that is shown in FIG. 84. A more detailed structural and operational description of the balanced modulator follows thereafter.

Referring to flowchart 8400, in step 8402, the balanced modulator 7104 receives the baseband signal 7110.

In step 8404, the balanced modulator 7104 samples the baseband signal in a differential and balanced fashion according to a first and second control signals that are phase shifted with respect to each other. The resulting harmonically rich signal 7138 includes multiple harmonic images that repeat at harmonics of the sampling frequency, where each image contains the necessary amplitude and frequency information to reconstruct the baseband signal 7110.

In embodiments of the invention, the control signals include pulses having pulse widths (or apertures) that are established to improve energy transfer to a desired harmonic of the harmonically rich signal 7138. In further embodiments of the invention, DC offset voltages are minimized between sampling modules as indicated in step 8406, thereby minimizing carrier insertion in the harmonic images of the harmonically rich signal 7138.

In step 8408, the optional bandpass filter 7106 selects the desired harmonic of interest (or a subset of harmonics) in from the harmonically rich signal 7138 for transmission.

In step 8410, the optional amplifier 7108 amplifies the selected harmonic(s) prior to transmission.

In step 8412, the selected harmonic(s) is transmitted over a communications medium.

25

7.3.1.1 Balanced Modulator Detailed Description

Referring to the example embodiment shown in FIG. 71A, the balanced modulator 7104 includes the following components: a buffer/inverter 7112; summer amplifiers 7118, 7119; UFT modules 7124 and 7128 having controlled switches 7148 and 7150, respectively; an inductor 7126; a blocking capacitor 7136; and a DC terminal 7111. As stated above, the balanced modulator 7104 differentially samples the baseband signal 7110 to generate a harmonically rich signal 7138. More specifically, the UFT modules 7124 and 7128 sample the baseband signal in differential fashion according to control signals 7123 and 7127, respectively. A DC reference voltage 7113 is applied to terminal 7111 and is uniformly distributed to the UFT modules 7124 and 7128. The distributed DC voltage 7113 prevents any DC offset voltages from developing between the UFT modules, which can lead to carrier insertion in the harmonically rich signal 7138. The operation of the balanced modulator 7104 is discussed in greater detail with reference to flowchart 8500 (FIG. 85), as follows.

In step 8402, the buffer/inverter 7112 receives the input baseband signal 7110 and generates input signal 7114 and inverted input signal 7116. Input signal 7114 is substantially similar to signal 7110, and inverted signal 7116 is an inverted version of signal 7114. As such, the buffer/inverter 7112 converts the (single-ended) baseband signal 7110 into differential input signals 7114 and 7116 that will be sampled by the UFT modules. Buffer/inverter 7112 can be implemented using known operational amplifier (op amp) circuits, as will be understood by those skilled in the arts, although the invention is not limited to this example.

In step 8504, the summer amplifier 7118 sums the DC reference voltage 7113 applied to terminal 7111 with the input signal 7114, to generate a combined signal 7120. Likewise, the summer amplifier 7119 sums the DC reference voltage 7113 with the inverted input signal 7116 to generate a combined signal 7122. Summer amplifiers 7118 and 7119 can be implemented using known op amp summer circuits, and can be designed to have a specified gain or attenuation, including unity gain, although the invention is not

limited to this example. The DC reference voltage 7113 is also distributed to the outputs of both UFT modules 7124 and 7128 through the inductor 7126 as is shown.

In step 8506, the control signal generator 7142 generates control signals 7123 and 7127 that are shown by way of example in FIG. 72B and FIG. 72C, respectively. As illustrated, both control signals 7123 and 7127 have the same period T_s as a master clock signal 7145 (FIG.72A), but have a pulse width (or aperture) of T_A . In the example, control signal 7123 triggers on the rising pulse edge of the master clock signal 7145, and control signal 7127 triggers on the falling pulse edge of the master clock signal 7145. Therefore, control signals 7123 and 7127 are shifted in time by 180 degrees relative to each other. In embodiments of invention, the master clock signal 7145 (and therefore the control signals 7123 and 7127) have a frequency that is a sub-harmonic of the desired output signal 7140. The invention is not limited to the example of FIGs. 72A-72C.

In one embodiment, the control signal generator 7142 includes an oscillator 7146, pulse generators 7144a and 7144b, and an inverter 7147 as shown. In operation, the oscillator 7146 generates the master clock signal 7145, which is illustrated in FIG. 72A as a periodic square wave having pulses with a period of T_s . Other clock signals could be used including but not limited to sinusoidal waves, as will be understood by those skilled in the arts. Pulse generator 7144a receives the master clock signal 7145 and triggers on the rising pulse edge, to generate the control signal 7123. Inverter 7147 inverts the clock signal 7145 to generate an inverted clock signal 7143. The pulse generator 7144b receives the inverted clock signal 7143 and triggers on the rising pulse edge (which is the falling edge of clock signal 7145), to generate the control signal 7127.

FIG 89A-E illustrate example embodiments for the pulse generator 7144. FIG. 89A illustrates a pulse generator 8902. The pulse generator 8902 generates pulses 8908 having pulse width T_A from an input signal 8904. Example input signals 8904 and pulses 8908 are depicted in FIGs 89B and 89C, respectively. The input signal 8904 can be any type of periodic signal, including, but not limited to, a sinusoid, a square wave, a sawtooth wave etc. The pulse width (or aperture) T_A of the pulses 8908 is determined by delay 8906 of the pulse generator 8902. The pulse generator 8902 also includes an optional inverter 8910, which is optionally added for polarity considerations as understood

1744.0630003

[]

5

25

30

by those skilled in the arts. The example logic and implementation shown for the pulse generator 8902 is provided for illustrative purposes only, and is not limiting. The actual logic employed can take many forms. Additional examples of pulse generation logic are shown in FIGs. 89D and 89E. FIG. 89D illustrates a rising edge pulse generator 8912 that triggers on the rising edge of input signal 8904. FIG. 89E illustrates a falling edge pulse generator 8916 that triggers on the falling edge of the input signal 8904.

In step 8508, the UFT module 7124 samples the combined signal 7120 according to the control signal 7123 to generate harmonically rich signal 7130. More specifically, the switch 7148 closes during the pulse widths T_A of the control signal 7123 to sample the combined signal 7120 resulting in the harmonically rich signal 7130. FIG. 71B illustrates an exemplary frequency spectrum for the harmonically rich signal 7130 having harmonic images 7152a-n. The images 7152 repeat at harmonics of the sampling frequency 1/T_s, at infinitum, where each image 7152 contains the necessary amplitude, frequency, and phase information to reconstruct the baseband signal 7110. As discussed further below, the relative amplitude of the frequency images is generally a function of the harmonic number and the pulse width T_A. As such, the relative amplitude of a particular harmonic 7152 can be increased (or decreased) by adjusting the pulse width T_A of the control signal 7123. In general, shorter pulse widths of T_A shift more energy into the higher frequency harmonics, and longer pulse widths of T_A shift energy into the lower frequency harmonics. The generation of harmonically rich signals by sampling an input signal according to a controlled aperture have been described earlier in this application in the section titled, "Frequency Up-conversion Using Universal Frequency Translation", and is illustrated by FIGs. 3-6. A more detailed discussion of frequency up-conversion using a switch with a controlled sampling aperture is discussed in the co-pending patent application titled, "Method and System for Frequency Up-Conversion," Ser. No./09/176,154, field on October 21, 1998, and incorporated herein by reference.

In step 8510, the UFT module 7128 samples the combined signal 7122 according to the control signal 7127 to generate harmonically rich signal 7134. More specifically, the switch 7150 closes during the pulse widths T_A of the control signal 7127 to sample the combined signal 7122 resulting in the harmonically rich signal 7134. The harmonically

10

25

rich signal 7134 includes multiple frequency images of baseband signal 7110 that repeat at harmonics of the sampling frequency $(1/T_{\rm S})$, similar to that for the harmonically rich signal 7130. However, the images in the signal 7134 are phase-shifted compared to those in signal 7130 because of the inversion of signal 7116 compared to signal 7114, and because of the relative phase shift between the control signals 7123 and 7127.

In step 8512, the node 7132 sums the harmonically rich signals 7130 and 7134 to generate harmonically rich signal 7133. FIG. 71C illustrates an exemplary frequency spectrum for the harmonically rich signal 7133 that has multiple images 7154a-n that repeat at harmonics of the sampling frequency 1/T_s. Each image 7154 includes the necessary amplitude, frequency and phase information to reconstruct the baseband signal 7110. The capacitor 7136 operates as a DC blocking capacitor and substantially passes the harmonics in the harmonically rich signal 7133 to generate harmonically rich signal 7138 at the output of the modulator 7104.

In step 8408, the optional filter 7106 can be used to select a desired harmonic image for transmission. This is represented for example by a passband 7156 that selects the harmonic image 7154c for transmission in FIG. 71C.

An advantage of the modulator 7104 is that it is fully balanced, which substantially minimizes (or eliminates) any DC voltage offset between the two UFT modules 7124 and 7128. DC offset is minimized because the reference voltage 7113 contributes a consistent DC component to the input signals 7120 and 7122 through the summing amplifiers 7118 and 7119, respectively. Furthermore, the reference voltage 7113 is also directly coupled to the outputs of the UFT modules 7124 and 7128 through the inductor 7126 and the node 7132. The result of controlling the DC offset between the UFT modules is that carrier insertion is minimized in the harmonic images of the harmonically rich signal 7138. As discussed above, carrier insertion is substantially wasted energy because the information for a modulated signal is carried in the sidebands of the modulated signal and not in the carrier. Therefore, it is often desirable to minimize the energy at the carrier frequency by controlling the relative DC offset.

20

25

7.3.1.2 Balanced Modulator Example Signal Diagrams and Mathematical Description

In order to further describe the invention, FIGs. 72D-72I illustrate various example signal diagrams (vs. time) that are representative of the invention. These signal diagrams are meant for example purposes only and are not meant to be limiting. FIG. 72D illustrates a signal 7202 that is representative of the input baseband signal 7110 (FIG. 71A). FIG. 72E illustrates a step function 7204 that is an expanded portion of the signal 7202 from time t_0 to t_1 , and represents signal 7114 at the output of the buffer/inverter 7112. Similarly, FIG. 72F illustrates a signal 7206 that is an inverted version of the signal 7204, and represents the signal 7116 at the inverted output of buffer/inverter 7112. For analysis purposes, a step function is a good approximation for a portion of a single bit of data (for the baseband signal 7110) because the clock rates of the control signals 7123 and 7127 are significantly higher than the data rates of the baseband signal 7110. For example, if the data rate is in the KHz frequency range, then the clock rate will preferably be in MHZ frequency range in order to generate an output signal in the Ghz frequency range.

Still referring to FIGs. 72D-I, FIG. 72G illustrates a signal 7208 that an example of the harmonically rich signal 7130 when the step function 7204 is sampled according to the control signal 7123 in FIG. 72B. The signal 7208 includes positive pulses 7209 as referenced to the DC voltage 7113. Likewise, FIG. 72H illustrates a signal 7210 that is an example of the harmonically rich signal 7134 when the step function 7206 is sampled according to the control signal 7127. The signal 7210 includes negative pulses 7211 as referenced to the DC voltage 7113, which are time-shifted relative the positive pulses 7209 in signal 7208.

Still referring to FIGs. 72D-I, the FIG. 72I illustrates a signal 7212 that is the combination of signal 7208 (FIG. 72G) and the signal 7210 (FIG. 72H), and is an example of the harmonically rich signal 7133 at the output of the summing node 7132. As illustrated, the signal 7212 spends approximately as much time above the DC reference voltage 7113 as below the DC reference voltage 7113 over a limited time period. For example, over a time period 7214, the energy in the positive pulses 7209a-b is canceled

the state of the s

20

15

out by the energy in the negative pulses 7211a-b. This is indicative of minimal (or zero) DC offset between the UFT modules 7124 and 7128, which results in minimal carrier insertion during the sampling process.

Still referring to FIG. 72I, the time axis of the signal 7212 can be phased in such a manner to represent the waveform as an odd function. For such an arrangement, the Fourier series is readily calculated to obtain:

$$I_c(t) = \sum_{n=1}^{\infty} \left(\frac{4 \sin\left(\frac{n\pi T_A}{T_s}\right) \cdot \sin\left(\frac{n\pi}{2}\right)}{n\pi} \right) \cdot \sin\left(\frac{2n\pi t}{T_s}\right) \quad Equation \ 1.$$

where:

 T_s = period of the master clock 7145

 T_A = pulse width of the control signals 7123 and 7127

n= harmonic number

As shown by Equation 1, the relative amplitude of the frequency images is generally a function of the harmonic number n, and the ratio of T_A/T_S . As indicated, the T_A/T_S ratio represents the ratio of the pulse width of the control signals relative to the period of the sub-harmonic master clock. The T_A/T_S ratio can be optimized in order to maximize the amplitude of the frequency image at a given harmonic. For example, if a passband waveform is desired to be created at 5x the frequency of the sub-harmonic clock, then a baseline power for that harmonic extraction may be calculated for the fifth harmonic (n=5) as:

$$I_c(t) = \left(\frac{4\sin\left(\frac{5\pi T_A}{T_s}\right)}{5\pi}\right) \cdot \sin(5\omega st)$$
 Equation 2

As shown by Equation 2, $I_C(t)$ for the fifth harmonic is a sinusoidal function having an amplitude that is proportional to the sin $(5\pi T_A/T_S)$. The signal amplitude can be maximized by setting $T_A = (1/10 \cdot T_S)$ so that $\sin(5\pi T_A/T_S) = \sin(\pi/2) = 1$. Doing so results in the equation:

$$I_c(t)\big|_{n=5} = \frac{4}{5\pi} \Big(\sin(5\omega_s t) \Big)$$
 Equation 3.

This component is a frequency at 5x of the sampling frequency of sub-harmonic clock, and can be extracted from the Fourier series via a bandpass filter (such as bandpass filter 7106) that is centered around $5f_s$. The extracted frequency component can then be optionally amplified by the amplifier 7108 prior to transmission on a wireless or wire-line communications channel or channels.

Equation 3 can be extended to reflect the inclusion of a message signal as illustrated by equation 4 below:

$$m(t) \cdot I_c(t) \Big|_{\theta=\theta(t)}^{n=5} = \frac{4 \cdot m(t)}{5\pi} \Big(\sin(5\omega_s t + 5\theta(t)) \Big)$$
 Equation 4.

Equation 4 illustrates that a message signal can be carried in harmonically rich signals 7133 such that both amplitude and phase can be modulated. In other words, m(t) is modulated for amplitude and $\theta(t)$ is modulated for phase. In such cases, it should be noted that $\theta(t)$ is augmented modulo n while the amplitude modulation m(t) is simply scaled.

20

Therefore, complex waveforms may be reconstructed from their Fourier series with multiple aperture UFT combinations.

As discussed above, the signal amplitude for the 5th harmonic was maximized by setting the sampling aperture width $T_A=1/10~T_S$, where T_S is the period of the master clock signal. This can be restated and generalized as setting $T_A=\frac{1}{2}$ the period (or π radians) at the harmonic of interest. In other words, the signal amplitude of any harmonic n can be maximized by sampling the input waveform with a sampling aperture of $T_A=\frac{1}{2}$ the period of the harmonic of interest (n). Based on this discussion, it is apparent that varying the aperture changes the harmonic and amplitude content of the output waveform. For example, if the sub-harmonic clock has a frequency of 200 MHZ, then the fifth harmonic is at 1Ghz. The amplitude of the fifth harmonic is maximized by setting the aperture width $T_A=500$ picoseconds, which equates to $\frac{1}{2}$ the period (or π radians) at 1 Ghz.

FIG. 72J depicts a frequency plot 7216 that graphically illustrates the effect of varying the sampling aperture of the control signals on the harmonically rich signal 7133 given a 200 MHZ harmonic clock. The frequency plot 7216 compares two frequency spectrums 7218 and 7220 for different control signal apertures given a 200 MHZ clock. More specifically, the frequency spectrum 7218 is an example spectrum for signal 7133 given the 200 MHZ clock with the aperture $T_A = 500$ psec (where 500 psec is π radians at the 5th harmonic of 1GHz). Similarly, the frequency spectrum 7220 is an example spectrum for signal 7133 given a 200 MHZ clock that is a square wave (so $T_A = 5000$ psec). The spectrum 7218 includes multiple harmonics 7218a-I, and the frequency spectrum 7220 includes multiple harmonics 7220a-e. [It is noted that spectrum 7220 includes only the odd harmonics as predicted by Fourier analysis for a square wave.] At 1 Ghz (which is the 5th harmonic), the signal amplitude of the two frequency spectrums 7218e and 7220c are approximately equal. However, at 200 MHZ, the frequency spectrum 7218a has a much lower amplitude than the frequency spectrum 7220a, and therefore the frequency spectrum 7218 is more efficient than the frequency spectrum 7220, assuming the desired harmonic is the 5th harmonic. In other words, assuming 1 Ghz

20

is the desired harmonic, the frequency spectrum 7218 wastes less energy at the 200 MHZ fundamental than does the frequency spectrum 7218.

7.3.1.3 Balanced Modulator Having a Shunt Configuration

FIG. 79A illustrates a universal transmitter 7900 that is a second embodiment of a universal transmitter having two balanced UFT modules in a shunt configuration. (In contrast, the balanced modulator 7104 can be described as having a series configuration based on the orientation of the UFT modules.) Transmitter 7900 includes a balanced modulator 7901, the control signal generator 7142, the optional bandpass filter 7106, and the optional amplifier 7108. The transmitter 7900 up-converts a baseband signal 7902 to produce an output signal 7936 that is conditioned for wireless or wire line transmission. In doing so, the balanced modulator 7901 receives the baseband signal 7902 and shunts the baseband signal to ground in a differential and balanced fashion to generate a harmonically rich signal 7934. The harmonically rich signal 7934 includes multiple harmonic images, where each image contains the baseband information in the baseband signal 7902. In other words, each harmonic image includes the necessary amplitude, frequency, and phase information to reconstruct the baseband signal 7902. The optional bandpass filter 7106 may be included to select a harmonic of interest (or a subset of harmonics) in the signal 7934 for transmission. The optional amplifier 7108 may be included to amplify the selected harmonic prior to transmission, resulting in the output signal 7936.

The balanced modulator 7901 includes the following components: a buffer/inverter 7904; optional impedances 7910, 7912; UFT modules 7916 and 7922 having controlled switches 7918 and 7924, respectively; blocking capacitors 7928 and 7930; and a terminal 7920 that is tied to ground. As stated above, the balanced modulator 7901 differentially shunts the baseband signal 7902 to ground, resulting in a harmonically rich signal 7934. More specifically, the UFT modules 7916 and 7922 alternately shunts the baseband signal to terminal 7920 according to control signals 7123 and 7127, respectively. Terminal 7920

5

25

30

is tied to ground and prevents any DC offset voltages from developing between the UFT modules 7916 and 7922. As described above, a DC offset voltage can lead to undesired carrier insertion. The operation of the balanced modulator 7901 is described in greater detail according to the flowchart 8600 (FIG. 86) as follows.

In step 8402, the buffer/inverter 7904 receives the input baseband signal 7902 and generates I signal 7906 and inverted I signal 7908. I signal 7906 is substantially similar to the baseband signal 7902, and the inverted I signal 7908 is an inverted version of signal 7902. As such, the buffer/inverter 7904 converts the (single-ended) baseband signal 7902 into differential signals 7906 and 7908 that are sampled by the UFT modules. Buffer/inverter 7904 can be implemented using known operational amplifier (op amp) circuits, as will be understood by those skilled in the arts, although the invention is not limited to this example.

In step 8604, the control signal generator 7142 generates control signals 7123 and 7127 from the master clock signal 7145. Examples of the master clock signal 7145, control signal 7123, and control signal 7127 are shown in FIGs. 72A-C, respectively. As illustrated, both control signals 7123 and 7127 have the same period T_s as a master clock signal 7145, but have a pulse width (or aperture) of T_A . Control signal 7123 triggers on the rising pulse edge of the master clock signal 7145, and control signal 7127 triggers on the falling pulse edge of the master clock signal 7145. Therefore, control signals 7123 and 7127 are shifted in time by 180 degrees relative to each other. A specific embodiment of the control signal generator 7142 is illustrated in FIG. 71A, and was discussed in detail above.

In step 8606, the UFT module 7916 shunts the signal 7906 to ground according to the control signal 7123, to generate a harmonically rich signal 7914. More specifically, the switch 7918 closes and shorts the signal 7906 to ground (at terminal 7920) during the aperture width T_A of the control signal 7123, to generate the harmonically rich signal 7914. FIG. 79B illustrates an exemplary frequency spectrum for the harmonically rich signal 7918 having harmonic images 7950a-n. The images 7950 repeat at harmonics of the sampling frequency 1/T_S, at infinitum, where each image 7950 contains the necessary amplitude, frequency, and phase information to reconstruct the baseband signal 7902. The

5

25

30

generation of harmonically rich signals by sampling an input signal according to a controlled aperture have been described earlier in this application in the section titled, "Frequency Up-conversion Using Universal Frequency Translation", and is illustrated by FIGs. 3-6. A more detailed discussion of frequency up-conversion using a switch with a controlled sampling aperture is discussed in the co-pending patent application titled, "Method and System for Frequency Up-Conversion," Ser. No./09/176,154, field on October 21, 1998, and incorporated herein by reference.

The relative amplitude of the frequency images 7950 are generally a function of the harmonic number and the pulse width T_A . As such, the relative amplitude of a particular harmonic 7950 can be increased (or decreased) by adjusting the pulse width T_A of the control signal 7123. In general, shorter pulse widths of T_A shift more energy into the higher frequency harmonics, and longer pulse widths of T_A shift energy into the lower frequency harmonics, as described by equations 1-4 above. Additionally, the relative amplitude of a particular harmonic 7950 can also be adjusted by adding/tuning an optional impedance 7910. Impedance 7910 operates as a filter that emphasizes a particular harmonic in the harmonically rich signal 7914.

In step 8608, the UFT module 7922 shunts the inverted signal 7908 to ground according to the control signal 7127, to generate a harmonically rich signal 7926. More specifically, the switch 7924 closes during the pulse widths T_A and shorts the inverted I signal 7908 to ground (at terminal 7920), to generate the harmonically rich signal 7926. At any given time, only one of input signals 7906 or 7908 is shorted to ground because the pulses in the control signals 7123 and 7127 are phase shifted with respect to each other, as shown in FIGs. 72B and 72C.

The harmonically rich signal 7926 includes multiple frequency images of baseband signal 7902 that repeat at harmonics of the sampling frequency ($1/T_s$), similar to that for the harmonically rich signal 7914. However, the images in the signal 7926 are phase-shifted compared to those in signal 7914 because of the inversion of the signal 7908 compared to the signal 7906, and because of the relative phase shift between the control signals 7123 and 7127. The optional impedance 7912 can be included to emphasis a particular harmonic of interest, and is similar to the impedance 7910 above.

5

In step 8610, the node 7932 sums the harmonically rich signals 7914 and 7926 to generate the harmonically rich signal 7934. The capacitors 7928 and 7930 operate as blocking capacitors that substantially pass the respective harmonically rich signals 7914 and 7926 to the node 7932. (The capacitor values may be chosen to substantially block baseband frequency components as well.) FIG. 79C illustrates an exemplary frequency spectrum for the harmonically rich signal 7934 that has multiple images 7952a-n that repeat at harmonics of the sampling frequency 1/T_s. Each image 7952 includes the necessary amplitude, frequency, and phase information to reconstruct the baseband signal 7902. The optional filter 7106 can be used to select the harmonic image of interest for transmission. This is represented by a passband 7956 that selects the harmonic image 7932c for transmission.

An advantage of the modulator 7901 is that it is fully balanced, which substantially minimizes (or eliminates) any DC voltage offset between the two UFT modules 7912 and 7914. DC offset is minimized because the UFT modules 7916 and 7922 are both connected to ground at terminal 7920. The result of controlling the DC offset between the UFT modules is that carrier insertion is minimized in the harmonic images of the harmonically rich signal 7934. As discussed above, carrier insertion is substantially wasted energy because the information for a modulated signal is carried in the sidebands of the modulated signal and not in the carrier. Therefore, it is often desirable to minimize the energy at the carrier frequency by controlling the relative DC offset.

7.3.1.4 Balanced Modulator FET Configuration

As described above, the balanced modulators 7104 and 7901 utilize two balanced UFT modules to sample the input baseband signals to generate harmonically rich signals that contain the up-converted baseband information. More specifically, the UFT modules include controlled switches that sample the baseband signal in a balanced and differential fashion. FIGs. 71D and 79D illustrate embodiments of the controlled switch in the UFT module.

10

and the first of the transition of the first of the first

25

FIG. 71D illustrates an example embodiment of the modulator 7104 (FIG. 71B) where the controlled switches in the UFT modules are field effect transistors (FET). More specifically, the controlled switches 7148 and 7128 are embodied as FET 7158 and FET 7160, respectively. The FET 7158 and 7160 are oriented so that their gates are controlled by the control signals 7123 and 7127, so that the control signals control the FET conductance. For the FET 7158, the combined baseband signal 7120 is received at the source of the FET 7158 and is sampled according to the control signal 7123 to produce the harmonically rich signal 7130 at the drain of the FET 7158. Likewise, the combined baseband signal 7122 is received at the source of the FET 7160 and is sampled according to the control signal 7127 to produce the harmonically rich signal 7134 at the drain of FET 7160. The source and drain orientation that is illustrated is not limiting, as the source and drains can be switched for most FETs. In other words, the combined baseband signal can be received at the drain of the FETs, and the harmonically rich signals can be taken from the source of the FETs, as will be understood by those skilled in the relevant arts.

FIG. 79D illustrates an embodiment of the modulator 7900 (FIG. 79A) where the controlled switches in the UFT modules are field effect transistors (FET). More specifically, the controlled switches 7918 and 7924 are embodied as FET 7936 and FET 7938, respectively. The FETs 7936 and 7938 are oriented so that their gates are controlled by the control signals 7123 and 7127, respectively, so that the control signals determine FET conductance. For the FET 7936, the baseband signal 7906 is received at the source of the FET 7936 and shunted to ground according to the control signal 7123, to produce the harmonically rich signal 7914. Likewise, the baseband signal 7908 is received at the source of the FET 7938 and is shunted to grounding according to the control signal 7127, to produce the harmonically rich signal 7926. The source and drain orientation that is illustrated is not limiting, as the source and drains can be switched for most FETs, as will be understood by those skilled in the relevant arts.

25

7.3.1.5 Universal Transmitter Configured for Carrier Insertion

As discussed above, the transmitters 7102 and 7900 have a balanced configuration that substantially eliminates any DC offset and results in minimal carrier insertion in the output signal 7140. Minimal carrier insertion is generally desired for most applications because the carrier signal carries no information and reduces the overall transmitter efficiency. However, some applications require the received signal to have sufficient carrier energy for the receiver to extract the carrier for coherent demodulation. In support thereof, the present invention can be configured to provide the necessary carrier insertion by implementing a DC offset between the two sampling UFT modules.

FIG. 73A illustrates a transmitter 7302 that up-converts a baseband signal 7306 to an output signal 7322 having carrier insertion. As is shown, the transmitter 7302 is similar to the transmitter 7102 (FIG. 71A) with the exception that the up-converter/modulator 7304 is configured to accept two DC references voltages. In contrast, modulator 7104 was configured to accept only one DC reference voltage. More specifically, the modulator 7304 includes a terminal 7309 to accept a DC reference voltage 7308, and a terminal 7313 to accept a DC reference voltage 7314. Vr 7308 appears at the UFT module 7124 though summer amplifier 7118 and the inductor 7310. Vr 7314 appears at UFT module 7128 through the summer amplifier 7119 and the inductor 7316. Capacitors 7312 and 7318 operate as blocking capacitors. If Vr 7308 is different from Vr 7314 then a DC offset voltage will be exist between UFT module 7124 and UFT module 7128, which will be up-converted at the carrier frequency in the harmonically rich signal 7320. More specifically, each harmonic image in the harmonically rich signal 7320 will include a carrier signal as depicted in FIG. 73B.

FIG. 73B illustrates an exemplary frequency spectrum for the harmonically rich signal 7320 that has multiple harmonic images 7324a-n. In addition to carrying the baseband information in the sidebands, each harmonic image 7324 also includes a carrier signal 7326 that exists at respective harmonic of the sampling frequency 1/T_s. The amplitude of the carrier signal increases with increasing DC offset voltage. Therefore, as

20

25

the difference between Vr 7308 and Vr 7314 widens, the amplitude of each carrier signal 7326 increases. Likewise, as the difference between Vr 7308 and Vr 7314 shrinks, the amplitude of each carrier signal 7326 shrinks. As with transmitter 7302, the optional bandpass filter 7106 can be included to select a desired harmonic image for transmission. This is represented by passband 7328 in FIG. 73B.

7.3.2 Universal Transmitter In I Q Configuration:

As described above, the balanced modulators 7104 and 7901 up-convert a baseband signal to a harmonically rich signal having multiple harmonic images of the baseband information. By combining two balanced modulators, IQ configurations can be formed for up-converting I and Q baseband signals. In doing so, either the (series type) balanced modulator 7104 or the (shunt type) balanced modulator 7901 can be utilized. IQ modulators having both series and shunt configurations are described below.

7.3.2.1 IQ Transmitter Using Series-Type Balanced Modulator

FIG. 74 illustrates an IQ transmitter 7420 with an in-phase (I) and quadrature (Q) configuration according to embodiments of the invention. The transmitter 7420 includes an IQ balanced modulator 7410, an optional filter 7414, and an optional amplifier 7416. The transmitter 7420 is useful for transmitting complex I Q waveforms and does so in a balanced manner to control DC offset and carrier insertion. In doing so, the modulator 7410 receives an I baseband signal 7402 and a Q baseband signal 7404 and up-converts these signals to generate a combined harmonically rich signal 7412. The harmonically rich signal 7412 includes multiple harmonics images, where each image contains the baseband information in the I signal 7402 and the Q signal 7404. The optional bandpass filter 7414 may be included to select a harmonic of interest (or subset of harmonics) from the signal 7412 for transmission. The optional amplifier 7416 may be included to amplify the selected harmonic prior to transmission, to generate the IQ output signal 7418.

5

25

30

As stated above, the balanced IQ modulator 7410 up-converts the I baseband signal 7402 and the Q baseband signal 7404 in a balanced manner to generate the combined harmonically rich signal 7412 that carriers the I and Q baseband information. To do so, the modulator 7410 utilizes two balanced modulators 7104 from FIG. 71A, a signal combiner 7408, and a DC terminal 7407. The operation of the balanced modulator 7410 and other circuits in the transmitter is described according to the flowchart 8700 in FIG. 87, as follows.

In step 8702, the IQ modulator 7410 receives the I baseband signal 7402 and the Q baseband signal 7404.

In step 8704, the I balanced modulator 7104a samples the I baseband signal 7402 in a differential fashion using the control signals 7123 and 7127 to generate a harmonically rich signal 7411a. The harmonically rich signal 7411a contains multiple harmonic images of the I baseband information, similar to the harmonically rich signal 7130 in FIG. 71B.

In step 8706, the balanced modulator 7104b samples the Q baseband signal 7404 in a differential fashion using control signals 7123 and 7127 to generate harmonically rich signal 7411b, where the harmonically rich signal 7411b contains multiple harmonic images of the Q baseband signal 7404. The operation of the balanced modulator 7104 and the generation of harmonically rich signals was fully described above and illustrated in FIGs. 71A-C, to which the reader is referred for further details.

In step 8708, the DC terminal 7407 receives a DC voltage 7406 that is distributed to both modulators 7104a and 7104b. The DC voltage 7406 is distributed to both the input and output of both UFT modules 7124 and 7128 in each modulator 7104. This minimizes (or prevents) DC offset voltages from developing between the four UFT modules, and thereby minimizes or prevents any carrier insertion during the sampling steps 8704 and 8706.

In step 8710, the 90 degree signal combiner 7408 combines the harmonically rich signals 7411a and 7411b to generate IQ harmonically rich signal 7412. This is further illustrated in FIGs. 75A-C. FIG. 75A depicts an exemplary frequency spectrum for the harmonically rich signal 7411a having harmonic images 7502a-n. The images 7502 repeat at harmonics of the sampling frequency $1/T_s$, where each image 7502 contains the

5

and the state an

25

30

necessary amplitude and frequency information to reconstruct the I baseband signal 7402. Likewise, FIG. 75B depicts an exemplary frequency spectrum for the harmonically rich signal 7411b having harmonic images 7504a-n. The harmonic images 7504a-n also repeat at harmonics of the sampling frequency 1/T_s, where each image 7504 contains the necessary amplitude, frequency, and phase information to reconstruct the Q baseband signal 7404. FIG.75C illustrates an exemplary frequency spectrum for the combined harmonically rich signal 7412 having images 7506. Each image 7506 carries the I baseband information and the Q baseband information from the corresponding images 7502 and 7504, respectively, without substantially increasing the frequency bandwidth occupied by each harmonic 7506. This can occur because the signal combiner 7408 phase shifts the Q signal 7411b by 90 degrees relative to the I signal 7411a. The result is that the images 7502a-n and 7504a-n effectively share the signal bandwidth do to their orthogonal relationship. For example, the images 7502a and 7504a effectively share the frequency spectrum that is represented by the image 7506a.

In step 8712, the optional filter 7414 can be included to select a harmonic of interest, as represented by the passband 7508 selecting the image 7506c in FIG. 75c.

In step 8714, the optional amplifier 7416 can be included to amplify the harmonic (or harmonics) of interest prior to transmission.

In step 8716, the selected harmonic (or harmonics) is transmitted over a communications medium.

FIG. 76A illustrates a transmitter 7608 that is a second embodiment for an I Q transmitter having a balanced configuration. Transmitter 7608 is similar to the transmitter 7420 except that the 90 degree phase shift between the I and Q channels is achieved by phase shifting the control signals instead of using a 90 degree signal combiner to combine the harmonically rich signals. More specifically, delays 7604a and 7604b delay the control signals 7123 and 7127 for the Q channel modulator 7104b by 90 degrees relative the control signals for the I channel modulator 7104a. As a result, the Q modulator 7104b samples the Q baseband signal 7404 with 90 degree delay relative to the sampling of the I baseband signal 7402 by the I channel modulator 7104a. Therefore, the Q harmonically rich signal 7411b is phase shifted by 90 degrees relative to the I harmonically rich signal.

5

Since the phase shift is achieved using the control signals, an in-phase signal combiner 7606 combines the harmonically rich signals 7411a and 7411b, to generate the harmonically rich signal 7412.

FIG. 76B illustrates a transmitter 7618 that is similar to transmitter 7608 in FIG. 76A. The difference being that the transmitter 7618 has a modulator 7620 that utilizes a summing node 7622 to sum the signals 7411a and 7411b instead of the in-phase signal combiner 7606 that is used in modulator 7602 of transmitter 7608.

FIG. 90A-90D illustrate various detailed circuit implementations of the transmitter 7420 in FIG. 74. These circuit implementations are meant for example purposes only, and are not meant to be limiting.

FIG. 90A illustrates I input circuitry 9002a and Q input circuitry 9002b that receive the I and Q input signals 7402 and 7404, respectively.

FIG. 90B illustrates the I channel circuitry 9006 that processes an I data 9004a from the I input circuit 9002a.

FIG. 90C illustrates the Q channel circuitry 9008 that processes the Q data 9004b from the Q input circuit 9002b.

FIG. 90D illustrates the output combiner circuit 9012 that combines the I channel data 9007 and the Q channel data 9010 to generate the output signal 7418.

7.3.2.2 IQ Transmitter Using Shunt-Type Balanced Modulator

FIG. 80 illustrates an IQ transmitter 8000 that is another IQ transmitter embodiment according to the present invention. The transmitter 8000 includes an IQ balanced modulator 8001, an optional filter 8012, and an optional amplifier 8014. During operation, the modulator 8001 up-converts an I baseband signal 8002 and a Q baseband signal 8004 to generate a combined harmonically rich signal 8011. The harmonically rich signal 8011 includes multiple harmonics images, where each image contains the baseband information in the I signal 8002 and the Q signal 8004. The optional bandpass filter 8012 may be included to select a harmonic of interest (or subset of harmonics) from the harmonically rich signal 8011 for transmission. The optional amplifier 8014 may be

included to amplify the selected harmonic prior to transmission, to generate the IQ output signal 8016.

The IQ modulator 8001 includes two shunt balanced modulators 7901 from FIG. 79A, and a 90 degree signal combiner 8010 as shown. The operation of the IQ modulator 8001 is described in reference to the flowchart 8800 (FIG. 88), as follows. The order of the steps in flowchart 8800 is not limiting.

In step 8802, the balanced modulator 8001 receives the I baseband signal 8002 and the Q baseband signal 8004.

In step 8804, the balanced modulator 7901a differentially shunts the I baseband signal 8002 to ground according the control signals 7123 and 7127, to generate a harmonically rich signal 8006. More specifically, the UFT modules 7916a and 7922a alternately shunt the I baseband signal 8002 and an inverted version of the I baseband signal 8002 to ground according to the control signals 7123 and 7127, respectively. The operation of the balanced modulator 7901 and the generation of harmonically rich signals was fully described above and is illustrated in FIGs. 79A-C, to which the reader is referred for further details. As such, the harmonically rich signal 8006 contains multiple harmonic images of the I baseband information as described above.

In step 8806, the balanced modulator 7901b differentially shunts the Q baseband signal 8004 to ground according to control signals 7123 and 7127, to generate harmonically rich signal 8008. More specifically, the UFT modules 7916b and 7922b alternately shunt the Q baseband signal 8004 and an inverted version of the Q baseband signal 8004 to ground, according to the control signals 7123 and 7127, respectively. As such, the harmonically rich signal 8008 contains multiple harmonic images that contain the Q baseband information.

In step 8808, the 90 degree signal combiner 8010 combines the harmonically rich signals 8006 and 8008 to generate IQ harmonically rich signal 8011. This is further illustrated in FIGs. 81A-C. FIG. 81A depicts an exemplary frequency spectrum for the harmonically rich signal 8006 having harmonic images 8102a-n. The harmonic images 8102 repeat at harmonics of the sampling frequency $1/T_{\rm S}$, where each image 8102 contains the necessary amplitude, frequency, and phase information to reconstruct the I baseband

30

25

5

10

and the first and the first buy the first buy the first see that the first see thad the first see that the first see that the first see that the f

signal 8002. Likewise, FIG. 81B depicts an exemplary frequency spectrum for the harmonically rich signal 8008 having harmonic images 8104a-n. The harmonic images 8104a-n also repeat at harmonics of the sampling frequency 1/T_s, where each image 8104 contains the necessary amplitude, frequency, and phase information to reconstruct the Q baseband signal 8004. FIG.81C illustrates an exemplary frequency spectrum for the IQ harmonically rich signal 8011 having images 8106a-n. Each image 8106 carries the I baseband information and the Q baseband information from the corresponding images 8102 and 8104, respectively, without substantially increasing the frequency bandwidth occupied by each image 8106. This can occur because the signal combiner 8010 phase shifts the Q signal 8008 by 90 degrees relative to the I signal 8006.

In step 8810, the optional filter 8012 may be included to select a harmonic of interest, as represented by the passband 8108 selecting the image 8106c in FIG. 81C.

In step 8812, the optional amplifier 8014 can be included to amplify the selected harmonic image 8106 prior to transmission.

In step 8814, the selected harmonic (or harmonics) is transmitted over a communications medium.

FIG. 82 illustrates a transmitter 8200 that is another embodiment for an IQ transmitter having a balanced configuration. Transmitter 8200 is similar to the transmitter 8000 except that the 90 degree phase shift between the I and Q channels is achieved by phase shifting the control signals instead of using a 90 degree signal combiner to combine the harmonically rich signals. More specifically, delays 8204a and 8204b delay the control signals 7123 and 7127 for the Q channel modulator 7901b by 90 degrees relative the control signals for the I channel modulator 7901a. As a result, the Q modulator 7901b samples the Q baseband signal 8004 with a 90 degree delay relative to the sampling of the I baseband signal 8002 by the I channel modulator 7901a. Therefore, the Q harmonically rich signal 8008 is phase shifted by 90 degrees relative to the I harmonically rich signal 8006. Since the phase shift is achieved using the control signals, an in-phase signal combiner 8206 combines the harmonically rich signals 8006 and 8008, to generate the harmonically rich signal 8011.

20

25

FIG.83 illustrates a transmitter 8300 that is similar to transmitter 8200 in FIG. 82. The difference being that the transmitter 8300 has a balanced modulator 8302 that utilizes a summing node 8304 to sum the I harmonically rich signal 8006 and the Q harmonically rich signal 8008 instead of the in-phase signal combiner 8206 that is used in the modulator 8202 of transmitter 8200. The 90 degree phase shift between the I and Q channels is implemented by delaying the Q clock signals using 90 degree delays 8204, as shown.

7.3.2.3 IQ Transmitters Configured for Carrier Insertion

The transmitters 7420 (FIG. 74) and 7608 (FIG. 76A) have a balanced configuration that substantially eliminates any DC offset and results in minimal carrier insertion in the IQ output signal 7418. Minimal carrier insertion is generally desired for most applications because the carrier signal carries no information and reduces the overall transmitter efficiency. However, some applications require the received signal to have sufficient carrier energy for the receiver to extract the carrier for coherent demodulation. In support thereof, FIG. 77 illustrates a transmitter 7702 to provide any necessary carrier insertion by implementing a DC offset between the two sets of sampling UFT modules.

Transmitter 7702 is similar to the transmitter 7420 with the exception that a modulator 7704 in transmitter 7702 is configured to accept two DC reference voltages so that the I channel modulator 7104a can be biased separately from the Q channel modulator 7104b. More specifically, modulator 7704 includes a terminal 7706 to accept a DC voltage reference 7707, and a terminal 7708 to accept a DC voltage reference 7709. Voltage 7707 biases the UFT modules 7124a and 7128a in the I channel modulator 7104a. Likewise, voltage 7709 biases the UFT modules 7124b and 7128b in the Q channel modulator 7104b. When voltage 7707 is different from voltage 7709, then a DC offset will appear between the I channel modulator 7104a and the Q channel modulator 7104b, which results in carrier insertion in the IQ harmonically rich signal 7412. The relative amplitude of the carrier frequency energy increases in proportion to the amount of DC offset.

FIG. 78 illustrates a transmitter 7802 that is a second embodiment of an IQ transmitter having two DC terminals to cause DC offset, and therefore carrier insertion. Transmitter 7802 is similar to transmitter 7702 except that the 90 degree phase shift between the I and Q channels is achieved by phase shifting the control signals, similar to that done in transmitter 7608. More specifically, delays 7804a and 7804b phase shift the control signals 7123 and 7127 for the Q channel modulator 7104b relative to those of the I channel modulator 7104a. As a result, the Q modulator 7104b samples the Q baseband signal 7404 with 90 degree delay relative to the sampling of the I baseband signal 7402 by the I channel modulator 7104a. Therefore, the Q harmonically rich signal 7411b is phase shifted by 90 degrees relative to the I harmonically rich signal 7411a, which are combined by the in-phase combiner 7806.

7.4 Transceiver Embodiments

Referring to FIG. 39, in embodiments the receiver 3906, transmitter 3910, and LNA/PA 3904 are configured as a transceiver, such as but not limited to transceiver 9100, that is shown in FIG. 91.

Referring to FIG. 91, the transceiver 9100 includes a diplexer 9108, the IQ receiver 7000, and the IQ transmitter 8000. Transceiver 9100 up-converts an I baseband signal 9114 and a Q baseband signal 9116 using the IQ transmitter 8000 (FIG. 80) to generate an IQ RF output signal 9106. A detailed description of the IQ transmitter 8000 is included for example in section 7.3.2.2, to which the reader is referred for further details. Additionally, the transceiver 9100 also down-converts a received RF signal 9104 using the IQ Receiver 7000, resulting in I baseband output signal 9110 and a Q baseband output signal 9112. A detailed description of the IQ receiver 7000 is included in section 7.2.2, to which the reader is referred for further details.

7.5 Demodulator/Modulator Facilitation Module

An example demodulator/modulator facilitation module 3912 is shown in FIGS. 47 and 48. A corresponding BOM list is shown in FIGS. 49A and 49B.

An alternate example demodulator/modulator facilitation module 3912 is shown in FIGS. 50 and 51. A corresponding BOM list is shown in FIGS. 52A and 52B.

FIG. 52C illustrates an exemplary demodulator/modulator facilitation module 5201. Facilitation module 5201 includes the following: de-spread module 5204, spread module 5206, de-modulator 5210, and modulator 5212.

For receive, the de-spread module 5204 de-spreads received spread signals 3926 and 3928 using a spreading code 5202. Separate spreading codes can be used for the I and Q channels as will be understood by those skilled in the arts. The demodulator 5210 uses a signal 5208 to demodulate the de-spread received signals from the de-spread module 5204, to generate the I baseband signal 3930a and the Q baseband signal 3932a.

For transmit, the modulator 5212 modulates the I baseband signal 3930b and the Q baseband signal 3932b using a modulation signal 5208. The resulting modulated signals are then spread by the spread module 5206, to generate I spread signal 3942 and Q spread signal 3944.

In embodiments, the modulation scheme that is utilized is differential binary phase shift keying (DBPSK) or differential quadrature phase shift keying (DQPSK), and is compliant with the various versions of IEEE 802.11. Other modulation schemes could be utilized besides DBPSK or DQPSK, as will understood by those skilled in arts based on the discussion herein.

In embodiments, the spreading code 5202 is a Barker spreading code, and is compliant with the various versions of IEEE 802.11. More specifically, in embodiments, an 11-bit Barker word is utilized for spreading/de-spreading. Other spreading codes could be utilized as will be understood by those skilled in the arts based on the discussion herein.

7.6 MAC Interface

An example MAC interface 3914 is shown in FIG. 45. A corresponding BOM list is shown in FIGS. 46A and 46B.

In embodiments, the MAC 3918 and MAC interface 3914 supply the functionality required to provide a reliable delivery mechanism for user data over noisy, and unreliable wireless media. This is done this while also providing advanced LAN services, equal to or beyond those of existing wired LANs.

The first functionality of the MAC is to provide a reliable data delivery service to users of the MAC. Through a frame exchange protocol at the MAC level, the MAC significantly improves on the reliability of data delivery services over wireless media, as compared to earlier WLANs. More specifically, the MAC implements a frame exchange protocol to allow the source of a frame to determine when the frame has been successfully received at the destination. This frame exchange protocol adds some overhead beyond that of other MAC protocols, like IEEE 802.3, because it is not sufficient to simply transmit a frame and expect that the destination has received it correctly on the wireless media. In addition, it cannot be expected that every station in the WLAN is able to communicate with every other station in the WLAN. If the source does not receive this acknowledgment, then the source will attempt to transmit the frame again. This retransmission of frame by the source effectively reduces the effective error rate of the medium at the cost of additional bandwidth consumption.

The minimal MAC frame exchange protocol consists of two frames, a frame sent from the source to the destination and an acknowledgment from the destination that the frame was received correctly. The frame and its acknowledgment are an atomic unit of the MAC protocol. As such, they cannot be interrupted by the transmission from any other station. Additionally, a second set of frames may be added to the minimal MAC frame exchange. The two added frames are a request to send frame and a clear to send frame. The source sends a request to send to the destination. The destination returns a clear to send to the source. Each of these frames contains information that allows other stations receiving them to be notified of the upcoming frame transmission, and therefore to delay

10

and the control and the contro

25

30

any transmission their own. The request to send and clear frames serve to announce to all stations in the neighborhood of both the source and the destination about the pending transmission from the source to the destination. When the source receives the clear to send from the destination, the real frame that the source wants delivered to the destination is sent. If the frame is correctly received at the destination, then the destination will return an acknowledgment. completing the frame exchange protocol. While this four way frame exchange protocol is a required function of the MAC, it may be disabled by an attribute in the management information base.

The second functionality of the MAC is to fairly control access to the shared wireless medium. It performs this function through two different access mechanisms: the basic access mechanism, call the distribution coordination system function, and a centrally controlled access mechanism, called the point coordination function.

The basic access mechanism is a carrier sense multiple access with collision avoidance (CSMA/CA) with binary exponential backoff. This access mechanism is similar to that used for IEEE 802.3, with some variations. CSMA/CA is a "listen before talk" (LBT) access mechanism. In this type of access mechanism, a station will listen to the medium before beginning a transmission. If the medium is already carrying a transmission, then the station that listening will not begin its own transmission. More specifically, if a listening station detects an existing transmission in progress, the listening station enters a transmit deferral period determined by the binary exponential backoff algorithm. The binary exponential backoff mechanism chooses a random number which represents the amount of time that must elapse while there are not any transmission. In other words, the medium is idle before the listening station may attempt to begin its transmission again. The MAC may also implement a network allocation vector (NAV). The NAV is the value that indicates to a station that amount of time that remains before a medium becomes available. The NAV is kept current through duration values that are transmitted in all frames. By examining the NAV, a station may avoid transmitting, even when the medium does not appear to be carrying a transmission in the physical sense.

The centrally controlled access mechanism uses a poll and response protocol to eliminate the possibility of contention for the medium. This access mechanism is called

5

the point coordination function (PCF). A point coordinator (PC) controls the PCF. The PC is always located in an AP. Generally, the PCF operates by stations requesting that the PC register them on a polling list, and the PC then regularly polls the stations for traffic while also delivering traffic to the stations. With proper planning, the PCF is able to deliver near isochronous service to the stations on the polling list.

The third function of the MAC is to protect the data that it delivers. Because it is difficult to contain wireless WLAN signals to a particular physical area, the MAC provides a privacy service, called Wired Equivalent Privacy (WEP), which encrypts the data sent over the wireless medium. The level of encryption chosen approximates the level of protection data might have on a wireless LAN in a building with controlled access that prevents physically connecting to the LAN without authorization.

7.7 Control Signal Generator - Synthesizer

In an embodiment, the control signal generator 3908 is preferably implemented using a synthesizer. An example synthesizer is shown in FIG. 55. A corresponding BOM list is shown in FIGS. 56A and 56B.

7.8 *LNA/PA*

An example LNA/PA 3904 is shown in FIGS. 64 and 65. A corresponding BOM list is shown in FIG. 66.

Additionally, FIG. 93 illustrates a LNA/PA module 9301 that is another embodiment of the LNA/PA 3904. LNA/PA module 9301 includes a switch 9302, a LNA 9304, and a PA 9306. The switch 9302 connects either the LNA 9304 or the PA 9306 to the antenna 3903, as shown. The switch 9302 can be controlled by an on -board processor that is not shown.

20

25

8.0 802.11 Physical Layer Configurations

The 802.11 WLAN standard specifies two RF physical layers: frequency hopped spread spectrum (FHSS) and direct sequence spread spectrum (DSSS). The invention is not limited to these specific examples. Both DSSS and FHSS support 1 Mbps and 2 Mbps data rates and operate in the 2.400-2.835 GHz band for wireless communications in accordance to FCC part 15 and ESTI-300 rules. Additionally, 802.11 has added an 11 Mbps standard that operates at 5 GHz and utilizes OFDM modulation.

The DSSS configuration supports the 1 MBPS data rate utilizing differential binary phase shift keying (DBPSK) modulation, and supports 2 MBPS utilizing differential quadrature phase shift keying modulation. In embodiments, an 11-bit Barker word is used as the spreading sequence that is utilized by the stations in the 802.11 network. A Barker word has a relatively short sequence, and is known to have very good correlation properties, and includes the following sequence: +1, -1, +1, +1, +1, +1, +1, +1, -1, -1, -1. The Barker word used for 802.11 is not to be confused with the spreading codes used for code division multiple access (CDMA) and global positioning system (GPS). CDMA and GPS use orthogonal spreading codes, which allow multiple users to operate on the same channel frequency. Generally, CDMA codes have longer sequences and have richer correlation properties.

During transmission, the 11-bit barker word is exclusive-ored (EX-OR) with each of the information bits using a modulo-2 adder, as illustrated by modulo-2 adder 9202 in FIG. 92. Referring to FIG. 92, the 11-bit (at 11 MBPS) Barker word is applied to a modulo-2 adder together with each one (at 1 MBPS) of the information bits (in the PPDU data). The Ex-OR function combines both signals by performing a modulo-2 addition of each information bit with each Barker bit (or chip). The output of the modulo-2 adder results in a signal with a data rate that is 10x higher than the information rate. The result in the frequency domain signal is a signal that is spread over a wider bandwidth at a reduced RF power level. At the receiver, the DSSS signal is convolved with an 11-bit Barker word and correlated. As shown in FIG. 92, the correlation recovers the information bits at the transmitted information rate, and the undesired interfering in-band

signals are spread out-of-band. The spreading and despreading of narrowband to wideband signal is commonly referred to as processing gain and is measured in decibels (dB). Processing gain is the ratio of DSSS signal rate information rate. In embodiments, the minimum requirement for processing gain is 10 dB.

5

10

The state that the man was the state that the state

25

30

The second RF physical layer that is specified by the IEEE 802.11 standard is frequency hopping spread spectrum (FHSS). A set of hop sequences is defined in IEEE 802.11 for use in the 2.4 GHz frequency band. The channels are evenly spaced across the band over a span of 83.5 MHz. During the development of IEEE 802.11, the hop sequences listed in the standard were pre-approved for operation in North America, Europe, and Japan. In North America and Europe (excluding Spain and France), the required number of hop channels is 79. The number of hopped channels for Spain and France is 23 and 35, respectively. In Japan, the required number of hopped channels is 23. The hopped center channels are spaced uniformly across the 2.4 GHz frequency band occupying a bandwidth of 1MHz. In North America and Europe (excluding Spain and France), the hopped channels operate from 2.402 GHz to 2.480 GHz. In Japan, the hopped channels operate from 2.447 GHz to 2.473 GHz. The modulation scheme called out for FHSS by 802.11 is 2-level Gaussian Phase Shift Keying (GFSK) for the 1 MBps data rate, and 4-level GFSK for the 2 MBps data rate.

In addition to DSSS and FHSS RF layer standards, the IEEE 802.11 Executive Committee approved two projects for higher rate physical layer extensions. The first extension, IEEE 802.11a defines requirements for a physical layer operating in the 5.0 GHz frequency band, and data rates ranging from 6 MBps to 54 MBps. This 802.11a draft standard is based on Orthogonal Frequency Division Multiplexing (OFDM) and uses 48 carriers as a phase reference (so coherent), with 20 MHZ spacing between the channels. The second extension, IEEE 802.11b, defines a set of physical layer specifications operating in the 2.4 GHz ISM frequency band. This 802.11b utilizes complementary code keying (CCK), and extends the data rate up to 5.5 Mbps and 11 Mbps.

The transmitter and receiver circuits described herein can be operated in all of the WLAN physical layer embodiments described herein, including the DSSS and FHSS embodiments described herein. However, the present invention is not limited to being

25

operated in WLAN physical layer embodiments that were described herein, as the invention could be configured in other physical layer embodiments.

Figure 94 illustrates a block diagram of an IEEE 802.11 DSSS radio transceiver 9400 using UFT Zero IF technology. DSSS transceiver 9400 includes: antenna 9402, switch 9404, amplifiers 9406 and 9408, transceivers 9410, baseband processor 9412, MAC 9414, bus interface unit 9416, and PCMCIA connector 9418. The DSSS transceiver 9400 includes an IQ receiver 7000 and an IQ transmitter 8000, which are described herein. UFT technology interfaces directly to the baseband processor 9412 of the physical layer. In the receive path, the IQ receiver 7000 transforms a 2.4GHz RF signal-of-interest into I/Q analog baseband signals in a single step and passes the signals to the baseband processor 9412, where the baseband processor is then responsible for de-spreading and demodulating the signal. In embodiments, the IQ receiver 7000 includes all of the circuitry necessary for accommodating AGC, baseband filtering and baseband amplification. In the transmit path, the transmitter 8000 transforms the I/Q analog baseband signals to a 2.4GHz RF carrier directly in a single step. The signal conversion clock is derived from a single synthesized local oscillator (LO) 9420. The selection of the clock frequency is determined by choosing a sub-harmonic of the carrier frequency. For example, a 5th harmonic of 490 MHZ was used, which corresponds to a RF channel frequency of 2.450GHz. Using UFT technology simplifies the requirements and complexity of the synthesizer design.

9. Appendix

The attached Appendix contained in FIGS. 95A-C, 96-161, which forms part of this patent application, includes schematics of an integrated circuit (IC) implementation example of the present invention. This example embodiment is provided solely for illustrative purposes, and is not limiting. Other embodiments will be apparent to persons skilled in the relevant art(s) based on the teachings herein. FIG. 95A illustrates a schematic for a WLAN modulator/demodulator IC according to embodiments of the invention. FIGs. 95B and 95C illustrate an expanded view of the circuit in FIG. 95A. FIGs. 96-161

further illustrate detailed circuit schematics of the WLAN modulator/demodulator integrated circuit.

10. Conclusions

Example implementations of the systems and components of the invention have been described herein. As noted elsewhere, these example implementations have been described for illustrative purposes only, and are not limiting. Other implementation embodiments are possible and covered by the invention, such as but not limited to software and software/hardware implementations of the systems and components of the invention. Such implementation embodiments will be apparent to persons skilled in the relevant art(s) based on the teachings contained herein.

While various application embodiments of the present invention have been described above, it should be understood that they have been presented by way of example only, and not limitation. Thus, the breadth and scope of the present invention should not be limited by any of the above-described exemplary embodiments, but should be defined only in accordance with the following claims and their equivalents.

2

3 4 1 A wireless modem apparatus, comprising:

a balanced transmitter for up-converting a baseband signal, including,

an inverter, to receive said baseband signal and generate an inverted baseband signal;

a first controlled switch, coupled to a non-inverting output of said inverter, said first controlled switch to sample said baseband signal according to a first control signal, resulting in a first harmonically rich signal;

a second controlled switch, coupled to an inverting output of said inverter, said second controlled switch to sample said inverted baseband signal according to a second control signal, resulting in a second harmonically rich signal; and

a combiner, coupled to an output of said first controlled switch and an output of said second controlled switch, said combiner to combine said first harmonically rich signal and said second harmonically rich signal, resulting in a third harmonically rich signal.

- 2. The apparatus of claim 1, wherein said second control signal is phase shifted with respect to said first control signal.
- 3. The apparatus of claim 1, wherein said second control signal is phase shifted by 180 degrees with respect to said first control signal.
- 4. The apparatus of claim 1, wherein said first control signal and said second control signal each comprise a plurality of pulses having an associated pulse width T_A that operates to improve energy transfer to a desired harmonic image in said harmonically rich signal.

1	5. The apparatus of claim 4, wherein said pulse width T_A is approximately $\frac{1}{2}$ of a		
2	period of said desired harmonic.		
1	6. The apparatus of claim 1, further comprising a filter attached to an output of said		
2	combiner, wherein said filter selects a desired harmonic from said third harmonically rich		
3	signal.		
1	7. The apparatus of claim 1, further comprising:		
2	a balanced receiver, coupled to said balanced modulator, said receiver including,		
3	a first universal frequency down-conversion module to down-convert an		
4	input signal, wherein said first universal frequency down-conversion module down-		
5	converts said input signal according to a third control signal and outputs a first down-		
6	converted signal;		
7	a second universal frequency down-conversion module to down-convert		
7 1118	said input signal, wherein said second universal frequency down-conversion module		
9	down-converts said input signal according to a fourth control signal and outputs a second		
10	down-converted signal; and		
1	a subtractor module that subtracts said second down-converted signal from		
10 11 12	said first down-converted signal and outputs a down-converted signal.		
1	8. The apparatus of claim 7, wherein said fourth control signal is delayed relative to		
2	said third control signal by .5 + n cycles of said input signal, wherein n may be any integer		
3	greater than or equal to 1.		
1	9. The apparatus of claim 7, wherein said first universal frequency down-conversion		
2	module under-samples said input signal according to said third control signal, and said		
3	second universal frequency down-conversion module under-samples said input signal		
4	according to said fourth control signal.		

1	10. The apparatus of claim 7, wherein said third and said fourth control signals each
2	comprise a train of pulses having pulse widths that are established to improve energy
3	transfer from said input signal to said first and said second down-converted signals,
4	respectively.
1	11. The apparatus of claim 10, wherein said train of pulses have a pulse width that is
2	approximately a fraction of a period of said input signal.
1	12. The apparatus of claim 10, wherein said train of pulses have pulse width that is
2	approximately multiple periods and a fraction of a period of said input signal.
	13. The apparatus of claim 10, wherein said first and said second universal frequency
2 11112 111111	down-conversion modules each comprise a switch and a storage element.
1	14. The apparatus of claim 13, wherein said storage element comprises a capacitor that
2	reduces a DC offset voltage in said first down-converted signal and said second down-
113	converted signal.
1	15. The apparatus of claim 7, wherein said subtractor module comprises a differential
2	amplifier.
1	16. The apparatus of claim 7, further comprising an antenna coupled to said balanced
2	transmitter and said balanced receiver.
1	17. The apparatus of claim 16, further comprising a switch, said switch connecting
2	either said transmitter or said receiver to said antenna.
1	18. The apparatus of claim 7, further comprising a baseband processor coupled to said

transmitter and said receiver.

2

1	19. The apparatus of claim 7, further comprising a media access controller (MAC)
2	coupled to said transmitter and said receiver.
1	The apparatus of claim 19, wherein said MAC comprises a means for controlling
2	accessing to a WLAN medium.
1	21. The apparatus of claim 20, wherein said means for controlling includes carrier
2	sense multiple access with collision avoidance (CSMA/CA).
1	The apparatus of claim 7, further comprising a demodulator/modulator facilitation
10.2 10.5 10.5	module coupled to said transmitter and receiver.
1 1 1 1 1 3	23. The apparatus of claim 22, wherein said demodulator/modulator facilitation
1112	module comprises a means for modulating said baseband signal using differential binary
	phase shift keying (DBPSK).
1 2 3	24. The apparatus of claim 22, wherein said demodulator/modulator facilitation
2	module comprises a means for de-modulating said down-converted signal using differential binary phase shift keying (DBPSK).
	disconstant officers shift keying (DDI SR).
1	25. The apparatus of claim 22, wherein said demodulator/modulator facilitation
2	module comprises a means for spreading said baseband signal.
1	26. The apparatus of claim 25, wherein said means for spreading comprises a means
2	for spreading said baseband signal using a Barker code.
1	27. The apparatus of claim 22, wherein said demodulator/modulator facilitation
2	module comprises a means for de spreading said down converted signal

1	28.	The apparatus of claim 27, wherein said means for de-spreading comprises a	
2	means	for de-spreading said down-converted signal using a Barker code.	
1	29.	The apparatus of claim 1, wherein said apparatus is an infrastructure device.	
1	30.	The apparatus of claim 1, wherein said apparatus is a client device.	
1	31.	The apparatus of claim 1, wherein said first controlled switch shunts said baseband

wherein said first and said second control signals each comprise a train of pulses
having pulse widths that are established to improve energy transfer from said received RF
signal to said down-converted signal.

40. The method of claim 39, wherein said pulse widths are approximately ½ of a period of said received RF signal.

Wireless Local Area Network (WLAN) Using Universal Frequency Translation Technology Including Multi-Phase Embodiments and Circuit Implementations

Abstract

Frequency translation and applications of the same are described herein, including RF modem and wireless local area network (WLAN) applications. In embodiments, the WLAN invention includes an antenna, an LNA/PA module, a receiver, a transmitter, a control signal generator, a demodulation/modulation facilitation module, and a MAC interface. The WLAN receiver includes at least one universal frequency translation module that frequency down-converts a received EM signal. In embodiments, the UFT based receiver is configured in a multi-phase embodiment to reduce or eliminate re-radiation that is caused by DC offset. The WLAN transmitter includes at least one universal frequency translation module that frequency up-converts a baseband signal in preparation for transmission over the wireless LAN. In embodiments, the UFT based transmitter is configured in a differential and multi-phase embodiment to reduce carrier insertion and spectral growth.

Box Patent Application

Re:

U.S. Non-Provisional Utility Patent Application under 37 C.F.R. § 1.53(b)

Appl. No. To be assigned; Filed: August 4, 2000

For:

Wireless Local Area Network (WLAN) Using Universal Frequency

Translation Technology Including Multi-Phase Embodiments and Circuit Implementations

Inventors:

David F. Sorrells, Michael J. Bultman, Robert W. Cook.

Richard C. Looke, Charley D. Moses, Jr., Gregory S. Rawlins,

and Michael W. Rawlins

Our Ref:

1744.0630003

Sir:

The following documents are forwarded herewith for appropriate action by the U.S. Patent and Trademark Office:

- 1. USPTO Utility Patent Application Transmittal Form PTO/SB/05;
- 2. U.S. Utility Patent Application entitled:

Wireless Local Area Network (WLAN) Using Universal Frequency Translation Technology Including Multi-Phase Embodiments and Circuit Implementations

and naming as inventors:

David F. Sorrells, Michael J. Bultman, Robert W. Cook, Richard C. Looke, Charley D. Moses, Jr., Gregory S. Rawlins, and Michael W. Rawlins

Commissioner for Patents August 4, 2000 Page 2

the application comprising:

- a. specification containing:
 - i. <u>98</u> pages of description prior to the claims;
 - ii. __7_ pages of claims (_40_ claims);
 - iii. a one (1) page abstract;
- b. Two-hundred and eight (208) sheets of drawings: (Figures 1A-D, 2A, 2B, 3-14, 15A-F, 16-19, 20A, 20A-1, 20B-F, 21, 22A-F, 23A, 24A-J, 25-45, 46A, 46B, 47, 48, 49A, 49B, 50, 51, 52A-C, 53-55, 56A, 56B, 57-60, 61A, 61B, 62-66, 67A, 67B, 68A, 68B, 69A, 69B, 70A-S, 71A-D, 72A-J, 73A, 73B, 74, 75A-C, 76A, 76B, 77, 78, 79A-D, 80, 81A-C, 82-88, 89A-E, 90A-D, 91-94, 95A-C, 96-161);
- 3. 37 C.F.R. § 1.136(a)(3) Authorization to Treat a Reply As Incorporating An Extension of Time (in duplicate); and
- 4. Two (2) return postcards.

It is respectfully requested that, of the two attached postcards, one be stamped with the filing date of these documents and returned to our courier, and the other, prepaid postcard, be stamped with the filing date and unofficial application number and returned as soon as possible.

This patent application is being submitted under 37 C.F.R. § 1.53(b) without Declaration and without filing fee.

Commissioner for Patents August 4, 2000 Page 3

This application claims priority to U.S. Provisional Application No. 60/147,129, filed August 4, 1999; U.S. Application No. 09/525,615, filed on March 14, 2000; and U.S. Application No. 09/526,041, filed on March 14, 2000.

Respectfully submitted,

STERNE, KESSLER, GOLDSTEIN & FOX P.L.L.C.

Authorization To Treat A Reply As Incorporating An Extension Of Time Under 37 C.F.R. § 1.136(a)(3)

Commissioner for Patents Washington, D.C. 20231

Sir:

The U.S. Patent and Trademark Office is hereby authorized to treat any concurrent or future reply that requires a petition for an extension of time under this paragraph for its timely submission, as incorporating a petition for extension of time for the appropriate length of time. The U.S. Patent and Trademark Office is hereby authorized to charge all required extension of time fees to our Deposit Account No. 19-0036, if such fees are not otherwise provided for in such reply. A duplicate copy of this authorization is enclosed.

Respectfully submitted,

STERNE, KESSLER, GOLDSTEIN & FOX P.L.L.C.

The structure and operation of embodiments of the UFT module, and various applications of the same are described in detail in the following sections.

Further features and advantages of the invention, as well as the structure and operation of various embodiments of the invention, are described in detail below with reference to the accompanying drawings. The drawing in which an element first appears is typically indicated by the leftmost character(s) and/or digit(s) in the corresponding reference number.

Brief Description of the Figures

The present invention will be described with reference to the accompanying drawings, wherein:

- FIG. 1A is a block diagram of a universal frequency translation (UFT) module according to an embodiment of the invention;
- FIG. 1B is a more detailed diagram of a universal frequency translation (UFT) module according to an embodiment of the invention;
- FIG. 1C illustrates a UFT module used in a universal frequency down-conversion (UFD) module according to an embodiment of the invention;
- FIG. 1D illustrates a UFT module used in a universal frequency up-conversion (UFU) module according to an embodiment of the invention,
- FIG. 2A-2B illustrate block diagrams of universal frequency translation (UFT) modules according to an embodiment of the invention;
- FIG. 3 is a block diagram of a universal frequency up-conversion (UFU) module according to an embodiment of the invention;
- FIG. 4 is a more detailed diagram of a universal frequency up-conversion (UFU) module according to an embodiment of the invention;
- FIG. 5 is a block diagram of a universal frequency up-conversion (UFU) module according to an alternative embodiment of the invention;

25

- - FIG. 18 is a table of example values at nodes in the UDF module of FIG. 19;
- FIG. 19 is a detailed diagram of an example UDF module according to an embodiment of the invention;

- FIGS. 6A-6I illustrate example waveforms used to describe the operation of the UFU module;
- FIG. 7 illustrates a UFT module used in a receiver according to an embodiment of the invention;
- FIG. 8 illustrates a UFT module used in a transmitter according to an embodiment of the invention;
- FIG. 9 illustrates an environment comprising a transmitter and a receiver, each of which may be implemented using a UFT module of the invention;
 - FIG. 10 illustrates a transceiver according to an embodiment of the invention;
- FIG. 11 illustrates a transceiver according to an alternative embodiment of the invention:
- FIG. 12 illustrates an environment comprising a transmitter and a receiver, each of which may be implemented using enhanced signal reception (ESR) components of the invention:
- FIG. 13 illustrates a UFT module used in a unified down-conversion and filtering (UDF) module according to an embodiment of the invention;
- FIG. 14 illustrates an example receiver implemented using a UDF module according to an embodiment of the invention;
- FIGS. 15A-15F illustrate example applications of the UDF module according to embodiments of the invention;

of which may be implemented using enhanced signal reception (ESR) components of the

invention, wherein the receiver may be further implemented using one or more UFD

FIG. 16 illustrates an environment comprising a transmitter and a receiver, each

- modules of the invention; FIG. 17 illustrates a unified down-converting and filtering (UDF) module according to an embodiment of the invention;

30

5

FIGS. 20A and 20A-1 are example aliasing modules according to embodiments of the invention;

FIGS. 20B-20F are example waveforms used to describe the operation of the aliasing modules of FIGS. 20A and 20A-1;

- FIG. 21 illustrates an enhanced signal reception system according to an embodiment of the invention;
 - FIGS. 22A-22F are example waveforms used to describe the system of FIG. 21;
- FIG. 23A illustrates an example transmitter in an enhanced signal reception system according to an embodiment of the invention;
- FIGS. 23B and 23C are example waveforms used to further describe the enhanced signal reception system according to an embodiment of the invention;
- FIG. 23D illustrates another example transmitter in an enhanced signal reception system according to an embodiment of the invention;
- FIGS. 23E and 23F are example waveforms used to further describe the enhanced signal reception system according to an embodiment of the invention;
- FIG. 24A illustrates an example receiver in an enhanced signal reception system according to an embodiment of the invention;
- FIGS. 24B-24J are example waveforms used to further describe the enhanced signal reception system according to an embodiment of the invention;
 - FIG. 25 illustrates a block diagram of an example computer network;
 - FIG. 26 illustrates a block diagram of an example computer network;
 - FIG. 27 illustrates a block diagram of an example wireless interface;
- FIG. 28 illustrates an example heterodyne implementation of the wireless interface illustrated in FIG. 27;
- FIG. 29 illustrates an example in-phase/quadrature-phase (I/Q) heterodyne implementation of the interface illustrated in FIG. 27;
- FIG. 30 illustrates an example high level block diagram of the interface illustrated in FIG. 27, in accordance with the present invention;
- FIG. 31 illustrates a example block diagram of the interface illustrated in FIG. 29, in accordance with the invention,

1744.0630003

5

FIG. 32 illustrates an example I/Q implementation of the interface illustrated in FIG.31;

FIGS. 33-38 illustrate example environments encompassed by the invention;

FIG. 39 illustrates a block diagram of a WLAN interface according to an embodiment of the invention;

FIG. 40 illustrates a WLAN receiver according to an embodiment of the invention;

FIG. 41 illustrates a WLAN transmitter according to an embodiment of the invention;

FIGS. 42-44 are example implementations of a WLAN interface;

FIGS. 45, 46A, and 46B relate to an example MAC interface for an example WLAN interface embodiment:

FIGS. 47, 48, 49A, and 49B relate to an example demodulator/modulator facilitation module for an example WLAN interface embodiment;

FIGS. 50, 51, 52A, 52B, and 52C relate to an example alternate demodulator/modulator facilitation module for an example WLAN interface embodiment;

FIGS. 53 and 54 relate to an example receiver for an example WLAN interface embodiment;

FIGS. 55, 56A, and 56B relate to an example synthesizer for an example WLAN interface embodiment;

FIGS. 57, 58, 59, 60, 61A, and 61B relate to an example transmitter for an example WLAN interface embodiment;

FIGS. 62 and 63 relate to an example motherboard for an example WLAN interface embodiment;

FIGS. 64-66 relate to example LNAs for an example WLAN interface embodiment;

FIGS. 67A-B illustrate IQ receivers having UFT modules in a series and shunt configurations, according to embodiments of the invention;

FIGS. 68A-B illustrate IQ receivers having UFT modules with delayed control signals for quadrature implementation, according to embodiments of the present invention;

1744.0630003

30

5

FIGS. 69A-B illustrate IQ receivers having FET implementations, according to embodiments of the invention,

FIG. 70A illustrates an IQ receiver having shunt UFT modules according to

embodiments of the invention;

FIG. 70B illustrates control signal generator embodiments for receiver 7000 according to embodiments of the invention;

FIGS. 70C-D illustrate various control signal waveforms according to embodiments of the invention;

FIG. 70E illustrates an example IQ modulation receiver embodiment according to embodiments of the invention;

FIGS. 70F-P illustrate example waveforms that are representative of the IQ receiver in FIG. 70E;

FIGS. 70Q-R illustrate single channel receiver embodiments according to embodiments of the invention;

FIG. 70S illustrates a FET configuration of an IQ receiver embodiment according to embodiments of the invention;

FIG. 71A illustrate a balanced transmitter 7102, according to an embodiment of the present invention;

FIGs. 71B-C illustrate example waveforms that are associated with the balanced transmitter 7102, according to an embodiment of the present invention;

FIG. 71D illustrates example FET configurations of the balanced transmitter 7102, according to embodiments of the present invention;

FIGs. 72A-I illustrate various example timing diagrams that are associated with the transmitter 7102, according to embodiments of the present invention;

FIG. 72J illustrates an example frequency spectrum that is associated with a modulator 7104, according to embodiments of the present invention,

FIG. 73A illustrate a transmitter 7302 that is configured for carrier insertion, according to embodiments of the present invention,

FIG. 73B illustrates example signals associated with the transmitter 7302, according to embodiments of the invention;

1744.0630003

5

25

- FIG. 74 illustrates an IQ balanced transmitter 7420, according to embodiments of the present invention;
- FIGs. 75A-C illustrate various example signal diagrams associated with the balanced transmitter 7420 in FIG. 74;
- FIG. 76A illustrates an IQ balanced transmitter 7608 according to embodiments of the invention;
- FIG. 76B illustrates an IQ balanced modulator 7618 according to embodiments of the invention;
- FIG. 77 illustrates an IQ balanced modulator 7702 configured for carrier insertion according to embodiments of the invention;
- FIG. 78 illustrates an IQ balanced modulator 7802 configured for carrier insertion according to embodiments of the invention;
- FIG. 79A illustrate a transmitter 7900, according to embodiments of the present invention;
- FIGs. 79B-C illustrate various frequency spectrums that are associated with the transmitter 7900:
- FIG. 79D illustrates a FET configuration for the transmitter 7900, according to embodiments of the present invention;

1. Universal Frequency Translation

The present invention is related to frequency translation, and applications of same. Such applications include, but are not limited to, frequency down-conversion, frequency up-conversion, enhanced signal reception, unified down-conversion and filtering, and combinations and applications of same.

FIG. 1A illustrates a universal frequency translation (UFT) module 102 according to embodiments of the invention. (The UFT module is also sometimes called a universal frequency translator, or a universal translator.)

As indicated by the example of FIG. 1A, some embodiments of the UFT module 102 include three ports (nodes), designated in FIG. 1A as Port 1, Port 2, and Port 3. Other UFT embodiments include other than three ports.

Generally, the UFT module 102 (perhaps in combination with other components) operates to generate an output signal from an input signal, where the frequency of the output signal differs from the frequency of the input signal. In other words, the UFT module 102 (and perhaps other components) operates to generate the output signal from the input signal by translating the frequency (and perhaps other characteristics) of the input signal to the frequency (and perhaps other characteristics) of the output signal.

An example embodiment of the UFT module 103 is generally illustrated in FIG. 1B. Generally, the UFT module 103 includes a switch 106 controlled by a control signal 108. The switch 106 is said to be a controlled switch.

As noted above, some UFT embodiments include other than three ports. For example, and without limitation, FIG. 2 illustrates an example UFT module 202. The example UFT module 202 includes a diode 204 having two ports, designated as Port 1 and Port 2/3. This embodiment does not include a third port, as indicated by the dotted line around the "Port 3" label.

The UFT module is a very powerful and flexible device. Its flexibility is illustrated, in part, by the wide range of applications in which it can be used. Its power is illustrated, in part, by the usefulness and performance of such applications.

10

25

For example, a UFT module 115 can be used in a universal frequency down-conversion (UFD) module 114, an example of which is shown in FIG. 1C. In this capacity, the UFT module 115 frequency down-converts an input signal to an output signal.

As another example, as shown in FIG. 1D, a UFT module 117 can be used in a universal frequency up-conversion (UFU) module 116. In this capacity, the UFT module 117 frequency up-converts an input signal to an output signal.

These and other applications of the UFT module are described below. Additional applications of the UFT module will be apparent to persons skilled in the relevant art(s) based on the teachings contained herein. In some applications, the UFT module is a required component. In other applications, the UFT module is an optional component.

2. Frequency Down-Conversion

The present invention is directed to systems and methods of universal frequency down-conversion, and applications of same.

In particular, the following discussion describes down-converting using a Universal Frequency Translation Module. The down-conversion of an EM signal by aliasing the EM signal at an aliasing rate is fully described in co-pending U.S. Patent Application entitled "Method and System for Down-Converting Electromagnetic Signals," Ser. No. 09/176,022, filed October 21, 1998, issued as U.S. Patent No. 6,061,551 on May 9, 2000, the full disclosure of which is incorporated herein by reference. A relevant portion of the above mentioned patent application is summarized below to describe down-converting an input signal to produce a down-converted signal that exists at a lower frequency or a baseband signal.

FIG. 20A illustrates an aliasing module 2000 (also called a universal frequency down-conversion module) for down-conversion using a universal frequency translation (UFT) module 2002 which down-converts an EM input signal 2004. In particular embodiments, aliasing module 2000 includes a switch 2008 and a capacitor 2010. The electronic alignment of the circuit components is flexible. That is, in one implementation,

the switch 2008 is in series with input signal 2004 and capacitor 2010 is shunted to ground (although it may be other than ground in configurations such as differential mode). In a second implementation (see FIG. 20A-1), the capacitor 2010 is in series with the input signal 2004 and the switch 2008 is shunted to ground (although it may be other than ground in configurations such as differential mode). Aliasing module 2000 with UFT module 2002 can be easily tailored to down-convert a wide variety of electromagnetic signals using aliasing frequencies that are well below the frequencies of the EM input signal 2004.

In one implementation, aliasing module 2000 down-converts the input signal 2004.

In one implementation, aliasing module 2000 down-converts the input signal 2004 to an intermediate frequency (IF) signal. In another implementation, the aliasing module 2000 down-converts the input signal 2004 to a demodulated baseband signal. In yet another implementation, the input signal 2004 is a frequency modulated (FM) signal, and the aliasing module 2000 down-converts it to a non-FM signal, such as a phase modulated (PM) signal or an amplitude modulated (AM) signal. Each of the above implementations is described below.

In an embodiment, the control signal 2006 includes a train of pulses that repeat at an aliasing rate that is equal to, or less than, twice the frequency of the input signal 2004. In this embodiment, the control signal 2006 is referred to herein as an aliasing signal because it is below the Nyquist rate for the frequency of the input signal 2004. Preferably, the frequency of control signal 2006 is much less than the input signal 2004.

A train of pulses 2018 as shown in FIG. 20D controls the switch 2008 to alias the input signal 2004 with the control signal 2006 to generate a down-converted output signal 2012. More specifically, in an embodiment, switch 2008 closes on a first edge of each pulse 2020 of FIG. 20D and opens on a second edge of each pulse. When the switch 2008 is closed, the input signal 2004 is coupled to the capacitor 2010, and charge is transferred from the input signal to the capacitor 2010. The charge stored during successive pulses forms down-converted output signal 2012.

Exemplary waveforms are shown in FIGS. 20B-20F.

FIG. 20B illustrates an analog amplitude modulated (AM) carrier signal 2014 that is an example of input signal 2004. For illustrative purposes, in FIG. 20C, an analog AM

30

25

5

10

The state of the section and the state of th

carrier signal portion 2016 illustrates a portion of the analog AM carrier signal 2014 on an expanded time scale. The analog AM carrier signal portion 2016 illustrates the analog AM carrier signal 2014 from time t_0 to time t_1 .

FIG. 20D illustrates an exemplary aliasing signal 2018 that is an example of control signal 2006. Aliasing signal 2018 is on approximately the same time scale as the analog AM carrier signal portion 2016. In the example shown in FIG. 20D, the aliasing signal 2018 includes a train of pulses 2020 having negligible apertures that tend towards zero (the invention is not limited to this embodiment, as discussed below). The pulse aperture may also be referred to as the pulse width as will be understood by those skilled in the art(s). The pulses 2020 repeat at an aliasing rate, or pulse repetition rate of aliasing signal 2018. The aliasing rate is determined as described below, and further described in co-pending U.S. Patent Application entitled "Method and System for Down-converting Electromagnetic Signals," Application No. 09/176,022, Attorney Docket Number 1744.0010000, issued as U.S. Patent No. 6,061,551 on May 9, 2000.

As noted above, the train of pulses 2020 (i.e., control signal 2006) control the switch 2008 to alias the analog AM carrier signal 2016 (i.e., input signal 2004) at the aliasing rate of the aliasing signal 2018. Specifically, in this embodiment, the switch 2008 closes on a first edge of each pulse and opens on a second edge of each pulse. When the switch 2008 is closed, input signal 2004 is coupled to the capacitor 2010, and charge is transferred from the input signal 2004 to the capacitor 2010. The charge transferred during a pulse is referred to herein as an under-sample. Exemplary under-samples 2022 form down-converted signal portion 2024 (FIG. 20E) that corresponds to the analog AM carrier signal portion 2016 (FIG. 20C) and the train of pulses 2020 (FIG. 20D). The charge stored during successive under-samples of AM carrier signal 2014 form the downconverted signal 2024 (FIG. 20E) that is an example of down-converted output signal 2012 (FIG. 20A). In FIG. 20F, a demodulated baseband signal 2026 represents the demodulated baseband signal 2024 after filtering on a compressed time scale. As illustrated, down-converted signal 2026 has substantially the same "amplitude envelope" as AM carrier signal 2014. Therefore, FIGS, 20B-20F illustrate down-conversion of AM carrier signal 2014.

1744.0630003

5

10

25

30

5

20

25

The waveforms shown in FIGS. 20B-20F are discussed herein for illustrative purposes only, and are not limiting. Additional exemplary time domain and frequency domain drawings, and exemplary methods and systems of the invention relating thereto, are disclosed in co-pending U.S. Patent Application entitled "Method and System for Down-converting Electromagnetic Signals," Application No.09/176,022, Attorney Docket Number 1744.0010000, issued as U.S. Patent No. 6,061,551 on May 9, 2000.

The aliasing rate of control signal 2006 determines whether the input signal 2004 is down-converted to an IF signal, down-converted to a demodulated baseband signal, or down-converted from an FM signal to a PM or an AM signal. Generally, relationships between the input signal 2004, the aliasing rate of the control signal 2006, and the down-converted output signal 2012 are illustrated below:

(Freq. of input signal 2004) =
$$n \cdot (\text{Freq. of control signal 2006}) \pm (\text{Freq. of down-converted output signal 2012})$$

For the examples contained herein, only the "+" condition will be discussed. The value of n represents a harmonic or sub-harmonic of input signal 2004 (e.g., n = 0.5, 1, 2, 3, ...).

When the aliasing rate of control signal 2006 is off-set from the frequency of input signal 2004, or off-set from a harmonic or sub-harmonic thereof, input signal 2004 is down-converted to an IF signal. This is because the under-sampling pulses occur at different phases of subsequent cycles of input signal 2004. As a result, the under-samples form a lower frequency oscillating pattern. If the input signal 2004 includes lower frequency changes, such as amplitude, frequency, phase, etc., or any combination thereof, the charge stored during associated under-samples reflects the lower frequency changes, resulting in similar changes on the down-converted IF signal. For example, to down-convert a 901 MHZ input signal to a 1 MHZ IF signal, the frequency of the control signal 2006 would be calculated as follows:

$$(Freq_{input} - Freq_{IF})/n = Freq_{control}$$

25

5

$$(901 \text{ MHZ} - 1 \text{ MHZ})/n = 900/n$$

For n = 0.5, 1, 2, 3, 4, etc., the frequency of the control signal 2006 would be substantially equal to 1.8 GHz, 900 MHZ, 450 MHZ, 300 MHZ, 225 MHZ, etc.

Exemplary time domain and frequency domain drawings, illustrating down-conversion of analog and digital AM, PM and FM signals to IF signals, and exemplary methods and systems thereof, are disclosed in co-pending U.S. Patent Application entitled "Method and System for Down-converting Electromagnetic Signals," Application No. 09/176,022, Attorney Docket Number 1744.0010000, issued as U.S. Patent No. 6,061,551 on May 9, 2000.

Alternatively, when the aliasing rate of the control signal 2006 is substantially equal to the frequency of the input signal 2004, or substantially equal to a harmonic or sub-harmonic thereof, input signal 2004 is directly down-converted to a demodulated baseband signal. This is because, without modulation, the under-sampling pulses occur at the same point of subsequent cycles of the input signal 2004. As a result, the under-samples form a constant output baseband signal. If the input signal 2004 includes lower frequency changes, such as amplitude, frequency, phase, etc., or any combination thereof, the charge stored during associated under-samples reflects the lower frequency changes, resulting in similar changes on the demodulated baseband signal. For example, to directly down-convert a 900 MHZ input signal to a demodulated baseband signal (i.e., zero IF), the frequency of the control signal 2006 would be calculated as follows:

$$(Freq_{input} - Freq_{IF})/n = Freq_{control}$$

(900 MHZ - 0 MHZ)/n = 900 MHZ/n

For n = 0.5, 1, 2, 3, 4, etc., the frequency of the control signal 2006 should be substantially equal to 1.8 GHz, 900 MHZ, 450 MHZ, 300 MHZ, 225 MHZ, etc.

Exemplary time domain and frequency domain drawings, illustrating direct downconversion of analog and digital AM and PM signals to demodulated baseband signals, and exemplary methods and systems thereof, are disclosed in the co-pending U.S. Patent

Application entitled "Method and System for Down-converting Electromagnetic Signals," Application No. 09/176,022, issued as U.S. Patent No. 6,061,551 on May 9, 2000.

Alternatively, to down-convert an input FM signal to a non-FM signal, a frequency within the FM bandwidth must be down-converted to baseband (i.e., zero IF). As an example, to down-convert a frequency shift keying (FSK) signal (a sub-set of FM) to a phase shift keying (PSK) signal (a subset of PM), the mid-point between a lower frequency F_1 and an upper frequency F_2 (that is, $[(F_1 + F_2) \div 2]$) of the FSK signal is down-converted to zero IF. For example, to down-convert an FSK signal having F_1 equal to 899 MHZ and F_2 equal to 901 MHZ, to a PSK signal, the aliasing rate of the control signal 2006 would be calculated as follows:

Frequency of the input
$$= (F_1 + F_2) \div 2$$

= (899 MHZ + 901 MHZ) $\div 2$
= 900 MHZ

Frequency of the down-converted signal = 0 (i.e., baseband)

$$(Freq_{input} - Freq_{IF})/n = Freq_{control}$$

(900 MHZ - 0 MHZ)/n = 900 MHZ/n

For n = 0.5, 1, 2, 3, etc., the frequency of the control signal 2006 should be substantially equal to 1.8 GHz, 900 MHZ, 450 MHZ, 300 MHZ, 225 MHZ, etc. The frequency of the down-converted PSK signal is substantially equal to one half the difference between the lower frequency F_1 and the upper frequency F_2 .

As another example, to down-convert a FSK signal to an amplitude shift keying (ASK) signal (a subset of AM), either the lower frequency F_1 or the upper frequency F_2 of the FSK signal is down-converted to zero IF. For example, to down-convert an FSK signal having F_1 equal to 900 MHZ and F_2 equal to 901 MHZ, to an ASK signal, the aliasing rate of the control signal 2006 should be substantially equal to:

25

20

5

10

The first that the term

10 and the control and the con

20

25

5

(900 MHZ - 0 MHZ)/n = 900 MHZ/n, or (901 MHZ - 0 MHZ)/n = 901 MHZ/n.

For the former case of 900 MHZ/n, and for n = 0.5, 1, 2, 3, 4, etc., the frequency of the control signal 2006 should be substantially equal to 1.8 GHz, 900 MHZ, 450 MHZ, 300 MHZ, 225 MHZ, etc. For the latter case of 901 MHZ/n, and for n = 0.5, 1, 2, 3, 4, etc., the frequency of the control signal 2006 should be substantially equal to 1.802 GHz, 901 MHZ, 450.5 MHZ, 300.333 MHZ, 225.25 MHZ, etc. The frequency of the down-converted AM signal is substantially equal to the difference between the lower frequency F_1 and the upper frequency F_2 (i.e., 1 MHZ).

Exemplary time domain and frequency domain drawings, illustrating down-conversion of FM signals to non-FM signals, and exemplary methods and systems thereof, are disclosed in the co-pending U.S. Patent Application entitled "Method and System for Down-converting Electromagnetic Signals," Application No. 09/176,022, issued as U.S. Patent No. 6,061,551 on May 9, 2000.

In an embodiment, the pulses of the control signal 2006 have negligible apertures that tend towards zero. This makes the UFT module 2002 a high input impedance device. This configuration is useful for situations where minimal disturbance of the input signal may be desired.

In another embodiment, the pulses of the control signal 2006 have non-negligible apertures that tend away from zero. This makes the UFT module 2002 a lower input impedance device. This allows the lower input impedance of the UFT module 2002 to be substantially matched with a source impedance of the input signal 2004. This also improves the energy transfer from the input signal 2004 to the down-converted output signal 2012, and hence the efficiency and signal to noise (s/n) ratio of UFT module 2002.

Exemplary systems and methods for generating and optimizing the control signal 2006, and for otherwise improving energy transfer and s/n ratio, are disclosed in the copending U.S. Patent Application entitled "Method and System for Down-converting Electromagnetic Signals," Application No. 09/176,022, issued as U.S. Patent No. 6,061,551 on May 9, 2000.

20

3. Frequency Up-Conversion

The present invention is directed to systems and methods of frequency upconversion, and applications of same.

An example frequency up-conversion system 300 is illustrated in FIG. 3. The frequency up-conversion system 300 is now described.

An input signal 302 (designated as "Control Signal" in FIG. 3) is accepted by a switch module 304. For purposes of example only, assume that the input signal 302 is a FM input signal 606, an example of which is shown in FIG. 6C. FM input signal 606 may have been generated by modulating information signal 602 onto oscillating signal 604 (FIGS. 6A and 6B). It should be understood that the invention is not limited to this embodiment. The information signal 602 can be analog, digital, or any combination thereof, and any modulation scheme can be used.

The output of switch module 304 is a harmonically rich signal 306, shown for example in FIG. 6D as a harmonically rich signal 608. The harmonically rich signal 608 has a continuous and periodic waveform.

FIG. 6E is an expanded view of two sections of harmonically rich signal 608, section 610 and section 612. The harmonically rich signal 608 may be a rectangular wave, such as a square wave or a pulse (although, the invention is not limited to this embodiment). For ease of discussion, the term "rectangular waveform" is used to refer to waveforms that are substantially rectangular. In a similar manner, the term "square wave" refers to those waveforms that are substantially square and it is not the intent of the present invention that a perfect square wave be generated or needed.

Harmonically rich signal 608 is comprised of a plurality of sinusoidal waves whose frequencies are integer multiples of the fundamental frequency of the waveform of the harmonically rich signal 608. These sinusoidal waves are referred to as the harmonics of the underlying waveform, and the fundamental frequency is referred to as the first harmonic. FIG. 6F and FIG. 6G show separately the sinusoidal components making up the first, third, and fifth harmonics of section 610 and section 612. (Note that in theory there may be an infinite number of harmonics, in this example, because harmonically rich

signal 608 is shown as a square wave, there are only odd harmonics). Three harmonics are shown simultaneously (but not summed) in FIG. 6H.

The relative amplitudes of the harmonics are generally a function of the relative widths of the pulses of harmonically rich signal 306 and the period of the fundamental frequency, and can be determined by doing a Fourier analysis of harmonically rich signal 306. According to an embodiment of the invention, the input signal 606 may be shaped to ensure that the amplitude of the desired harmonic is sufficient for its intended use (e.g., transmission).

A filter 308 filters out any undesired frequencies (harmonics), and outputs an electromagnetic (EM) signal at the desired harmonic frequency or frequencies as an output signal 310, shown for example as a filtered output signal 614 in FIG. 6I.

FIG. 4 illustrates an example universal frequency up-conversion (UFU) module 401. The UFU module 401 includes an example switch module 304, which comprises a bias signal 402, a resistor or impedance 404, a universal frequency translator (UFT) 450, and a ground 408. The UFT 450 includes a switch 406. The input signal 302 (designated as "Control Signal" in FIG. 4) controls the switch 406 in the UFT 450, and causes it to close and open. Harmonically rich signal 306 is generated at a node 405 located between the resistor or impedance 404 and the switch 406.

Also in FIG. 4, it can be seen that an example filter 308 is comprised of a capacitor 410 and an inductor 412 shunted to a ground 414. The filter is designed to filter out the undesired harmonics of harmonically rich signal 306.

The invention is not limited to the UFU embodiment shown in FIG. 4.

For example, in an alternate embodiment shown in FIG. 5, an unshaped input signal 501 is routed to a pulse shaping module 502. The pulse shaping module 502 modifies the unshaped input signal 501 to generate a (modified) input signal 302 (designated as the "Control Signal" in FIG. 5). The input signal 302 is routed to the switch module 304, which operates in the manner described above. Also, the filter 308 of FIG. 5 operates in the manner described above.

The purpose of the pulse shaping module 502 is to define the pulse width of the input signal 302. Recall that the input signal 302 controls the opening and closing of the

30

25

5

10

25

switch 406 in switch module 304. During such operation, the pulse width of the input signal 302 establishes the pulse width of the harmonically rich signal 306. As stated above, the relative amplitudes of the harmonics of the harmonically rich signal 306 are a function of at least the pulse width of the harmonically rich signal 306. As such, the pulse width of the input signal 302 contributes to setting the relative amplitudes of the harmonics of harmonically rich signal 306.

Further details of up-conversion as described in this section are presented in pending U.S. application "Method and System for Frequency Up-Conversion," Ser. No. 09/176,154, filed October 21, 1998, incorporated herein by reference in its entirety.

4. Enhanced Signal Reception

The present invention is directed to systems and methods of enhanced signal reception (ESR), and applications of same.

Referring to FIG. 21, transmitter 2104 accepts a modulating baseband signal 2102 and generates (transmitted) redundant spectrums 2106a-n, which are sent over communications medium 2108. Receiver 2112 recovers a demodulated baseband signal 2114 from (received) redundant spectrums 2110a-n. Demodulated baseband signal 2114 is representative of the modulating baseband signal 2102, where the level of similarity between the modulating baseband signal 2114 and the modulating baseband signal 2102 is application dependent.

Modulating baseband signal 2102 is preferably any information signal desired for transmission and/or reception. An example modulating baseband signal 2202 is illustrated in FIG. 22A, and has an associated modulating baseband spectrum 2204 and image spectrum 2203 that are illustrated in FIG. 22B. Modulating baseband signal 2202 is illustrated as an analog signal in FIG. 22a, but could also be a digital signal, or combination thereof. Modulating baseband signal 2202 could be a voltage (or current) characterization of any number of real world occurrences, including for example and without limitation, the voltage (or current) representation for a voice signal.

10

25

Each transmitted redundant spectrum 2106a-n contains the necessary information to substantially reconstruct the modulating baseband signal 2102. In other words, each redundant spectrum 2106a-n contains the necessary amplitude, phase, and frequency information to reconstruct the modulating baseband signal 2102.

FIG. 22C illustrates example transmitted redundant spectrums 2206b-d. Transmitted redundant spectrums 2206b-d are illustrated to contain three redundant spectrums for illustration purposes only. Any number of redundant spectrums could be generated and transmitted as will be explained in following discussions.

Transmitted redundant spectrums 2206b-d are centered at f_1 , with a frequency spacing f_2 between adjacent spectrums. Frequencies f_1 and f_2 are dynamically adjustable in real-time as will be shown below. FIG. 22D illustrates an alternate embodiment, where redundant spectrums 2208c,d are centered on unmodulated oscillating signal 2209 at f_1 (Hz). Oscillating signal 2209 may be suppressed if desired using, for example, phasing techniques or filtering techniques. Transmitted redundant spectrums are preferably above baseband frequencies as is represented by break 2205 in the frequency axis of FIGS. 22C and 22D.

Received redundant spectrums 2110a-n are substantially similar to transmitted redundant spectrums 2106a-n, except for the changes introduced by the communications medium 2108. Such changes can include but are not limited to signal attenuation, and signal interference. FIG. 22E illustrates example received redundant spectrums 2210b-d. Received redundant spectrums 2210b-d are substantially similar to transmitted redundant spectrums 2206b-d, except that redundant spectrum 2210c includes an undesired jamming signal spectrum 2211 in order to illustrate some advantages of the present invention. Jamming signal spectrum 2211 is a frequency spectrum associated with a jamming signal. For purposes of this invention, a "jamming signal" refers to any unwanted signal, regardless of origin, that may interfere with the proper reception and reconstruction of an intended signal. Furthermore, the jamming signal is not limited to tones as depicted by spectrum 2211, and can have any spectral shape, as will be understood by those skilled in the art(s).

10 mm and are not are and and profession of the second of

5

25

30

As stated above, demodulated baseband signal 2114 is extracted from one or more of received redundant spectrums 2210b-d. FIG. 22F illustrates example demodulated baseband signal 2212 that is, in this example, substantially similar to modulating baseband signal 2202 (FIG. 22A); where in practice, the degree of similarity is application dependent.

An advantage of the present invention should now be apparent. The recovery of modulating baseband signal 2202 can be accomplished by receiver 2112 in spite of the fact that high strength jamming signal(s) (e.g. jamming signal spectrum 2211) exist on the communications medium. The intended baseband signal can be recovered because multiple redundant spectrums are transmitted, where each redundant spectrum carries the necessary information to reconstruct the baseband signal. At the destination, the redundant spectrums are isolated from each other so that the baseband signal can be recovered even if one or more of the redundant spectrums are corrupted by a jamming signal.

Transmitter 2104 will now be explored in greater detail. FIG. 23A illustrates transmitter 2301, which is one embodiment of transmitter 2104 that generates redundant spectrums configured similar to redundant spectrums 2206b-d. Transmitter 2301 includes generator 2303, optional spectrum processing module 2304, and optional medium interface module 2320. Generator 2303 includes: first oscillator 2302, second oscillator 2309, first stage modulator 2306, and second stage modulator 2310.

Transmitter 2301 operates as follows. First oscillator 2302 and second oscillator 2309 generate a first oscillating signal 2305 and second oscillating signal 2312, respectively. First stage modulator 2306 modulates first oscillating signal 2305 with modulating baseband signal 2202, resulting in modulated signal 2308. First stage modulator 2306 may implement any type of modulation including but not limited to: amplitude modulation, frequency modulation, phase modulation, combinations thereof, or any other type of modulation. Second stage modulator 2310 modulates modulated signal 2308 with second oscillating signal 2312, resulting in multiple redundant spectrums 2206a-n shown in FIG. 23B. Second stage modulator 2310 is preferably a phase modulator, or a frequency modulator, although other types of modulation may be implemented including but not limited to amplitude modulation. Each redundant spectrum

2206a-n contains the necessary amplitude, phase, and frequency information to substantially reconstruct the modulating baseband signal 2202.

Redundant spectrums 2206a-n are substantially centered around f_1 , which is the characteristic frequency of first oscillating signal 2305. Also, each redundant spectrum 2206a-n (except for 2206c) is offset from f_1 by approximately a multiple of f_2 (Hz), where f_2 is the frequency of the second oscillating signal 2312. Thus, each redundant spectrum 2206a-n is offset from an adjacent redundant spectrum by f_2 (Hz). This allows the spacing between adjacent redundant spectrums to be adjusted (or tuned) by changing f_2 that is associated with second oscillator 2309. Adjusting the spacing between adjacent redundant spectrums allows for dynamic real-time tuning of the bandwidth occupied by redundant spectrums 2206a-n.

In one embodiment, the number of redundant spectrums 2206a-n generated by transmitter 2301 is arbitrary and may be unlimited as indicated by the "a-n" designation for redundant spectrums 2206a-n. However, a typical communications medium will have a physical and/or administrative limitations (i.e. FCC regulations) that restrict the number of redundant spectrums that can be practically transmitted over the communications medium. Also, there may be other reasons to limit the number of redundant spectrums transmitted. Therefore, preferably, the transmitter 2301 will include an optional spectrum processing module 2304 to process the redundant spectrums 2206a-n prior to transmission over communications medium 2108.

In one embodiment, spectrum processing module 2304 includes a filter with a passband 2207 (FIG. 23C) to select redundant spectrums 2206b-d for transmission. This will substantially limit the frequency bandwidth occupied by the redundant spectrums to the passband 2207. In one embodiment, spectrum processing module 2304 also up converts redundant spectrums and/or amplifies redundant spectrums prior to transmission over the communications medium 2108. Finally, medium interface module 2320 transmits redundant spectrums over the communications medium 2108. In one embodiment, communications medium 2108 is an over-the-air link and medium interface module 2320 is an antenna. Other embodiments for communications medium 2108 and medium interface module 2320 will be understood based on the teachings contained herein.

30

FIG. 23D illustrates transmitter 2321, which is one embodiment of transmitter 2104 that generates redundant spectrums configured similar to redundant spectrums 2208c-d and unmodulated spectrum 2209. Transmitter 2321 includes generator 2311, spectrum processing module 2304, and (optional) medium interface module 2320. Generator 2311 includes: first oscillator 2302, second oscillator 2309, first stage modulator 2306, and second stage modulator 2310.

As shown in FIG. 23D, many of the components in transmitter 2321 are similar to those in transmitter 2301. However, in this embodiment, modulating baseband signal 2202 modulates second oscillating signal 2312. Transmitter 2321 operates as follows. First stage modulator 2306 modulates second oscillating signal 2312 with modulating baseband signal 2202, resulting in modulated signal 2322. As described earlier, first stage modulator 2306 can effect any type of modulation including but not limited to: amplitude modulation frequency modulation, combinations thereof, or any other type of modulation. Second stage modulator 2310 modulates first oscillating signal 2304 with modulated signal 2322, resulting in redundant spectrums 2208a-n, as shown in FIG. 23E. Second stage modulator 2310 is preferably a phase or frequency modulator, although other modulators could used including but not limited to an amplitude modulator.

Redundant spectrums 2208a-n are centered on unmodulated spectrum 2209 (at f₁ Hz), and adjacent spectrums are separated by f₂ Hz. The number of redundant spectrums 2208a-n generated by generator 2311 is arbitrary and unlimited, similar to spectrums 2206a-n discussed above. Therefore, optional spectrum processing module 2304 may also include a filter with passband 2325 to select, for example, spectrums 2208c,d for transmission over communications medium 2108. In addition, optional spectrum processing module 2304 may also include a filter (such as a bandstop filter) to attenuate unmodulated spectrum 2209. Alternatively, unmodulated spectrum 2209 may be attenuated by using phasing techniques during redundant spectrum generation. Finally, (optional) medium interface module 2320 transmits redundant spectrums 2208c,d over communications medium 2108.

Receiver 2112 will now be explored in greater detail to illustrate recovery of a demodulated baseband signal from received redundant spectrums. FIG. 24A illustrates

10
If I lind form our man man man program are the man and man are the man are

25

30

5

receiver 2430, which is one embodiment of receiver 2112. Receiver 2430 includes optional medium interface module 2402, down-converter 2404, spectrum isolation module 2408, and data extraction module 2414. Spectrum isolation module 2408 includes filters 2410a-c. Data extraction module 2414 includes demodulators 2416a-c, error check modules 2420a-c, and arbitration module 2424. Receiver 2430 will be discussed in relation to the signal diagrams in FIGS. 24B-24J.

In one embodiment, optional medium interface module 2402 receives redundant spectrums 2210b-d (FIG. 22E, and FIG. 24B). Each redundant spectrum 2210b-d includes the necessary amplitude, phase, and frequency information to substantially reconstruct the modulating baseband signal used to generated the redundant spectrums. However, in the present example, spectrum 2210c also contains jamming signal 2211, which may interfere with the recovery of a baseband signal from spectrum 2210c. Downconverter 2404 down-converts received redundant spectrums 2210b-d to lower intermediate frequencies, resulting in redundant spectrums 2406a-c (FIG. 24C). Jamming signal 2211 is also down-converted to jamming signal 2407, as it is contained within redundant spectrum 2406b. Spectrum isolation module 2408 includes filters 2410a-c that isolate redundant spectrums 2406a-c from each other (FIGS. 24D-24F, respectively). Demodulators 2416a-c independently demodulate spectrums 2406a-c, resulting in demodulated baseband signals 2418a-c, respectively (FIGS. 24G-24I). Error check modules 2420a-c analyze demodulate baseband signal 2418a-c to detect any errors. In one embodiment, each error check module 2420a-c sets an error flag 2422a-c whenever an error is detected in a demodulated baseband signal. Arbitration module 2424 accepts the demodulated baseband signals and associated error flags, and selects a substantially errorfree demodulated baseband signal (FIG. 24J). In one embodiment, the substantially errorfree demodulated baseband signal will be substantially similar to the modulating baseband signal used to generate the received redundant spectrums, where the degree of similarity is application dependent.

Referring to FIGS. 24G-I, arbitration module 2424 will select either demodulated baseband signal 2418a or 2418c, because error check module 2420b will set the error flag 2422b that is associated with demodulated baseband signal 2418b.

25

The error detection schemes implemented by the error detection modules include but are not limited to: cyclic redundancy check (CRC) and parity check for digital signals, and various error detections schemes for analog signal.

Further details of enhanced signal reception as described in this section are presented in pending U.S. application "Method and System for Ensuring Reception of a Communications Signal," Ser. No. 09/176,415, filed October 21, 1998, issued as U.S. Patent No. 6,061,555 on May 9, 2000.

5. Unified Down-Conversion and Filtering

The present invention is directed to systems and methods of unified down-conversion and filtering (UDF), and applications of same.

In particular, the present invention includes a unified down-converting and filtering (UDF) module that performs frequency selectivity and frequency translation in a unified (i.e., integrated) manner. By operating in this manner, the invention achieves high frequency selectivity prior to frequency translation (the invention is not limited to this embodiment). The invention achieves high frequency selectivity at substantially any frequency, including but not limited to RF (radio frequency) and greater frequencies. It should be understood that the invention is not limited to this example of RF and greater frequencies. The invention is intended, adapted, and capable of working with lower than radio frequencies.

FIG. 17 is a conceptual block diagram of a UDF module 1702 according to an embodiment of the present invention. The UDF module 1702 performs at least frequency translation and frequency selectivity.

The effect achieved by the UDF module 1702 is to perform the frequency selectivity operation prior to the performance of the frequency translation operation. Thus, the UDF module 1702 effectively performs input filtering.

According to embodiments of the present invention, such input filtering involves a relatively narrow bandwidth. For example, such input filtering may represent channel select filtering, where the filter bandwidth may be, for example, 50 KHz to 150 KHz. It

should be understood, however, that the invention is not limited to these frequencies. The invention is intended, adapted, and capable of achieving filter bandwidths of less than and greater than these values.

In embodiments of the invention, input signals 1704 received by the UDF module 1702 are at radio frequencies. The UDF module 1702 effectively operates to input filter these RF input signals 1704. Specifically, in these embodiments, the UDF module 1702 effectively performs input, channel select filtering of the RF input signal 1704. Accordingly, the invention achieves high selectivity at high frequencies.

The UDF module 1702 effectively performs various types of filtering, including but not limited to bandpass filtering, low pass filtering, high pass filtering, notch filtering, all pass filtering, band stop filtering, etc., and combinations thereof.

Conceptually, the UDF module 1702 includes a frequency translator 1708. The frequency translator 1708 conceptually represents that portion of the UDF module 1702 that performs frequency translation (down conversion).

The UDF module 1702 also conceptually includes an apparent input filter 1706 (also sometimes called an input filtering emulator). Conceptually, the apparent input filter 1706 represents that portion of the UDF module 1702 that performs input filtering.

In practice, the input filtering operation performed by the UDF module 1702 is integrated with the frequency translation operation. The input filtering operation can be viewed as being performed concurrently with the frequency translation operation. This is a reason why the input filter 1706 is herein referred to as an "apparent" input filter 1706.

The UDF module 1702 of the present invention includes a number of advantages. For example, high selectivity at high frequencies is realizable using the UDF module 1702. This feature of the invention is evident by the high Q factors that are attainable. For example, and without limitation, the UDF module 1702 can be designed with a filter center frequency $f_{\rm C}$ on the order of 900 MHZ, and a filter bandwidth on the order of 50 KHz. This represents a Q of 18,000 (Q is equal to the center frequency divided by the bandwidth).

It should be understood that the invention is not limited to filters with high Q factors. The filters contemplated by the present invention may have lesser or greater Qs,

30

25

5

10

In the series and the series and the series are series are series and the series are series are series and the series are serie

10

I I I find from one part from the set of the first find from the set of the

25

depending on the application, design, and/or implementation. Also, the scope of the invention includes filters where Q factor as discussed herein is not applicable.

The invention exhibits additional advantages. For example, the filtering center frequency $f_{\rm c}$ of the UDF module 1702 can be electrically adjusted, either statically or dynamically.

Also, the UDF module 1702 can be designed to amplify input signals.

Further, the UDF module 1702 can be implemented without large resistors, capacitors, or inductors. Also, the UDF module 1702 does not require that tight tolerances be maintained on the values of its individual components, i.e., its resistors, capacitors, inductors, etc. As a result, the architecture of the UDF module 1702 is friendly to integrated circuit design techniques and processes.

The features and advantages exhibited by the UDF module 1702 are achieved at least in part by adopting a new technological paradigm with respect to frequency selectivity and translation. Specifically, according to the present invention, the UDF module 1702 performs the frequency selectivity operation and the frequency translation operation as a single, unified (integrated) operation. According to the invention, operations relating to frequency translation also contribute to the performance of frequency selectivity, and vice versa.

According to embodiments of the present invention, the UDF module generates an output signal from an input signal using samples/instances of the input signal and samples/instances of the output signal.

More particularly, first, the input signal is under-sampled. This input sample includes information (such as amplitude, phase, etc.) representative of the input signal existing at the time the sample was taken.

As described further below, the effect of repetitively performing this step is to translate the frequency (that is, down-convert) of the input signal to a desired lower frequency, such as an intermediate frequency (IF) or baseband.

Next, the input sample is held (that is, delayed).

10

The state and the state of the

20

25

Then, one or more delayed input samples (some of which may have been scaled) are combined with one or more delayed instances of the output signal (some of which may have been scaled) to generate a current instance of the output signal.

Thus, according to a preferred embodiment of the invention, the output signal is generated from prior samples/instances of the input signal and/or the output signal. (It is noted that, in some embodiments of the invention, current samples/instances of the input signal and/or the output signal may be used to generate current instances of the output signal.) By operating in this manner, the UDF module preferably performs input filtering and frequency down-conversion in a unified manner.

FIG. 19 illustrates an example implementation of the unified down-converting and filtering (UDF) module 1922. The UDF module 1922 performs the frequency translation operation and the frequency selectivity operation in an integrated, unified manner as described above, and as further described below.

In the example of FIG. 19, the frequency selectivity operation performed by the UDF module 1922 comprises a band-pass filtering operation according to EQ. 1, below, which is an example representation of a band-pass filtering transfer function.

$$VO = \alpha_1 z^{-1}VI - \beta_1 z^{-1}VO - \beta_0 z^{-2}VO$$
 EQ. 1

It should be noted, however, that the invention is not limited to band-pass filtering. Instead, the invention effectively performs various types of filtering, including but not limited to bandpass filtering, low pass filtering, high pass filtering, notch filtering, all pass filtering, band stop filtering, etc., and combinations thereof. As will be appreciated, there are many representations of any given filter type. The invention is applicable to these filter representations. Thus, EQ. 1 is referred to herein for illustrative purposes only, and is not limiting.

The UDF module 1922 includes a down-convert and delay module 1924, first and second delay modules 1928 and 1930, first and second scaling modules 1932 and 1934, an output sample and hold module 1936, and an (optional) output smoothing module

10 IJ

L)

25

1938. Other embodiments of the UDF module will have these components in different configurations, and/or a subset of these components, and/or additional components. For example, and without limitation, in the configuration shown in FIG. 19, the output smoothing module 1938 is optional.

As further described below, in the example of FIG. 19, the down-convert and delay module 1924 and the first and second delay modules 1928 and 1930 include switches that are controlled by a clock having two phases, φ_1 and φ_2 . φ_1 and φ_2 preferably have the same frequency, and are non-overlapping (alternatively, a plurality such as two clock signals having these characteristics could be used). As used herein, the term "non-overlapping" is defined as two or more signals where only one of the signals is active at any given time. In some embodiments, signals are "active" when they are high. In other embodiments, signals are active when they are low.

Preferably, each of these switches closes on a rising edge of ϕ_1 or ϕ_2 , and opens on the next corresponding falling edge of ϕ_1 or ϕ_2 . However, the invention is not limited to this example. As will be apparent to persons skilled in the relevant art(s), other clock conventions can be used to control the switches.

In the example of FIG. 19, it is assumed that α_1 is equal to one. Thus, the output of the down-convert and delay module 1924 is not scaled. As evident from the embodiments described above, however, the invention is not limited to this example.

The example UDF module 1922 has a filter center frequency of 900.2 MHZ and a filter bandwidth of 570 KHz. The pass band of the UDF module 1922 is on the order of 899.915 MHZ to 900.485 MHZ. The Q factor of the UDF module 1922 is approximately 1879 (i.e., 900.2 MHZ divided by 570 KHz).

The operation of the UDF module 1922 shall now be described with reference to a Table 1802 (FIG. 18) that indicates example values at nodes in the UDF module 1922 at a number of consecutive time increments. It is assumed in Table 1802 that the UDF module 1922 begins operating at time t-1. As indicated below, the UDF module 1922 reaches steady state a few time units after operation begins. The number of time units necessary for a given UDF module to reach steady state depends on the configuration of

10

25

the UDF module, and will be apparent to persons skilled in the relevant art(s) based on the teachings contained herein.

At the rising edge of ϕ_1 at time t-1, a switch 1950 in the down-convert and delay module 1924 closes. This allows a capacitor 1952 to charge to the current value of an input signal, VI_{t-1}, such that node 1902 is at VI_{t-1}. This is indicated by cell 1804 in FIG. 18. In effect, the combination of the switch 1950 and the capacitor 1952 in the down-convert and delay module 1924 operates to translate the frequency of the input signal VI to a desired lower frequency, such as IF or baseband. Thus, the value stored in the capacitor 1952 represents an instance of a down-converted image of the input signal VI.

The manner in which the down-convert and delay module 1924 performs frequency down-conversion is further described elsewhere in this application, and is additionally described in pending U.S. application "Method and System for Down-Converting Electromagnetic Signals," Ser. No. 09/176,022, filed October 21, 1998, issued as U.S. Patent No. 6,061,551 on May 9, 2000, which is herein incorporated by reference in its entirety.

Also at the rising edge of ϕ_1 at time t-1, a switch 1958 in the first delay module 1928 closes, allowing a capacitor 1960 to charge to VO_{t-1} , such that node 1906 is at VO_{t-1} . This is indicated by cell 1806 in Table 1802. (In practice, VO_{t-1} is undefined at this point. However, for ease of understanding, VO_{t-1} shall continue to be used for purposes of explanation.)

Also at the rising edge of ϕ_1 at time t-1, a switch 1966 in the second delay module 1930 closes, allowing a capacitor 1968 to charge to a value stored in a capacitor 1964. At this time, however, the value in capacitor 1964 is undefined, so the value in capacitor 1968 is undefined. This is indicated by cell 1807 in table 1802.

At the rising edge of ϕ_2 at time t-1, a switch 1954 in the down-convert and delay module 1924 closes, allowing a capacitor 1956 to charge to the level of the capacitor 1952. Accordingly, the capacitor 1956 charges to VI_{t-1} , such that node 1904 is at VI_{t-1} . This is indicated by cell 1810 in Table 1802.

5

The UDF module 1922 may optionally include a unity gain module 1990A between capacitors 1952 and 1956. The unity gain module 1990A operates as a current source to enable capacitor 1956 to charge without draining the charge from capacitor 1952. For a similar reason, the UDF module 1922 may include other unity gain modules 1990B-1990G. It should be understood that, for many embodiments and applications of the invention, these unity gain modules 1990A-1990G are optional. The structure and operation of the unity gain modules 1990 will be apparent to persons skilled in the relevant art(s).

Also at the rising edge of ϕ_2 at time t-1, a switch 1962 in the first delay module 1928 closes, allowing a capacitor 1964 to charge to the level of the capacitor 1960. Accordingly, the capacitor 1964 charges to VO_{t-1} , such that node 1908 is at VO_{t-1} . This is indicated by cell 1814 in Table 1802.

Also at the rising edge of ϕ_2 at time t-1, a switch 1970 in the second delay module 1930 closes, allowing a capacitor 1972 to charge to a value stored in a capacitor 1968. At this time, however, the value in capacitor 1968 is undefined, so the value in capacitor 1972 is undefined. This is indicated by cell 1815 in table 1802.

At time t, at the rising edge of ϕ_1 , the switch 1950 in the down-convert and delay module 1924 closes. This allows the capacitor 1952 to charge to VI₁, such that node 1902 is at VI₁. This is indicated in cell 1816 of Table 1802.

Also at the rising edge of ϕ_1 at time t, the switch 1958 in the first delay module 1928 closes, thereby allowing the capacitor 1960 to charge to VO₁. Accordingly, node 1906 is at VO₁. This is indicated in cell 1820 in Table 1802.

Further at the rising edge of ϕ_1 at time t, the switch 1966 in the second delay module 1930 closes, allowing a capacitor 1968 to charge to the level of the capacitor 1964. Therefore, the capacitor 1968 charges to VO_{t-1} , such that node 1910 is at VO_{t-1} . This is indicated by cell 1824 in Table 1802.

At the rising edge of ϕ_2 at time t, the switch 1954 in the down-convert and delay module 1924 closes, allowing the capacitor 1956 to charge to the level of the capacitor 1952. Accordingly, the capacitor 1956 charges to VI_t , such that node 1904 is at VI_t . This is indicated by cell 1828 in Table 1802.

30

25

10

II II S.d. firm, and provided from the first sure was a first sure and sure was a first sure was a

25

30

Also at the rising edge of ϕ_2 at time t, the switch 1962 in the first delay module 1928 closes, allowing the capacitor 1964 to charge to the level in the capacitor 1960. Therefore, the capacitor 1964 charges to VO_t , such that node 1908 is at VO_t . This is indicated by cell 1832 in Table 1802.

Further at the rising edge of ϕ_2 at time t, the switch 1970 in the second delay module 1930 closes, allowing the capacitor 1972 in the second delay module 1930 to charge to the level of the capacitor 1968 in the second delay module 1930. Therefore, the capacitor 1972 charges to VO_{t-1} , such that node 1912 is at VO_{t-1} . This is indicated in cell 1836 of FIG. 18.

At time t+1, at the rising edge of ϕ_1 , the switch 1950 in the down-convert and delay module 1924 closes, allowing the capacitor 1952 to charge to VI_{t+1}. Therefore, node 1902 is at VI_{t+1}, as indicated by cell 1838 of Table 1802.

Also at the rising edge of ϕ_1 at time t+1, the switch 1958 in the first delay module 1928 closes, allowing the capacitor 1960 to charge to VO_{t+1} . Accordingly, node 1906 is at VO_{t+1} , as indicated by cell 1842 in Table 1802.

Further at the rising edge of ϕ_1 at time t+1, the switch 1966 in the second delay module 1930 closes, allowing the capacitor 1968 to charge to the level of the capacitor 1964. Accordingly, the capacitor 1968 charges to VO_t, as indicated by cell 1846 of Table 1802.

In the example of FIG. 19, the first scaling module 1932 scales the value at node 1908 (i.e., the output of the first delay module 1928) by a scaling factor of -0.1. Accordingly, the value present at node 1914 at time t+1 is -0.1 * VO_t . Similarly, the second scaling module 1934 scales the value present at node 1912 (i.e., the output of the second scaling module 1930) by a scaling factor of -0.8. Accordingly, the value present at node 1916 is -0.8 * VO_{t-1} at time t+1.

At time t+1, the values at the inputs of the summer 1926 are: VI_t at node 1904, $-0.1 * VO_t$ at node 1914, and $-0.8 * VO_{t-1}$ at node 1916 (in the example of FIG. 19, the values at nodes 1914 and 1916 are summed by a second summer 1925, and this sum is presented to the summer 1926). Accordingly, at time t+1, the summer generates a signal equal to $VI_t - 0.1 * VO_t - 0.8 * VO_{t-1}$.

At the rising edge of ϕ_1 at time t+1, a switch 1991 in the output sample and hold module 1936 closes, thereby allowing a capacitor 1992 to charge to VO_{t+1} . Accordingly, the capacitor 1992 charges to VO_{t+1} , which is equal to the sum generated by the adder 1926. As just noted, this value is equal to: $VI_t - 0.1 * VO_t - 0.8 * VO_{t-1}$. This is indicated in cell 1850 of Table 1802. This value is presented to the optional output smoothing module 1938, which smooths the signal to thereby generate the instance of the output signal VO_{t+1} . It is apparent from inspection that this value of VO_{t+1} is consistent with the band pass filter transfer function of EQ. 1.

Further details of unified down-conversion and filtering as described in this section are presented in pending U.S. application "Integrated Frequency Translation And Selectivity," Ser. No. 09/175,966, filed October 21, 1998, issued as U.S. Patent No. 6,049,706 on April 11, 2000, incorporated herein by reference in its entirety.

6. Example Application Embodiments of the Invention

As noted above, the UFT module of the present invention is a very powerful and flexible device. Its flexibility is illustrated, in part, by the wide range of applications in which it can be used. Its power is illustrated, in part, by the usefulness and performance of such applications.

Example applications of the UFT module were described above. In particular, frequency down-conversion, frequency up-conversion, enhanced signal reception, and unified down-conversion and filtering applications of the UFT module were summarized above, and are further described below. These applications of the UFT module are discussed herein for illustrative purposes. The invention is not limited to these example applications. Additional applications of the UFT module will be apparent to persons skilled in the relevant art(s), based on the teachings contained herein.

For example, the present invention can be used in applications that involve frequency down-conversion. This is shown in FIG. 1C, for example, where an example UFT module 115 is used in a down-conversion module 114. In this capacity, the UFT module 115 frequency down-converts an input signal to an output signal. This is also

shown in FIG. 7, for example, where an example UFT module 706 is part of a down-conversion module 704, which is part of a receiver 702.

The present invention can be used in applications that involve frequency upconversion. This is shown in FIG. 1D, for example, where an example UFT module 117 is used in a frequency up-conversion module 116. In this capacity, the UFT module 117 frequency up-converts an input signal to an output signal. This is also shown in FIG. 8, for example, where an example UFT module 806 is part of up-conversion module 804, which is part of a transmitter 802.

The present invention can be used in environments having one or more transmitters 902 and one or more receivers 906, as illustrated in FIG. 9. In such environments, one or more of the transmitters 902 may be implemented using a UFT module, as shown for example in FIG. 8. Also, one or more of the receivers 906 may be implemented using a UFT module, as shown for example in FIG. 7.

The invention can be used to implement a transceiver. An example transceiver 1002 is illustrated in FIG. 10. The transceiver 1002 includes a transmitter 1004 and a receiver 1008. Either the transmitter 1004 or the receiver 1008 can be implemented using a UFT module. Alternatively, the transmitter 1004 can be implemented using a UFT module 1006, and the receiver 1008 can be implemented using a UFT module 1010. This embodiment is shown in FIG. 10.

Another transceiver embodiment according to the invention is shown in FIG. 11. In this transceiver 1102, the transmitter 1104 and the receiver 1108 are implemented using a single UFT module 1106. In other words, the transmitter 1104 and the receiver 1108 share a UFT module 1106.

As described elsewhere in this application, the invention is directed to methods and systems for enhanced signal reception (ESR). Various ESR embodiments include an ESR module (transmit) in a transmitter 1202, and an ESR module (receive) in a receiver 1210. An example ESR embodiment configured in this manner is illustrated in FIG. 12.

The ESR module (transmit) 1204 includes a frequency up-conversion module 1206. Some embodiments of this frequency up-conversion module 1206 may be implemented using a UFT module, such as that shown in FIG. 1D.

1744.0630003

10

5

25

30

10

25

30

The ESR module (receive) 1212 includes a frequency down-conversion module 1214. Some embodiments of this frequency down-conversion module 1214 may be implemented using a UFT module, such as that shown in FIG. 1C.

As described elsewhere in this application, the invention is directed to methods and systems for unified down-conversion and filtering (UDF). An example unified down-conversion and filtering module 1302 is illustrated in FIG. 13. The unified down-conversion and filtering module 1302 includes a frequency down-conversion module 1304 and a filtering module 1306. According to the invention, the frequency down-conversion module 1304 and the filtering module 1306 are implemented using a UFT module 1308, as indicated in FIG. 13.

Unified down-conversion and filtering according to the invention is useful in applications involving filtering and/or frequency down-conversion. This is depicted, for example, in FIGS 15A-15F. FIGS 15A-15C indicate that unified down-conversion and filtering according to the invention is useful in applications where filtering precedes, follows, or both precedes and follows frequency down-conversion. FIG 15D indicates that a unified down-conversion and filtering module 1524 according to the invention can be utilized as a filter 1522 (i.e., where the extent of frequency down-conversion by the down-converter in the unified down-conversion and filtering module 1524 is minimized). FIG 15E indicates that a unified down-conversion and filtering module 1528 according to the invention can be utilized as a down-converter 1526 (i.e., where the filter in the unified down-conversion and filtering module 1532 can be used as an amplifier. It is noted that one or more UDF modules can be used in applications that involve at least one or more of filtering, frequency translation, and amplification.

For example, receivers, which typically perform filtering, down-conversion, and filtering operations, can be implemented using one or more unified down-conversion and filtering modules. This is illustrated, for example, in FIG. 14.

The methods and systems of unified down-conversion and filtering of the invention have many other applications. For example, as discussed herein, the enhanced signal

25

30

5

reception (ESR) module (receive) operates to down-convert a signal containing a plurality of spectrums. The ESR module (receive) also operates to isolate the spectrums in the down-converted signal, where such isolation is implemented via filtering in some embodiments. According to embodiments of the invention, the ESR module (receive) is implemented using one or more unified down-conversion and filtering (UDF) modules. This is illustrated, for example, in FIG. 16. In the example of FIG. 16, one or more of the UDF modules 1610, 1612, 1614 operates to down-convert a received signal. The UDF modules 1610, 1612, 1614 also operate to filter the down-converted signal so as to isolate the spectrum(s) contained therein. As noted above, the UDF modules 1610, 1612, 1614 are implemented using the universal frequency translation (UFT) modules of the invention.

The invention is not limited to the applications of the UFT module described above. For example, and without limitation, subsets of the applications (methods and/or structures) described herein (and others that would be apparent to persons skilled in the relevant art(s) based on the herein teachings) can be associated to form useful combinations.

For example, transmitters and receivers are two applications of the UFT module. FIG. 10 illustrates a transceiver 1002 that is formed by combining these two applications of the UFT module, i.e., by combining a transmitter 1004 with a receiver 1008.

Also, ESR (enhanced signal reception) and unified down-conversion and filtering are two other applications of the UFT module. FIG. 16 illustrates an example where ESR and unified down-conversion and filtering are combined to form a modified enhanced signal reception system.

The invention is not limited to the example applications of the UFT module discussed herein. Also, the invention is not limited to the example combinations of applications of the UFT module discussed herein. These examples were provided for illustrative purposes only, and are not limiting. Other applications and combinations of such applications will be apparent to persons skilled in the relevant art(s) based on the teachings contained herein. Such applications and combinations include, for example and without limitation, applications/combinations comprising and/or involving one or more of:

(1) frequency translation; (2) frequency down-conversion; (3) frequency up-conversion;

O Start from the control of the cont

(4) receiving; (5) transmitting; (6) filtering; and/or (7) signal transmission and reception in environments containing potentially jamming signals.

Additional example applications are described below.

6.1 Data Communication

5

The invention is directed to data communication among data processing devices. For example, and without limitation, the invention is directed to computer networks such as, for example, local area networks (LANs), wide area networks (WANs), including wireless LANs (WLANs) and wireless WANs, modulator/demodulators (modems), including wireless modems, etc.

FIG. 25 illustrates an example environment 2502 wherein computers 2504, 2512, and 2526 communicate with one another via a computer network 2534. It is noted that the invention is not limited to computers, but encompasses any data processing and/or communications device or other device where communications with external devices is desired. Also, the invention includes but si not limited to WLAN client (also called mobile terminals, and/or stations) and infrastructure devices (also called access points). In the example of FIG. 25, computer 2504 is communicating with the network 2534 via a wired link, whereas computers 2512 and 2526 are communicating with the network 2534 via wireless links.

In the teachings contained herein, for illustrative purposes, a link may be designated as being a wired link or a wireless link. Such designations are for example purposes only, and are not limiting. A link designated as being wireless may alternatively be wired. Similarly, a link designated as being wired may alternatively be wireless. This is applicable throughout the entire application.

25

20

The computers 2504, 2512 and 2526 each include an interface 2506, 2514, and 2528, respectively, for communicating with the network 2534. The interfaces 2506, 2514, and 2528 include transmitters 2508, 2516, and 2530 respectively. Also, the interfaces 2506, 2514 and 2528 include receivers 2510, 2518, and 2532 respectively. In embodiments of the invention, the transmitters 2508, 2516 and 2530 are implemented

25

20

30

using UFT modules for performing frequency up-conversion operations (see, for example, FIG. 8). In embodiments, the receivers 2510, 2518 and 2532 are implemented using UFT modules for performing frequency down-conversion operations (see, for example, FIG. 7).

As noted above, the computers 2512 and 2526 interact with the network 2534 via wireless links. In embodiments of the invention, the interfaces 2514, 2528 in computers 2512, 2526 represent modulator/demodulators (modems).

In embodiments, the network 2534 includes an interface or modem 2520 for communicating with the modems 2514, 2528 in the computers 2512, 2526. In embodiments, the interface 2520 includes a transmitter 2522, and a receiver 2524. Either or both of the transmitter 2522, and the receiver 2524 are implemented using UFT modules for performing frequency translation operations (see, for example, FIGS. 7 and 8).

In alternative embodiments, one or more of the interfaces 2506, 2514, 2520, and 2528 are implemented using transceivers that employ one or more UFT modules for performing frequency translation operations (see, for example, FIGS. 10 and 11).

FIG. 26 illustrates another example data communication embodiment 2602. Each of a plurality of computers 2604, 2612, 2614 and 2616 includes an interface, such as an interface 2606 shown in the computer 2604. It should be understood that the other computers 2612, 2614, 2616 also include an interface such as an interface 2606. The computers 2604, 2612, 2614 and 2616 communicate with each other via interfaces 2606 and wireless or wired links, thereby collectively representing a data communication network.

The interfaces 2606 may represent any computer interface or port, such as but not limited to a high speed internal interface, a wireless serial port, a wireless PS2 port, a wireless USB port, PCMCIA port, etc.

The interface 2606 includes a transmitter 2608 and a receiver 2610. In embodiments of the invention, either or both of the transmitter 2608 and the receiver 2610 are implemented using UFT modules for frequency up-conversion and down-conversion (see, for example, FIGS. 7 and 8). Alternatively, the interfaces 2806 can be

10

The live and and the live and t

25

30

implemented using a transceiver having one or more UFT modules for performing frequency translation operations (see, for example, FIGS. 10 and 11).

FIGS. 33-38 illustrate other scenarios envisioned and encompassed by the invention. FIG. 33 illustrates a data processing environment 3302 wherein a wired network, such as an Ethernet network 3304, is linked to another network, such as a WLAN 3306, via a wireless link 3308. The wireless link 3308 is established via interfaces 3310, 3312 which are preferably implemented using universal frequency translation modules.

FIGS 35-38 illustrate that the present invention supports WLANs that are located in one or more buildings or over any defined geographical area, as shown in FIGs. 35-38.

The invention includes multiple networks linked together. The invention also envisions wireless networks conforming to any known or custom standard or specification. This is shown in FIG. 34, for example, where any combination of WLANs conforming to any WLAN standard or configuration, such as IEEE 802.11 and Bluetooth (or other relatively short range communication specification or standard), any WAN cellular or telephone standard or specification, any type of radio links, any custom standard or specification, etc., or combination thereof, can be implemented using the universal frequency translation technology described herein. Also, any combination of these networks may be coupled together, as illustrated in FIG. 34.

The invention supports WLANs that are located in one or multiple buildings, as shown in FIGS. 35 and 36. The invention also supports WLANs that are located in an area including and external to one or more buildings, as shown in FIG. 37. In fact, the invention is directed to networks that cover any defined geographical area, as shown in FIG. 38. In the embodiments described above, wireless links are preferably established using WLAN interfaces as described herein.

More generally, the invention is directed to WLAN client devices and WLAN infrastructure devices. "WLAN Client Devices" refers to, for example, any data processing and/or communication devices in which wired or wireless communication functionality is desired, such as but not limited to computers, personal data assistants (PDAs), automatic identification data collection devices (such as bar code

25

scanners/readers, electronic article surveillance readers, and radio frequency identification readers), telephones, network devices, etc., and combinations thereof. "WLAN Infrastructure Devices" refers to, for example, Access Points and other devices used to provide the ability for WLAN Client Devices (as well as potentially other devices) to connect to wired and/or wireless networks and/or to provide the network functionality of a WLAN. "WLAN" refers to, for example, a Wireless Local Area Network that is implemented according to and that operates within WLAN standards and/or specifications, such as but not limited to IEEE 802.11, IEEE 802.11a, IEEE 802.11b, HomeRF, Proxim Range LAN, Proxim Range LAN2, Symbol Spectrum 1, Symbol Spectrum 24 as it existed prior to adoption of IEEE 802.11, HiperLAN1, or HiperLAN2. WLAN client devices and/or WLAN infrastructure devices may operate in a multi-mode capacity. For example, a device may include WLAN and WAN functionality. Another device may include WLAN and short range communication (such as but not limited to Blue Tooth) functionality. Another device may include WLAN and WAN and short range communication functionality. It is noted that the above definitions and examples are provided for illustrative purposes, and are not limiting. Equivalents to that described above will be apparent to persons skilled in the relevant art(s) based on the teachings contained herein.

6.1.1. Example Implementations: Interfaces, Wireless Modems, Wireless LANs, etc.

The present invention is now described as implemented in an interface, such as a wireless modem or other device (such as client or infrastructure device), which can be utilized to implement or interact with a wireless local area network (WLAN) or wireless wide area network (WWAN), for example. In an embodiment, the present invention is implemented in a WLAN to support IEEE WLAN Standard 802.11, but this embodiment is mentioned for illustrative purposes only. The invention is not limited to this standard.

Conventional wireless modems are described in, for example, U.S. Patent 5,764,693, titled, "Wireless Radio Modem with Minimal Inter-Device RF Interference,"

5

10

incorporated herein by reference in its entirety. The present invention replaces a substantial portion of conventional wireless modems with one or more universal frequency translators (UFTs). The resultant improved wireless modem consumes less power that conventional wireless modems and is easier and less expensive to design and build. A wireless modem in accordance with the present invention can be implemented in a PC-MCIA card or within a main housing of a computer, for example.

FIG. 27 illustrates an example block diagram of a computer system 2710, which can be wirelessly coupled to a LAN, as illustrated in FIGS. 25 and 26. The computer system 2710 includes an interface 2714 and an antenna 2712. The interface 2714 includes a transmitter module 2716 that receives information from a digital signal processor (DSP) 2720, and modulates and up-converts the information for transmission from the antenna 2712. The interface 2714 also includes a receiver module 2718 that receives modulated carrier signals via the antenna 2712. The receiver module 2718 down-converts and demodulates the modulated carrier signals to baseband information, and provides the baseband information to the DSP 2720. The DSP 2720 can include a central processing unit (CPU) and other components of the computer 2712. Conventionally, the interface 2714 is implemented with heterodyne components.

FIG. 28 illustrates an example interface 2810 implemented with heterodyne components. The interface 2810 includes a transmitter module 2812 and a receiver module 2824. The receiver module 2824 includes an RF section 2830, one or more IF sections 2828, a demodulator section 2826, an optional analog to digital (A/D) converter 2834, and a frequency generator/synthesizer 2832. The transmitter module 2812 includes an optional digital to analog (D/A) converter 2822, a modulator \section 2818, one or more IF sections 2816, an RF section 2814, and a frequency generator/synthesizer 2820. Operation of the interface 2810 will be apparent to one skilled in the relevant art(s), based on the description herein.

FIG. 29 illustrates an example in-phase/quadrature-phase (I/Q) interface 2910 implemented with heterodyne components. I/Q implementations allow two channels of information to be communicated on a carrier signal and thus can be utilized to increase data transmission.

30

25

25

30

5

The interface 2910 includes a transmitter module 2912 and a receiver module 2934. The receiver module 2934 includes an RF section 2936, one or more IF sections 2938, an I/Q demodulator section 2940, an optional A/D converter 2944, and a frequency generator/synthesizer 2942. The I/Q demodulator section 2940 includes a signal splitter 2946, mixers 2948, and a phase shifter 2950. The signal splitter 2946 provides a received signal to the mixers 2948. The phase shifter 2950 operates the mixers 2948 ninety degrees out of phase with one another to generate I and Q information channels 2952 and 2954, respectively, which are provided to a DSP 2956 through the optional A/D converter 2944.

The transmitter module 2912 includes an optional D/A converter 2922, an I/Q modulator section 2918, one or more IF sections 2916, an RF section 2914, and a frequency generator/synthesizer 2920. The I/Q modulator section 2918 includes mixers 2924, a phase shifter 2926, and a signal combiner 2928. The phase shifter 2926 operates the mixers 2924 ninety degrees out of phase with one another to generate I and Q modulated information signals 2930 and 2932, respectively, which are combined by the signal combiner 2928. The IF section(s) 2916 and RF section 2914 up-convert the combined I and Q modulated information signals 2930 and 2932 to RF for transmission by the antenna, in a manner well known in the relevant art(s).

Heterodyne implementations, such as those illustrated in FIGS. 28 and 29, are expensive and difficult to design, manufacture and tune. In accordance with the present invention, therefore, the interface 2714 (FIG. 27) is preferably implemented with one or more universal frequency translation (UFT) modules, such as the UFT module 102 (FIG. 1A). Thus previously described benefits of the present invention are obtained in wireless modems, WLANs, etc.

FIG. 30 illustrates an example block diagram embodiment of the interface 2714 that is associated with a computer or any other data processing and/or communications device. In FIG. 30, the receiver module 2718 includes a universal frequency down-converter (UFD) module 3014 and an optional analog to digital (A/D) converter 3016, which converts an analog output from the UFD 3014 to a digital format for the DSP 2720. The transmitter module 2716 includes an optional modulator 3012 and a universal

10 Այլ Արագրագրու ապրասերի արդարագրույթություն արդարագրույթուն արդարագրույթություն արդարագրույն արդարագրույթություն արդարագրույթություն արդարագրույթություն արդարագրույթություն արդարագրույթություն արդարագրույթուց արդարագրույթություն արդարագրույթություն արդարագրույթություն արդարագրույթո

25

30

5

frequency up-converter (UFU) module 3010. The optional modulator 3012 can be a variety of types of modulators, including conventional modulators. Alternatively, the UFU module 3010 includes modulator functionality. The example implementation of FIG. 30 operates substantially as described above and in co-pending U.S. Patent Applications titled, "Method and System for Down-Converting Electromagnetic Signals," Ser. No. 09/176,022, filed October 21, 1998, issued as U.S. Patent No. 6,061,551 on May 9, 2000, and "Method and System for Frequency Up-Conversion," Ser. No. 09/176,154, filed October 21, 1998, issued as U.S. Patent No. 6,091,940 on July 18, 2000, as well as other cited documents.

FIG. 31 illustrates an example implementation of the interface 2714 illustrated in FIG. 30, wherein the receiver UFD 3014 includes a UFT module 3112, and the transmitter UFU 3010 includes a universal frequency translation (UFT) module 3110. This example implementation operates substantially as described above and in co-pending U.S. Patent Applications titled, "Method and System for Down-Converting Electromagnetic Signals," Ser. No. 09/176,022, filed October 21, 1998,issued as U.S. Patent No. 6,061,551 on May 9, 2000, and "Method and System for Frequency Up-Conversion," Ser. No. 09/176,154, filed October 21, 1998, "Method and System for Frequency Up-Conversion," Ser. No. 09/176,154, filed October 21, 1998, issued as U.S. Patent No. 6,091,940 on July 18, 2000, as well as other cited documents.

FIG. 32 illustrates an example I/Q implementation of the interface module 2710. Other I/Q implementations are also contemplated and are within the scope of the present invention.

In the example of FIG. 32, the receiver UFD module 3014 includes a signal divider 3228 that provides a received I/Q modulated carrier signal 3230 between a third UFT module 3224 and a fourth UFT module 3226. A phase shifter 3232, illustrated here as a 90 degree phase shifter, controls the third and fourth UFT modules 3224 and 3226 to operate 90 degrees out of phase with one another. As a result, the third and fourth UFT modules 3224 and 3226 down-convert and demodulate the received I/Q modulated carrier signal 3230, and output I and Q channels 3234 and 3236, respectively, which are provided to the DSP 2720 through the optional A/D converter 3016.

5

In the example of FIG. 32, the transmitter UFU module 3010 includes first and second UFT modules 3212 and 3214 and a phase shifter 3210, which is illustrated here as a 90 degree phase shifter. The phase shifter 3210 receives a lower frequency modulated carrier signal 3238 from the modulator 3012. The phase shifter 3210 controls the first and second UFT modules 3212 and 3214 to operate 90 degrees out of phase with one another. The first and second UFT modules 3212 and 3214 up-convert the lower frequency modulated carrier signal 3238, which are output as higher frequency modulated I and Q carrier channels 3218 and 3220, respectively. A signal combiner 3216 combines the higher frequency modulated I and Q carrier channels 3218 and 3220 into a single higher frequency modulated I/Q carrier signal 3222 for transmitting by the antenna 2712.

The example implementations of the interfaces described above, and variations thereof, can also be used to implement network interfaces, such as the network interface 2520 illustrated in FIG. 25.

6.1.2. Example Modifications

The RF modem applications, WLAN applications, etc., described herein, can be modified by incorporating one or more of the enhanced signal reception (ESR) techniques described herein. Use of ESR embodiments with the network embodiments described herein will be apparent to persons skilled in the relevant art(s) based on the teachings contained herein.

The RF modem applications, WLAN applications, etc., described herein can be enhanced by incorporating one or more of the unified down-conversion and filtering (UDF) techniques described herein. Use of UDF embodiments with the network embodiments described herein will be apparent to persons skilled in the relevant art(s) based on the teachings contained herein.

O

6.2. Other Example Applications

The application embodiments described above are provided for purposes of illustration. These applications and embodiments are not intended to limit the invention. Alternate and additional applications and embodiments, differing slightly or substantially from those described herein, will be apparent to persons skilled in the relevant art(s) based on the teachings contained herein. For example, such alternate and additional applications and embodiments include combinations of those described above. Such combinations will be apparent to persons skilled in the relevant art(s) based on the herein teachings.

7.0. Example WLAN Implementation Embodiments

7.1 Architecture

FIG. 39 is a block diagram of a WLAN interface 3902 (also referred to as a WLAN modem herein) according to an embodiment of the invention. The WLAN interface/modem 3902 includes an antenna 3904, a low noise amplifier or power amplifier (LNA/PA) 3904, a receiver 3906, a transmitter 3910, a control signal generator 3908, a demodulator/modulator facilitation module 3912, and a media access controller (MAC) interface 3914. Other embodiments may include different elements. The MAC interface 3914 couples the WLAN interface/modem 3902 to a computer 3916 or other data processing device. The computer 3916 preferably includes a MAC 3918.

The WLAN interface/modem 3902 represents a transmit and receive application that utilizes the universal frequency translation technology described herein. It also represents a zero IF (or direct-to-data) WLAN architecture.

The WLAN interface/modem 3902 also represents a vector modulator and a vector demodulator using the universal frequency translation (UFT) technology described herein. Use of the UFT technology enhances the flexibility of the WLAN application (i.e., makes it universal).

25

20

5

In the embodiment shown in FIG. 39, the WLAN interface/modem 3902 is compliant with WLAN standard IEEE 802.11. However, the invention is not limited to this standard. The invention is applicable to any communication standard or specification, as will be appreciated by persons skilled in the relevant art(s) based on the teachings contained herein. Any modifications to the invention to operate with other standards or specifications will be apparent to persons skilled in the relevant art(s) based on the teachings contained herein.

In the embodiment shown in FIG. 39, the WLAN interface/modem 3902 provides half duplex communication. However, the invention is not limited to this communication mode. The invention is applicable and directed to other communication modes, as will be appreciated by persons skilled in the relevant art(s) based on the teachings contained herein.

In the embodiment shown in FIG. 39, the modulation/demodulation performed by the WLAN interface/modem 3902 is preferably direct sequence spread spectrum QPSK (quadrature phase shift keying) with differential encoding. However, the invention is not limited to this modulation/demodulation mode. The invention is applicable and directed to other modulation and demodulation modes, such as but not limited to those described herein, as well as frequency hopping according to IEEE 802.11, OFDM (orthogonal frequency division multiplexing), as well as others. These modulation/demodulation modes will be appreciated by persons skilled in the relevant art(s) based on the teachings contained herein.

The operation of the WLAN interface/modem 3902 when receiving shall now be described.

Signals 3922 received by the antenna 3903 are amplified by the LNA/PA 3904. The amplified signals 3924 are down-converted and demodulated by the receiver 3906. The receiver 3906 outputs I signal 3926 and Q signal 3928.

FIG. 40 illustrates an example receiver 3906 according to an embodiment of the invention. It is noted that the receiver 3906 shown in FIG. 40 represents a vector modulator. The "receiving" function performed by the WLAN interface/modem 3902 can

be considered to be all processing performed by the WLAN interface/modem 3902 from the LNA/PA 3904 to generation of baseband information.

Signal 3924 is split by a 90 degree splitter 4001 to produce an I signal 4006A and Q signal 4006B that are preferably 90 degrees apart in phase. I and Q signals 4006A, 4006B are down-converted by UFD (universal frequency down-conversion) modules 4002A, 4002B. The UDF modules 4002A, 4002B output down-converted I and Q signals 3926, 3928. The UFD modules 4002A, 4002B each includes at least one UFT (universal frequency translation) module 4004A. UFD and UFT modules are described above. An example implementation of the receiver 3906 (vector demodulator) is shown in FIG. 53. An example BOM list for the receiver 3906 of FIG. 53 is shown in FIG. 54.

The demodulator/modulator facilitation module 3912 receives the I and Q signals 3926, 3928. The demodulator/modulator facilitation module 3912 amplifies and filters the I and Q signals 3926, 3928. The demodulator/modulator facilitation module 3912 also performs automatic gain control (AGC) functions. The AGC function is coupled with the universal frequency translation technology described herein. The demodulator/modulator facilitation module 3912 outputs processed I and Q signals 3930, 3932.

The MAC interface 3914 receives the processed I and Q signals 3930, 3932. The MAC interface 3914 preferably includes a baseband processor. The MAC interface 3914 preferably performs functions such as combining the I and Q signals 3930, 3932, and arranging the data according to the protocol/file formal being used. Other functions performed by the MAC interface 3914 and the baseband processor contained therein will be apparent to persons skilled in the relevant art(s) based on the teachings contained herein. The MAC interface 3914 outputs the baseband information signal, which is received and processed by the computer 3916 in an implementation and application specific manner.

In the example embodiment of FIG. 39, the demodulation function is distributed among the receiver 3906, the demodulator/modulator facilitation module 3912, and a baseband processor contained in the MAC interface 3914. The functions collectively performed by these components include, but are not limited to, despreading the information, differentially decoding the information, tracking the carrier phase,

30

5

10

I)

g L

W.

jor (# & & # 1 | 1 | 1 | 20

25

descrambling, recreating the data clock, and combining the I and Q signals. The invention is not limited to this arrangement. These demodulation-type functions can be centralized in a single component, or distributed in other ways.

The operation of the WLAN interface/modem 3902 when transmitting shall now be described.

A baseband information signal 3936 is received by the MAC interface 3914 from the computer 3916. The MAC interface 3914 preferably performs functions such as splitting the baseband information signal to form I and Q signals 3930, 3932, and arranging the data according to the protocol/file formal being used. Other functions performed by the MAC interface 3914 and the baseband processor contained therein will be apparent to persons skilled in the relevant art(s) based on the teachings contained herein.

The demodulator/modulator facilitation module 3912 filters and amplifies the I and Q signals 3930, 3932. The demodulator/modulator facilitation module 3912 outputs processed I and Q signals 3942, 3944. Preferably, at least some filtering and/or amplifying components in the demodulator/modulator facilitation module 3912 are used for both the transmit and receive paths.

The transmitter 3910 up-converts the processed I and Q signals 3942, 3944, and combines the up-converted I and Q signals. This up-converted/combined signal is amplified by the LNA/PA 3904, and then transmitted via the antenna 3904.

FIG. 41 illustrates an example transmitter 3910 according to an embodiment of the invention. The device in FIG. 41 can also be called a vector modulator. In an embodiment, the "transmit" function performed by the WLAN interface/modem 3902 can be considered to be all processing performed by the WLAN interface/modem 3902 from receipt of baseband information through the LNA/PA 3904. An example implementation of the transmitter 3910 (vector modulator) is shown in FIGS. 57-60. The data conditioning interfaces 5802 in FIG. 58 effectively pre-process the I and Q signals 3942, 3944 before being received by the UFU modules 4102. An example BOM list for the transmitter 3910 of FIGS. 57-60 is shown in FIGS. 61A and 61B.

30

5

I and Q signals 3942, 3944 are received by UFU (universal frequency upconversion) modules 4102A, 4102B. The UFU modules 4102A, 4102B each includes at least one UFT module 4104A, 4104B. The UFU modules 4102A, 4102B up-convert I and Q signals 3942, 3944. The UFU modules 4102A, 4102B output up-converted I and Q signals 4106, 4108. The 90 degree combiner 4110 effectively phase shifts either the I signal 4106 or the Q signal 4108 by 90 degrees, and then combines the phase shifted signal with the unshifted signal to generate a combined, up-converted I/Q signal 3946.

In the example embodiment of FIG. 39, the modulation function is distributed among the transmitter 3910, the demodulator/modulator facilitation module 3912, and a baseband processor contained in the MAC interface 3914. The functions collectively performed by these components include, but are not limited to, differentially encoding data, splitting the baseband information signal into I and Q signals, scrambling data, and data spreading. The invention is not limited to this arrangement. These modulation-type functions can be centralized in a single component, or distributed in other ways.

An example implementation of the transmitter 3910 (vector modulator) is shown in FIGS. 57-60. The data conditioning interfaces 5802 in FIG. 58 effectively pre-process the I and Q signals 3942, 3944 before being received by the UFU modules 4102. An example BOM list for the transmitter 3910 of FIGS. 57-60 is shown in FIGS. 61A and 61B.

The components in the WLAN interface/modem 3902 are preferably controlled by the MAC interface 3914 in operation with the MAC 3918 in the computer 3916. This is represented by the distributed control arrow 3940 in FIG. 39. Such control includes setting the frequency, data rate, whether receiving or transmitting, and other communication characteristics/modes that will be apparent to persons skilled in the relevant art(s) based on the teachings contained herein. In embodiments, control signals are sent over the corresponding wireless medium and received by the antenna 3904, and sent to the MAC 3918.

FIG. 42 illustrates an example implementation of the WLAN interface/modem 3902. It is noted that in this implementation example, the MAC interface 3914 is located on a different board. FIG. 62 is an example motherboard corresponding to FIG. 42. FIG.

10

 63 is an example bill-of-materials (BOM) list for the motherboard of FIG. 62. This and other implementations are provided herein for example purposes only. Other implementations will be apparent to persons skilled in the relevant art(s), and the invention is directed to such other implementations.

FIG. 102 illustrates an alternate example PCMCIA test bed assembly for a WLAN interface/modem 3902 according to an embodiment of the invention. In this embodiment, the baseband processor 10202 is separate from the MAC interface 3914.

In some applications, it is desired to separate the receive path and the transmit path. FIG. 43 illustrates an example receive implementation, and FIG. 44 illustrates an example transmit implementation.

7.2 Receiver

Example embodiments and implementations of the IQ receiver 3906 will be discussed as follows. The example embodiments and implementations include multi-phase embodiments that are useful for reducing or eliminating unwanted DC offsets and circuit re-radiation. The invention is not limited to these example receiver embodiments. Other receiver embodiments will be understood by those skilled in the relevant arts based on the discussion given herein. These other embodiments are within the scope and spirit of the present invention.

7.2.1 IQ Receiver

20

An example embodiment of the receiver 3906 is shown in FIG. 67A. Referring to FIG. 67A, the UFD module 4002A (FIG. 40) is configured so that the UFT module 4004A is coupled to a storage module 6704A. The UFT module 4004A is a controlled switch 6702A that is controlled by the control signal 3920A. The storage module 6704A is a capacitor 6706A. However, other storage modules could be used including an inductor, as will be understood by those skilled in the relevant arts. Likewise, the UFD module 4002B (FIG. 40) is configured so that the UFT module 4004B is coupled to a

25

10

25

30

storage module 6704B. The UFT module 4004B is a controlled switch 6702B that is controlled by the control signal 3920B. The storage module 6704B is a capacitor 6706B. However, other storage modules could be used including an inductor, as will be understood by those skilled in the relevant arts. The operation of the receiver 3906 is discussed as follows.

The 90 degree splitter 4001 receives the received signal 3924 from the LNA/PA module 3904. The 90 degree splitter 4001 divides the signal 3924 into an I signal 4006A and a Q signal 4006B.

The UFD module 4002A receives the I signal 4006A and down-converts the I signal 4006A using the control signal 3920A to a lower frequency signal I 3926. More specifically, the controlled switch 6702A samples the I signal 4006A according to the control signal 3920A, transferring charge (or energy) to the storage module 6704A. The charge stored during successive samples of the I signal 4006A, results in the down-converted signal I signal 3926. Likewise, UFD module 4002B receives the Q signal 4006B and down-converts the Q signal 4006B using the control signal 3920B to a lower frequency signal Q 3928. More specifically, the controlled switch 6702B samples the Q signal 4006B according to the control signal 3920B, resulting in charge (or energy) that is stored in the storage module 6704B. The charge stored during successive samples of the I signal 4006A, results in the down-converted signal Q signal 3928.

Down-conversion utilizing a UFD module (also called an aliasing module) is further described in the above referenced applications, such as "Method and System for Down-converting Electromagnetic Signals," Ser. No. 09/176,022, now U.S. Patent No. 6,061,551. As discussed in the '551 patent, the control signals 3920A,B can be configured as a plurality of pulses that are established to improve energy transfer from the signals 4006A,B to the down-converted signals 3926 and 3928, respectively. In other words, the pulse widths of the control signals 3920 can be adjusted to increase and/or optimize the energy transfer from the signals 4006 to the down-converted output signals 3926 and 3938, respectively. Additionally, matched filter principles can be implemented to shape the sampling pulses of the control signal 3920, and therefore further improve energy transfer to the down-converted output signal 3106. Matched filter principle and energy transfer

are further described in the above referenced applications, such as U.S. patent application titled, "Method and System for Down-Converting an Electromagnetic Signal, Transforms For Same, and Aperture Relationships", Ser. No. 09/550,644, filed on April 14, 2000.

The configuration of the UFT based receiver 3906 is flexible. In FIG. 67A, the controlled switches 6702 are in a series configuration relative to the signals 4006. Alternatively, FIG 67B illustrates the controlled switches 6702 in a shunt configuration so that the switches 6702 shunt the signals 4006 to ground.

Additionally in FIGs. 67A-B, the 90 degree phase shift between the I and Q channels is realized with the 90 degree splitter 4001. Alternatively, FIG. 68A illustrates a receiver 6806 in series configuration, where the 90 degree phase shift is realized by shifting the control signal 3920B by 90 degrees relative to the control signal 3920A. More specifically, the 90 degree shifter 6804 is added to shift the control signal 3920B by 90 degrees relative to the control signal 3920A. As such, the splitter 6802 is an in-phase (i.e. 0 degree) signal splitter. FIG. 68B illustrates an embodiment of the receiver 3906 of the receiver 3906 in a shunt configuration with 90 degree delays on the control signal.

Furthermore, the configuration of the controlled switch 6702 is also flexible. More specifically, the controlled switches 6702 can be implemented in many different ways, including transistor switches. FIG. 69A illustrates the UFT modules 6702 in a series configuration and implemented as FETs 6902, where the gate of each FET 6902 is controlled by the respective control signal 3920. As such, the FET 6902 samples the respective signal 4006, according to the respective control signal 3920. FIG. 69B illustrates the shunt configuration.

7.2.2 Multi-Phase IQ Receiver

25

FIG. 70A illustrates an exemplary I/Q modulation receiver 7000, according to an embodiment of the present invention. I/Q modulation receiver 7000 has additional advantages of reducing or eliminating unwanted DC offsets and circuit re-radiation. As will be apparent, the IQ receiver 7000 can be described as a multi-phase receiver to those skilled in the arts.

20

25

30.

I/Q modulation receiver 7000 comprises a first UFD module 7002, a first optional filter 7004, a second UFD module 7006, a second optional filter 7008, a third UFD module 7010, a third optional filter 7012, a fourth UFD module 7014, a fourth filter 7016, an optional LNA 7018, a first differential amplifier 7020, a second differential amplifier 7022, and an antenna 7072.

I/Q modulation receiver 7000 receives, down-converts, and demodulates a I/Q modulated RF input signal 7082 to an I baseband output signal 7084, and a Q baseband output signal 7086. I/Q modulated RF input signal 7082 comprises a first information signal and a second information signal that are I/Q modulated onto an RF carrier signal. I baseband output signal 7084 comprises the first baseband information signal. Q baseband output signal 7086 comprises the second baseband information signal.

Antenna 7072 receives I/Q modulated RF input signal 7082. I/Q modulated RF input signal 7082 is output by antenna 7072 and received by optional LNA 7018. When present, LNA 7018 amplifies I/Q modulated RF input signal 7082, and outputs amplified I/Q signal 7088.

First UFD module 7002 receives amplified I/Q signal 7088. First UFD module 7002 down-converts the I-phase signal portion of amplified input I/Q signal 7088 according to an I control signal 7090. First UFD module 7002 outputs an I output signal 7098.

In an embodiment, first UFD module 7002 comprises a first storage module 7024, a first UFT module 7026, and a first voltage reference 7028. In an embodiment, a switch contained within first UFT module 7026 opens and closes as a function of I control signal 7090. As a result of the opening and closing of this switch, which respectively couples and de-couples first storage module 7024 to and from first voltage reference 7028, a down-converted signal, referred to as I output signal 7098, results. First voltage reference 7028 may be any reference voltage, and is preferably ground. I output signal 7098 is stored by first storage module 7024.

In an embodiment, first storage module 7024 comprises a first capacitor 7074. In addition to storing I output signal 7098, first capacitor 7074 reduces or prevents a DC offset voltage resulting from charge injection from appearing on I output signal 7098.

I output signal 7098 is received by optional first filter 7004. When present, first filter 7004 is in some embodiments a high pass filter to at least filter I output signal 7098 to remove any carrier signal "bleed through". In a preferred embodiment, when present, first filter 7004 comprises a first resistor 7030, a first filter capacitor 7032, and a first filter voltage reference 7034. Preferably, first resistor 7030 is coupled between I output signal 7098 and a filtered I output signal 7007, and first filter capacitor 7032 is coupled between filtered I output signal 7007 and first filter voltage reference 7034. Alternately, first filter 7004 may comprise any other applicable filter configuration as would be understood by persons skilled in the relevant art(s). First filter 7004 outputs filtered I output signal 7007.

Second UFD module 7006 receives amplified I/Q signal 7088. Second UFD module 7006 down-converts the inverted I-phase signal portion of amplified input I/Q signal 7088 according to an inverted I control signal 7092. Second UFD module 7006 outputs an inverted I output signal 7001.

In an embodiment, second UFD module 7006 comprises a second storage module 7036, a second UFT module 7038, and a second voltage reference 7040. In an embodiment, a switch contained within second UFT module 7038 opens and closes as a function of inverted I control signal 7092. As a result of the opening and closing of this switch, which respectively couples and de-couples second storage module 7036 to and from second voltage reference 7040, a down-converted signal, referred to as inverted I output signal 7001, results. Second voltage reference 7040 may be any reference voltage, and is preferably ground. Inverted I output signal 7001 is stored by second storage module 7036.

In an embodiment, second storage module 7036 comprises a second capacitor 7076. In addition to storing inverted I output signal 7001, second capacitor 7076 reduces or prevents a DC offset voltage resulting from charge injection from appearing on inverted I output signal 7001.

Inverted I output signal 7001 is received by optional second filter 7008. When present, second filter 7008 is a high pass filter to at least filter inverted I output signal 7001 to remove any carrier signal "bleed through". In a preferred embodiment, when present, second filter 7008 comprises a second resistor 7042, a second filter capacitor

25

coupled between inverted I output signal 7001 and a filtered inverted I output signal 7009, and second filter capacitor 7044 is coupled between filtered inverted I output signal 7009 and second filter voltage reference 7046. Alternately, second filter 7008 may comprise any other applicable filter configuration as would be understood by persons skilled in the relevant art(s). Second filter 7008 outputs filtered inverted I output signal 7009. First differential amplifier 7020 receives filtered I output signal 7007 at its non-

7044, and a second filter voltage reference 7046. Preferably, second resistor 7042 is

inverting input and receives filtered inverted I output signal 7009 at its inverting input. First differential amplifier 7020 subtracts filtered inverted I output signal 7009 from filtered I output signal 7007, amplifies the result, and outputs I baseband output signal 7084. Because filtered inverted I output signal 7009 is substantially equal to an inverted version of filtered I output signal 7007, I baseband output signal 7084 is substantially equal to filtered I output signal 7009, with its amplitude doubled. Furthermore, filtered I output signal 7007 and filtered inverted I output signal 7009 may comprise substantially equal noise and DC offset contributions from prior down-conversion circuitry, including first UFD module 7002 and second UFD module 7006, respectively. When first differential amplifier 7020 subtracts filtered inverted I output signal 7009 from filtered I output signal 7007, these noise and DC offset contributions substantially cancel each other.

Third UFD module 7010 receives amplified I/Q signal 7088. Third UFD module 7010 down-converts the Q-phase signal portion of amplified input I/Q signal 7088 according to an Q control signal 7094. Third UFD module 7010 outputs an Q output signal 7003.

In an embodiment, third UFD module 7010 comprises a third storage module 7048, a third UFT module 7050, and a third voltage reference 7052. In an embodiment, a switch contained within third UFT module 7050 opens and closes as a function of Q control signal 7094. As a result of the opening and closing of this switch, which respectively couples and de-couples third storage module 7048 to and from third voltage reference 7052, a down-converted signal, referred to as Q output signal 7003, results.

15 ... In the last of the last

25

30

Third voltage reference 7052 may be any reference voltage, and is preferably ground. Q output signal 7003 is stored by third storage module 7048.

In an embodiment, third storage module 7048 comprises a third capacitor 7078. In addition to storing Q output signal 7003, third capacitor 7078 reduces or prevents a DC offset voltage resulting from charge injection from appearing on Q output signal 7003.

Q output signal 7003 is received by optional third filter 7012. When present, in an embodiment, third filter 7012 is a high pass filter to at least filter Q output signal 7003 to remove any carrier signal "bleed through". In an embodiment, when present, third filter 7012 comprises a third resistor 7054, a third filter capacitor 7056, and a third filter voltage reference 7058. Preferably, third resistor 7054 is coupled between Q output signal 7003 and a filtered Q output signal 7011, and third filter capacitor 7056 is coupled between filtered Q output signal 7011 and third filter voltage reference 7058. Alternately, third filter 7012 may comprise any other applicable filter configuration as would be understood by persons skilled in the relevant art(s). Third filter 7012 outputs filtered Q output signal 7011.

Fourth UFD module 7014 receives amplified I/Q signal 7088. Fourth UFD module 7014 down-converts the inverted Q-phase signal portion of amplified input I/Q signal 7088 according to an inverted Q control signal 7096. Fourth UFD module 7014 outputs an inverted Q output signal 7005.

In an embodiment, fourth UFD module 7014 comprises a fourth storage module 7060, a fourth UFT module 7062, and a fourth voltage reference 7064. In an embodiment, a switch contained within fourth UFT module 7062 opens and closes as a function of inverted Q control signal 7096. As a result of the opening and closing of this switch, which respectively couples and de-couples fourth storage module 7060 to and from fourth voltage reference 7064, a down-converted signal, referred to as inverted Q output signal 7005, results. Fourth voltage reference 7064 may be any reference voltage, and is preferably ground. Inverted Q output signal 7005 is stored by fourth storage module 7060.

In an embodiment, fourth storage module 7060 comprises a fourth capacitor 7080. In addition to storing inverted Q output signal 7005, fourth capacitor 7080 reduces or

25

30

prevents a DC offset voltage resulting from charge injection from appearing on inverted Q output signal 7005.

Inverted Q output signal 7005 is received by optional fourth filter 7016. When present, fourth filter 7016 is a high pass filter to at least filter inverted Q output signal 7005 to remove any carrier signal "bleed through". In a preferred embodiment, when present, fourth filter 7016 comprises a fourth resistor 7066, a fourth filter capacitor 7068, and a fourth filter voltage reference 7070. Preferably, fourth resistor 7066 is coupled between inverted Q output signal 7005 and a filtered inverted Q output signal 7013, and fourth filter capacitor 7068 is coupled between filtered inverted Q output signal 7013 and fourth filter voltage reference 7070. Alternately, fourth filter 7016 may comprise any other applicable filter configuration as would be understood by persons skilled in the relevant art(s). Fourth filter 7016 outputs filtered inverted Q output signal 7013.

Second differential amplifier 7022 receives filtered Q output signal 7011 at its noninverting input and receives filtered inverted Q output signal 7013 at its inverting input. Second differential amplifier 7022 subtracts filtered inverted Q output signal 7013 from filtered Q output signal 7011, amplifies the result, and outputs Q baseband output signal 7086. Because filtered inverted Q output signal 7013 is substantially equal to an inverted version of filtered Q output signal 7011, Q baseband output signal 7086 is substantially equal to filtered Q output signal 7013, with its amplitude doubled. Furthermore, filtered Q output signal 7011 and filtered inverted Q output signal 7013 may comprise substantially equal noise and DC offset contributions of the same polarity from prior down-conversion circuitry, including third UFD module 7010 and fourth UFD module 7014, respectively. When second differential amplifier 7022 subtracts filtered inverted Q output signal 7013 from filtered Q output signal 7011, these noise and DC offset contributions substantially cancel each other.

Additional embodiments relating to addressing DC offset and re-radiation concerns, applicable to the present invention, are described in co-pending Patent Application No. 09/526,041, entitled "DC Offset, Re-radiation, and I/Q Solutions Using Universal Frequency Translation Technology," Attorney Docket No. 1744.0880000, which is herein incorporated by reference in its entirety.

7.2.2.1 Example I/Q Modulation Control Signal Generator Embodiments

FIG. 70B illustrates an exemplary block diagram for I/Q modulation control signal generator 7023, according to an embodiment of the present invention. I/Q modulation control signal generator 7023 generates I control signal 7090, inverted I control signal 7092, Q control signal 7094, and inverted Q control signal 7096 used by I/Q modulation receiver 7000 of FIG. 70A. I control signal 7090 and inverted I control signal 7092 operate to down-convert the I-phase portion of an input I/Q modulated RF signal. Q control signal 7094 and inverted Q control signal 7096 act to down-convert the Q-phase portion of the input I/Q modulated RF signal. Furthermore, I/Q modulation control signal generator 7023 has the advantage of generating control signals in a manner such that resulting collective circuit re-radiation is radiated at one or more frequencies outside of the frequency range of interest. For instance, potential circuit re-radiation is radiated at a frequency substantially greater than that of the input RF carrier signal frequency.

I/Q modulation control signal generator 7023 comprises a local oscillator 7025, a first divide-by-two module 7027, a 180 degree phase shifter 7029, a second divide-by-two module 7031, a first pulse generator 7033, a second pulse generator 7035, a third pulse generator 7037, and a fourth pulse generator 7039.

Local oscillator 7025 outputs an oscillating signal 7015. FIG. 70C shows an exemplary oscillating signal 7015.

First divide-by-two module 7027 receives oscillating signal 7015, divides oscillating signal 7015 by two, and outputs a half frequency LO signal 7017 and a half frequency inverted LO signal 7041. FIG. 70C shows an exemplary half frequency LO signal 7017. Half frequency inverted LO signal 7041 is an inverted version of half frequency LO signal 7017. First divide-by-two module 7027 may be implemented in circuit logic, hardware, software, or any combination thereof, as would be known by persons skilled in the relevant art(s).

25

30

5

180 degree phase shifter 7029 receives oscillating signal 7015, shifts the phase of oscillating signal 7015 by 180 degrees, and outputs phase shifted LO signal 7019. 180 degree phase shifter 7029 may be implemented in circuit logic, hardware, software, or any combination thereof, as would be known by persons skilled in the relevant art(s). In alternative embodiments, other amounts of phase shift may be used.

Second divide-by two module 7031 receives phase shifted LO signal 7019, divides phase shifted LO signal 7019 by two, and outputs a half frequency phase shifted LO signal 7021 and a half frequency inverted phase shifted LO signal 7043. FIG. 70C shows an exemplary half frequency phase shifted LO signal 7021. Half frequency inverted phase shifted LO signal 7043 is an inverted version of half frequency phase shifted LO signal 7021. Second divide-by-two module 7031 may be implemented in circuit logic, hardware, software, or any combination thereof, as would be known by persons skilled in the relevant art(s).

First pulse generator 7033 receives half frequency LO signal 7017, generates an output pulse whenever a rising edge is received on half frequency LO signal 7017, and outputs I control signal 7090. FIG. 70C shows an exemplary I control signal 7090.

Second pulse generator 7035 receives half frequency inverted LO signal 7041, generates an output pulse whenever a rising edge is received on half frequency inverted LO signal 7041, and outputs inverted I control signal 7092. FIG. 70C shows an exemplary inverted I control signal 7092.

Third pulse generator 7037 receives half frequency phase shifted LO signal 7021, generates an output pulse whenever a rising edge is received on half frequency phase shifted LO signal 7021, and outputs Q control signal 7094. FIG. 70C shows an exemplary Q control signal 7094.

Fourth pulse generator 7039 receives half frequency inverted phase shifted LO signal 7043, generates an output pulse whenever a rising edge is received on half frequency inverted phase shifted LO signal 7043, and outputs inverted Q control signal 7096. FIG. 70C shows an exemplary inverted Q control signal 7096.

In an embodiment, control signals 7090, 7021, 7041 and 7043 include pulses having a width equal to one-half of a period of I/Q modulated RF input signal 7082. The

5

And then it is that the train that the second that the train that train that the train that train t

25

20

invention, however, is not limited to these pulse widths, and control signals 7090, 7021, 7041, and 7043 may comprise pulse widths of any fraction of, or multiple and fraction of, a period of I/Q modulated RF input signal 7082.

First, second, third, and fourth pulse generators 7033, 7035, 7037, and 7039 may be implemented in circuit logic, hardware, software, or any combination thereof, as would be known by persons skilled in the relevant art(s).

As shown in FIG. 70C, in an embodiment, control signals 7090, 7021, 7041, and 7043 comprise pulses that are non-overlapping in other embodiments the pulses may overlap. Furthermore, in this example, pulses appear on these signals in the following order: I control signal 7090, Q control signal 7094, inverted I control signal 7092, and inverted Q control signal 7096. Potential circuit re-radiation from I/Q modulation receiver 7000 may comprise frequency components from a combination of these control signals.

For example, FIG. 70D shows an overlay of pulses from I control signal 7090, Q control signal 7094, inverted I control signal 7092, and inverted Q control signal 7096. When pulses from these control signals leak through first, second, third, and/or fourth UFD modules 7002, 7006, 7010, and 7014 to antenna 7072 (shown in FIG. 70A), they may be radiated from I/Q modulation receiver 7000, with a combined waveform that appears to have a primary frequency equal to four times the frequency of any single one of control signals 7090, 7021, 7041, and 7043. FIG. 70 shows an example combined control signal 7045.

FIG. 70D also shows an example I/Q modulation RF input signal 7082 overlaid upon control signals 7090, 7094, 7092, and 7096. As shown in FIG. 70D, pulses on I control signal 7090 overlay and act to down-convert a positive I-phase portion of I/Q modulation RF input signal 7082. Pulses on inverted I control signal 7092 overlay and act to down-convert a negative I-phase portion of I/Q modulation RF input signal 7082. Pulses on Q control signal 7094 overlay and act to down-convert a rising Q-phase portion of I/Q modulation RF input signal 7082. Pulses on inverted Q control signal 7096 overlay and act to down-convert a falling Q-phase portion of I/Q modulation RF input signal 7082.

25

5

10

As FIG. 70D further shows in this example, the frequency ratio between the combination of control signals 7090, 7021, 7041, and 7043 and I/Q modulation RF input signal 7082 is approximately 4:3. Because the frequency of the potentially re-radiated signal, i.e., combined control signal 7045, is substantially different from that of the signal being down-converted, i.e., I/Q modulation RF input signal 7082, it does not interfere with signal down-conversion as it is out of the frequency band of interest, and hence may be filtered out. In this manner, I/Q modulation receiver 7000 reduces problems due to circuit re-radiation. As will be understood by persons skilled in the relevant art(s) from the teachings herein, frequency ratios other than 4:3 may be implemented to achieve similar reduction of problems of circuit re-radiation.

It should be understood that the above control signal generator circuit example is provided for illustrative purposes only. The invention is not limited to these embodiments. Alternative embodiments (including equivalents, extensions, variations, deviations, etc., of the embodiments described herein) for I/Q modulation control signal generator 7023 will be apparent to persons skilled in the relevant art(s) from the teachings herein, and are within the scope of the present invention.

FIG. 70S illustrates the receiver 7000, where the UFT modules 7028, 7038, 7050, and 7062 are configured with FETs 7099a-d.

Additional embodiments relating to addressing DC offset and re-radiation concerns, applicable to the present invention, are described in co-pending patent application no. 09/526, 041, entitled "DC Offset, Re-radiation, and I/Q Solutions Using Universal Frequency Translation Technology," which is herein incorporated by reference in its entirety.

7.2.2.2 Implementation of Multi-phase I/Q Modulation Embodiment with Exemplary Receiver Waveforms

FIG. 70E illustrates a more detailed example circuit implementation of I/Q modulation receiver 7000, according to an embodiment of the present invention. FIGS.

5

70F-P show example waveforms related to an example implementation of I/Q modulation receiver 7000 of FIG. 70E.

FIGS. 70F and 70G show first and second input data signals 7047 and 7049 to be I/Q modulated with a RF carrier signal frequency as the I-phase and Q-phase information signals, respectively.

FIGS. 70I and 70J show the signals of FIG. 70F and 70G after modulation with a RF carrier signal frequency, respectively, as I-modulated signal 7051 and Q-modulated signal 7053.

FIG. 70H shows an I/Q modulation RF input signal 7082 formed from I-modulated signal 7051 and Q-modulated signal 7053 of FIGS. 70I and 70J, respectively.

FIG. 70O shows an overlaid view of filtered I output signal 7007 and filtered inverted I output signal 7009.

FIG. 70P shows an overlaid view of filtered Q output signal 7011 and filtered inverted Q output signal 7013.

FIGS. 70K and 70L show I baseband output signal 7084 and Q baseband output signal 7086, respectfully. A data transition 7055 is indicated in both I baseband output signal 7084 and Q baseband output signal 7086. The corresponding data transition 7055 is indicated in I-modulated signal 7051 of FIG. 70I, Q-modulated signal 7053 of FIG. 70J, and I/Q modulation RF input signal 7082 of FIG. 70H.

FIGS. 70M and 70N show I baseband output signal 7084 and Q baseband output signal 7086 over a wider time interval.

7.2.2.3 Example Single Channel Receiver Embodiment

FIG. 70Q illustrates an example single channel receiver 7091, corresponding to either the I or Q channel of I/Q modulation receiver 7000, according to an embodiment of the present invention. Single channel receiver 7091 can down-convert an input RF signal 7097 modulated according to AM, PM, FM, and other modulation schemes. Refer. to section 7.2.1 above for further description on the operation of single channel receiver

7091. In other words, the single channel receiver 7091 is a one channel of the IQ receiver 7000 that was discussed in section 7.2.1.

7.2.2.4 Alternative Example I/Q Modulation Receiver Embodiment

FIG. 70R illustrates an exemplary I/Q modulation receiver 7089, according to an embodiment of the present invention. I/Q modulation receiver 7089 receives, down-converts, and demodulates an I/Q modulated RF input signal 7082 to an I baseband output signal 7084, and a Q baseband output signal 7086. I/Q modulation receiver 7089 has additional advantages of reducing or eliminating unwanted DC offsets and circuit reradiation, in a similar fashion to that of I/Q modulation receiver 7000 described above.

7.3 Transmitter

Example embodiments and implementations of the IQ transmitter 3910 will be discussed as follows. The example embodiments and implementations include multi-phase embodiments that are useful for reducing or eliminating unwanted DC offsets that can result in unwanted carrier insertion.

7.3.1 Universal Transmitter with 2 UFT Modules

FIG. 71A illustrates a transmitter 7102 according to embodiments of the present invention. Transmitter 7102 includes a balanced modulator/up-converter 7104, a control signal generator 7142, an optional filter 7106, and an optional amplifier 7108. Transmitter 7102 up-converts a baseband signal 7110 to produce an output signal 7140 that is conditioned for wireless or wire line transmission. In doing so, the balanced modulator 7104 receives the baseband signal 7110 and samples the baseband signal in a differential and balanced fashion to generate a harmonically rich signal 7138. The harmonically rich signal 7138 includes multiple harmonic images, where each image contains the baseband

25

20

25

information in the baseband signal 7110. The optional bandpass filter 7106 may be included to select a harmonic of interest (or a subset of harmonics) in the signal 7138 for transmission. The optional amplifier 7108 may be included to amplify the selected harmonic prior to transmission. The universal transmitter is further described at a high level by the flowchart 8400 that is shown in FIG. 84. A more detailed structural and operational description of the balanced modulator follows thereafter.

Referring to flowchart 8400, in step 8402, the balanced modulator 7104 receives the baseband signal 7110.

In step 8404, the balanced modulator 7104 samples the baseband signal in a differential and balanced fashion according to a first and second control signals that are phase shifted with respect to each other. The resulting harmonically rich signal 7138 includes multiple harmonic images that repeat at harmonics of the sampling frequency, where each image contains the necessary amplitude and frequency information to reconstruct the baseband signal 7110.

In embodiments of the invention, the control signals include pulses having pulse widths (or apertures) that are established to improve energy transfer to a desired harmonic of the harmonically rich signal 7138. In further embodiments of the invention, DC offset voltages are minimized between sampling modules as indicated in step 8406, thereby minimizing carrier insertion in the harmonic images of the harmonically rich signal 7138.

In step 8408, the optional bandpass filter 7106 selects the desired harmonic of interest (or a subset of harmonics) in from the harmonically rich signal 7138 for transmission.

In step 8410, the optional amplifier 7108 amplifies the selected harmonic(s) prior to transmission.

In step 8412, the selected harmonic(s) is transmitted over a communications medium.

7.3.1.1 Balanced Modulator Detailed Description

Referring to the example embodiment shown in FIG. 71A, the balanced modulator 7104 includes the following components: a buffer/inverter 7112; summer amplifiers 7118, 7119; UFT modules 7124 and 7128 having controlled switches 7148 and 7150, respectively; an inductor 7126; a blocking capacitor 7136; and a DC terminal 7111. As stated above, the balanced modulator 7104 differentially samples the baseband signal 7110 to generate a harmonically rich signal 7138. More specifically, the UFT modules 7124 and 7128 sample the baseband signal in differential fashion according to control signals 7123 and 7127, respectively. A DC reference voltage 7113 is applied to terminal 7111 and is uniformly distributed to the UFT modules 7124 and 7128. The distributed DC voltage 7113 prevents any DC offset voltages from developing between the UFT modules, which can lead to carrier insertion in the harmonically rich signal 7138. The operation of the balanced modulator 7104 is discussed in greater detail with reference to flowchart 8500 (FIG. 85), as follows.

In step 8402, the buffer/inverter 7112 receives the input baseband signal 7110 and generates input signal 7114 and inverted input signal 7116. Input signal 7114 is substantially similar to signal 7110, and inverted signal 7116 is an inverted version of signal 7114. As such, the buffer/inverter 7112 converts the (single-ended) baseband signal 7110 into differential input signals 7114 and 7116 that will be sampled by the UFT modules. Buffer/inverter 7112 can be implemented using known operational amplifier (op amp) circuits, as will be understood by those skilled in the arts, although the invention is not limited to this example.

In step 8504, the summer amplifier 7118 sums the DC reference voltage 7113 applied to terminal 7111 with the input signal 7114, to generate a combined signal 7120. Likewise, the summer amplifier 7119 sums the DC reference voltage 7113 with the inverted input signal 7116 to generate a combined signal 7122. Summer amplifiers 7118 and 7119 can be implemented using known op amp summer circuits, and can be designed to have a specified gain or attenuation, including unity gain, although the invention is not

limited to this example. The DC reference voltage 7113 is also distributed to the outputs of both UFT modules 7124 and 7128 through the inductor 7126 as is shown.

In step 8506, the control signal generator 7142 generates control signals 7123 and 7127 that are shown by way of example in FIG. 72B and FIG. 72C, respectively. As illustrated, both control signals 7123 and 7127 have the same period T_s as a master clock signal 7145 (FIG.72A), but have a pulse width (or aperture) of T_A . In the example, control signal 7123 triggers on the rising pulse edge of the master clock signal 7145, and control signal 7127 triggers on the falling pulse edge of the master clock signal 7145. Therefore, control signals 7123 and 7127 are shifted in time by 180 degrees relative to each other. In embodiments of invention, the master clock signal 7145 (and therefore the control signals 7123 and 7127) have a frequency that is a sub-harmonic of the desired output signal 7140. The invention is not limited to the example of FIGs. 72A-72C.

In one embodiment, the control signal generator 7142 includes an oscillator 7146, pulse generators 7144a and 7144b, and an inverter 7147 as shown. In operation, the oscillator 7146 generates the master clock signal 7145, which is illustrated in FIG. 72A as a periodic square wave having pulses with a period of T_s. Other clock signals could be used including but not limited to sinusoidal waves, as will be understood by those skilled in the arts. Pulse generator 7144a receives the master clock signal 7145 and triggers on the rising pulse edge, to generate the control signal 7123. Inverter 7147 inverts the clock signal 7145 to generate an inverted clock signal 7143. The pulse generator 7144b receives the inverted clock signal 7143 and triggers on the rising pulse edge (which is the falling edge of clock signal 7145), to generate the control signal 7127.

FIG 89A-E illustrate example embodiments for the pulse generator 7144. FIG. 89A illustrates a pulse generator 8902. The pulse generator 8902 generates pulses 8908 having pulse width T_A from an input signal 8904. Example input signals 8904 and pulses 8908 are depicted in FIGs 89B and 89C, respectively. The input signal 8904 can be any type of periodic signal, including, but not limited to, a sinusoid, a square wave, a sawtooth wave etc. The pulse width (or aperture) T_A of the pulses 8908 is determined by delay 8906 of the pulse generator 8902. The pulse generator 8902 also includes an optional inverter 8910, which is optionally added for polarity considerations as understood

30

25

5

10

30

by those skilled in the arts. The example logic and implementation shown for the pulse generator 8902 is provided for illustrative purposes only, and is not limiting. The actual logic employed can take many forms. Additional examples of pulse generation logic are shown in FIGs. 89D and 89E. FIG. 89D illustrates a rising edge pulse generator 8912 that triggers on the rising edge of input signal 8904. FIG. 89E illustrates a falling edge pulse generator 8916 that triggers on the falling edge of the input signal 8904.

In step 8508, the UFT module 7124 samples the combined signal 7120 according to the control signal 7123 to generate harmonically rich signal 7130. More specifically, the switch 7148 closes during the pulse widths T_A of the control signal 7123 to sample the combined signal 7120 resulting in the harmonically rich signal 7130. FIG. 71B illustrates an exemplary frequency spectrum for the harmonically rich signal 7130 having harmonic images 7152a-n. The images 7152 repeat at harmonics of the sampling frequency 1/T_s, at infinitum, where each image 7152 contains the necessary amplitude, frequency, and phase information to reconstruct the baseband signal 7110. As discussed further below, the relative amplitude of the frequency images is generally a function of the harmonic number and the pulse width T_A. As such, the relative amplitude of a particular harmonic 7152 can be increased (or decreased) by adjusting the pulse width T_A of the control signal 7123. In general, shorter pulse widths of T_A shift more energy into the higher frequency harmonics, and longer pulse widths of T_A shift energy into the lower frequency harmonics. The generation of harmonically rich signals by sampling an input signal according to a controlled aperture have been described earlier in this application in the section titled, "Frequency Up-conversion Using Universal Frequency Translation", and is illustrated by FIGs. 3-6. A more detailed discussion of frequency up-conversion using a switch with a controlled sampling aperture is discussed in the co-pending patent application titled, "Method and System for Frequency Up-Conversion," Ser. No./09/176,154, field on October 21, 1998, and incorporated herein by reference.

In step 8510, the UFT module 7128 samples the combined signal 7122 according to the control signal 7127 to generate harmonically rich signal 7134. More specifically, the switch 7150 closes during the pulse widths T_A of the control signal 7127 to sample the combined signal 7122 resulting in the harmonically rich signal 7134. The harmonically

rich signal 7134 includes multiple frequency images of baseband signal 7110 that repeat at harmonics of the sampling frequency $(1/T_s)$, similar to that for the harmonically rich signal 7130. However, the images in the signal 7134 are phase-shifted compared to those in signal 7130 because of the inversion of signal 7116 compared to signal 7114, and because of the relative phase shift between the control signals 7123 and 7127.

In step 8512, the node 7132 sums the harmonically rich signals 7130 and 7134 to generate harmonically rich signal 7133. FIG. 71C illustrates an exemplary frequency spectrum for the harmonically rich signal 7133 that has multiple images 7154a-n that repeat at harmonics of the sampling frequency 1/T_s. Each image 7154 includes the necessary amplitude, frequency and phase information to reconstruct the baseband signal 7110. The capacitor 7136 operates as a DC blocking capacitor and substantially passes the harmonics in the harmonically rich signal 7133 to generate harmonically rich signal 7138 at the output of the modulator 7104.

In step 8408, the optional filter 7106 can be used to select a desired harmonic image for transmission. This is represented for example by a passband 7156 that selects the harmonic image 7154c for transmission in FIG. 71C.

An advantage of the modulator 7104 is that it is fully balanced, which substantially minimizes (or eliminates) any DC voltage offset between the two UFT modules 7124 and 7128. DC offset is minimized because the reference voltage 7113 contributes a consistent DC component to the input signals 7120 and 7122 through the summing amplifiers 7118 and 7119, respectively. Furthermore, the reference voltage 7113 is also directly coupled to the outputs of the UFT modules 7124 and 7128 through the inductor 7126 and the node 7132. The result of controlling the DC offset between the UFT modules is that carrier insertion is minimized in the harmonic images of the harmonically rich signal 7138. As discussed above, carrier insertion is substantially wasted energy because the information for a modulated signal is carried in the sidebands of the modulated signal and not in the carrier. Therefore, it is often desirable to minimize the energy at the carrier frequency by controlling the relative DC offset.

20

7.3.1.2 Balanced Modulator Example Signal Diagrams and Mathematical Description

In order to further describe the invention, FIGs. 72D-72I illustrate various example signal diagrams (vs. time) that are representative of the invention. These signal diagrams are meant for example purposes only and are not meant to be limiting. FIG. 72D illustrates a signal 7202 that is representative of the input baseband signal 7110 (FIG. 71A). FIG. 72E illustrates a step function 7204 that is an expanded portion of the signal 7202 from time t_0 to t_1 , and represents signal 7114 at the output of the buffer/inverter 7112. Similarly, FIG. 72F illustrates a signal 7206 that is an inverted version of the signal 7204, and represents the signal 7116 at the inverted output of buffer/inverter 7112. For analysis purposes, a step function is a good approximation for a portion of a single bit of data (for the baseband signal 7110) because the clock rates of the control signals 7123 and 7127 are significantly higher than the data rates of the baseband signal 7110. For example, if the data rate is in the KHz frequency range, then the clock rate will preferably be in MHZ frequency range in order to generate an output signal in the Ghz frequency range.

Still referring to FIGs. 72D-I, FIG. 72G illustrates a signal 7208 that an example of the harmonically rich signal 7130 when the step function 7204 is sampled according to the control signal 7123 in FIG. 72B. The signal 7208 includes positive pulses 7209 as referenced to the DC voltage 7113. Likewise, FIG. 72H illustrates a signal 7210 that is an example of the harmonically rich signal 7134 when the step function 7206 is sampled according to the control signal 7127. The signal 7210 includes negative pulses 7211 as referenced to the DC voltage 7113, which are time-shifted relative the positive pulses 7209 in signal 7208.

Still referring to FIGs. 72D-I, the FIG. 72I illustrates a signal 7212 that is the combination of signal 7208 (FIG. 72G) and the signal 7210 (FIG. 72H), and is an example of the harmonically rich signal 7133 at the output of the summing node 7132. As illustrated, the signal 7212 spends approximately as much time above the DC reference voltage 7113 as below the DC reference voltage 7113 over a limited time period. For example, over a time period 7214, the energy in the positive pulses 7209a-b is canceled

20

15

out by the energy in the negative pulses 7211a-b. This is indicative of minimal (or zero) DC offset between the UFT modules 7124 and 7128, which results in minimal carrier insertion during the sampling process.

Still referring to FIG. 72I, the time axis of the signal 7212 can be phased in such a manner to represent the waveform as an odd function. For such an arrangement, the Fourier series is readily calculated to obtain:

$$I_c(t) = \sum_{n=1}^{\infty} \left(\frac{4 \sin\left(\frac{n\pi T_A}{T_s}\right) \cdot \sin\left(\frac{n\pi}{2}\right)}{n\pi} \right) \cdot \sin\left(\frac{2n\pi t}{T_s}\right) \quad Equation 1.$$

where:

 T_s = period of the master clock 7145

 T_A = pulse width of the control signals 7123 and 7127

n= harmonic number

As shown by Equation 1, the relative amplitude of the frequency images is generally a function of the harmonic number n, and the ratio of T_A/T_S . As indicated, the T_A/T_S ratio represents the ratio of the pulse width of the control signals relative to the period of the sub-harmonic master clock. The T_A/T_S ratio can be optimized in order to maximize the amplitude of the frequency image at a given harmonic. For example, if a passband waveform is desired to be created at 5x the frequency of the sub-harmonic clock, then a baseline power for that harmonic extraction may be calculated for the fifth harmonic (n=5) as:

5

$$I_c(t) = \left(\frac{4\sin\left(\frac{5\pi T_A}{T_s}\right)}{5\pi}\right) \cdot \sin(5\omega st)$$
 Equation 2.

As shown by Equation 2, $I_C(t)$ for the fifth harmonic is a sinusoidal function having an amplitude that is proportional to the sin $(5\pi T_A/T_S)$. The signal amplitude can be maximized by setting $T_A = (1/10 \cdot T_S)$ so that $\sin(5\pi T_A/T_S) = \sin(\pi/2) = 1$. Doing so results in the equation:

$$I_c(t)\big|_{n=5} = \frac{4}{5\pi} \Big(\sin(5\omega_s t)\Big)$$
 Equation 3.

This component is a frequency at 5x of the sampling frequency of sub-harmonic clock, and can be extracted from the Fourier series via a bandpass filter (such as bandpass filter 7106) that is centered around $5f_s$. The extracted frequency component can then be optionally amplified by the amplifier 7108 prior to transmission on a wireless or wire-line communications channel or channels.

Equation 3 can be extended to reflect the inclusion of a message signal as illustrated by equation 4 below:

$$m(t) \cdot I_c(t)\Big|_{\substack{n=5\\\theta=\theta(t)}} = \frac{4 \cdot m(t)}{5\pi} \Big(\sin(5\omega_s t + 5\theta(t)) \Big)$$
 Equation 4.

Equation 4 illustrates that a message signal can be carried in harmonically rich signals 7133 such that both amplitude and phase can be modulated. In other words, m(t) is modulated for amplitude and $\theta(t)$ is modulated for phase. In such cases, it should be noted that $\theta(t)$ is augmented modulo n while the amplitude modulation m(t) is simply scaled.

5

As discussed above, the signal amplitude for the 5th harmonic was maximized by setting the sampling aperture width $T_A = 1/10 T_S$, where T_S is the period of the master clock signal. This can be restated and generalized as setting $T_A = \frac{1}{2}$ the period (or π radians) at the harmonic of interest. In other words, the signal amplitude of any harmonic n can be maximized by sampling the input waveform with a sampling aperture of $T_A = \frac{1}{2}$ the period of the harmonic of interest (n). Based on this discussion, it is apparent that varying the aperture changes the harmonic and amplitude content of the output waveform. For example, if the sub-harmonic clock has a frequency of 200 MHZ, then the fifth harmonic is at 1 Ghz. The amplitude of the fifth harmonic is maximized by setting the aperture width $T_A = 500$ picoseconds, which equates to $\frac{1}{2}$ the period (or π radians) at 1 Ghz.

FIG. 72J depicts a frequency plot 7216 that graphically illustrates the effect of varying the sampling aperture of the control signals on the harmonically rich signal 7133 given a 200 MHZ harmonic clock. The frequency plot 7216 compares two frequency spectrums 7218 and 7220 for different control signal apertures given a 200 MHZ clock. More specifically, the frequency spectrum 7218 is an example spectrum for signal 7133 given the 200 MHZ clock with the aperture $T_A = 500$ psec (where 500 psec is π radians at the 5th harmonic of 1GHz). Similarly, the frequency spectrum 7220 is an example spectrum for signal 7133 given a 200 MHZ clock that is a square wave (so $T_A = 5000$ psec). The spectrum 7218 includes multiple harmonics 7218a-I, and the frequency spectrum 7220 includes multiple harmonics 7220a-e. [It is noted that spectrum 7220 includes only the odd harmonics as predicted by Fourier analysis for a square wave.] At 1 Ghz (which is the 5th harmonic), the signal amplitude of the two frequency spectrums 7218e and 7220c are approximately equal. However, at 200 MHZ, the frequency spectrum 7218a has a much lower amplitude than the frequency spectrum 7220a, and therefore the frequency spectrum 7218 is more efficient than the frequency spectrum 7220, assuming the desired harmonic is the 5th harmonic. In other words, assuming 1 Ghz

O 15 June 1911 J

20

25

5

is the desired harmonic, the frequency spectrum 7218 wastes less energy at the 200 MHZ fundamental than does the frequency spectrum 7218.

7.3.1.3 Balanced Modulator Having a Shunt Configuration

FIG. 79A illustrates a universal transmitter 7900 that is a second embodiment of a universal transmitter having two balanced UFT modules in a shunt configuration. (In contrast, the balanced modulator 7104 can be described as having a series configuration based on the orientation of the UFT modules.) Transmitter 7900 includes a balanced modulator 7901, the control signal generator 7142, the optional bandpass filter 7106, and the optional amplifier 7108. The transmitter 7900 up-converts a baseband signal 7902 to produce an output signal 7936 that is conditioned for wireless or wire line transmission. In doing so, the balanced modulator 7901 receives the baseband signal 7902 and shunts the baseband signal to ground in a differential and balanced fashion to generate a harmonically rich signal 7934. The harmonically rich signal 7934 includes multiple harmonic images, where each image contains the baseband information in the baseband signal 7902. In other words, each harmonic image includes the necessary amplitude, frequency, and phase information to reconstruct the baseband signal 7902. The optional bandpass filter 7106 may be included to select a harmonic of interest (or a subset of harmonics) in the signal 7934 for transmission. The optional amplifier 7108 may be included to amplify the selected harmonic prior to transmission, resulting in the output signal 7936.

The balanced modulator 7901 includes the following components: a buffer/inverter 7904; optional impedances 7910, 7912; UFT modules 7916 and 7922 having controlled switches 7918 and 7924, respectively; blocking capacitors 7928 and 7930; and a terminal 7920 that is tied to ground. As stated above, the balanced modulator 7901 differentially shunts the baseband signal 7902 to ground, resulting in a harmonically rich signal 7934. More specifically, the UFT modules 7916 and 7922 alternately shunts the baseband signal to terminal 7920 according to control signals 7123 and 7127, respectively. Terminal 7920

is tied to ground and prevents any DC offset voltages from developing between the UFT modules 7916 and 7922. As described above, a DC offset voltage can lead to undesired carrier insertion. The operation of the balanced modulator 7901 is described in greater detail according to the flowchart 8600 (FIG. 86) as follows.

In step 8402, the buffer/inverter 7904 receives the input baseband signal 7902 and generates I signal 7906 and inverted I signal 7908. I signal 7906 is substantially similar to the baseband signal 7902, and the inverted I signal 7908 is an inverted version of signal 7902. As such, the buffer/inverter 7904 converts the (single-ended) baseband signal 7902 into differential signals 7906 and 7908 that are sampled by the UFT modules. Buffer/inverter 7904 can be implemented using known operational amplifier (op amp) circuits, as will be understood by those skilled in the arts, although the invention is not limited to this example.

In step 8604, the control signal generator 7142 generates control signals 7123 and 7127 from the master clock signal 7145. Examples of the master clock signal 7145, control signal 7123, and control signal 7127 are shown in FIGs. 72A-C, respectively. As illustrated, both control signals 7123 and 7127 have the same period T_s as a master clock signal 7145, but have a pulse width (or aperture) of T_A. Control signal 7123 triggers on the rising pulse edge of the master clock signal 7145, and control signal 7127 triggers on the falling pulse edge of the master clock signal 7145. Therefore, control signals 7123 and 7127 are shifted in time by 180 degrees relative to each other. A specific embodiment of the control signal generator 7142 is illustrated in FIG. 71A, and was discussed in detail above.

In step 8606, the UFT module 7916 shunts the signal 7906 to ground according to the control signal 7123, to generate a harmonically rich signal 7914. More specifically, the switch 7918 closes and shorts the signal 7906 to ground (at terminal 7920) during the aperture width T_A of the control signal 7123, to generate the harmonically rich signal 7914. FIG. 79B illustrates an exemplary frequency spectrum for the harmonically rich signal 7918 having harmonic images 7950a-n. The images 7950 repeat at harmonics of the sampling frequency $1/T_s$, at infinitum, where each image 7950 contains the necessary amplitude, frequency, and phase information to reconstruct the baseband signal 7902. The

25

5

10

25

30

5

generation of harmonically rich signals by sampling an input signal according to a controlled aperture have been described earlier in this application in the section titled, "Frequency Up-conversion Using Universal Frequency Translation", and is illustrated by FIGs. 3-6. A more detailed discussion of frequency up-conversion using a switch with a controlled sampling aperture is discussed in the co-pending patent application titled, "Method and System for Frequency Up-Conversion," Ser. No./09/176,154, field on October 21, 1998, and incorporated herein by reference.

The relative amplitude of the frequency images 7950 are generally a function of the harmonic number and the pulse width T_A . As such, the relative amplitude of a particular harmonic 7950 can be increased (or decreased) by adjusting the pulse width T_A of the control signal 7123. In general, shorter pulse widths of T_A shift more energy into the higher frequency harmonics, and longer pulse widths of T_A shift energy into the lower frequency harmonics, as described by equations 1-4 above. Additionally, the relative amplitude of a particular harmonic 7950 can also be adjusted by adding/tuning an optional impedance 7910. Impedance 7910 operates as a filter that emphasizes a particular harmonic in the harmonically rich signal 7914.

In step 8608, the UFT module 7922 shunts the inverted signal 7908 to ground according to the control signal 7127, to generate a harmonically rich signal 7926. More specifically, the switch 7924 closes during the pulse widths T_A and shorts the inverted I signal 7908 to ground (at terminal 7920), to generate the harmonically rich signal 7926. At any given time, only one of input signals 7906 or 7908 is shorted to ground because the pulses in the control signals 7123 and 7127 are phase shifted with respect to each other, as shown in FIGs. 72B and 72C.

The harmonically rich signal 7926 includes multiple frequency images of baseband signal 7902 that repeat at harmonics of the sampling frequency $(1/T_s)$, similar to that for the harmonically rich signal 7914. However, the images in the signal 7926 are phase-shifted compared to those in signal 7914 because of the inversion of the signal 7908 compared to the signal 7906, and because of the relative phase shift between the control signals 7123 and 7127. The optional impedance 7912 can be included to emphasis a particular harmonic of interest, and is similar to the impedance 7910 above.

25

5

In step 8610, the node 7932 sums the harmonically rich signals 7914 and 7926 to generate the harmonically rich signal 7934. The capacitors 7928 and 7930 operate as blocking capacitors that substantially pass the respective harmonically rich signals 7914 and 7926 to the node 7932. (The capacitor values may be chosen to substantially block baseband frequency components as well.) FIG. 79C illustrates an exemplary frequency spectrum for the harmonically rich signal 7934 that has multiple images 7952a-n that repeat at harmonics of the sampling frequency 1/T_s. Each image 7952 includes the necessary amplitude, frequency, and phase information to reconstruct the baseband signal 7902. The optional filter 7106 can be used to select the harmonic image of interest for transmission. This is represented by a passband 7956 that selects the harmonic image 7932c for transmission.

An advantage of the modulator 7901 is that it is fully balanced, which substantially minimizes (or eliminates) any DC voltage offset between the two UFT modules 7912 and 7914. DC offset is minimized because the UFT modules 7916 and 7922 are both connected to ground at terminal 7920. The result of controlling the DC offset between the UFT modules is that carrier insertion is minimized in the harmonic images of the harmonically rich signal 7934. As discussed above, carrier insertion is substantially wasted energy because the information for a modulated signal is carried in the sidebands of the modulated signal and not in the carrier. Therefore, it is often desirable to minimize the energy at the carrier frequency by controlling the relative DC offset.

7.3.1.4 Balanced Modulator FET Configuration

As described above, the balanced modulators 7104 and 7901 utilize two balanced UFT modules to sample the input baseband signals to generate harmonically rich signals that contain the up-converted baseband information. More specifically, the UFT modules include controlled switches that sample the baseband signal in a balanced and differential fashion. FIGs. 71D and 79D illustrate embodiments of the controlled switch in the UFT module.

5

FIG. 71D illustrates an example embodiment of the modulator 7104 (FIG. 71B) where the controlled switches in the UFT modules are field effect transistors (FET). More specifically, the controlled switches 7148 and 7128 are embodied as FET 7158 and FET 7160, respectively. The FET 7158 and 7160 are oriented so that their gates are controlled by the control signals 7123 and 7127, so that the control signals control the FET conductance. For the FET 7158, the combined baseband signal 7120 is received at the source of the FET 7158 and is sampled according to the control signal 7123 to produce the harmonically rich signal 7130 at the drain of the FET 7158. Likewise, the combined baseband signal 7122 is received at the source of the FET 7160 and is sampled according to the control signal 7127 to produce the harmonically rich signal 7134 at the drain of FET 7160. The source and drain orientation that is illustrated is not limiting, as the source and drains can be switched for most FETs. In other words, the combined baseband signal can be received at the drain of the FETs, and the harmonically rich signals can be taken from the source of the FETs, as will be understood by those skilled in the relevant arts.

FIG. 79D illustrates an embodiment of the modulator 7900 (FIG. 79A) where the controlled switches in the UFT modules are field effect transistors (FET). More specifically, the controlled switches 7918 and 7924 are embodied as FET 7936 and FET 7938, respectively. The FETs 7936 and 7938 are oriented so that their gates are controlled by the control signals 7123 and 7127, respectively, so that the control signals determine FET conductance. For the FET 7936, the baseband signal 7906 is received at the source of the FET 7936 and shunted to ground according to the control signal 7123, to produce the harmonically rich signal 7914. Likewise, the baseband signal 7908 is received at the source of the FET 7938 and is shunted to grounding according to the control signal 7127, to produce the harmonically rich signal 7926. The source and drain orientation that is illustrated is not limiting, as the source and drains can be switched for most FETs, as will be understood by those skilled in the relevant arts.

7.3.1.5 Universal Transmitter Configured for Carrier Insertion

As discussed above, the transmitters 7102 and 7900 have a balanced configuration that substantially eliminates any DC offset and results in minimal carrier insertion in the output signal 7140. Minimal carrier insertion is generally desired for most applications because the carrier signal carries no information and reduces the overall transmitter efficiency. However, some applications require the received signal to have sufficient carrier energy for the receiver to extract the carrier for coherent demodulation. In support thereof, the present invention can be configured to provide the necessary carrier insertion by implementing a DC offset between the two sampling UFT modules.

FIG. 73A illustrates a transmitter 7302 that up-converts a baseband signal 7306 to an output signal 7322 having carrier insertion. As is shown, the transmitter 7302 is similar to the transmitter 7102 (FIG. 71A) with the exception that the up-converter/modulator 7304 is configured to accept two DC references voltages. In contrast, modulator 7104 was configured to accept only one DC reference voltage. More specifically, the modulator 7304 includes a terminal 7309 to accept a DC reference voltage 7308, and a terminal 7313 to accept a DC reference voltage 7314. Vr 7308 appears at the UFT module 7124 though summer amplifier 7118 and the inductor 7310. Vr 7314 appears at UFT module 7128 through the summer amplifier 7119 and the inductor 7316. Capacitors 7312 and 7318 operate as blocking capacitors. If Vr 7308 is different from Vr 7314 then a DC offset voltage will be exist between UFT module 7124 and UFT module 7128, which will be up-converted at the carrier frequency in the harmonically rich signal 7320. More specifically, each harmonic image in the harmonically rich signal 7320 will include a carrier signal as depicted in FIG. 73B.

FIG. 73B illustrates an exemplary frequency spectrum for the harmonically rich signal 7320 that has multiple harmonic images 7324a-n. In addition to carrying the baseband information in the sidebands, each harmonic image 7324 also includes a carrier signal 7326 that exists at respective harmonic of the sampling frequency $1/T_s$. The amplitude of the carrier signal increases with increasing DC offset voltage. Therefore, as

25

the difference between Vr 7308 and Vr 7314 widens, the amplitude of each carrier signal 7326 increases. Likewise, as the difference between Vr 7308 and Vr 7314 shrinks, the amplitude of each carrier signal 7326 shrinks. As with transmitter 7302, the optional bandpass filter 7106 can be included to select a desired harmonic image for transmission. This is represented by passband 7328 in FIG. 73B.

7.3.2 Universal Transmitter In I Q Configuration:

As described above, the balanced modulators 7104 and 7901 up-convert a baseband signal to a harmonically rich signal having multiple harmonic images of the baseband information. By combining two balanced modulators, IQ configurations can be formed for up-converting I and Q baseband signals. In doing so, either the (series type) balanced modulator 7104 or the (shunt type) balanced modulator 7901 can be utilized. IQ modulators having both series and shunt configurations are described below.

7.3.2.1 IQ Transmitter Using Series-Type Balanced Modulator

FIG. 74 illustrates an IQ transmitter 7420 with an in-phase (I) and quadrature (Q) configuration according to embodiments of the invention. The transmitter 7420 includes an IQ balanced modulator 7410, an optional filter 7414, and an optional amplifier 7416. The transmitter 7420 is useful for transmitting complex I Q waveforms and does so in a balanced manner to control DC offset and carrier insertion. In doing so, the modulator 7410 receives an I baseband signal 7402 and a Q baseband signal 7404 and up-converts these signals to generate a combined harmonically rich signal 7412. The harmonically rich signal 7412 includes multiple harmonics images, where each image contains the baseband information in the I signal 7402 and the Q signal 7404. The optional bandpass filter 7414 may be included to select a harmonic of interest (or subset of harmonics) from the signal 7412 for transmission. The optional amplifier 7416 may be included to amplify the selected harmonic prior to transmission, to generate the IQ output signal 7418.

10 I I find from one one one property of the last of the

5

25

30

As stated above, the balanced IQ modulator 7410 up-converts the I baseband signal 7402 and the Q baseband signal 7404 in a balanced manner to generate the combined harmonically rich signal 7412 that carriers the I and Q baseband information. To do so, the modulator 7410 utilizes two balanced modulators 7104 from FIG. 71A, a signal combiner 7408, and a DC terminal 7407. The operation of the balanced modulator 7410 and other circuits in the transmitter is described according to the flowchart 8700 in FIG. 87, as follows.

In step 8702, the IQ modulator 7410 receives the I baseband signal 7402 and the O baseband signal 7404.

In step 8704, the I balanced modulator 7104a samples the I baseband signal 7402 in a differential fashion using the control signals 7123 and 7127 to generate a harmonically rich signal 7411a. The harmonically rich signal 7411a contains multiple harmonic images of the I baseband information, similar to the harmonically rich signal 7130 in FIG. 71B.

In step 8706, the balanced modulator 7104b samples the Q baseband signal 7404 in a differential fashion using control signals 7123 and 7127 to generate harmonically rich signal 7411b, where the harmonically rich signal 7411b contains multiple harmonic images of the Q baseband signal 7404. The operation of the balanced modulator 7104 and the generation of harmonically rich signals was fully described above and illustrated in FIGs. 71A-C, to which the reader is referred for further details.

In step 8708, the DC terminal 7407 receives a DC voltage 7406 that is distributed to both modulators 7104a and 7104b. The DC voltage 7406 is distributed to both the input and output of both UFT modules 7124 and 7128 in each modulator 7104. This minimizes (or prevents) DC offset voltages from developing between the four UFT modules, and thereby minimizes or prevents any carrier insertion during the sampling steps 8704 and 8706.

In step 8710, the 90 degree signal combiner 7408 combines the harmonically rich signals 7411a and 7411b to generate IQ harmonically rich signal 7412. This is further illustrated in FIGs. 75A-C. FIG. 75A depicts an exemplary frequency spectrum for the harmonically rich signal 7411a having harmonic images 7502a-n. The images 7502 repeat at harmonics of the sampling frequency 1/T_s, where each image 7502 contains the

25

30

5

necessary amplitude and frequency information to reconstruct the I baseband signal 7402. Likewise, FIG. 75B depicts an exemplary frequency spectrum for the harmonically rich signal 7411b having harmonic images 7504a-n. The harmonic images 7504a-n also repeat at harmonics of the sampling frequency $1/T_s$, where each image 7504 contains the necessary amplitude, frequency, and phase information to reconstruct the Q baseband signal 7404. FIG.75C illustrates an exemplary frequency spectrum for the combined harmonically rich signal 7412 having images 7506. Each image 7506 carries the I baseband information and the Q baseband information from the corresponding images 7502 and 7504, respectively, without substantially increasing the frequency bandwidth occupied by each harmonic 7506. This can occur because the signal combiner 7408 phase shifts the Q signal 7411b by 90 degrees relative to the I signal 7411a. The result is that the images 7502a-n and 7504a-n effectively share the signal bandwidth do to their orthogonal relationship. For example, the images 7502a and 7504a effectively share the frequency spectrum that is represented by the image 7506a.

In step 8712, the optional filter 7414 can be included to select a harmonic of interest, as represented by the passband 7508 selecting the image 7506c in FIG. 75c.

In step 8714, the optional amplifier 7416 can be included to amplify the harmonic (or harmonics) of interest prior to transmission.

In step 8716, the selected harmonic (or harmonics) is transmitted over a communications medium.

FIG. 76A illustrates a transmitter 7608 that is a second embodiment for an I Q transmitter having a balanced configuration. Transmitter 7608 is similar to the transmitter 7420 except that the 90 degree phase shift between the I and Q channels is achieved by phase shifting the control signals instead of using a 90 degree signal combiner to combine the harmonically rich signals. More specifically, delays 7604a and 7604b delay the control signals 7123 and 7127 for the Q channel modulator 7104b by 90 degrees relative the control signals for the I channel modulator 7104a. As a result, the Q modulator 7104b samples the Q baseband signal 7404 with 90 degree delay relative to the sampling of the I baseband signal 7402 by the I channel modulator 7104a. Therefore, the Q harmonically rich signal 7411b is phase shifted by 90 degrees relative to the I harmonically rich signal.

Since the phase shift is achieved using the control signals, an in-phase signal combiner 7606 combines the harmonically rich signals 7411a and 7411b, to generate the harmonically rich signal 7412.

FIG. 76B illustrates a transmitter 7618 that is similar to transmitter 7608 in FIG. 76A. The difference being that the transmitter 7618 has a modulator 7620 that utilizes a summing node 7622 to sum the signals 7411a and 7411b instead of the in-phase signal combiner 7606 that is used in modulator 7602 of transmitter 7608.

FIG. 90A-90D illustrate various detailed circuit implementations of the transmitter 7420 in FIG. 74. These circuit implementations are meant for example purposes only, and are not meant to be limiting.

FIG. 90A illustrates I input circuitry 9002a and Q input circuitry 9002b that receive the I and Q input signals 7402 and 7404, respectively.

FIG. 90B illustrates the I channel circuitry 9006 that processes an I data 9004a from the I input circuit 9002a.

FIG. 90C illustrates the Q channel circuitry 9008 that processes the Q data 9004b from the Q input circuit 9002b.

FIG. 90D illustrates the output combiner circuit 9012 that combines the I channel data 9007 and the Q channel data 9010 to generate the output signal 7418.

7.3.2.2 IQ Transmitter Using Shunt-Type Balanced Modulator

FIG. 80 illustrates an IQ transmitter 8000 that is another IQ transmitter embodiment according to the present invention. The transmitter 8000 includes an IQ balanced modulator 8001, an optional filter 8012, and an optional amplifier 8014. During operation, the modulator 8001 up-converts an I baseband signal 8002 and a Q baseband signal 8004 to generate a combined harmonically rich signal 8011. The harmonically rich signal 8011 includes multiple harmonics images, where each image contains the baseband information in the I signal 8002 and the Q signal 8004. The optional bandpass filter 8012 may be included to select a harmonic of interest (or subset of harmonics) from the harmonically rich signal 8011 for transmission. The optional amplifier 8014 may be

10

25

30

included to amplify the selected harmonic prior to transmission, to generate the IQ output signal 8016.

The IQ modulator 8001 includes two shunt balanced modulators 7901 from FIG. 79A, and a 90 degree signal combiner 8010 as shown. The operation of the IQ modulator 8001 is described in reference to the flowchart 8800 (FIG. 88), as follows. The order of the steps in flowchart 8800 is not limiting.

In step 8802, the balanced modulator 8001 receives the I baseband signal 8002 and the Q baseband signal 8004.

In step 8804, the balanced modulator 7901a differentially shunts the I baseband signal 8002 to ground according the control signals 7123 and 7127, to generate a harmonically rich signal 8006. More specifically, the UFT modules 7916a and 7922a alternately shunt the I baseband signal 8002 and an inverted version of the I baseband signal 8002 to ground according to the control signals 7123 and 7127, respectively. The operation of the balanced modulator 7901 and the generation of harmonically rich signals was fully described above and is illustrated in FIGs. 79A-C, to which the reader is referred for further details. As such, the harmonically rich signal 8006 contains multiple harmonic images of the I baseband information as described above.

In step 8806, the balanced modulator 7901b differentially shunts the Q baseband signal 8004 to ground according to control signals 7123 and 7127, to generate harmonically rich signal 8008. More specifically, the UFT modules 7916b and 7922b alternately shunt the Q baseband signal 8004 and an inverted version of the Q baseband signal 8004 to ground, according to the control signals 7123 and 7127, respectively. As such, the harmonically rich signal 8008 contains multiple harmonic images that contain the Q baseband information.

In step 8808, the 90 degree signal combiner 8010 combines the harmonically rich signals 8006 and 8008 to generate IQ harmonically rich signal 8011. This is further illustrated in FIGs. 81A-C. FIG. 81A depicts an exemplary frequency spectrum for the harmonically rich signal 8006 having harmonic images 8102a-n. The harmonic images 8102 repeat at harmonics of the sampling frequency 1/T_s, where each image 8102 contains the necessary amplitude, frequency, and phase information to reconstruct the I baseband

5

10

signal 8002. Likewise, FIG. 81B depicts an exemplary frequency spectrum for the harmonically rich signal 8008 having harmonic images 8104a-n. The harmonic images 8104a-n also repeat at harmonics of the sampling frequency 1/T_s, where each image 8104 contains the necessary amplitude, frequency, and phase information to reconstruct the Q baseband signal 8004. FIG.81C illustrates an exemplary frequency spectrum for the IQ harmonically rich signal 8011 having images 8106a-n. Each image 8106 carries the I baseband information and the Q baseband information from the corresponding images 8102 and 8104, respectively, without substantially increasing the frequency bandwidth occupied by each image 8106. This can occur because the signal combiner 8010 phase shifts the Q signal 8008 by 90 degrees relative to the I signal 8006.

In step 8810, the optional filter 8012 may be included to select a harmonic of interest, as represented by the passband 8108 selecting the image 8106c in FIG. 81C.

In step 8812, the optional amplifier 8014 can be included to amplify the selected harmonic image 8106 prior to transmission.

In step 8814, the selected harmonic (or harmonics) is transmitted over a communications medium.

FIG. 82 illustrates a transmitter 8200 that is another embodiment for an IQ transmitter having a balanced configuration. Transmitter 8200 is similar to the transmitter 8000 except that the 90 degree phase shift between the I and Q channels is achieved by phase shifting the control signals instead of using a 90 degree signal combiner to combine the harmonically rich signals. More specifically, delays 8204a and 8204b delay the control signals 7123 and 7127 for the Q channel modulator 7901b by 90 degrees relative the control signals for the I channel modulator 7901a. As a result, the Q modulator 7901b samples the Q baseband signal 8004 with a 90 degree delay relative to the sampling of the I baseband signal 8002 by the I channel modulator 7901a. Therefore, the Q harmonically rich signal 8008 is phase shifted by 90 degrees relative to the I harmonically rich signal 8006. Since the phase shift is achieved using the control signals, an in-phase signal combiner 8206 combines the harmonically rich signals 8006 and 8008, to generate the harmonically rich signal 8011.

FIG.83 illustrates a transmitter 8300 that is similar to transmitter 8200 in FIG. 82. The difference being that the transmitter 8300 has a balanced modulator 8302 that utilizes a summing node 8304 to sum the I harmonically rich signal 8006 and the Q harmonically rich signal 8008 instead of the in-phase signal combiner 8206 that is used in the modulator 8202 of transmitter 8200. The 90 degree phase shift between the I and Q channels is implemented by delaying the Q clock signals using 90 degree delays 8204, as shown.

7.3.2.3 IQ Transmitters Configured for Carrier Insertion

The transmitters 7420 (FIG. 74) and 7608 (FIG. 76A) have a balanced configuration that substantially eliminates any DC offset and results in minimal carrier insertion in the IQ output signal 7418. Minimal carrier insertion is generally desired for most applications because the carrier signal carries no information and reduces the overall transmitter efficiency. However, some applications require the received signal to have sufficient carrier energy for the receiver to extract the carrier for coherent demodulation. In support thereof, FIG. 77 illustrates a transmitter 7702 to provide any necessary carrier insertion by implementing a DC offset between the two sets of sampling UFT modules.

Transmitter 7702 is similar to the transmitter 7420 with the exception that a modulator 7704 in transmitter 7702 is configured to accept two DC reference voltages so that the I channel modulator 7104a can be biased separately from the Q channel modulator 7104b. More specifically, modulator 7704 includes a terminal 7706 to accept a DC voltage reference 7707, and a terminal 7708 to accept a DC voltage reference 7709. Voltage 7707 biases the UFT modules 7124a and 7128a in the I channel modulator 7104a. Likewise, voltage 7709 biases the UFT modules 7124b and 7128b in the Q channel modulator 7104b. When voltage 7707 is different from voltage 7709, then a DC offset will appear between the I channel modulator 7104a and the Q channel modulator 7104b, which results in carrier insertion in the IQ harmonically rich signal 7412. The relative amplitude of the carrier frequency energy increases in proportion to the amount of DC offset.

FIG. 78 illustrates a transmitter 7802 that is a second embodiment of an IQ transmitter having two DC terminals to cause DC offset, and therefore carrier insertion. Transmitter 7802 is similar to transmitter 7702 except that the 90 degree phase shift between the I and Q channels is achieved by phase shifting the control signals, similar to that done in transmitter 7608. More specifically, delays 7804a and 7804b phase shift the control signals 7123 and 7127 for the Q channel modulator 7104b relative to those of the I channel modulator 7104a. As a result, the Q modulator 7104b samples the Q baseband signal 7404 with 90 degree delay relative to the sampling of the I baseband signal 7402 by the I channel modulator 7104a. Therefore, the Q harmonically rich signal 7411b is phase shifted by 90 degrees relative to the I harmonically rich signal 7411a, which are combined by the in-phase combiner 7806.

7.4 Transceiver Embodiments

Referring to FIG. 39, in embodiments the receiver 3906, transmitter 3910, and LNA/PA 3904 are configured as a transceiver, such as but not limited to transceiver 9100, that is shown in FIG. 91.

Referring to FIG. 91, the transceiver 9100 includes a diplexer 9108, the IQ receiver 7000, and the IQ transmitter 8000. Transceiver 9100 up-converts an I baseband signal 9114 and a Q baseband signal 9116 using the IQ transmitter 8000 (FIG. 80) to generate an IQ RF output signal 9106. A detailed description of the IQ transmitter 8000 is included for example in section 7.3.2.2, to which the reader is referred for further details. Additionally, the transceiver 9100 also down-converts a received RF signal 9104 using the IQ Receiver 7000, resulting in I baseband output signal 9110 and a Q baseband output signal 9112. A detailed description of the IQ receiver 7000 is included in section 7.2.2, to which the reader is referred for further details.

20

7.5 Demodulator/Modulator Facilitation Module

An example demodulator/modulator facilitation module 3912 is shown in FIGS. 47 and 48. A corresponding BOM list is shown in FIGS. 49A and 49B.

An alternate example demodulator/modulator facilitation module 3912 is shown in FIGS. 50 and 51. A corresponding BOM list is shown in FIGS. 52A and 52B.

FIG. 52C illustrates an exemplary demodulator/modulator facilitation module 5201. Facilitation module 5201 includes the following: de-spread module 5204, spread module 5206, de-modulator 5210, and modulator 5212.

For receive, the de-spread module 5204 de-spreads received spread signals 3926 and 3928 using a spreading code 5202. Separate spreading codes can be used for the I and Q channels as will be understood by those skilled in the arts. The demodulator 5210 uses a signal 5208 to demodulate the de-spread received signals from the de-spread module 5204, to generate the I baseband signal 3930a and the Q baseband signal 3932a.

For transmit, the modulator 5212 modulates the I baseband signal 3930b and the Q baseband signal 3932b using a modulation signal 5208. The resulting modulated signals are then spread by the spread module 5206, to generate I spread signal 3942 and Q spread signal 3944.

In embodiments, the modulation scheme that is utilized is differential binary phase shift keying (DBPSK) or differential quadrature phase shift keying (DQPSK), and is compliant with the various versions of IEEE 802.11. Other modulation schemes could be utilized besides DBPSK or DQPSK, as will understood by those skilled in arts based on the discussion herein.

In embodiments, the spreading code 5202 is a Barker spreading code, and is compliant with the various versions of IEEE 802.11. More specifically, in embodiments, an 11-bit Barker word is utilized for spreading/de-spreading. Other spreading codes could be utilized as will be understood by those skilled in the arts based on the discussion herein.

20

7.6 MAC Interface

An example MAC interface 3914 is shown in FIG. 45. A corresponding BOM list is shown in FIGS. 46A and 46B.

In embodiments, the MAC 3918 and MAC interface 3914 supply the functionality required to provide a reliable delivery mechanism for user data over noisy, and unreliable wireless media. This is done this while also providing advanced LAN services, equal to or beyond those of existing wired LANs.

The first functionality of the MAC is to provide a reliable data delivery service to users of the MAC. Through a frame exchange protocol at the MAC level, the MAC significantly improves on the reliability of data delivery services over wireless media, as compared to earlier WLANs. More specifically, the MAC implements a frame exchange protocol to allow the source of a frame to determine when the frame has been successfully received at the destination. This frame exchange protocol adds some overhead beyond that of other MAC protocols, like IEEE 802.3, because it is not sufficient to simply transmit a frame and expect that the destination has received it correctly on the wireless media. In addition, it cannot be expected that every station in the WLAN is able to communicate with every other station in the WLAN. If the source does not receive this acknowledgment, then the source will attempt to transmit the frame again. This retransmission of frame by the source effectively reduces the effective error rate of the medium at the cost of additional bandwidth consumption.

The minimal MAC frame exchange protocol consists of two frames, a frame sent from the source to the destination and an acknowledgment from the destination that the frame was received correctly. The frame and its acknowledgment are an atomic unit of the MAC protocol. As such, they cannot be interrupted by the transmission from any other station. Additionally, a second set of frames may be added to the minimal MAC frame exchange. The two added frames are a request to send frame and a clear to send frame. The source sends a request to send to the destination. The destination returns a clear to send to the source. Each of these frames contains information that allows other stations receiving them to be notified of the upcoming frame transmission, and therefore to delay

any transmission their own. The request to send and clear frames serve to announce to all stations in the neighborhood of both the source and the destination about the pending transmission from the source to the destination. When the source receives the clear to send from the destination, the real frame that the source wants delivered to the destination is sent. If the frame is correctly received at the destination, then the destination will return an acknowledgment. completing the frame exchange protocol. While this four way frame exchange protocol is a required function of the MAC, it may be disabled by an attribute in the management information base.

The second functionality of the MAC is to fairly control access to the shared wireless medium. It performs this function through two different access mechanisms: the basic access mechanism, call the distribution coordination system function, and a centrally controlled access mechanism, called the point coordination function.

The basic access mechanism is a carrier sense multiple access with collision avoidance (CSMA/CA) with binary exponential backoff. This access mechanism is similar to that used for IEEE 802.3, with some variations. CSMA/CA is a "listen before talk" (LBT) access mechanism. In this type of access mechanism, a station will listen to the medium before beginning a transmission. If the medium is already carrying a transmission, then the station that listening will not begin its own transmission. More specifically, if a listening station detects an existing transmission in progress, the listening station enters a transmit deferral period determined by the binary exponential backoff algorithm. The binary exponential backoff mechanism chooses a random number which represents the amount of time that must elapse while there are not any transmission. In other words, the medium is idle before the listening station may attempt to begin its transmission again. The MAC may also implement a network allocation vector (NAV). The NAV is the value that indicates to a station that amount of time that remains before a medium becomes available. The NAV is kept current through duration values that are transmitted in all frames. By examining the NAV, a station may avoid transmitting, even when the medium does not appear to be carrying a transmission in the physical sense.

The centrally controlled access mechanism uses a poll and response protocol to eliminate the possibility of contention for the medium. This access mechanism is called

30

25

5

10

ı[]

20

5

P(

the point coordination function (PCF). A point coordinator (PC) controls the PCF. The PC is always located in an AP. Generally, the PCF operates by stations requesting that the PC register them on a polling list, and the PC then regularly polls the stations for traffic while also delivering traffic to the stations. With proper planning, the PCF is able to deliver near isochronous service to the stations on the polling list.

The third function of the MAC is to protect the data that it delivers. Because it is difficult to contain wireless WLAN signals to a particular physical area, the MAC provides a privacy service, called Wired Equivalent Privacy (WEP), which encrypts the data sent over the wireless medium. The level of encryption chosen approximates the level of protection data might have on a wireless LAN in a building with controlled access that prevents physically connecting to the LAN without authorization.

7.7 Control Signal Generator - Synthesizer

In an embodiment, the control signal generator 3908 is preferably implemented using a synthesizer. An example synthesizer is shown in FIG. 55. A corresponding BOM list is shown in FIGS. 56A and 56B.

7.8 LNA/PA

An example LNA/PA 3904 is shown in FIGS. 64 and 65. A corresponding BOM list is shown in FIG. 66.

Additionally, FIG. 93 illustrates a LNA/PA module 9301 that is another embodiment of the LNA/PA 3904. LNA/PA module 9301 includes a switch 9302, a LNA 9304, and a PA 9306. The switch 9302 connects either the LNA 9304 or the PA 9306 to the antenna 3903, as shown. The switch 9302 can be controlled by an on-board processor that is not shown.

8.0 802.11 Physical Layer Configurations

The 802.11 WLAN standard specifies two RF physical layers: frequency hopped spread spectrum (FHSS) and direct sequence spread spectrum (DSSS). The invention is not limited to these specific examples. Both DSSS and FHSS support 1 Mbps and 2 Mbps data rates and operate in the 2.400-2.835 GHz band for wireless communications in accordance to FCC part 15 and ESTI-300 rules. Additionally, 802.11 has added an 11 Mbps standard that operates at 5 GHz and utilizes OFDM modulation.

The DSSS configuration supports the 1 MBPS data rate utilizing differential binary phase shift keying (DBPSK) modulation, and supports 2 MBPS utilizing differential quadrature phase shift keying modulation. In embodiments, an 11-bit Barker word is used as the spreading sequence that is utilized by the stations in the 802.11 network. A Barker word has a relatively short sequence, and is known to have very good correlation properties, and includes the following sequence: +1, -1, +1, +1, -1, +1, +1, -1, -1, -1. The Barker word used for 802.11 is not to be confused with the spreading codes used for code division multiple access (CDMA) and global positioning system (GPS). CDMA and GPS use orthogonal spreading codes, which allow multiple users to operate on the same channel frequency. Generally, CDMA codes have longer sequences and have richer correlation properties.

During transmission, the 11-bit barker word is exclusive-ored (EX-OR) with each of the information bits using a modulo-2 adder, as illustrated by modulo-2 adder 9202 in FIG. 92. Referring to FIG. 92, the11-bit (at 11 MBPS) Barker word is applied to a modulo-2 adder together with each one (at 1 MBPS) of the information bits (in the PPDU data). The Ex-OR function combines both signals by performing a modulo-2 addition of each information bit with each Barker bit (or chip). The output of the modulo-2 adder results in a signal with a data rate that is 10x higher than the information rate. The result in the frequency domain signal is a signal that is spread over a wider bandwidth at a reduced RF power level. At the receiver, the DSSS signal is convolved with an 11-bit Barker word and correlated. As shown in FIG. 92, the correlation recovers the information bits at the transmitted information rate, and the undesired interfering in-band

signals are spread out-of-band. The spreading and despreading of narrowband to wideband signal is commonly referred to as processing gain and is measured in decibels (dB). Processing gain is the ratio of DSSS signal rate information rate. In embodiments, the minimum requirement for processing gain is 10 dB.

The first first that the first that the first that the first first first that the first first first that the first first

25

20

30

The second RF physical layer that is specified by the IEEE 802.11 standard is frequency hopping spread spectrum (FHSS). A set of hop sequences is defined in IEEE 802.11 for use in the 2.4 GHz frequency band. The channels are evenly spaced across the band over a span of 83.5 MHz. During the development of IEEE 802.11, the hop sequences listed in the standard were pre-approved for operation in North America, Europe, and Japan. In North America and Europe (excluding Spain and France), the required number of hop channels is 79. The number of hopped channels for Spain and France is 23 and 35, respectively. In Japan, the required number of hopped channels is 23. The hopped center channels are spaced uniformly across the 2.4 GHz frequency band occupying a bandwidth of 1MHz. In North America and Europe (excluding Spain and France), the hopped channels operate from 2.402 GHz to 2.480 GHz. In Japan, the hopped channels operate from 2.447 GHz to 2.473 GHz. The modulation scheme called out for FHSS by 802.11 is 2-level Gaussian Phase Shift Keying (GFSK) for the 1 MBps data rate, and 4-level GFSK for the 2 MBps data rate.

In addition to DSSS and FHSS RF layer standards, the IEEE 802.11 Executive Committee approved two projects for higher rate physical layer extensions. The first extension, IEEE 802.11a defines requirements for a physical layer operating in the 5.0 GHz frequency band, and data rates ranging from 6 MBps to 54 MBps. This 802.11a draft standard is based on Orthogonal Frequency Division Multiplexing (OFDM) and uses 48 carriers as a phase reference (so coherent), with 20 MHZ spacing between the channels. The second extension, IEEE 802.11b, defines a set of physical layer specifications operating in the 2.4 GHz ISM frequency band. This 802.11b utilizes complementary code keying (CCK), and extends the data rate up to 5.5 Mbps and 11 Mbps.

The transmitter and receiver circuits described herein can be operated in all of the WLAN physical layer embodiments described herein, including the DSSS and FHSS embodiments described herein. However, the present invention is not limited to being

5

operated in WLAN physical layer embodiments that were described herein, as the invention could be configured in other physical layer embodiments.

Figure 94 illustrates a block diagram of an IEEE 802.11 DSSS radio transceiver 9400 using UFT Zero IF technology. DSSS transceiver 9400 includes: antenna 9402, switch 9404, amplifiers 9406 and 9408, transceivers 9410, baseband processor 9412, MAC 9414, bus interface unit 9416, and PCMCIA connector 9418. The DSSS transceiver 9400 includes an IQ receiver 7000 and an IQ transmitter 8000, which are described herein. UFT technology interfaces directly to the baseband processor 9412 of the physical layer. In the receive path, the IQ receiver 7000 transforms a 2.4GHz RF signal-of-interest into I/Q analog baseband signals in a single step and passes the signals to the baseband processor 9412, where the baseband processor is then responsible for de-spreading and demodulating the signal. In embodiments, the IQ receiver 7000 includes all of the circuitry necessary for accommodating AGC, baseband filtering and baseband amplification. In the transmit path, the transmitter 8000 transforms the I/Q analog baseband signals to a 2.4GHz RF carrier directly in a single step. The signal conversion clock is derived from a single synthesized local oscillator (LO) 9420. The selection of the clock frequency is determined by choosing a sub-harmonic of the carrier frequency. For example, a 5th harmonic of 490 MHZ was used, which corresponds to a RF channel frequency of 2.450GHz. Using UFT technology simplifies the requirements and complexity of the synthesizer design.

9. Appendix

The attached Appendix contained in FIGS. 95A-C, 96-161, which forms part of this patent application, includes schematics of an integrated circuit (IC) implementation example of the present invention. This example embodiment is provided solely for illustrative purposes, and is not limiting. Other embodiments will be apparent to persons skilled in the relevant art(s) based on the teachings herein. FIG. 95A illustrates a schematic for a WLAN modulator/demodulator IC according to embodiments of the invention. FIGs. 95B and 95C illustrate an expanded view of the circuit in FIG. 95A. FIGs. 96-161

further illustrate detailed circuit schematics of the WLAN modulator/demodulator integrated circuit.

10. Conclusions

Example implementations of the systems and components of the invention have been described herein. As noted elsewhere, these example implementations have been described for illustrative purposes only, and are not limiting. Other implementation embodiments are possible and covered by the invention, such as but not limited to software and software/hardware implementations of the systems and components of the invention. Such implementation embodiments will be apparent to persons skilled in the relevant art(s) based on the teachings contained herein.

While various application embodiments of the present invention have been described above, it should be understood that they have been presented by way of example only, and not limitation. Thus, the breadth and scope of the present invention should not be limited by any of the above-described exemplary embodiments, but should be defined only in accordance with the following claims and their equivalents.

What Is Claimed Is:

1	1 A wireless modem apparatus, comprising:
2	a balanced transmitter for up-converting a baseband signal, including,
3	an inverter, to receive said baseband signal and generate an inverted
4.	baseband signal;
5	a first controlled switch, coupled to a non-inverting output of said inverter
6	said first controlled switch to sample said baseband signal according to a first contro
7	signal, resulting in a first harmonically rich signal;
8	a second controlled switch, coupled to an inverting output of said inverter
119 11	said second controlled switch to sample said inverted baseband signal according to a
(T10	second control signal, resulting in a second harmonically rich signal, and
1 1 2	a combiner, coupled to an output of said first controlled switch and ar
12	output of said second controlled switch, said combiner to combine said first harmonically
13	rich signal and said second harmonically rich signal, resulting in a third harmonically rich
14 11 11 12 2	signal.
121 121	
. ‡ 1	2. The apparatus of claim 1 wherein said second control signal is phase shifted with
= 2	respect to said first control signal.
1	3. The apparatus of claim 1, wherein said second control signal is phase shifted by
2	180 degrees with respect to said first control signal.
. 1	4. The apparatus of claim 1, wherein said first control signal and said second control
2	signal each comprise a plurality of pulses having an associated pulse width TA that

operates to improve energy transfer to a desired harmonic image in said harmonically rich

1744.0630003

signal.

3

4

1	5. The apparatus of claim 4, wherein said pulse width T _A is approximately ½ of a
2	period of said desired harmonic.
1	6. The apparatus of claim 1, further comprising a filter attached to an output of said
2	combiner, wherein said filter selects a desired harmonic from said third harmonically rich
3	signal.
1	7. The apparatus of claim 1, further comprising:
2	a balanced receiver, coupled to said balanced modulator, said receiver including,
3	a first universal frequency down-conversion module to down-convert an
[] 4	input signal, wherein said first universal frequency down-conversion module down-
114 5 115 116 117 118 118	converts said input signal according to a third control signal and outputs a first down-
46	converted signal;
114 []]7	a second universal frequency down-conversion module to down-convert
[]] []]8	said input signal, wherein said second universal frequency down-conversion module
9	down-converts said input signal according to a fourth control signal and outputs a second
10	down-converted signal; and
	a subtractor module that subtracts said second down-converted signal from
10 11 12 12	said first down-converted signal and outputs a down-converted signal.
_	
1	8. The apparatus of claim 7, wherein said fourth control signal is delayed relative to
2	said third control signal by .5 + n cycles of said input signal, wherein n may be any integer
3	greater than or equal to 1.
1	9. The apparatus of claim 7, wherein said first universal frequency down-conversion
2	module under-samples said input signal according to said third control signal, and said
3	second universal frequency down-conversion module under-samples said input signal
4	according to said fourth control signal.

1		10.	The apparatus of claim 7, wherein said third and said fourth control signals each
2		compr	ise a train of pulses having pulse widths that are established to improve energy
3		transfe	er from said input signal to said first and said second down-converted signals,
4		respec	ctively.
1		11.	The apparatus of claim 10, wherein said train of pulses have a pulse width that is
2		appro	ximately a fraction of a period of said input signal.
1		12.	The apparatus of claim 10, wherein said train of pulses have pulse width that is
2		approx	ximately multiple periods and a fraction of a period of said input signal.
	.B \		
IJ1	Stra	≂ 13.	The apparatus of claim 10, wherein said first and said second universal frequency
2 1 1 1 1	177	down-	conversion modules each comprise a switch and a storage element.

201 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1		differen	tial binary phase shift keying (DBPSK).
1		25.	The apparatus of claim \$2, wherein said demodulator/modulator facilitation
2		module	comprises a means for spreading said baseband signal.
1		26.	The apparatus of claim 25, wherein said means for spreading comprises a means
2		for spre	ading said baseband/signal using a Barker code.
1		27.	The apparatus of claim 22, wherein said demodulator/modulator facilitation
2		module	comprises a means for de-spreading said down-converted signal.

2	The apparatus of claim 27, wherein said means for de-spreading comprises	a
m	ans for de-spreading said down-converted signal using a Barker code.	
2	The apparatus of claim 1, wherein said apparatus is an infrastructure device.	
3	The apparatus of claim 1, wherein said apparatus is a client device.	
3	The apparatus of claim 1, wherein said first controlled switch shunts said baseba	nd
		ıaı
a	cording to said second control signal.	
-18		
CV 3/3	A method of transmitting a baseband signal over a wireless LAN, comprising t	he
11/	steps of:	
	(1) spreading the baseband signal using a spreading code, resulting in a spre	ad
ba	seband signal; and	
	(2) differentially sampling the spread baseband signal according to a fire	rst
co	ntrol signal and a second control signal resulting in a plurality of harmonic images th	at
aı	each representative of the baseband signal, wherein said first and second contr	ol
si	nals have pulse widths that improve energy transfer to a desired harmonic image of sa	id
•		
33	The method of claim 32, further comprising the step of:	
)
		,.
34	The method of claim 32, further comprising the steps of:	
	(3) determining availability of a WLAN medium; and	
	(4) transmitting said desired harmonic over said WLAN medium if sa	id
m	dium is available.	
	bas corrare sign plu 33.	means for de-spreading said down-converted signal using a Barker code. 29. The apparatus of claim 1, wherein said apparatus is an infrastructure device. 30. The apparatus of claim 1, wherein said first controlled switch shunts said baseban signal to a reference potential according to said/first control signal, and wherein sa second controlled switch shunts said inverted baseband signal to said reference potent according to said second control signal. A method of transmitting a baseband signal over a wireless LAN, comprising the steps of: (1) spreading the baseband signal using a spreading code, resulting in a spreading spreading code, resulting in a spreading control signal and a second control signal resulting in a plurality of harmonic images the are each representative of the baseband signal, wherein said first and second control signals have pulse widths that improve energy transfer to a desired harmonic image of sa plurality of harmonics. 33. The method of claim 32, further comprising the step of: (3) modulating the baseband signal using phase shift keying prior to step (1) and the method of claim 32, further comprising the steps of: (3) determining availability of a WLAN medium, and

1	3	The method of claim 34, wherein step (3) comprises the step of determining
2	а	vailability of said WLAN medium using carrier sense multiple access (CSMA) protocol.
1	3	The method of claim 32, wherein said step (2) comprises the step of:
2		(a) converting said baseband signal into a differential baseband signal having
3	a	first differential baseband component and a second differential baseband component;
4		(b) sampling said first differential component according to said first control
5	S	ignal to generate a first harmonically rich signal, and sampling said second differential
6	С	component according to said second control signal to generate a second harmonically rich
7	S	ignal, wherein said second control signal is phase shifted relative to said first control
€)8	S	ignal; and
<u>I</u> 9		(c) combining said first harmonically rich signal and said second harmonically
10	ri	ich signal to generate said harmonic images.
ii M		
	3	7. The method of claim 32, further comprising the step of:
2		(3) minimizing DC offset voltages between sampling modules during step (2),
113	a	nd thereby minimizing carrier insertion in said harmonic images.
		, <i>'</i>
113 124 124 124 124 124 124 124 124 124 124	3	8. The method of claim 32, wherein said pulse widths are approximately ½ of a
2	р	eriod of said desired harmonic.
	1 1/	
1 -	HHH 2	In a wireless LAN device, a method of down-converting a received RF signal,
2		omprising the steps of:
3	1	down-converting said received RF signal according to a first control signal and a
4	S	econd control signal, resulting in a down-converted signal, wherein said second control
5	si	ignal is delayed relative to said first control signal by .5 + n cycles of said received RF
6	si	ignal, wherein n may be any integer greater than or equal to 1;
7		de-spreading said down-converted signal using a spreading code, resulting in a de-
8	sı	pread signal; and
9		de-modulating said de-spread signal, resulting in a de-modulated signal;
	1744 06200	

2

wherein said first and said second control signals each comprise a train of pulses having pulse widths that are established to improve energy transfer from said received RF signal to said down-converted signal.

40. The method of claim 39 wherein said pulse widths are approximately ½ of a period of said received RF signal.

NOTICE TO FILE MISSING PARTS OF NONPROVISIONAL APPLICATION

FILED UNDER 37 CFR 1.53(b)

Filing Date Granted

An application number and filing date have been accorded to this application. The item(s) indicated below, however, are missing. Applicant is given TWO MONTHS from the date of this Notice within which to file all required items and pay any fees required below to avoid abandonment. Extensions of time may be obtained by filing a petition accompanied by the extension fee under the provisions of 37 CFR 1.136(a).

- The statutory basic filing fee is missing.
 Applicant must submit \$ 690 to complete the basic filing fee and/or file a small entity statement claiming such status (37 CFR 1.27).
- Total additional claim fee(s) for this application is \$360.
 - **\$360** for **20** total claims over 20.
- The oath or declaration is missing.
 A properly signed oath or declaration in compliance with 37 CFR 1.63, identifying the application by the above Application Number and Filing Date, is required.
- To avoid abandonment, a late filing fee or oath or declaration surcharge as set forth in 37 CFR 1.16(e) of \$130 for a non-small entity, must be submitted with the missing items identified in this letter.
- The balance due by applicant is \$ 1180.

A copy of this notice <u>MUST</u> be returned with the reply.

POWER OF ATTORNEY FROM ASSIGNEE

Parker Vision, Inc., a corporation of Jacksonville, FL, having a principal place of business at 8493 Baymeadows Way, Jacksonville, FL 32256, is assignee of the entire right, title and interest for the United States of America (as defined in 35 U.S.C. § 100), by reason of an Assignment to the Assignee executed on (1) 10-5-00, (2) 10-5-00, (3) 10-5-00, (4) 10-0-00, (5) 10-5-00, (6) 10-6-00, (7) 10-6-00, of an invention known as Wireless Local Area Network (WLAN) Using Universal Frequency Translation Technology Including Multi-Phase Embodiments and Circuit Implementations (Attorney Docket No. 1744.0630003/MQL/JTH), which is disclosed and claimed in a patent application of the same title by the inventors (1) David F. Sorrells, (2) Michael J. Bultman, (3) Robert W. Cook, (4) Richard C. Looke, (5) Charley D. Moses, Jr., (6) Gregory S. Rawlins, (7) Michael W. Rawlins, (said application filed on August 4, 2000 at the U.S. Patent and Trademark Office, having Application Number 09/632,856).

The Assignee hereby appoints the following U.S. attorneys to prosecute this application and any continuation, divisional, continuation-in-part, or reissue application thereof, and to transact all business in the U.S. Patent and Trademark Office connected therewith: Robert Greene Sterne, Esq., Reg. No. 28,912; Edward J. Kessler, Esq., Reg. No. 25,688; Jorge A. Goldstein, Esq., Reg. No. 29,021; Samuel L. Fox, Esq., Reg. No. 30,353; David K.S. Cornwell, Esq., Reg. No. 31,944; Robert W. Esmond, Esq., Reg. No. 32,893; Tracy-Gene G. Durkin, Esq., Reg. No. 32,831; Michele A. Cimbala, Esq., Reg. No. 33,851; Michael B. Ray, Esq., Reg. No. 33,997; Robert E. Sokohl, Esq., Reg. No. 36,013; Eric K. Steffe, Esq., Reg. No. 36,688, Michael Q. Lee, Esq., Reg. No. 35,239; Steven R. Ludwig, Esq., Reg. No. 36,203; John M. Covert, Esq., Reg. No. 38,759; and Linda E. Alcorn, Esq., Reg. No. 39,588. The Assignee hereby grants said attorneys the power to insert on this Power of Attorney any further identification that may be necessary or desirable in order to comply with the rules of the U.S. Patent and Trademark Office.

ASSIGNMENT

In consideration of the sum of One Dollar (\$1.00) or equivalent and other good and valuable consideration paid to each of the undersigned inventors: (1) David F. Sorrells, (2) Michael J. Bultman, (3) Robert W. Cook, (4) Richard C. Looke, (5) Charley D. Moses, Jr., (6) Gregory S. Rawlins, (7) Michael W. Rawlins, the undersigned inventor(s) hereby sell(s) and assigns to ParkerVision, Inc. (the Assignee) his/her entire right, title and interest, including the right to sue for past infringement and to collect for all past, present and future damages:

check applicable box(es)

for the United States of America (as defined in 35 U.S.C. § 100),

and throughout the world,

- (b) in any and all applications that claim the benefit of the patent application listed above in part (a), including continuing applications, reissues, extensions, renewals and reexaminations of the patent application or Letters Patent therefor listed above in part (a), to the full extent of the term or terms for which Letters Patents issue, and
- (c) in any and all inventions described in the patent application listed above in part (a), and in any and all forms of intellectual and industrial property protection derivable from such patent application, and that are derivable from any and all continuing applications, reissues, extensions, renewals and reexaminations of such patent application, including, without limitation, patents, applications, utility models, inventor's certificates, and designs together with the right to file applications therefor; and including the right to claim the same priority rights from any previously filed applications under the International Agreement for the Protection of Industrial Property, or any other international agreement, or the domestic laws of the country in which any such application is filed, as may be applicable;

all such rights, title and interest to be held and enjoyed by the above-named Assignee, its successors, legal representatives and assigns to the same extent as all such rights, title and interest would have been held and enjoyed by the Assignor had this assignment and sale not been made.

The undersigned inventor(s) agree(s) to execute all papers necessary in connection with the application(s) and any continuing (continuation, divisional, or continuation-in-part), reissue, reexamination or corresponding application(s) thereof and also to execute separate assignments in connection with such application(s) as the Assignee may deem necessary or expedient.

The undersigned inventor(s) agree(s) to execute all papers necessary in connection with any interference or patent enforcement action (judicial or otherwise) related to the application(s) or any continuing (continuation, divisional, or continuation-in-part), reissue or reexamination application(s) thereof and to cooperate with the Assignee in every way possible in obtaining evidence and going forward with such interference or patent enforcement action.

The undersigned inventor(s) hereby represent(s) that he/she has full right to convey the entire interest herein assigned, and that he/she has not executed, and will not execute, any agreement in conflict therewith.

DO NOT FORWARD
TO ASSIGNMENT BRANCH
NOT FOR RECORDATION

The undersigned inventor(s) hereby grant(s) Robert Greene Sterne, Esquire, Registration No. 28,912; Edward J. Kessler, Esquire, Registration No. 25,688; Jorge A. Receipt is acknowledged of this nonprovisional Patent Application. It will be considered in its order and you will be notified as to the results of the examination. Be sure to provide the U.S. APPLICATION NUMBER, FILING DATE, NAME OF APPLICANT, and TITLE OF INVENTION when inquiring about this application. Fees transmitted by check or draft are subject to collection. Please verify the accuracy of the data presented on this receipt. If an error is noted on this Filing Receipt, please write to the Office of Initial Patent Examination's Customer Service Center. Please provide a copy of this Filing Receipt with the changes noted thereon. If you received a "Notice to File Missing Parts" for this application, please submit any corrections to this Filing Receipt with your reply to the Notice. When the PTO processes the reply to the Notice, the PTO will generate another Filing Receipt incorporating the requested corrections (if appropriate).

ILINIA BIKA BIKA 1966 INIK BIKA BIKA BIKA BIKA KINI BIKA KATA BIKA BIKA BIKA BIKA KATA KATA INIK KATA BIKA BIKA

LICENSE FOR FOREIGN FILING UNDER Title 35, United States Code, Section 184 Title 37, Code of Federal Regulations, 5.11 & 5.15

GRANTED

The applicant has been granted a license under 35 U.S.C. 184, if the phrase "IF REQUIRED, FOREIGN FILING LICENSE GRANTED" followed by a date appears on this form. Such licenses are issued in all applications where the conditions for issuance of a license have been met, regardless of whether or not a license may be required as set forth in 37 CFF 5.15. The scope and limitations of this license are set forth in 37 CFR 5.15(a) unless an earlier license has been issued under 37 CFR 5.15(b). The license is subject to revocation upon written notification. The date indicated is the effective date of the license, unless an earlier license of similar scope has been granted under 37 CFR 5.13 or 5.14.

This license is to be retained by the licensee and may be used at any time on or after the effective date thereof unless it is revoked. This license is automatically transferred to any related applications(s) filed under 36 CFR 1.53(d). This license is not retroactive.

The grant of a license does not in any way lessen the responsibility of a licensee for the security of the subject matter as imposed by any Government contract or the provisions of existing laws relating to espionage and the national security or the export of technical data. Licensees should apprise themselves of current regulations especially with respect to certain countries, of other agencies, particularly the Office of Defense Trade Controls, Department of State (with respect to Arms, Munitions and Implements of War (22 CFR 121-128)); the Office of Export Administration, Department of Commerce (15 CFR 370.10 (j)); the Office of Foreign Assets Control, Department of Treasury (31 CFR Parts 500+) and the Department of Energy.

NOT GRANTED

No license under 35 U.S.C. 184 has been granted at this time, if the phrase "IF REQUIRED, FOREIGN FILING LICENSE GRANTED" DOES NOT appear on this form. Applicant may still petition for a license under 37 CFR 5.12, if a license is desired before the expiration of 6 months from the filing date of the application. If 6 months has lapsed from the filing date of this application and the licensee has not received any indication of a secrecy order under 35 U.S.C. 181, the licensee may foreign file the application pursuant to 37 CFR 5.15(b).

PLEASE NOTE the following information about the Filing Receipt:

- The articles such as "a," "an" and "the" are not included as the first words in the title of an application. They are considered to be unnecessary to the understanding of the title.
- The words "new," "improved," "improvements in" or "relating to" are not included as first words in the title of an application because a patent application, by nature, is a new idea or improvement.
- The title may be truncated if it consists of more than 600 characters (letters and spaces combined).
- The docket number allows a maximum of 25 characters.
- If your application was submitted under 37 CFR 1.10, your filing date should be the "date in" found on the Express Mail label. If there is a discrepancy, you should submit a request for a corrected Filing Receipt along with a copy of the Express Mail label showing the "date in."
- The title is recorded in sentence case.

Any corrections that may need to be done to your Filing Receipt should be directed to:

TC 2600 MAILROOM

Assistant Commissioner of Patents Washington, D.C. 20231

Sir:

Prior to Examination of the captioned application, Applicants submit the following Preliminary Amendment.

It is not believed that extensions of time or fees for net addition of claims are required, beyond those which may otherwise be provided for in documents accompanying this paper. However, in the event that additional extensions of time are necessary to allow consideration of this paper, then such extensions of time are hereby petitioned under 37 CFR § 1.136(a), and any fees required therefore (including fees for net addition of claims) are hereby authorized to be charged to our Deposit Account No. 19-0036.

Kindly enter the following amendments:

In the Specification:

On page 1, lines 12-15, replace with the following:

al

This application claims the benefit of U.S. Provisional Application No.60/147,129, filed on August 4, 1999; and this application is a continuation-in-part of U.S. Application No. 09/525,615, filed on March 14, 2000; and this application is a continuation-in-part of U.S. Application No. 09/526,041, filed on March 14, 2000, all of which are incorporated herein by reference in their entireties.

In the Claims:

Please cancel claims 4-5,10-12, 38, and 40.

Please amend claims 13, 32, and 39 as follows:

() 2

13. (Once Amended) The apparatus of claim 7, wherein said first and said second universal frequency down-conversion modules each comprise a switch and a storage element.

32. (Once Amended) A method of transmitting a baseband signal over a wireless LAN, comprising the steps of:

a3

- (1) spreading the baseband signal using a spreading code, resulting in a spread baseband signal; and
- (2) differentially sampling the spread baseband signal according to a first control signal and a second control signal resulting in a plurality of harmonic images that are each representative of the baseband signal, wherein said first and second control signals have pulse widths.

39. (Once Amended) In a wireless LAN device, a method of down-converting a received RF signal, comprising the steps of:

down-converting said received RF signal according to a first control signal and a second control signal, resulting in a down-converted signal, wherein said second control signal is delayed relative to said first control signal by .5 + n cycles of said received RF signal, wherein n may be any integer greater than or equal to 1;

Sorrells *et al*. Appl: 09/632,856

de-spreading said down-converted signal using a spreading code, resulting in a de-spread signal; and

de-modulating said de-spread signal, resulting in a de-modulated signal;

wherein said first and said second control signals each comprise a train of pulses having pulse widths.

ÌPR2022-00245 Page 00663

Sorrells *et al*. Appl: 09/632,856

Remarks

Claims 1-3, 6-9, 13-37, and 39 are pending in this application. By the foregoing amendment, Applicants seek to cancel claims 4-5, 10-12, 38, and 40, and amend claims 13, 32, and 39. Furthermore, the specification has been amended to correct the priority claim. These changes are believed to be fully supported by the specification and are not believed to introduce new matter. Thus, it is respectfully requested that the amendments be entered by the Examiner. The Examiner is invited to telephone the undersigned representative if it is believe that an interview might be useful for any reason.

Respectfully submitted,

RNE, KESSLER, GOLDSTEIN & FOX P.L.L.C.

Version with markings to show changes made

In the Specification:

Page 1, lines 12-15:

This application claims the benefit of [the following:] U.S. Provisional Application No.60/147,129, filed on August 4, 1999; and this application is a continuation-in-part of U.S. Application No. 09/525,615, filed on March 14, 2000; and this application is a continuation-in-part of U.S. Application No. 09/526,041, filed on March 14, 2000, all of which are incorporated herein by reference in their entireties.

In the Claims:

- 13. (Once Amended) The apparatus of claim [10] 7, wherein said first and said second universal frequency down-conversion modules each comprise a switch and a storage element.
- 32. (Once Amended) A method of transmitting a baseband signal over a wireless LAN, comprising the steps of:
- (1) spreading the baseband signal using a spreading code, resulting in a spread baseband signal; and
- (2) differentially sampling the spread baseband signal according to a first control signal and a second control signal resulting in a plurality of harmonic images that are each representative of the baseband signal, wherein said first and second control signals have pulse widths [that improve energy transfer to a desired harmonic image of said plurality of harmonics].
- 39. In a wireless LAN device, a method of down-converting a received RF signal, comprising the steps of:

down-converting said received RF signal according to a first control signal and a second control signal, resulting in a down-converted signal, wherein said second control signal is delayed

Sorrells *et al*. Appl: 09/632,856

relative to said first control signal by .5 + n cycles of said received RF signal, wherein n may be any integer greater than or equal to 1;

de-spreading said down-converted signal using a spreading code, resulting in a de-spread signal; and

de-modulating said de-spread signal, resulting in a de-modulated signal;

wherein said first and said second control signals each comprise a train of pulses having pulse widths [that are established to improve energy transfer from said received RF signal to said down-converted signal].

Claims 4-5,10-12, 38, and 40 have been canceled.

Second Preliminary Amendment Under 37 C.F.R. § 1.115 in the Revised Format of the Pre-OG Notice Dated January 31, 2003

Commissioner for Patents PO Box 1450 Alexandria, VA 22313-1450

Sir:

In advance of prosecution, Applicants submit the following amendments and remarks.

This Second Preliminary Amendment is provided in the format approved in the pre-OG

Notice dated January 31, 2003, entitled, "Amendments In A Revised Format Now Permitted,"

and in the following format:

- (A) Each section begins on a separate sheet;
- (B) Starting on a separate sheet, amendments to the specification by presenting replacement paragraphs marked up to show changes made;
- (C) Starting on a separate sheet, a complete listing of all of the claims:
 - in ascending order;
 - with status identifiers; and
 - with markings in the currently amended claims;
- (D) Starting on a separate sheet, the Remarks.

It is not believed that extensions of time or fees for net addition of claims are required beyond those that may otherwise be provided for in documents accompanying this paper. However, if additional extensions of time are necessary to prevent abandonment of this application, then such extensions of time are hereby petitioned under 37 C.F.R. § 1.136(a), and any fees required therefor (including fees for net addition of claims) are hereby authorized to be charged to our Deposit Account No. 19-0036.

Amendments to the Claims

Please cancel claims 1-3, 6-9, 13-37 and 39.

Please add the following new claims:

41. A wireless modem apparatus, comprising:

a balanced receiver for frequency down-converting an input signal including,

a first frequency down-conversion module to down-convert the input signal, wherein said first frequency down-conversion module down-converts said input signal according to a first control signal and outputs a first down-converted signal;

a second frequency down-conversion module to down-convert said input signal, wherein said second frequency down-conversion module down-converts said input signal according to a second control signal and outputs a second down-converted signal; and a subtractor module that subtracts said second down-converted signal from said first down-converted signal and outputs a down-converted signal.

- 42. The apparatus of claim 41, wherein said second control signal is delayed relative to said first control signal by (.5 + n) cycles of said input signal, wherein n is an integer greater than or equal to 1.
- 43. The apparatus of claim 41, wherein said first frequency down-conversion module under-samples said input signal according to said first control signal, and said

Шос

second frequency down-conversion module under-samples said input signal according to said second control signal.

- 44. The apparatus of claim 41, wherein said first and said second frequency down-conversion modules each comprise a switch and a storage element.
- 45. The apparatus of claim 44, wherein said storage elements comprises a capacitor that reduces a DC offset voltage in said first down-converted signal and said second down-converted signal.
- 46. The apparatus of claim 41, wherein said subtractor module comprises a differential amplifier.
 - 47. The apparatus of claim 41, further comprising:

a balanced transmitter for up-converting a baseband signal and coupled to said balanced receiver, including,

an inverter, to receive said baseband signal and generate an inverted baseband signal;

a first controlled switch, coupled to a non-inverting output of said inverter, said first controlled switch to sample said baseband signal according to a third control signal, resulting in a first harmonically rich signal;

CONT

a second controlled switch, coupled to an inverting output of said inverter, said second controlled switch to sample said inverted baseband signal according to a fourth control signal, resulting in a second harmonically rich signal; and

a combiner, coupled to an output of said first controlled switch and an output of said second controlled switch, said combiner to combine said first harmonically rich signal and said second harmonically rich signal, resulting in a third harmonically rich signal.

- 48. The apparatus of claim 47, wherein said fourth control signal is phase shifted with respect to said third control signal.
- 49. The apparatus of claim 47, wherein said fourth control signal is phase shifted by 180 degrees with respect to said third control signal.
- 50. The apparatus of claim 47, further comprising a filter coupled to an output of said combiner, wherein said filter outputs a desired harmonic from said third harmonically rich signal.
 - 51. The apparatus of claim 47, wherein said apparatus is an infrastructure device.
 - 52. The apparatus of claim 47, wherein said apparatus is a client device.
- 53. The apparatus of claim 47, wherein said third controlled switch shunts said baseband signal to a reference potential according to said first control signal, and wherein

LONT

said fourth controlled switch shunts said inverted baseband signal to said reference potential according to said second control signal.

- 54. The apparatus of claim 47, further comprising an antenna coupled to said balanced transmitter and said balanced receiver.
- 55. The apparatus of claim 54, further comprising a switch, said switch selectively connecting said transmitter or said receiver to said antenna.
- 56. The apparatus of claim 47, further comprising a baseband processor coupled to said transmitter and said receiver.
- 57. The apparatus of claim 47, further comprising a media access controller (MAC) coupled to said transmitter and said receiver.
- 58. The apparatus of claim 57, wherein said MAC comprises a means for controlling accessing to a WLAN medium.
- 59. The apparatus of claim 58, wherein said means for controlling includes carrier sense multiple access with collision avoidance (CSMA/CA).
- 60. The apparatus of claim 47, further comprising a demodulator/modulator facilitation module coupled to said transmitter and receiver.

 \mathcal{T}

61. The apparatus of claim 60, wherein said demodulator/modulator facilitation module comprises a means for modulating said baseband signal using differential binary phase shift keying (DBPSK).

BI

62. The apparatus of claim 60, wherein said demodulator/modulator facilitation module comprises a means for de-modulating said down-converted signal using differential binary phase shift keying (DBPSK).

63. The apparatus of claim 60, wherein said demodulator/modulator facilitation module comprises a means for spreading said baseband signal.

CONT

- 64. The apparatus of claim 63, wherein said means for spreading comprises a means for spreading said baseband signal using a Barker code.
- 65. The apparatus of claim 60, wherein said demodulator/modulator facilitation module comprises a means for de-spreading said down-converted signal.
- 66. The apparatus of claim 65, wherein said means for de-spreading comprises a means for de-spreading said down-converted signal using a Barker code.
- 67. The apparatus of claim 60, wherein said demodulator/modulator facilitation module comprises a means for modulating said baseband signal using Gaussian phase shift keying (GFSK).

68. The apparatus of claim 60, wherein said demodulator/modulator facilitation module comprises a means for de-modulating said down converted signal using Gaussian phase shift keying (GFSK).

B

- 69. The apparatus of claim 60, wherein said demodulator/modulator facilitation module comprises a means for modulating said baseband signal using Orthogonal Frequency Division Multiplexing (OFDM).
- 70. The apparatus of claim 60, wherein said demodulator/modulator facilitation module comprises a means for de-modulating said down converted signal using Orthogonal Frequency Division Multiplexing (OFDM).

CONT

- 71. The apparatus of claim 60, wherein said demodulator/modulator facilitation module comprises a means for modulating said baseband signal using Complimentary Code Keying (CCK).
- 72. The apparatus of claim 60, wherein said demodulator/modulator facilitation module comprises a means for de-modulating said down converted signal using Complimentary Code Keying (CCK).
 - 73. A method of receiving a wireless LAN signal, comprising:
 - (1) splitting the wireless LAN signal into I and Q components;

- (2) down-converting said I signal component and said Q signal component;
- (3) de-spreading said down-converted I and Q signals using a spreading code;
- (4) differentially demodulating information encoded in said I and Q signals;
- (5) sending said demodulated information in said I and Q signals to a Media Access Controller (MAC) Interface wherein said I and Q signals are de-scrambled and combined to a single output signal.

CON

- 74. The method of claim 73, wherein separate spreading codes are used for the I and Q signal components in step (3).
- 75. The method of claim 73, wherein step (4) comprises using Binary Phase Shift Keying (BPSK) to demodulate said I and Q signals.
- 76. The method of claim 73, wherein step (4) comprises using Quadrature Phase Shift Keying (QPSK) to demodulate said I and Q signals.
- 77. In a wireless LAN device, a method of down-converting a received RF signal, comprising:

down-converting said received RF signal according to a first control signal and a second control signal, resulting in a down-converted signal, wherein said second control

BI

signal is delayed relative to said first control signal by (.5 + n) cycles of said received RF signal, wherein n is an integer greater than or equal to 1;

CONT

de-spreading said down-converted signal using a spreading code, resulting in a despread signal; and

de-modulating said de-spread signal, resulting in a de-modulated signal.

- 11 -

David F. SORRELLS et al. Appl. No. 09/632,856

Remarks

Upon entry of the foregoing amendment, claims 41-77 are pending in the application,

with 41, 73 and 77 being the independent claims. Claims 1-3, 6-9, 13-37 and 39 are sought

to be cancelled without prejudice to or disclaimer of the subject matter therein. New claims

41-77 are sought to be added. These changes are believed to introduce no new matter, and

their entry is respectfully requested.

Conclusion

Prompt and favorable consideration of this Preliminary Amendment is respectfully

requested. Applicants believe the present application is in condition for allowance. If the

Examiner believes, for any reason, that personal communication will expedite prosecution

of this application, the Examiner is invited to telephone the undersigned at the number

provided.

Respectfully submitted,

E, Ressler, Goldstein & Fox p.l.l.c.

DETAILED ACTION

Election/Restrictions

- 1. Restriction to one of the following inventions is required under 35 U.S.C. 121:
 - Claims 41-72, 77, drawn to a wireless modem, classified in class 455, subclass
 313.
 - II. Claim 73-76, drawn to a spread spectrum demodulation, classified in class 375, subclass 147.

The inventions are distinct, each from the other because of the following reasons:

- 2. Inventions I and II are unrelated. Inventions are unrelated if it can be shown that they are not disclosed as capable of use together and they have different modes of operation, different functions, or different effects (MPEP § 806.04, MPEP § 808.01). In the instant case the different inventions. The wireless mode comprising frequency downconverters is not discloses as capable of use together with the spread spectrum demodulator. The two inventions operate differently since the former use (parallel) frequency down converters and the latter employs a dispreading operation.
- 3. Because these inventions are distinct for the reasons given above and have acquired a separate status in the art as shown by their different classification, restriction for examination purposes as indicated is proper.
- 4. A telephone call was made to Mr. Michael Lee on November 5, 2003 to request an oral election to the above restriction requirement, but did not result in an election being made.

Application/Control Number: 09/632,856

Art Unit: 2634

Applicant is advised that the reply to this requirement to be complete must include an election of the invention to be examined even though the requirement be traversed (37 CFR 1.143).

5. Applicant is reminded that upon the cancellation of claims to a non-elected invention, the inventorship must be amended in compliance with 37 CFR 1.48(b) if one or more of the currently named inventors is no longer an inventor of at least one claim remaining in the application. Any amendment of inventorship must be accompanied by a request under 37 CFR 1.48(b) and by the fee required under 37 CFR 1.17(i).

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Kevin Y Kim whose telephone number is 703-305-4082. The examiner can normally be reached on 8AM --5PM M-F.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Stephen Chin can be reached on 703-305-4714. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9314.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is 703-305-3900.

Reply To Restriction Requirement

Commissioner for Patents Washington, D.C. 20231

Sir:

In reply to the Office Action mailed December 1, 2003, requesting an election of a single disclosed invention for prosecution in the above-referenced patent application, Applicants hereby submit the following Reply to the Restriction Requirement.

Applicants elect to prosecute Invention I, represented by claims 41-72, and 77. This election is made without prejudice to, or disclaimer of, the other claims, species or inventions disclosed. Applicants respectfully request reconsideration and withdrawal of the Restriction Requirement, and consideration of all the pending claims.

It is not believed that extensions of time or fees for net addition of claims are required beyond those that may otherwise be provided for in documents accompanying However, if additional extensions of time are necessary to prevent this paper. abandonment of this application, then such extensions of time are hereby petitioned under 37 C.F.R. § 1.136(a), and any fees required therefore (including fees for net addition of claims) are hereby authorized to be charged to our Deposit Account No.

If the Examiner believes, for any reason, that a personal communication will expedite prosecution of this application, the Examiner is invited to telephone the undersigned at the number provided.

DETAILED ACTION

Election/Restrictions

1. Applicant's election without traverse of Group I in Paper No. 10 is acknowledged.

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

3. Claims 41 is rejected under 35 U.S.C. 102(e) as being anticipated by Sanielevici et al (US 6,018,553).

Referring to Fig.2, Sanielevici et al discloses a balanced receiver, comprising

"a first frequency down-conversion module" (201) for down-converting an input signal according to a first control signal (5KHz, 0DEG),

"a second frequency down-conversion module" (204) for down-converting the input signal according to a second control signal (5KHz, -90 DEG) and

"a subtractor module" (213) that subtracts the down-converted signal of the "second frequency down-conversion module" (204) from the down-converted signal of the "first frequency down-conversion module" (201).

Art Unit: 2634

Claim Rejections - 35 USC § 103

- 4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 5. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).
- 6. Claim 46 is rejected under 35 U.S.C. 103(a) as being unpatentable over Sanielevici et al (US 6,018,553) in view of Nash (US 6,317,589).

Sanielevici et al disclose all the subject matter claimed except for the subtractor being a differential amplifier. Nash teaches that a subtractor is typically a differential amplifier. Col.4, lines 45-46. Thus, it would have been obvious to one skilled in the art at the time the invention was made to implement the function unit of the subtractor (213) with a differential amplifier as taught by Nash.

Allowable Subject Matter

Page 3

Art Unit: 2634

7. Claims 42-45, 47-72 are objected to as being dependent upon a rejected base claim, but

would be allowable if rewritten in independent form including all of the limitations of the base

claim and any intervening claims.

8. Claim 77 is allowed.

Any inquiry concerning this communication or earlier communications from the

examiner should be directed to Kevin Y Kim whose telephone number is 703-305-4082. The

examiner can normally be reached on 8AM -- 5PM M-F.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor, Stephen Chin can be reached on 703-305-4714. The fax phone number for the

organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent

Application Information Retrieval (PAIR) system. Status information for published applications

may be obtained from either Private PAIR or Public PAIR. Status information for unpublished

applications is available through Private PAIR only. For more information about the PAIR

system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR

system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).

Amendment and Reply Under 37 C.F.R. § 1.111

RECEIVED

AUG 0 3 2004

Technology Center 2600

Sir:

PO Box 1450

In reply to the Office Action dated March 30, 2004, Applicants submit the following Amendment and Remarks. This Amendment is provided in the following format:

- (A) Each section begins on a separate sheet;
- (B) Starting on a separate sheet, a complete listing of all of the claims:
 - in ascending order;
 - with status identifiers; and
 - with markings in the currently amended claims;
- (C) Starting on a separate sheet, the Remarks.

It is not believed that extensions of time or fees for net addition of claims are required beyond those that may otherwise be provided for in documents accompanying this paper. However, if additional extensions of time are necessary to prevent abandonment of this application, then such extensions of time are hereby petitioned

07/28/2004 EABUBAK1 00000079 09632856

under 37 C.F.R. § 1.136(a), and any fees required therefore (including fees for net addition of claims) are hereby authorized to be charged to our Deposit Account No. 19-0036.

Amendments to the Claims

This listing of claims will replace all prior versions, and listings of claims in the application.

- 1 41. (canceled).
- 42. (currently amended) A wireless modem apparatus, comprising: a receiver for frequency down-converting an input signal including,

a first frequency down-conversion module to down-convert the input signal, wherein said first frequency down-conversion module down-converts said input signal according to a first control signal and outputs a first down-converted signal;

a second frequency down-conversion module to down-convert said input signal, wherein said second frequency down-conversion module down-converts said input signal according to a second control signal and outputs a second down-converted signal; and

a subtractor module that subtracts said second down-converted signal from said first down-converted signal and outputs a down-converted signal;

The apparatus of claim 41, wherein said second control signal is delayed relative to said first control signal by (.5 + n) cycles of said input signal, wherein n is an integer greater than or equal to 1.

43. (currently amended) A wireless modem apparatus, comprising:

a receiver for frequency down-converting an input signal including,

a first frequency down-conversion module to down-convert the input signal, wherein said first frequency down-conversion module down-converts said input signal according to a first control signal and outputs a first down-converted signal;

a second frequency down-conversion module to down-convert said input signal, wherein said second frequency down-conversion module down-converts said input signal according to a second control signal and outputs a second down-converted signal; and

a subtractor module that subtracts said second down-converted signal from said first down-converted signal and outputs a down-converted signal;

The apparatus of claim 41, wherein said first frequency down-conversion module under-samples said input signal according to said first control signal, and said second frequency down-conversion module under-samples said input signal according to said second control signal.

44. (currently amended) A wireless modem apparatus, comprising: a receiver for frequency down-converting an input signal including,

a first frequency down-conversion module to down-convert the input signal, wherein said first frequency down-conversion module down-converts said input signal according to a first control signal and outputs a first down-converted signal;

a second frequency down-conversion module to down-convert said input signal, wherein said second frequency down-conversion module down-converts said input signal according to a second control signal and outputs a second down-converted signal; and

a subtractor module that subtracts said second down-converted signal from said first down-converted signal and outputs a down-converted signal;

The apparatus of claim 41, wherein said first and said second frequency down-conversion modules each comprise a switch and a storage element.

- 45. (previously presented) The apparatus of claim 44, wherein said storage elements comprises a capacitor that reduces a DC offset voltage in said first down-converted signal and said second down-converted signal.
- 46. (currently amended) The apparatus of claim <u>42</u> [[41]], wherein said subtractor module comprises a differential amplifier.
 - 47. (currently amended) A wireless modem apparatus, comprising:

 a receiver for frequency down-converting an input signal including,

a first frequency down-conversion module to down-convert the input signal, wherein said first frequency down-conversion module down-converts said input signal according to a first control signal and outputs a first down-converted signal;

a second frequency down-conversion module to down-convert said input signal, wherein said second frequency down-conversion module down-converts said input signal according to a second control signal and outputs a second down-converted signal;

a subtractor module that subtracts said second down-converted signal from said first down-converted signal and outputs a down-converted signal;

The apparatus of claim 41, further comprising:

a [balanced] transmitter for up-converting a baseband signal and coupled to said [balanced] receiver, including,

an inverter, to receive said baseband signal and generate an inverted baseband signal;

a first controlled switch, coupled to a non-inverting output of said inverter, said first controlled switch to sample said baseband signal according to a third control signal, resulting in a first harmonically rich signal;

a second controlled switch, coupled to an inverting output of said inverter, said second controlled switch to sample said inverted baseband signal according to a fourth control signal, resulting in a second harmonically rich signal; and

a combiner, coupled to an output of said first controlled switch and an output of said second controlled switch, said combiner to combine said first harmonically rich signal and said second harmonically rich signal, resulting in a third harmonically rich signal.

- 48. (previously presented) The apparatus of claim 47, wherein said fourth control signal is phase shifted with respect to said third control signal.
- 49. (previously presented) The apparatus of claim 47, wherein said fourth control signal is phase shifted by 180 degrees with respect to said third control signal.
- 50. (previously presented) The apparatus of claim 47, further comprising a filter coupled to an output of said combiner, wherein said filter outputs a desired harmonic from said third harmonically rich signal.

- 51. (previously presented) The apparatus of claim 47, wherein said apparatus is an infrastructure device.
- 52. (previously presented) The apparatus of claim 47, wherein said apparatus is a client device.
- 53. (currently amended) The apparatus of claim 47, wherein said third first controlled switch shunts said baseband signal to a reference potential according to said first third control signal, and wherein said fourth second controlled switch shunts said inverted baseband signal to said reference potential according to said second fourth control signal.
- 54. (previously presented) The apparatus of claim 47, further comprising an antenna coupled to said balanced transmitter and said balanced receiver.
- 55. (previously presented) The apparatus of claim 54, further comprising a switch, said switch selectively connecting said transmitter or said receiver to said antenna.
- 56. (previously presented) The apparatus of claim 47, further comprising a baseband processor coupled to said transmitter and said receiver.

- 57. (previously presented) The apparatus of claim 47, further comprising a media access controller (MAC) coupled to said transmitter and said receiver.
- 58. (previously presented) The apparatus of claim 57, wherein said MAC comprises a means for controlling accessing to a WLAN medium.
- 59. (previously presented) The apparatus of claim 58, wherein said means for controlling includes carrier sense multiple access with collision avoidance (CSMA/CA).
- 60. (previously presented) The apparatus of claim 47, further comprising a demodulator/modulator facilitation module coupled to said transmitter and receiver.
- 61. (previously presented) The apparatus of claim 60, wherein said demodulator/modulator facilitation module comprises a means for modulating said baseband signal using differential binary phase shift keying (DBPSK).
- 62. (previously presented) The apparatus of claim 60, wherein said demodulator/modulator facilitation module comprises a means for de-modulating said down-converted signal using differential binary phase shift keying (DBPSK).
- 63. (previously presented) The apparatus of claim 60, wherein said demodulator/modulator facilitation module comprises a means for spreading said baseband signal.

- 64. (previously presented) The apparatus of claim 63, wherein said means for spreading comprises a means for spreading said baseband signal using a Barker code.
- 65. (previously presented) The apparatus of claim 60, wherein said demodulator/modulator facilitation module comprises a means for de-spreading said down-converted signal.
- 66. (previously presented) The apparatus of claim 65, wherein said means for de-spreading comprises a means for de-spreading said down-converted signal using a Barker code.
- 67. (previously presented) The apparatus of claim 60, wherein said demodulator/modulator facilitation module comprises a means for modulating said baseband signal using Gaussian phase shift keying (GFSK).
- 68. (previously presented) The apparatus of claim 60, wherein said demodulator/modulator facilitation module comprises a means for de-modulating said down converted signal using Gaussian phase shift keying (GFSK).
- 69. (previously presented) The apparatus of claim 60, wherein said demodulator/modulator facilitation module comprises a means for modulating said baseband signal using Orthogonal Frequency Division Multiplexing (OFDM).

- 70. (previously presented) The apparatus of claim 60, wherein said demodulator/modulator facilitation module comprises a means for de-modulating said down converted signal using Orthogonal Frequency Division Multiplexing (OFDM).
- 71. (previously presented) The apparatus of claim 60, wherein said demodulator/modulator facilitation module comprises a means for modulating said baseband signal using Complimentary Code Keying (CCK).
- 72. (previously presented) The apparatus of claim 60, wherein said demodulator/modulator facilitation module comprises a means for de-modulating said down converted signal using Complimentary Code Keying (CCK).
 - 73. (withdrawn) A method of receiving a wireless LAN signal, comprising:
 - (1) splitting the wireless LAN signal into I and Q components;
 - (2) down-converting said I signal component and said Q signal component;
 - (3) de-spreading said down-converted I and Q signals using a spreading code;
 - (4) differentially demodulating information encoded in said I and Q signals;

- (5) sending said demodulated information in said I and Q signals to a Media Access Controller (MAC) Interface wherein said I and Q signals are de-scrambled and combined to a single output signal.
- 74. (withdrawn) The method of claim 73, wherein separate spreading codes are used for the I and Q signal components in step (3).
- 75. (withdrawn) The method of claim 73, wherein step (4) comprises using Binary Phase Shift Keying (BPSK) to demodulate said I and Q signals.
- 76. (withdrawn) The method of claim 73, wherein step (4) comprises using Quadrature Phase Shift Keying (QPSK) to demodulate said I and Q signals.
- 77. (previously presented) In a wireless LAN device, a method of down-converting a received RF signal, comprising:

down-converting said received RF signal according to a first control signal and a second control signal, resulting in a down-converted signal, wherein said second control signal is delayed relative to said first control signal by (.5 + n) cycles of said received RF signal, wherein n is an integer greater than or equal to 1;

de-spreading said down-converted signal using a spreading code, resulting in a de-spread signal; and

de-modulating said de-spread signal, resulting in a de-modulated signal.

Remarks

Upon entry of the foregoing amendment, claims 42-77 are pending in the application, with claims 42-44, 47, and 77 being the independent claims. Claims 73-76 have been previously withdrawn from consideration. By the foregoing amendment, claims 42-44 and 46-47, and 53 are currently amended, and claim 41 is canceled without prejudice to or disclaimer of the subject matter therein. These changes are believed to introduce no new matter, and their entry is respectfully requested. Based on the above amendment and the following remarks, Applicants respectfully request that the Examiner reconsider all outstanding objections and rejections and that they be withdrawn.

Rejections under 35 U.S.C. §§ 102 and 103

The Office Action indicates that claim 41 is rejected under 35 U.S.C. § 102(e) as being unpatentable over U.S. patent number 6,018,553 to Sanielevici (hereinafter "Sanielevici"). Further, the Office Action indicates that claim 46 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Sanielevici. Claims 42-45 and 47-72 are indicated to be allowable over the cited art if rewritten in independent form. Claim 77 is allowed.

Claims 42-44 and 47 have been re-written in independent form to include the features of claim 41. Claim 41 has been canceled. Independent claims 42, 43, 44 and 47 have been further amended to delete the word "balanced," to more distinctly claim the invention. Accordingly, independent claims 42-44 and 47 and their respective dependent claims are allowable over the cited art. Claim 46 has been amended to depend from

claim 42. Therefore, Applicants request that the rejections under 35 U.S.C. §§ 102 and 103 be removed and that these claims be passed to allowance.

Conclusion

All of the stated grounds of objection and rejection have been properly traversed, accommodated, or rendered moot. Applicants therefore respectfully request that the Examiner reconsider all presently outstanding objections and rejections and that they be withdrawn. Applicants believe that a full and complete reply has been made to the outstanding Office Action and, as such, the present application is in condition for allowance. If the Examiner believes, for any reason, that personal communication will expedite prosecution of this application, the Examiner is invited to telephone the undersigned at the number provided.

Prompt and favorable consideration of this Amendment and Reply is respectfully requested.

Respectfully submitted,

Petition for Extension of Time Under 37 C.F.R. § 1.136(a)(1)

Commissioner for Patents PO Box 1450 Alexandria, VA 22313-1450

Sir:

It is hereby requested that the period for replying to the outstanding Office Action be extended one (1) month from June 30, 2004 to July 30, 2004 by the filing of this Petition and fee payment.

The petition fee (37 C.F.R. § 1.17(a)) is believed to be \$110.00 for a one (1) month for a large entity. Fee payment is provided in our accompanying PTO-2038 Credit Card Payment Form. However, if extensions of time under 37 C.F.R. § 1.136 other than those provided herewith are required to prevent abandonment of the present patent application, then such extensions of time are hereby petitioned.

TITLE OF INVENTION: WIRELESS LOCAL AREA NETWORK (WLAN) USING UNIVERSAL FREQUENCY TRANSLATION TECHNOLOGY INCLUDING MULTI-PHASE EMBODIMENTS AND CIRCUIT IMPLEMENTATIONS

APPLN. TYPE	SMALL ENTITY	ISSUE FEE	PUBLICATION FEE	TOTAL FEE(S) DUE	DATE DUE
nonprovisional	NO	\$1330	\$0	\$1330	12/10/2004

THE APPLICATION IDENTIFIED ABOVE HAS BEEN EXAMINED AND IS ALLOWED FOR ISSUANCE AS A PATENT. PROSECUTION ON THE MERITS IS CLOSED. THIS NOTICE OF ALLOWANCE IS NOT A GRANT OF PATENT RIGHTS. THIS APPLICATION IS SUBJECT TO WITHDRAWAL FROM ISSUE AT THE INITIATIVE OF THE OFFICE OR UPON PETITION BY THE APPLICANT. SEE 37 CFR 1.313 AND MPEP 1308.

THE ISSUE FEE AND PUBLICATION FEE (IF REQUIRED) MUST BE PAID WITHIN THREE MONTHS FROM THE MAILING DATE OF THIS NOTICE OR THIS APPLICATION SHALL BE REGARDED AS ABANDONED. STATUTORY PERIOD CANNOT BE EXTENDED. SEE 35 U.S.C. 151. THE ISSUE FEE DUE INDICATED ABOVE REFLECTS A CREDIT FOR ANY PREVIOUSLY PAID ISSUE FEE APPLIED IN THIS APPLICATION. THE PTOL-85B (OR AN EQUIVALENT) MUST BE RETURNED WITHIN THIS PERIOD EVEN IF NO FEE IS DUE OR THE APPLICATION WILL BE REGARDED AS ABANDONED.

HOW TO REPLY TO THIS NOTICE:

I. Review the SMALL ENTITY status shown above.

If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

- A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.
- B. If the status above is to be removed, check box 5b on Part B -Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and twice the amount of the ISSUE FEE shown above, or

If the SMALL ENTITY is shown as NO:

- A. Pay TOTAL FEE(S) DUE shown above, or
- B. If applicant claimed SMALL ENTITY status before, or is now claiming SMALL ENTITY status, check box 5a on Part B - Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and 1/2 the ISSUE FEE shown above.
- II. PART B FEE(S) TRANSMITTAL should be completed and returned to the United States Patent and Trademark Office (USPTO) with your ISSUE FEE and PUBLICATION FEE (if required). Even if the fee(s) have already been paid, Part B - Fee(s) Transmittal should be completed and returned. If you are charging the fee(s) to your deposit account, section "4b" of Part B - Fee(s) Transmittal should be completed and an extra copy of the form should be submitted.
- III. All communications regarding this application must give the application number. Please direct all communications prior to issuance to Mail Stop ISSUE FEE unless advised to the contrary.

IMPORTANT REMINDER: Utility patents issuing on applications filed on or after Dec. 12, 1980 may require payment of maintenance fees. It is patentee's responsibility to ensure timely payment of maintenance fees when due.

PART B - FEE(S) TRANSMITTAL

Complete and send this form, together with applicable fee(s), to: Mail

Mail Stop ISSUE FEE Commissioner for Patents P.O. Box 1450 Alexandria, Virginia 22313-1450

or Fax (703) 746-4000

INSTRUCTIONS: This form should be used for transmitting the ISSUE FEE and PUBLICATION FEE (if required). Blocks 1 through 5 should be completed where appropriate. All further correspondence including the Patent, advance orders and notification of maintenance fees will be mailed to the current correspondence address as indicated unless corrected below or directed otherwise in Block 1, by (a) specifying a new correspondence address; and/or (b) indicating a separate "FEE ADDRESS" for maintenance fee notifications. maintenance fee notifications. Note: A certificate of mailing can only be used for domestic mailings of the Fee(s) Transmittal. This certificate cannot be used for any other accompanying papers. Each additional paper, such as an assignment or formal drawing, must CURRENT CORRESPONDENCE ADDRESS (Note: Use Block 1 for any change of address) have its own certificate of mailing or transmission. 09/10/2004 7590 Certificate of Mailing or Transmission
I hereby certify that this Fee(s) Transmittal is being deposited with the United States Postal Service with sufficient postage for first class mail in an envelope addressed to the Mail Stop ISSUE FEE address above, or being facsimile transmitted to the USPTO (703) 746-4000, on the date indicated below. Determination of Patent Term Adjustment under 35 U.S.C. 154 (b)

(application filed on or after May 29, 2000)

The Patent Term Adjustment to date is 737 day(s). If the issue fee is paid on the date that is three months after the mailing date of this notice and the patent issues on the Tuesday before the date that is 28 weeks (six and a half months) after the mailing date of this notice, the Patent Term Adjustment will be 737 day(s).

If a Continued Prosecution Application (CPA) was filed in the above-identified application, the filing date that determines Patent Term Adjustment is the filing date of the most recent CPA.

Applicant will be able to obtain more detailed information by accessing the Patent Application Information Retrieval (PAIR) WEB site (http://pair.uspto.gov).

Any questions regarding the Patent Term Extension or Adjustment determination should be directed to the Office of Patent Legal Administration at (703) 305-1383. Questions relating to issue and publication fee payments should be directed to the Customer Service Center of the Office of Patent Publication at (703) 305-8283.

DATE MAILED: 09/10/2004

Notice of Fee Increase on October 1, 2004

If a reply to a "Notice of Allowance and Fee(s) Due" is filed in the Office on or after October 1, 2004, then the amount due will be higher than that set forth in the "Notice of Allowance and Fee(s) Due" because some fees will increase effective October 1, 2004. See Revision of Patent Fees for Fiscal Year 2005; Final Rule, 69 Fed. Reg. 52604, 52606 (May 10, 2004).

The current fee schedule is accessible from WEB site (http://www.uspto.gov/main/howtofees.htm).

If the fee paid is the amount shown on the "Notice of Allowance and Fee(s) Due" but not the correct amount in view of the fee increase, a "Notice of Pay Balance of Issue Fee" will be mailed to applicant. In order to avoid processing delays associated with mailing of a "Notice of Pay Balance of Issue Fee," if the response to the Notice of Allowance is to be filed on or after October 1, 2004 (or mailed with a certificate of mailing on or after October 1, 2004), the issue fee paid should be the fee that is required at the time the fee is paid. See Manual of Patent Examining Procedure (MPEP), Section 1306 (Eighth Edition, Rev. 2, May 2004). If the issue fee was previously paid, and the response to the "Notice of Allowance and Fee(s) Due" includes a request to apply a previously-paid issue fee to the issue fee now due, then the difference between the issue fee amount at the time the response is filed and the previously-paid issue fee should be paid. See MPEP Section 1308.01.

Effective October 1, 2004, 37 CFR 1.18 is amended by revising paragraphs (a) through (c) to read as set forth below.

\$605 AA

Section 1.18 Patent post allowance (including issue) fees.

(a) Issue fee for issuing each original or reissue patent, except a design or plant patent:

Due amali antitu (Cas. 1.27(a))

By a small entity (Sec. 1.2/(a))	\$085.00
By other than a small entity	\$1,370.00
(b) Issue fee for issuing a design patent:	
By a small entity (Sec. 1.27(a))	\$245.00
By other than a small entity	\$490.00
(c) Issue fee for issuing a plant patent:	

Questions relating to issue and publication fee payments should be directed to the Customer Service Center of the Office of Patent Publication at (703) 305-8283.

EXAMINER'S AMENDMENT

1. An examiner's amendment to the record appears below. Should the changes and/or

additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR

1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the

payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with

Mr. Jeffrey Helvey (Reg. # 44757) on September 7, 2004.

The application has been amended as follows:

In claim 54, on line 2, delete "balanced" before "transmitter" and delete "balanced"

before "receiver"

In claim 67, on line 3, change "GFSK" to -GPSK—

In claim 68, on line 3, change "GFSK" to -GPSK—

Cancel claims 73-76.

End of Examiner's amendment.

2. This application is in condition for allowance except for the presence of claims 73-76 to

an invention non-elected without traverse. Accordingly, claims 73-76 have been cancelled.

REASONS FOR ALLOWANCE

Page 2

Application/Control Number: 09/632,856 Page 3

Art Unit: 2634

3. The following is an examiner's statement of reasons for allowance: No prior art has been found to disclose or suggest a frequency down converter that down converts a received input signal in accordance with two control signals that are delayed relative to each other by (.5 + n) cycles of the input signal, wherein n is an integer greater than or equal to 1.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Kevin Y Kim whose telephone number is 703-305-4082. The examiner can normally be reached on 8AM --5PM M-F.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Stephen Chin can be reached on 703-305-4714. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).

IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

In re application of:

Sorrells et al

Appl. No.: 09/632,856

Filed: August 4, 2000

For: Wireless Local Area Network (WLAN) Using Universal

Frequency Translation Technology

Including Multi-Phase Embodiments and Circuit

Implementations

Confirmation No.: 2377

Art Unit: 2634

Examiner: Kevin Y. Kim

Atty. Docket: 1744.0630003

Amendment Under 37 C.F.R. § 1.312

Mail Stop Issue Fee

Commissioner for Patents PO Box 1450 Alexandria, VA 22313-1450

Sir:

Submitted herein is an Amendment Under 37 C.F.R. § 1.312. As payment of the issue fee has not yet been made or is filed herewith, Applicants respectfully submit that filing under 37 C.F.R. § 1.312 is proper. (M.P.E.P. § 714.16.)

It is believed that extensions of time are not required beyond those that may otherwise be provided for in documents accompanying this Amendment. However, if additional extensions of time are necessary to prevent abandonment of this application, then such extensions of time are hereby petitioned under 37 C.F.R. § 1.136(a), and any fees required therefor are hereby authorized to be charged to our Deposit Account No. 19-0036.

This Amendment is provided in the following format:

(A) Each section begins on a separate sheet;

- (B) Starting on a separate sheet, amendments to the specification by presenting replacement paragraphs marked up to show changes made;
- (C) Starting on a separate sheet, a complete listing of all of the claims:
 - in ascending order;
 - with status identifiers; and
 - with markings in the currently amended claims;
- (D) Starting on a separate sheet, the Remarks.

Amendments to the Specification:

On page 7, line 9, please amend the paragraph as follows:

FIGs. 42-44 are example implementations of a WLAN interface; FIG. 42 includes FIGs. 42A and 42B and should be referred to for all references to FIG. 42 in the specification. FIG. 43 includes FIGs. 43A and 43B and should be referred to for all references to FIG. 43 in the specification. FIG. 44 includes FIGs. 44A and 44B and should be referred to for all references to FIG. 44 in the specification.

On page 7, line 10, please amend the paragraph as follows:

FIGS. 45, 46A, and 46B <u>and 46C</u> relate to an example MAC interface for an example WLAN interface embodiment;

On page 7, line, 12, please amend the specification as follows:

FIGS. 47, 48, 49A, and 49B and 49C relate to an example demodulator/modulator facilitation module for an example WLAN interface embodiment; FIG. 47 includes FIGs. 47A-D and should be referred to for all references to FIG. 47 in the specification. FIG. 48 includes FIGs. 48A-B and should be referred to for all references to FIG. 47 in the specification.

On page 7, line 14, please amend the specification as follows:

FIGS. 50, 51, 52A, 52B, and 52C relate to an example alternate demodulator/modulator facilitation module for an example WLAN interface embodiment; FIG. 50 includes FIGs. 50A-D and should be referred to for all references to FIG.50 in the specification. FIG. 51 includes FIGs. 51A-B and should be referred to

for all references to FIG. 51 in the specification. FIG. 52B includes FIG. 52B-1 and should be referred to for all references to FIG. 52B in the specification.

On page 7, line 16, please amend the specification as follows:

FIGS. 53 and 54 relate to an example receiver for an example WLAN interface embodiment; FIG. 53 includes FIGs. 53A-C and should be referred to for all references to FIG. 53 in the specification.

On page 7, line 18, please amend the specification as follows:

FIGS. 55, 56A, and 56B relate to an example synthesizer for an example WLAN interface embodiment; <u>FIG. 55 includes FIGs. 55A-C and should be referred to for all references to FIG. 55 in the specification.</u>

On page 7, line 20, please amend the specification as follows:

FIGS. 57, 58, 59, 60, 61A, and 61B relate to an example transmitter for an example WLAN interface embodiment; <u>FIG. 57 includes FIGs. 57A-D and should be</u> referred to for all references to FIG. 57 in the specification. <u>FIG. 60 includes FIGs. 60A-D and should be referred to for all references to FIG. 60 in the specification.</u>

On page 7, lines 22, please amend the specification as follows:

FIGS. 62 and 63 relate to an example motherboard for an example WLAN interface embodiment; <u>FIG. 62 includes FIGs. 62A-I and should be referred to for all references to FIG. 62 in the specification.</u>

On page 7, lines 24-25, please amend the specification as follows:

FIGS. 64-66 relate to example LNAs for an example WLAN interface embodiment; FIG. 64 includes FIGs. 64A-C and should be referred to for all references to FIG. 64 in the specification. FIG. 65 includes FIGs. 65A-E and should be referred to for all references to FIG. 65 in the specification. FIG. 66 includes FIGs. 66A-B and should be referred to for all references to FIG. 66 in the specification.

On page 8, line 3, please amend the specification as follows:

FIG. 70A illustrates an IQ receiver having shunt UFT modules according to embodiments of the invention; <u>FIG. 70A includes FIGs. 70A-1 and should be referred to</u> for all references to FIG. 70A in the specification.

On page 8, line 9, please amend the specification as follows:

FIG. 70E illustrates an example IQ modulation receiver embodiment according to embodiments of the invention; <u>FIG. 70E includes FIG. 70E1 and FIG. 70E2 and should</u> be referred to for all references to FIG. 70E in the specification.

On page 8, line 15, please amend the specification as follows:

FIG. 70S illustrates a FET configuration of an IQ receiver embodiment according to embodiments of the invention; <u>FIG. 70S includes FIGs. 70S-1 and should be referred</u> to for all references to FIG. 70S in the specification.

On page 10, line 16, please amend the specification as follows:

FIGS. 90A-D illustrate[[s]] various implementation circuits for the modulator 7410, according to embodiments of the present invention; <u>FIG. 90B includes FIGs. 90B-1, 90B-2, 90B-3, and 90B-4 and should be referred to for all references to FIG. 90B in the specification. FIG. 90C includes FIGs. 90C-1, 90C-2, 90C-3, and 90C-4 and should be referred to for all references to FIG. 90C in the specification.</u>

On page 10, line 26, please amend the specification as follows:

FIGs. 95A-C, and FIGs. 96-161 illustrate schematics for an integrated circuit implementation example of the present invention. FIG. 97 includes FIGs. 97A-D and should be referred to for all references to FIG. 97 in the specification. FIG 105 includes FIGs. 105A-D, 105 E1-E2, and 105F-V, and should be referred to for all references to FIG. 105 in the specification. FIG. 106 includes FIGs. 106A-F and should be referred to for all references to FIG. 106 in the specification. FIG. 107 includes FIGs. 107A-D and should be referred to for all references to FIG. 107 in the specification. FIG. 109 includes FIGs. 109A-D and should be referred to for all references to FIG. 109 in the specification. FIG. 110 includes FIGs. 110A-D and should be referred to for all references to FIG. 110 in the specification. FIG. 112 includes FIGs. 112A-D and should be referred to for all references to FIG. 112 in the specification. FIG. 113 includes FIGs. 113A-F and should be referred to for all references to FIG. 113 in the specification. FIG. 115 includes FIGs. 115A-F and should be referred to for all references to FIG. 115 in the specification. FIG. 118 includes FIGs. 118A-D and should be referred to for all references to FIG. 118 in the specification. FIG. 123 includes FIGs. 123A-H and should be referred to for all references to FIG. 123 in the specification. FIG. 125 includes FIGs. 125A-H and should be referred to for all references to FIG. 125 in the specification. FIG.

126 includes FIGs. 126A-H and should be referred to for all references to FIG. 126 in the specification. FIG. 127 includes FIGs. 127A-D and should be referred to for all references to FIG. 127 in the specification. FIG. 150 includes FIGs. 150A-H and should be referred to for all references to FIG. 150 in the specification. FIG. 159 includes FIGs. 159A-D and should be referred to for all references to FIG. 159 in the specification. FIG. 160 includes FIGs. 160A-D and should be referred to for all references to FIG. 160 in the specification.

Remarks

Formal drawings are filed herewith. Due to the detailed nature of the drawings, some of the drawings (as filed) were divided into multiple sheets to comply with the formal drawing requirements. Note that any added sheets are labeled as "New Sheets" on the formal drawings. Accordingly, the "Brief Description of the Figures" section of the specification has been amended herein so as to be consistent with the formal drawings. None of the amendments add new matter or change the scope of the claims.

Accordingly, Applicants respectfully request that this Amendment be entered.

Respectfully submitted,

STERNE, KESSLER, GOLDSTEIN & FOX P.L.L.C.

Sir:

In response to the **Notice of Allowance and Issue Fee Due** dated September 10, 2004, the following documents are forwarded for appropriate action by the U.S. Patent and Trademark Office:

- 1. Issue Fee Transmittal (Form PTOL-85B);
- 2. Fee Transmittal (Form PTO/SB/17);
- 3. Amendment Under 37 C.F.R. § 1.312
- 4. Submission of Drawings;
- 5. <u>349</u> sheets of Drawings, approval of which is respectfully requested;
- 6. Return postcard; and
- 7. PTO-2038 Credit Card Payment Form for \$1,403.00 to cover: \$1,400.00 Issue Fee; and

\$ 3.00 Advance copies of patent.

It is respectfully requested that the attached postcard be stamped with the date of filing of these documents, and that it be returned to our courier.

Commissioner for Patents PO Box 1450 Alexandria, VA 22313-1450

Sir:

Submitted herewith are three-hundred forty-nine (349) sheets of drawings with Figures 1A, 1B, 1C, 1D, 2A, 2B, 3, 4, 5, 6A, 6B, 6C, 6D, 6E, 6F, 6G, 6H, 6I, 7, 8, 9, 10, 11, 12, 13, 14, 15A, 15B, 15C, 15D, 15E, 15F, 16, 17, 18, 19, 20A, 20A-1, 20B, 20C, 20D, 20E, 20F, 21, 22A, 22B, 22C, 22D, 22E, 22F, 23A, 23B, 23C, 23D, 23E, 23F, 24A, 24B, 24C, 24D, 24E, 24F, 24G, 24H, 24I, 24J, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42A, 42B, 43A, 43B, 44A, 44B, 45, 46A, 46B, 46C, 47, 47A, 47B, 47C, 47D, 48A, 48B, 49A, 49B, 49C, 50, 50A, 50B, 50C, 50D, 51A, 51B, 52A, 52B, 52B-1, 52C, 53, 53A, 53B, 53C, 54, 55, 55A, 55B, 55C, 56A, 56B, 57, 57A, 57B, 57C, 57D, 58, 59, 60, 60A, 60B, 60C, 60D, 61A, 61B, 62, 62A, 62B, 62C, 62D, 62E, 62F, 62G, 62H, 62I, 63, 64, 64A, 64B, 64C, 65, 65A, 65B, 65C, 65D, 65E, 66A, 66B, 67A, 67B, 68A, 68B, 69A, 69B, 70A, 70A-1, 70B, 70C, 70D, 70E1, 70E2, 70F, 70G, 70H, 70I, 70J, 70K, 70L, 70M, 70N, 70O, 70P, 70Q, 70R, 70S, 70S-1, 71A, 71B, 71C, 71D, 72A, 72B, 72C, 72D, 72E, 72F, 72G, 72H, 72I, 72J, 73A, 73B, 74, 75A, 75B, 75C, 76A, 76B, 77, 78, 79A, 79B, 79C, 79D, 80, 81A, 81B, 81C, 82, 83, 84, 85, 86, 87, 88, 89A, 89B, 89C, 89D, 89E, 90A, 90B, 90B-1, 90B-2, 90B-3, 90B-4, 90C, 90C-1, 90C-2, 90C-3, 90C-4, 90D, 91, 92, 93, 94, 95A, 95B, 95C, 96, 97A, 97B, 97C, 97D, 98, 99, 100, 101, 102, 103, 104, 105, 105A, 105B, 105C, 105D, 105E-1, 105E-2, 105F, 105G, 105H, 105I, 105J, 105K, 105L, 105M, 105N, 105O, 105P, 105Q, 105R, 105S, 105T, 105U, 105V, 106A, 106B, 106C, 106D, 106E, 106F, 107A, 107B, 107C, 107D, 108, 109A, 109B, 109C, 109D, 110A, 110B, 110C, 110D, 111, 112A, 112B, 112C, 112D, 113A, 113B, 113C, 113D, 113E, 113F, 114, 115A, 115B, 115C, 115D, 115E, 115F, 116, 117, 118A, 118B, 118C, 118D, 119, 120, 121, 122, 123A, 123B, 123C, 123D, 123E, 123F, 123G, 123H, 124, 125A, 125B, 125C, 125D, 125E, 125F, 125G, 125H, 126A, 126B,

126C, 126D, 126E, 126F, 126G, 126H, 127A, 127B, 127C, 127D, 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150A, 150B, 150C, 150D, 150E, 150F, 150G, 150H, 151, 152, 153, 154, 155, 156, 157, 158, 159A, 159B, 159C, 159D, 160A, 160B, 160C, 160D, 161, corresponding to the above-captioned application. Identification of the drawings is provided in accordance with 37 C.F.R. § 1.84(c). Acknowledgment of the receipt, approval, and entry of these drawings into this application is respectfully requested.

It is not believed that an extension of time is required, other than any already provided herewith. However, if an extension of time is needed to prevent abandonment of the application, then such extension of time is hereby petitioned. The U.S. Patent and Trademark Office is hereby authorized to charge any fee deficiency, or credit any overpayment, to our Deposit Account No. 19-0036.

Respectfully submitted,

STERNE, KESSLER, GOLDSTEIN & FOX P.L.L.C.

WARNING: Information on this form may become public. Credit card information should not be included on this form. Provide credit card information and authorization on PTO-2038.

This collection of information is required by 37 CFR 1.17 and 1.27. The information is required to obtain or retain a benefit by the public which is to file (and by the USPTO to process) an application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.14. This collection is estimated to take 12 minutes to complete, including gathering, preparing, and submitting the completed application form to the USPTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, VA 22313-1450. DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. SEND TO: Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.

Information Disclosure Statement

1. The information disclosure statement (IDS) submitted on November 12, 2004 was filed

after the mailing date of the Notice of Allowability on September 10, 2004. The submission is in

compliance with the provisions of 37 CFR 1.97. Accordingly, the information disclosure

statement has been considered by the examiner. In addition, the previously submitted IDS on

July 25, 2002, June 9, 2003, January 23, 2004, August 19, 2004 has been considered and

initialed and dated copies of PTO-1449s are hereby returned to applicant.

Any inquiry concerning this communication or earlier communications from the examiner should be

directed to Kevin Y. Kim whose telephone number is 571-272-3039. The examiner can normally be reached on

8AM --5PM M-F.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Kenneth

Vanderpuye can be reached on 571-272-3078. The fax phone number for the organization where this application or

proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information

Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR

or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more

information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the

Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).

Re: U.S. Utility Patent

Patent No. 7,110,444 B1; Issued: September 19, 2006

Wireless Local Area Network (WLAN) Using Universal Frequency

Translation Technology Including Multi-Phase Embodiments and Circuit

Implementations

Inventors: Sorrells et al. Our Ref: 1744.0630003

Sir:

Transmitted herewith for appropriate action are the following documents:

- 1. Request for Certificate of Correction Under 37 C.F.R. § 1.322;
- Exhibit A (4 pages of Examiner-initialed PTO-1449 forms); and
- Form PTO/SB/44 (5 pages).

The above listed documents are being electronically submitted through EFS-Web.

The U.S. Patent and Trademark Office is hereby authorized to charge any fee deficiency, or credit any overpayment, to our Deposit Account No. 19-0036.

Respectfully submitted,

STERNE, KESSLER, GOLDSTEIN & FOX P.L.L.C.

IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

Under 37 C.F.R. § 1.322

In repatent of: Confirmation No.: 2377

Sorrells *et al.* Art Unit: 2611

Patent. No.: 7,110,444 B1 Examiner: Kim, Kevin

Issued: September 19, 2006 Atty. Docket: 1744.0630003

For: Wireless Local Area Network (WLAN) Using Universal

Frequency Translation Technology

Including Multi-Phase Embodiments and Circuit Implementations

Request for Certificate of Correction

Attn: Certificate of Correction Branch

Commissioner for Patents PO Box 1450 Alexandria, VA 22313-1450

Sir:

It is hereby requested that a Certificate of Correction under 37 C.F.R. § 1.322 be issued for the above-captioned United States Patent. This Certificate of Correction is being requested due to mistakes which appear in the printed patent. These mistakes were made by the U.S. Patent and Trademark Office.

Specifically, the printed patent contains the following errors for which a Certificate of Correction is respectfully requested:

In Section (56), References Cited, a number of references that were cited and considered are missing. The specific references are those that were listed on pages 15-18 of the Information Disclosure Statement PTO-1449 form, filed December 15, 2004.

Copies of these Examiner-initialed pages are enclosed as Exhibit A for the convenience of the Examiner.

Remarks

The above-noted corrections do not involve such changes in the patent as would constitute new matter or would require reexamination.

A completed Form PTO/SB/44 accompanies this request, with the above-noted corrections printed thereon. Accordingly, a Certificate of Correction is believed proper and issuance thereof is respectfully requested.

The Commissioner is hereby authorized to charge any fee deficiency, or credit any overpayment, to our Deposit Account No. 19-0036.

Respectfully submitted,

STERNE, KESSLER, GOLDSTEIN & FOX P.L.L.C.

MAILING ADDRESS OF SENDER (Please do not use customer number below):

1100 New York Avenue, NW Washington DC 20005-3934 Atty. Dkt. No. 1744.0630003

This collection of information is required by 37 CFR 1.322, 1.323 and 1.324. The information is required to obtain or retain a benefit by the public which is to file (and by the USPTO to process) an application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.14. This collection is estimated to take 1.0 hour to complete, including gathering, preparing, and submitting the completed application form to the USPTO. Time will vary depending upon the individual case. Any comments on the amount of time you are required to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, VA 22313-1450. DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. **SEND TO: Attention Certificate of Corrections Branch, Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.**

If you need assistance in completing the form, call 1-800-PTO-9199 (1-800-786-9199) and select option 2.

UNITED STATES PATENT AND TRADEMARK OFFICE CERTIFICATE OF CORRECTION

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

New Applications Under 35 U.S.C. 111

If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

National Stage of an International Application under 35 U.S.C. 371

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

UNITED STATES DEPARTMENT OF COMMERCE Patent and Trademark Office

ASSISTANT SECRETARY OF COMMERCE AND COMMISSIONER OF PATENTS AND TRADEMARKS P.O. Box 1450

Alexandria, VA 22313-1450

August 6, 2007

Sterne Kessler Goldstein & Fox P L L C Suite 600 1100 New York Avenue N W Washington DC 20005-3934

Patent No. :

: 7,110,444 B1

Inventor(s)

: David F. Sorrells, et al.

Issued

: September 19, 2006

For

WIRELESS LOCAL AREA NETWORK

NO USING UNIVERSAL FREQUENCY

(WLAN) USING UNIVERSAL FREQUENCY TRANSLATION TECHNOLOGY INCLUDING

MULTI-PHASE EMBODIMENTS AND CIRCUIT IMPLEMENTATIONS

Doc. No.

1744.0630003

To Whom It May Concern:

The Certificate of Correction issued on <u>August 7, 2007</u>, issued in error, in that error(s) was made in identifying the patent number and/or keying text/corrections, i.e.:

On the second and third page of the issued cofc, in the heading, the page numbering is labeled incorrectly. The label should be displayed on second page as --Page 2 of 4-- and on third page as --Page 3 of 4--..

Therefore, a certificate of correction will be issued to correct (supersede) the Certificate of Correction containing error(s), made during preparation of the Certificate of Correction, as noted above.

No further response is required, from applicants (attorney). However, errors discovered by attorney, other than as noted and described above, should be noted on *a copy* of the Certificate of Correction that was issued in error, accompanied by a signed transmittal letter and submitted directed to this Branch.

Antonio Johnson (703) 308-9390 ext. 111 For Cecelia Newman, Supervisor Decisions & Certificates of Correction Branch (703) 305-8309 / 703-308-9390 ext. 102 cbn

PATENT NO.

: 7,110,444 B1

JON W. DUDAS
Director of the United States Patent and Trademark Office

Under the Paperwork Reduction Act of 1995, no persons are required to respond to a collection of information unless it displays a valid OMB control number.

POWER OF ATTORNEY TO PROSECUTE APPLICATIONS BEFORE THE USPTO I hereby revoke all previous powers of attorney given in the application identified in the attached statement under 37 CFR 3.73(b). I hereby appoint: Practitioners associated with the Customer Number: 22913 OR Practitioner(s) named below (if more than ten patent practitioners are to be named, then a customer number must be used): Registration Registration Number Number as attorney(s) or agent(s) to represent the undersigned before the United States Patent and Trademark Office (USPTO) in connection with any and all patent applications assigned only to the undersigned according to the USPTO assignment records or assignment documents attached to this form in accordance with 37 CFR 3.73(b). Please change the correspondence address for the application identified in the attached statement under 37 CFR 3.73(b) to: 22913 The address associated with Customer Number: ORFirm or Individual Name Address City State Zip Country Telephone Email Assignee Name and Address: A copy of this form, together with a statement under 37 CFR 3.73(b) (Form PTO/SB/96 or equivalent) is required to be filed in each application in which this form is used. The statement under 37 CFR 3.73(b) may be completed by one of the practitioners appointed in this form if the appointed practitioner is authorized to act on behalf of the assignee, and must identify the application in which this Power of Attorney is to be filed. SIGNATURE of Assignee of Record The individual whose signature and title is supplied below is authorized to act on behalf of the assignee Signature 10-27-2011 Name Telephone 904-732-6100 David F. Sorrells

This collection of information is required by 37 CFR 1.31, 1.32 and 1.33. The information is required to obtain or retain a benefit by the public which is to file (and by the USPTO to process) an application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.11 and 1.14. This collection is estimated to take 3 minutes to complete, including gathering, preparing, and submitting the completed application form to the USPTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, VA 22313-1450. DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. SEND TO: Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.

Title

If you need assistance in completing the form, call 1-800-PTO-9199 and select option 2.

Under the Paperwork Reduction Act of 1995, no persons are required to respond to a collection of information unless it displays a valid OMB control number.

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

New Applications Under 35 U.S.C. 111

If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

National Stage of an International Application under 35 U.S.C. 371

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

Resubmission of Information Disclosure Statements

Attn: Mail Stop Issue Fee

Commissioner for Patents PO Box 1450 Alexandria, VA 22313-1450

Sir:

During prosecution of the subject application, Applicants timely filed an Information Disclosure Statement and Supplemental Information Disclosure Statements on July 25, 2002, June 9, 2003, January 23, 2004, August 19, 2004 and November 12, 2004. However, at the time of Allowance, Applicants had not yet received back the Examiner-initialed PTO-1449 forms indicating that the references were considered. Applicants hereby resubmit the Information Disclosure Statement and Supplemental Information Disclosure Statements, as they were filed on July 25, 2002, June 9, 2003, January 23, 2004, August 19, 2004 and November 12, 2004, so that the Examiner can consider the references and return the initialed PTO-1449 forms. Copies of the references which were provided with the aforementioned filings (as required by

applicable PTO rules at the time of filing) are hereby also re-submitted for the convenience of the Examiner.

It is respectfully requested that the Examiner initial and return a copy of the enclosed PTO-1449s, and indicate in the official file wrapper of this patent application that the documents listed have been considered.

The U.S. Patent and Trademark Office is hereby authorized to charge any fee deficiency, or credit any overpayment, to our Deposit Account No. 19-0036.

Respectfully submitted,

STERNE, KESSLER, GOLDSTEIN & FOX P.L.L.C.

Information Disclosure Statement

Commissioner for Patents Washington, D.C. 20231

Sir:

Listed on accompanying Form PTO-1449 are documents that may be considered material to the examination of this application, in compliance with the duty of disclosure requirements of 37 C.F.R. §§ 1.56, 1.97 and 1.98.

In addition to providing hard copies of the documents as required by applicable rules (see box 6 below), Applicants herewith provide two Compact Discs labeled "Sterne1B" and "Sterne2B" having stored thereon searchable electronic copies (in PDF format) of the documents listed on the PTO-1449. More specifically, the "Sterne1B" CD contains electronic copies of documents AA1-AR1, AA2-AR2, AA3-AR3, AA4-AR4, AA5-AR5, AA6-AR6, AA7-AR7, AA8-AR8, AA9-AR9, AA10-AR10, AA11-AR11, AA12-AR12, AA13-AL13, AN13-AR13, AA14-AI14, AN14-AR14, AA15-AI15, AN15-AR15, AA16-AI16, AN16-AR16, AA17-AI17, AN17-AR17, AA18-AI18, AN18-AR18, AA19-AI19, AN19-AR19, AA20-AI20, AN20-AR20, AA21-AI21, AN21-AR21, AA22-AI22, AN22-AR22, AA23-AI23, AN23-AR23, AA24-AI24, AN24-AR24, AA25-AI25, AN25-AR25,

AA26-AI26, AN26-AR26, AA27-AI27, AN27-AR27, AA28-AI28, AN28-AR28, AA29-AI29, AN29-AR29, AA30-AI30, AN30-AR30, AA31-AI31, AN31-AR31, AA32-AI32, AN32-AR32, AA33-AI33, AN33-AR33, AA34-AI34, AN34-AR34, AA35-AI35, AN35-AR35, AA36-AI36, AN36-AR36, AA37-AI37, AN37-AR37, AA38-AI38, AN38-AR38, AA39-AI39 and AN39-AR39, and the "Sterne2B" CD contains electronic copies of documents AA40-AI40, AA41-AI41, AA42-AI42, AA43-AI43, AA44-AI44, AA45-AI45, AA46-AB46, AM10, AJ11-AM11, AJ12-AM12, AJ13-AL13, AP50-AR50 and AN51-AP51. Documents AC46-AI46, AA47-AI47, AA48-AI48, AA49-AD49, AM13, AJ14-AM14, AJ15-AM15, AJ16-AM16, AJ17-AM17, AJ18-AM18, AJ19, AK19, AQ51, AR51, AN52-AR52, AN53-AR53, AN54-AR54, AN55-AR55 and AN56 have not yet been scanned. The file names on the CDs correspond to the identifiers on the PTO-1449. It is noted that the CDs are being provided in addition to hard copies of the documents for the convenience of the Examiner.

Applicants have listed publication dates on the attached PTO-1449 based on information presently available to the undersigned. However, the listed publication dates should not be construed as an admission that the information was actually published on the date indicated.

Applicants reserve the right to establish the patentability of the claimed invention over any of the information provided herewith, and/or to prove that this information may not be prior art, and/or to prove that this information may not be enabling for the teachings purportedly offered.

Applicants provide the following comments regarding the documents:

Documents AD1, AL1, AO1, AC2, AF2, AG2, AI2, AC5, AG5, AB6, AF7, AI7, AB8, AF8, AG9, AK9, AO9, AO11, AA12, AE14, AN14, AB15, AE15, AH15, AO15, AF16, AD18, AG18, AB20, AC20, AQ20, AA22, AH22, AI23, AC24, AF26, AC30, AH31, AC32, AA33, AR33, AH34, AP35 and AO48 were included with Petitions to Make Special pleadings in co-owned related U.S. Patent Nos. 6,061,551, 6,061,555, 6,049,706 and 6,091,940.

Documents AM4, AH6, AL7, AJ9, AM9, AC17, AA20, AG20, AG21, AA24, AD24, AG24, AI31, AA32, AG34, AD36 and AQ37 were cited in searches performed at Applicants' request by the European Patent Office's Searching Authority in the above-referenced co-owned related patents.

Documents AA6, AD6, AO6, AE7, AE8, AA11, AE11, AH11, AI12, AB13, AD13, AH13, AC14, AG14, AE16, AB17, AF19, AD20, AN21, AG23, AH27, AI27, AI28, AH29, AG30, AD37, AR40, AO49 and AQ49 were suggested or identified by potential licensees.

Documents AH5, AH17, AD21, AB34, AE34, AB36, AI36 and AI38 were cited by the Examiner in the above-referenced co-owned related patents.

Documents AR21, AN22-AR22, AN23-23, AN24-AR24, AN25-AR25, AN26-AR26, AN27-AR27, AN28-AR28, AN29-AR29, AN30-AR30, AN31-AR31, AN32-AR32 and AN33-AP33 are press releases issued by assignee ParkerVision, Inc.

Documents AP6-AR6 and AN7-AP7 are copies of Declarations (including Exhibits) made by Messrs. Bultman, Cook, Holtz, Looke, Moses, Parker, and Sorrells, filed in the above-referenced co-owned related patents.

Documents AJ1, AL9, AJ10, AA19, AC25, AB30 and AF32 were cited in search reports in the corresponding foreign applications of the above-referenced co-owned related patents.

Documents AK9, AC17, AD36 and AD40 were listed in a search report issued by the International Searching Authority in PCT application serial number PCT/US00/21359, filed August 4, 2000, entitled "Wireless Local Area Network (WLAN) Using Universal Frequency Translation Technology," directed to related subject matter.

Documents AM10, AJ11, AK11 and AE40 were listed in a communication issued by the International Preliminary Examination Authority in PCT application serial number PCT/US00/01108, filed January 19, 2000, entitled "Frequency Translation and Embodiments Thereof Such as the Family Radio Service," directed to related subject matter.

Documents AI7, AJ9, AK9, AG20, AG21, AB30 and AI43 were listed in a written opinion issued by the International Preliminary Examination Authority in PCT application serial number PCT/US00/23923, filed October 18, 1999, entitled "Applications of Frequency Translation," directed to related subject matter.

Documents AA44, AL11, AM11 and AQ50 were listed in a communication issued by the International Searching Authority in PCT application serial number PCT/US00/09911, filed April 14, 2000, entitled "Method And System For Down-converting an Electromagnetic Signal, And Transforms For Same," directed to related subject matter.

Documents AB44 and AC44 were cited by an Examiner in co-pending U.S. Patent Application Serial No. 09/293,342, filed April 16, 1999, entitled "Method and System for Down-Converting Electromagnetic Signals Including Resonant Structures for Enhanced Energy Transfer," directed to related subject matter.

Documents AD44-AI44 and AA45-AD45 were cited by an Examiner in co-pending U.S. Patent Application Serial No. 09/261,129, filed March 3, 1999, entitled "Applications of Universal Frequency Translation," directed to related subject matter.

Documents AE45, AF45, AJ12 and AK12 were listed in a search report issued by the International Searching Authority in PCT application serial number PCT/US00/27555, filed October 6, 2000, entitled "DC Offset, Re-radiation, and I/Q Solutions Using Universal Frequency Translation Technology," directed to related subject matter.

Documents AG45, AH45, AL12 and AM12 were listed in a search report issued by the International Searching Authority in PCT application serial number PCT/US00/34771, filed January 21, 2000, entitled "Phase Comparator Using Undersampling," directed to related subject matter.

Documents AI45, AJ13-AL13 and AB46 were listed in a search report issued by the International Searching Authority in PCT application serial number PCT/US00/27281, filed October 4, 2000, entitled "Frequency Converter and Method," directed to related subject matter.

Document AA46 was cited by an Examiner in co-pending U.S. Patent Application Serial No. 09/293,580, filed April 16, 1999, entitled "Method and System for Frequency Up-Conversion with a Variety of Transmitted Configurations," directed to related subject matter.

Document AC46 was cited by an Examiner in co-pending U.S. Patent Application Serial No. 09/670,831, filed September 28, 2000, entitled "Universal Frequency Translation, Embodiments Thereof, and a Web Site and Web Pages Directed to Same," directed to related subject matter.

Document AD46 was cited by an Examiner in co-pending U.S. Patent Application Serial No. 09/293,095, filed April 16, 1999, entitled "Method and System for Down-Converting an Electromagnetic Signal Having Optimized Switch Structures," directed to related subject matter.

Documents AD35, AE46-AI46 and AA47 were cited by an Examiner in co-pending U.S. Patent Application Serial No. 09/293,342, filed April 16, 1999, entitled "Method and System for Down-Converting Electromagnetic Signals Including Resonant Structures for Enhanced Energy Transfer," directed to related subject matter.

Documents AJ1, AK9-AM9, AG28, AB30, AA32, AN52 and AP55 were cited in an Examination Report in co-pending European Patent Application Serial No. 99954905.8, filed October 18, 1999, entitled "Integrated Frequency Translation and Selectivity with a Variety of Filter Embodiments," directed to related subject matter.

Documents AM13, AJ14, AK14 and AQ51 were cited in an Examination Report in co-pending Japanese Patent Application No. 2000-577,765, filed June 21, 2000, entitled "Method and System for Ensuring Reception of a Communications Signal," directed to related subject matter.

Documents AL14, AM14, AJ15 and AK15 were cited in an Examination Report in co-pending Japanese Patent Application No. 2000-577,761, filed June 20, 2000, entitled "Method and System for Frequency Up-conversion," directed to related subject matter.

Documents AL15, AM15, AJ16-AM16 and AJ17-AM17 were cited in an Examination Report in co-pending Japanese Patent Application No. 2000-577,764, filed June 21, 2000, entitled "Applications of Frequency Translation," directed to related subject matter.

()

Documents AJ18-AL18, AB47, AC47 and AE47-AG47 were cited by an Examiner in co-pending U.S. Patent Application Serial No. 09/489,675, filed January 24, 2000, entitled "Bar Code Scanner Using Universal Frequency Translation Technology for Up-Conversion and Down-Conversion," directed to related subject matter.

Documents AC24 and AD47 were cited by an Examiner in co-pending U.S. Patent Application Serial No. 09/376,509, filed August 18, 1999, entitled "Method and System for Ensuring Reception of a Communications Signal," directed to related subject matter.

Documents AH47, AI47 and AA48-AE48 are co-owned patents which are directed to related subject matter.

Documents AI43, AH47 and AH48 were cited by an Examiner in co-pending U.S. Patent Application Serial No. 09/293,283, filed April 16, 1999, entitled "Integrated Frequency Translation and Selectivity with a Variety of Filter Embodiments," directed to related subject matter.

Documents AA38 and AG48 were cited by an Examiner in co-pending U.S. Patent Application Serial No. 09/476,091, filed January 3, 2000, entitled "Image-Reject Down-Converter and Embodiments Thereof, Such as the Family Radio Service," directed to related subject matter.

Documents AK19 and AF48 were listed in a search report issued by the International Searching Authority in PCT application serial number PCT/US01/15111, filed October 5, 2001, entitled "Method and Apparatuses Relating to a Universal Platform Module and Enabled by Universal Frequency Translation Technology," directed to related subject matter.

Documents AI48 and AA49 were cited by an Examiner in co-pending U.S. Patent Application Serial No. 09/567,963, filed May 10, 2000, entitled "Frequency Synthesizer Using Universal Frequency Translation Technology," directed to related subject matter.

Document AB49 is a copy of co-pending U.S. Patent Application Serial No. 09/525,615, filed March 14, 2000, entitled "Method, System, and Apparatus for Balanced Frequency Up-Conversion of a Baseband Signal," directed to related subject matter. In the copy provided, the claims are shown as amended on June 6, 2001.

Document AC49 is a copy of co-pending U.S. Patent Application Serial No. 09/632,855, filed August 14, 2000, entitled "Wireless Local Area Network (WLAN) Using Universal Frequency Translation Technology Including Multi-Phase Embodiments," directed to related subject matter. In the copy provided, the claims are shown as amended on June 12, 2001.

Document AD49 is a copy of co-pending U.S. Patent Application Serial No. 09/632,857, filed August 14, 2000, entitled "Wireless Local Area Network (WLAN) Technology and Applications Including Techniques of Universal Frequency Translation," directed to related subject matter. In the copy provided, the claims are shown as amended on June 6, 2001.

It is noted that some of these documents could be classified in more than one of the above categories.

The other documents in the PTO-1449 do not fall within the above categories.

This statement should not be construed as a representation that information more material to the examination of the present patent application does not exist. The Examiner is specifically requested not to rely solely on the material submitted herewith.

Applicants have checked the appropriate boxes below.

- □ 2. This Information Disclosure Statement is being filed more than three months after the U.S. filing date AND after the mailing date of the first Office Action on the merits, but before the mailing date of a Final Rejection or Notice of Allowance.
 - □ a. I hereby state that each item of information contained in this Information Disclosure Statement was cited in a communication from a foreign patent office in a counterpart foreign application not more than three months prior to the filing of this Information Disclosure Statement.

 37 C.F.R. § 1.97(e)(1).
 - □ b. I hereby state that no item of information in this Information Disclosure Statement was cited in a communication from a foreign patent office in a counterpart foreign application and, to my knowledge after making reasonable inquiry, was known to any individual designated in 37 C.F.R. § 1.56(c) more than three months prior to the filing of this Information Disclosure Statement. 37 C.F.R. § 1.97(e)(2).
 - □ c. Attached is our check no.____ in the amount of ____ in payment of the fee under 37 C.F.R. § 1.17(p).
- □ 3. This Information Disclosure Statement is being filed more than three months after the U.S. filing date and after the mailing date of a Final Rejection or Notice of Allowance, but before payment of the Issue Fee. A separate Petition to the Group Director, requesting consideration of this Information Disclosure Statement, is concurrently submitted herewith, along with our Check No.

 ______ in the amount of \$ ______ in payment of the fee under 37 C.F.R. § 1.17(i).
 - □ a. I hereby state that each item of information contained in this Information

 Disclosure Statement was cited in a communication from a foreign

 patent office in a counterpart foreign application not more than three

months prior to the filing of this Information Disclosure Statement. 37 C.F.R. § 1.97(e)(1).

()

- □ b. I hereby state that no item of information in this Information Disclosure

 Statement was cited in a communication from a foreign patent office
 in a counterpart foreign application and, to my knowledge after
 making reasonable inquiry, was known to any individual designated
 in 37 C.F.R. § 1.56(c) more than three months prior to the filing of
 this Information Disclosure Statement. 37 C.F.R. § 1.97(e)(2).
- □ 4. The document(s) was/were cited in a search report by a foreign patent office in a counterpart foreign application. Submission of an English language version of the search report that indicates the degree of relevance found by the foreign office is provided in satisfaction of the requirement for a concise explanation of relevance. 1138 OG 37, 38.
- Some is explanations of the relevance of the non-English language documents AJ1, AK1, AJ6, AK7, AJ8-AL8, AK11-AM11, AJ12, AM13, AJ14-AM14, AJ15-AM15, AJ16-AM16, AJ17-AM17, AJ18-AL18, AQ50 and AQ51 appear below:
 - Document AJ1 (DE 42 37 692 C1) appears to be a receiver for a digital radio signal. The corresponding U.S. Patent No. 5,493,721 is enclosed as document AG28 on the attached PTO-1449.
 - Document AK1 (EP 0 035 166 A1) appears to describe a digitized receiver. A copy of the English language abstract of document AK1 is enclosed as document AQ8 on the attached PTO-1449.
 - Document AJ6 (EP 0 785 635 A1) appears to describe a method and apparatus for frequency diversity transmission using a plurality of uncorrelated carriers. A copy of the English language abstract of document AJ6 is enclosed as document AP8 on the attached PTO-1449.
 - Document AK7 (FR 2 743 231 A1) is the corresponding French application of document AJ6 (EP 0 785 635 A1), which is described above.

- Document AJ8 (JP 2-39632) appears to describe a transmitter for frequency diversity. A copy of the English language abstract of document AJ8 is enclosed as document AO8 on the attached PTO-1449.
- Document AK8 (JP 2-131629) appears to describe a transmitter-receiver for frequency diversity. A copy of the English language abstract of document AK8 is enclosed as document AN8 on the attached PTO-1449.
- Document AL8 (JP 2-276351) appears to describe an FSK demodulating circuit. A copy of the English language abstract of document AL8 is enclosed as document AR7 on the attached PTO-1449.
- Document AK11 (FR 2245130) appears to describe a converter. A partial English language translation of document AK11 is enclosed as document AP50 on the attached PTO-1449.
- Document AL11 (DE 3541031) appears to describe a method and device for demodulating high-frequency modulated signals. An English translation of document AL11 is enclosed as document AR50 on the attached PTO-1449.
- Document AM11 (EP 0 732 803) appears to describe a procedure and device for demodulation by sampling. An English translation of document AM11 is enclosed as document AN51 on the attached PTO-1449.
- Document AJ12 (DE 19735798) appears to describe a transceiver. An English translation of document AJ12 is enclosed as document AP51 on the attached PTO-1449.
- Document AM13 (JP 56-114451) appears to describe a system for diversity radio transmission. The corresponding U.S. Patent No. 4,363,132 is enclosed as document AF8 on the attached PTO-1449.
- Document AJ14 (JP 8-32556) appears to describe a data transmitter-receiver. A copy of the English language abstract of document AJ14 is enclosed as document AO52 on the attached PTO-1449.
- Document AK14 (JP 8-139524) appears to describe a frequency converting circuit and radio communication device. A copy of the English language abstract of document AK14 is enclosed as document AP52 on the attached PTO-1449.

- Document AL14 (JP 59-144249) appears to describe a pulse signal transmission system. A copy of the English language abstract of document AL14 is enclosed as document AQ52 on the attached PTO-1449.
- Document AM14 (JP 63-54002) appears to describe a microwave burst signal generator which incorporates a FET frequency multiplier. A copy of the English language abstract of document AM14 is enclosed as document AR52 on the attached PTO-1449.
- Document AJ15 (JP 6-237276) appears to describe a quadrature modulator. A copy of the English language abstract of document AJ15 is enclosed as document AN53 on the attached PTO-1449.
- Document AK15 (JP 8-23359) appears to describe a digital quadrature modulation device. A copy of the English language abstract of document AK15 is enclosed as document AO53 on the attached PTO-1449.
- Document AL15 (JP 47-2314) appears to describe a demodulator. An English language translation of document AL15 is enclosed as document AP53 on the attached PTO-1449.
- Document AM15 (JP 58-7903) appears to describe a switched capacitor modulator.

 A partial English language translation of document AM15 is enclosed as document AQ53 on the attached PTO-1449.
- Document AJ16 (JP 58-133004) appears to describe an amplitude detector. A copy of the English language abstract of document AJ16 is enclosed as document AR53 on the attached PTO-1449.
- Document AK16 (JP 60-58705) appears to describe a frequency converting circuit.

 A copy of the English language abstract of document AK16 is enclosed as document AN54 on the attached PTO-1449.
- Document AL16 (JP 4-123614) appears to describe a level converting circuit. A copy of the English language abstract of document AL16 is enclosed as document AO54 on the attached PTO-1449.
- Document AM16 (JP 4-127601) appears to describe a frequency conversion circuit.

 A copy of the English language abstract of document AM16 is enclosed as document AP54 on the attached PTO-1449.

- Document AJ17 (JP 5-175730) appears to describe a time division direct receiver. A copy of the English language abstract of document AJ17 is enclosed as document AQ54 on the attached PTO-1449.
- Document AK17 (JP 5-175734) appears to describe an FM demodulator. A copy of the English language abstract of document AK17 is enclosed as document AR54 on the attached PTO-1449.
- Document AL17 (JP 7-154344) appears to describe a receiver for receiving modulated carrier signals and an IQ mixer/demodulator using it's receiving constitution. A copy of the English language abstract of document AL17 is enclosed as document AN55 on the attached PTO-1449.
- Document AM17 (JP 7-307620) appears to describe a bottom detection circuit. A copy of the English language abstract of document AM17 is enclosed as document AO55 on the attached PTO-1449.
- Document AJ18 (JP 55-66057) appears to describe a bar-code detection circuit. A copy of the English language abstract of document AJ18 is enclosed as document AQ55 on the attached PTO-1449.
- Document AK18 (JP 63-65587) appears to describe a wireless light pen device. A copy of the English language abstract of document AK18 is enclosed as document AR55 on the attached PTO-1449.
- Document AL18 (JP 63-153691) appears to describe a data transfer for a semiconductor data carrier system. A copy of the English language abstract of document AL18 is enclosed as document AN56 on the attached PTO-1449.
- Document AQ50 (Fest *et al.*) appears to discuss analog-digital converters. An English translation of document AQ50 is enclosed as document AO51 on the attached PTO-1449.
- Document AQ51 (Miki *et al.*) appears to describe modulation systems. A partial English-language translation of document AQ51 is enclosed as document AR51 on the attached PTO-1449.

No. 09/525,615, filed March 14, 2000, which is relied upon for an earlier filing date under 35 U.S.C. § 120. Thus, copies of these documents are not attached. 37 C.F.R. § 1.98(d).

It is respectfully requested that the Examiner initial and return a copy of the enclosed PTO-1449, and indicate in the official file wrapper of this patent application that the documents have been considered.

The U.S. Patent and Trademark Office is hereby authorized to charge any fee deficiency, or credit any overpayment, to our Deposit Account No. 19-0036.

Respectfully submitted,

STERNE, KESSLER, GOLDSTEIN & FOX P.L.L.C.

Re:

U.S. Utility Patent Application

Appl. No. 09/632,856; Filed: August 4, 2000

For:

Wireless Local Area Network (WLAN) Using Universal Frequency

Translation Technology Including Multi-Phase Embodiments and

Circuit Implementations

Inventors:

Sorrells et al.

Our Ref:

1744.0630003/MQL/JTH

Sir:

Transmitted herewith for appropriate action are the following documents:

- 1. Information Disclosure Statement;
- 2. A list of the cited documents on Forms PTO-1449 (56 pages);
- 3. A copy of the twelve (12) documents cited on Forms PTO-1449;
- 4. A compact Disc labeled "Sterne1B" in PDF format;
- 5. A compact Disc labeled "Sterne2B" in PDF format; and
- 6. Return postcard.

It is respectfully requested that the attached postcard be stamped with the date of filing of these documents, and that it be returned to our courier. In the event that extensions of time are

Sterne, Kessler, Goldstein & Fox P.L.L.C. : 1100 New York Avenue, NW : Washington, DC 20005 : 202.371.2600 f 202.371.2540 : www.skgf.com

Re:

U.S. Utility Patent Application

Appl. No. 09/632,856; Filed: August 4, 2000

For:

Wireless Local Area Network (WLAN) Using Universal Frequency Translation Technology Including Multi-Phase Embodiments and

Circuit Implementations

Inventors:

David F. SORRELLS et al.

Our Ref:

1744.0630003

Sir:

Transmitted herewith for appropriate action are the following documents:

- Second Preliminary Amendment Under 37 C.F.R. § 1.115 in the Revised Format 1. of the Pre-OG Notice Dated January 31, 2003;
- 2. Supplemental Information Disclosure Statement;
- A listing of the cited documents on Form PTO-1449 (4 pages); 3.
- 4. Copies of the cited documents (AE49-AI49; AL19-AM19; AO56-AR56; AA50-AI50; AJ20-AM20; AN57-AQ57; AA51-AF51; AJ21-AM21; AJ22); and
- 5. One (1) return postcard.

It is respectfully requested that the attached postcard be stamped with the date of filing of these documents, and that it be returned to our courier. In the event that extensions of time are necessary to prevent abandonment of this patent application, then such extensions of time are hereby petitioned.

Supplemental Information Disclosure Statement

Commissioner for Patents Washington, D.C. 20231

Sir:

Listed on accompanying Form PTO-1449 are documents that may be considered material to the examination of this application, in compliance with the duty of disclosure requirements of 37 C.F.R. §§ 1.56, 1.97 and 1.98. The reference numbering on the accompanying Form PTO-1449 for this Supplemental Information Disclosure Statement is a continuation of the numbering in Applicants' Information Disclosure Statement filed on July 25, 2002 in connection with the above-captioned application.

Applicants have listed publication dates on the attached PTO-1449 based on information presently available to the undersigned. However, the listed publication dates should not be construed as an admission that the information was actually published on the date indicated.

Applicants reserve the right to establish the patentability of the claimed invention over any of the information provided herewith, and/or to prove that this information may

not be prior art, and/or to prove that this information may not be enabling for the teachings purportedly offered.

Applicants provide the following comments regarding the documents:

Document AE49 is a co-owned patent which is directed to related subject matter.

Document AF49 was cited in an Office Action in co-pending U.S. Patent Application Serial No. 09/489,675, filed January 24, 2000, entitled "Bar Code Scanner Using Universal Frequency Translation Technology for Up-Conversion and Down-Conversion," directed to related subject matter. Also cited in said Office Action was U.S. Patent No. 6,091,940, which was cited in Applicants' Information Disclosure Statement filed on July 25, 2002 in connection with the above-captioned application.

Documents AG49-AI49 and AA50-AC50 were cited in an Office Action in copending U.S. Patent Application Serial No. 09/476,092, filed January 3, 2000, entitled "Analog Zero IF FM Decoder and Embodiments Thereof, Such as the Family Radio Service," directed to related subject matter.

Documents AL19, AM19 and AD50 were cited in an International Search Report in PCT Appl. No. PCT/US01/08969, filed March 22, 2001, entitled, "Integrated Frequency Translation and Selectivity with a Gain Control Functionality, and Applications Thereof," directed to related subject matter. Also cited in said Search Report were U.S. Patent Nos. 4,888,557 and 5,801,654 and PCT Publication Nos. WO 96/02977 and WO 96/39750, which were cited in Applicants' Information Disclosure Statement filed on July 25, 2002 in connection with the above-captioned application.

Document AJ20 was cited in an Office Action in co-pending Japanese Patent Application Serial No. 2000-577,764, filed June 21, 2000, entitled "Applications of

Universal Frequency Translation,". Also cited in said Office Action was Japanese Patent Publication No. 58-133004, which was cited in Applicants' Information Disclosure Statement filed on July 25, 2002 in connection with the above-captioned application.

Documents AK20, AL20, AJ21, AK21, AL21, AP56 and AQ56 were cited in an International Search Report in PCT Appl. No. PCT/US01/12086, filed April 13, 2001, entitled, "Frequency Converter," directed to related subject matter. Also cited in said International Search Report was U.S. Patent No. 5,844,449, which was cited in Applicants' Information Disclosure Statement filed on July 25, 2002 in connection with the above-captioned application.

Document AE50 was cited in an Office Action in co-pending U.S. Patent Application Serial No. 09/376,509, filed August 18, 1999, entitled "Method and System for Ensuring Reception of a Communications Signal," directed to related subject matter.

Documents AM21 and AJ22 were cited in an Official Notice of Rejection in copending Japanese Patent Application No. 2000-577,765, filed June 21, 2000, entitled "Method and System for Ensuring Reception of a Communications Signal," directed to related subject matter. Also cited in said Rejection were Japanese Patent Publication Nos. 56-114451, 8-32556 and 8-139524, which were cited in Applicants' Information Disclosure Statement filed on July 25, 2002 in connection with the above-captioned application.

Documents AF50-AH50, AA51, AC51 and AF51 were cited in and Office Action in co-pending U.S. Patent Application Serial No. 09/476,330, filed January 3, 2000, entitled "Multi-Mode, Multi-Band Communication System," directed to related subject matter.

Document AI50 was cited in an Office Action in co-pending U.S. Patent Application Serial No. 09/567,963, filed May 10, 2000, entitled "Frequency Synthesizer Using Universal Frequency Translation Technology," directed to related subject matter.

Documents AB51, AD51 and AE51 were cited in an Office Action in co-pending U.S. Patent Appl. No. 09/526,041, filed March 14, 2000, entitled, "DC Offset, Re-radiation, and I/Q Solutions Using Universal Frequency Translation Technology," directed to related subject matter.

The other documents in the PTO-1449 do not fall within the above categories.

It is noted that some of these documents could be classified in more than one of the above categories.

This statement should not be construed as a representation that information more material to the examination of the present patent application does not exist. The Examiner is specifically requested not to rely solely on the material submitted herewith.

Applicants have checked the appropriate boxes below.

- 1. This Information Disclosure Statement is being filed before the mailing of a first Office Action. No statement or fee is required.
- This Information Disclosure Statement is being filed more than three months after the U.S. filing date AND after the mailing date of the first Office Action on the merits, but before the mailing date of a Final Rejection or Notice of Allowance.
 - □ a. I hereby state that each item of information contained in this Information

 Disclosure Statement was cited in a communication from a

 foreign patent office in a counterpart foreign application not more
 than three months prior to the filing of this Information Disclosure

 Statement. 37 C.F.R. § 1.97(e)(1).

()

- □ b. I hereby state that no item of information in this Information Disclosure Statement was cited in a communication from a foreign patent office in a counterpart foreign application and, to my knowledge after making reasonable inquiry, was known to any individual designated in 37 C.F.R. § 1.56(c) more than three months prior to the filing of this Information Disclosure Statement. 37 C.F.R. § 1.97(e)(2).
- □ c. Attached is our Check No. 32067 in the amount of \$_____ in payment of the fee under 37 C.F.R. § 1.17(p).
- □ 3. This Information Disclosure Statement is being filed more than three months after the U.S. filing date and after the mailing date of a Final Rejection or Notice of Allowance, but before payment of the Issue Fee. A separate Petition to the Group Director, requesting consideration of this Information Disclosure Statement, is concurrently submitted herewith, along with our Check No. ______ in the amount of \$ _____ in payment of the fee under 37 C.F.R. § 1.17(i).
 - □ a. I hereby state that each item of information contained in this Information

 Disclosure Statement was cited in a communication from a

 foreign patent office in a counterpart foreign application not more
 than three months prior to the filing of this Information Disclosure

 Statement. 37 C.F.R. § 1.97(e)(1).
 - □ b. I hereby state that no item of information in this Information Disclosure Statement was cited in a communication from a foreign patent office in a counterpart foreign application and, to my knowledge after making reasonable inquiry, was known to any individual designated in 37 C.F.R. § 1.56(c) more than three months prior to the filing of this Information Disclosure Statement. 37 C.F.R. § 1.97(e)(2).
- □ 4. The document(s) was/were cited in a search report by a foreign patent office in a counterpart foreign application. Submission of an English language version of the search report that indicates the degree of relevance found

- by the foreign office is provided in satisfaction of the requirement for a concise explanation of relevance. 1138 OG 37, 38.
- 5. Concise explanations of the relevance of non-English language documents AJ20AL20, AK21, AM21 and AJ22 appear below:
 - Document AJ20 (JP 60-130203) appears to describe a frequency converter. A copy of the English language translation of document AJ20 is enclosed as document AO56 on the attached PTO-1449.
 - Document AK20 (DE 196 27 640 A1) appears to describe a mixer. Document AK20 is a counterpart German application of U.S. Patent No. 5,680,078, which was cited in Applicants' Information Disclosure Statement filed on July 25, 2002 in connection with the above-captioned application.
 - Document AL20 (EP 0 087 336 A1) appears to describe a transistorized mixer for microwave transmitters. The granted version of document AL20 is cited as document AM20 (EP 0 087 336 B1) and contains an Englishlanguage version of the claims.
 - Document AK21 (FR 2 669 787 A1) appears to describe a symmetrical super high frequency mixer. A copy of the English-language abstract of document AK21 is enclosed as document AR56 on the attached PTO-1449.
 - Document AM21 (JP 61-30821) appears to describe a squelch device. A copy of the English-language abstract of document AM21 is enclosed as document AP57 on the attached PTO-1449.
 - Document AJ22 (JP 5-327356) appears to describe a frequency converter. A copy of the English-language abstract of document AJ22 is enclosed as document AQ57 on the attached PTO-1449.
- □ 6. Copies of the documents were cited by or submitted to the Office in an IDS that complies with 37 C.F.R. § 1.98(a)-(c) in Application No. ________, filed _______, which is relied upon for an earlier filing date under 35 U.S.C. § 120. Thus, copies of these documents are not attached. 37 C.F.R. § 1.98(d).

It is respectfully requested that the Examiner initial and return a copy of the enclosed PTO-1449, and indicate in the official file wrapper of this patent application that the documents have been considered.

The U.S. Patent and Trademark Office is hereby authorized to charge any fee deficiency, or credit any overpayment, to our Deposit Account No. 19-0036.

Respectfully submitted,

Sorrells et al.

Appl. No. 09/632,856

Filed: August 4, 2000

For:

Wireless Local Area Network

(WLAN) Using Universal Frequency Translation Technology Including Multi-Phase Embodiments and Circuit Implementation Confirmation No. 2377

Art Unit: 2634

Examiner: Kim, Kevin

Atty. Docket: 1744.0630003

Second Supplemental Information Disclosure Statement

Commissioner for Patents PO Box 1450 Alexandria, VA 22313-1450

Sir:

Listed on accompanying Form PTO-1449 are documents that may be considered material to the examination of this application, in compliance with the duty of disclosure requirements of 37 C.F.R. §§ 1.56, 1.97 and 1.98. The numbering on this Second Supplemental Information Disclosure Statement is a continuation of the numbering in Applicants' Supplemental Information Disclosure Statement filed on June 9, 2003 in connection with the above-captioned application.

In addition to providing hard copies of the documents as required by applicable rules (see box 7 below), Applicants herewith provide a Compact Disc labeled "Disc 3" having stored thereon searchable electronic copies (in PDF format) of many of the documents listed on the PTO-1449. More specifically, the CD contains electronic copies of documents AG51-AI51, AA52-AI52, AA53-AI53, AA54-AG54, AK22, AL22, AM22, AJ23, AK23, AR57 and AN58-AR58. In addition, the CD contains electronic copies of

documents AC46-AI46, AA47-AI47, AA48-AI48, AA49, AE49-AI49, AA50-AI50, AA51-AF51, AM13, AJ14-AM14, AJ15-AM15, AJ16-AM16, AJ17-AM17, AJ18-AM18, AJ19-AM19, AJ20-AM20, AJ21-AM21, AJ22, AQ51, AR51, AN52-AR52, AN53-AR53, AN54-AR54, AN55-AR55, AN56-AR56 and AN57-AQ57, all of which were cited in previous Information Disclosure Statements. Documents AH54, AI54, AA55-AI55, AA56-AE56 and AN59 have not yet been scanned. The file names on the CD correspond to the identifiers on the PTO-1449s. It is noted that the CD is being provided in addition to hard copies of the documents (as required by applicable rules) for the convenience of the Examiner.

Applicants have listed publication dates on the attached PTO-1449 based on information presently available to the undersigned. However, the listed publication dates should not be construed as an admission that the information was actually published on the date indicated.

Applicants reserve the right to establish the patentability of the claimed invention over any of the information provided herewith, and/or to prove that this information may not be prior art, and/or to prove that this information may not be enabling for the teachings purportedly offered.

Applicants provide the following comments regarding the documents:

Document AH51 was cited in an Office Action in related U.S. Patent Application Serial No. 09/476,092, filed January 3, 2000, entitled "Analog Zero IF FM Decoder and Embodiments Thereof, Such as the Family Radio Service," directed to related subject matter. Also cited in the Office Action were U.S. Patent Nos. 5,600,680 and 5,606,731,

which have already been cited in the present application in the Supplemental Information Disclosure Statement, filed June 9, 2003.

Documents AI51, AA52, AF52, AA55 and AI55 are co-owned patents which are directed to related subject matter.

Documents AB52, AE56, AN58-AP58 and AN59 were cited in Office Actions in related U.S. Patent Appl. No. 09/567,977, filed May 10, 2000, entitled, "Optical Down-converter Using Universal Frequency Translation Technology," directed to related subject matter.

Documents AE52 and AJ23 were cited in an Invitation to Pay Additional Fees in related PCT Appl. No. PCT/US01/43077, filed November 14, 2001, entitled "Method and Apparatus for a Parallel Correlator and Applications Thereof," directed to related subject matter.

Documents AG52-AI52 and AA53 were cited in an Office Action in related U.S. Patent Application No. 09/986,764, filed November 9, 2001, entitled "Method and Apparatus for Reducing DC Offsets in a Communication System," directed to related subject matter.

Documents AB53-AE53 were cited in an International Search Report in related PCT Application No. PCT/US02/35861, filed November 8, 2002, entitled "Method and Apparatus for Reducing DC Offsets in a Communication System," directed to related subject matter.

Documents AF53-AI53 and AA54-AC54 were cited in an Office Action in related U.S. Patent Application No. 09/476,093, filed January 3, 2000, entitled "Family Radio

System with Multi-Mode and Multi-Band Functionality," directed to related subject matter.

Documents AD54-AG54 were cited in an International Search Report in related PCT Application No. PCT/US03/16403, filed May 27, 2003, entitled "Method and Apparatus for DC Offset Removal in a Radio Frequency Communication Channel," directed to related subject matter.

Documents AH54 and AI54 were cited in an Office Action in related U.S. Patent Application No. 09/550,642, filed April 14, 2000, entitled "Method and System for Down-converting an Electromagnetic Signal, and Transforms for Same," directed to related subject matter.

Documents AB55-AF55 were cited in an Office Action in related U.S. Patent Application No. 09/548,923, filed April 13, 2000, entitled "Method and System for Frequency Conversion with Modulation Embodiments," directed to related subject matter. Also cited in the Office Action were U.S. Patent Nos. 6,091,940 and 6,353,735, which have already been cited in the present application in the Information Disclosure Statement, filed July 25, 2002.

Documents AG55 and AH55 were cited in an Office Action in related U.S. Patent Application No. 09/543,867, filed April 5, 2000, entitled "Automated Meter Reader Applications of Universal Frequency Translation," directed to related subject matter.

Documents AA56 and AB56 were cited in an Office Action in related U.S. Patent Application No. 10/317,181, filed December 12, 2002, entitled "Differential Frequency Down-Conversion Using Techniques of Universal Frequency Translation Technology," directed to related subject matter.

Documents AC56 and AD56 were cited in an Office Action in related U.S. Patent Application No. 10/317,165, filed December 12, 2002, entitled "Method and Apparatus for Reducing DC Offsets in Communication Systems Using Universal Frequency Translation Technology," directed to related subject matter.

Documents AK22-AM22, AA52, AB52 and AQ58 were cited in an International Search Report in related PCT Appl. No. PCT/US01/15555, filed May 16, 2001, entitled, "Apparatus, System, and Method for Down-Converting and Up-Converting Electromagnetic Signals," directed to related subject matter. Also cited the International Search Reportswere U.S. Patent Nos. 4,888,557, 5,454,007, 5,640,698 and 5,705,949, and PCT Publication No. WO 96/02977, which have already been cited in the present application in the Information Disclosure Statement, filed July 25, 2002.

Document AK23 was cited in an Office Action in related Japanese Patent Application No. 2000-577,764, filed June 21, 2000, entitled "Applications of Frequency Translation," directed to related subject matter.

The other documents in the PTO-1449 do not fall within the above categories.

This statement should not be construed as a representation that information more material to the examination of the present patent application does not exist. The Examiner is specifically requested not to rely solely on the material submitted herewith.

Applicants have checked the appropriate boxes below.

□ 1. Statement under 37 C.F.R. 1.704(d). Each item of information contained in this Information Disclosure Statement was cited in a communication from a foreign patent office in a counterpart application and this communication was not received by any individual designated in 37 C.F.R. § 1.56(c) more than thirty days prior to the filing of this information disclosure statement.

- 2. Filing under 37 C.F.R. § 1.97(b). This Information Disclosure Statement is being filed before the mailing date of a first Office Action on the merits. No statement or fee is required.
- □ 3. Filing under 37 C.F.R. § 1.97(c). This Information Disclosure Statement is being filed more than three months after the U.S. filing date AND after the mailing date of the first Office Action on the merits, but before the mailing date of a Final Rejection, or Notice of Allowance, or an action that otherwise closes prosecution in the application.
 - □ a. Statement under 37 C.F.R. § 1.97(e)(1). I hereby state that each item of information contained in this Information Disclosure Statement was first cited in any communication from a foreign patent office in a counterpart foreign application not more than three months prior to the filing of this Information Disclosure Statement. 37 C.F.R. § 1.97(e)(1).
 - □ b. Statement under 37 C.F.R. § 1.97(e)(2). I hereby state that no item of information in this Information Disclosure Statement was cited in a communication from a foreign patent office in a counterpart foreign application and, to my knowledge after making reasonable inquiry, was known to any individual designated in 37 C.F.R. § 1.56(c) more than three months prior to the filing of this Information Disclosure Statement. 37 C.F.R. § 1.97(e)(2).
 - □ c. Attached is our PTO-2038 Credit Card Payment Form in the amount of _____ in payment of the fee under 37 C.F.R. § 1.17(p).
- ☐ 4. Filing under 37 C.F.R. § 1.97(d) This Information Disclosure Statement is being filed more than three months after the U.S. filing date and after the mailing date of a Final Rejection or Notice of Allowance, but before payment of the Issue Fee. Enclosed find our Check No. ______ in the amount of \$ _____ in payment of the fee under 37 C.F.R. § 1.17(p); in addition:
 - □ a. Statement under 37 C.F.R. § 1.97(e)(1). I hereby state that each item of information contained in this Information Disclosure Statement

was cited in a communication from a foreign patent office in a counterpart foreign application not more than three months prior to the filing of this Information Disclosure Statement. 37 C.F.R. § 1.97(e)(1).

- □ b. Statement under 37 C.F.R. § 1.97(e)(2). I hereby state that no item of information in this Information Disclosure Statement was cited in a communication from a foreign patent office in a counterpart foreign application and, to my knowledge after making reasonable inquiry, was known to any individual designated in 37 C.F.R. § 1.56(c) more than three months prior to the filing of this Information Disclosure Statement. 37 C.F.R. § 1.97(e)(2).
- □ 5. The document(s) was/were cited in a search report by a foreign patent office in a counterpart foreign application. Submission of an English language version of the search report that indicates the degree of relevance found by the foreign office is provided in satisfaction of the requirement for a concise explanation of relevance. 1138 OG 37, 38.
- 6. A concise explanation of the relevance of non-English language document AK23 appears below:
 - Document AK23 (JP 9-36664) appears to describe a frequency conversion circuit. A copy of the English-language abstract of document AK23 is enclosed as document AR58.
- Topies of documents AA56-AE56 and AN59 are enclosed. Copies of the remaining documents were submitted to the Patent Office in Information Disclosure Statements that comply with 37 C.F.R. § 1.98(a)-(c) in Application No. 09/525,615, filed March 14, 2000, and Appl. No. 09/526,041, filed March 14, 2000, which are both relied upon for an earlier filing date under 35 U.S.C. § 120. Thus, copies of these documents are not attached. 37 C.F.R. § 1.98(d).

It is respectfully requested that the Examiner initial and return a copy of the enclosed PTO-1449, and indicate in the official file wrapper of this patent application that the documents have been considered.

The U.S. Patent and Trademark Office is hereby authorized to charge any fee deficiency, or credit any overpayment, to our Deposit Account No. 19-0036.

Respectfully submitted,

STERNE, KESSLER, GOLDSTEIN & FOX P.L.L.C.

Re: U.S. Utility Patent Application

Appl. No. 09/632,856; Filed: August 4, 2000

For: Wireless Local Area Network (WLAN) Using Universal Frequency Translation Technology Including Multi-Phase Embodiments and

Circuit Implementation ors: Sorrells et al.

Inventors: Sorrells *et al.*Our Ref: 1744.0630003

Sir:

Transmitted herewith for appropriate action are the following documents:

- 1. SKGF Cover Letter;
- 2. Fee Transmittal (Form PTO/SB/17);
- 3. Third Supplemental Information Disclosure Statement;
- 4. Form PTO-1449 (6 pages);
- 5. Return postcard; and
- 6. PTO-2038 Credit Card Payment Form for \$180.00 to cover: \$180.00 for IDS Late Filing Surcharge.

It is respectfully requested that the attached postcard be stamped with the date of filing of these documents, and that it be returned to our courier. In the event that extensions of time are necessary to prevent abandonment of this patent application, then such extensions of time are hereby petitioned.

Commissioner for Patents August 19, 2004 Page 2

The U.S. Patent and Trademark Office is hereby authorized to charge any fee deficiency, or credit any overpayment, to our Deposit Account No. 19-0036.

Respectfully submitted,

STERNE, KESSLER, GOLDSTEIN & FOX P.L.L.C.

Atty: MQL/JTH

Application No.: 09/632,856 **Filed:** August 4, 2000

For: Wireless Loca

Wireless Local Area Network (WLAN) Using Universal

Frequency Translation Technology Including Multi-Phase Embodiments and Circuit Implementation

When receipt stamp is placed hereon, the USPTO acknowledges receipt of the following documents:

SKGF Cover Letter;

2. Second Supplemental Information Disclosure Statement;

3. A list of the cited documents on Forms PTO-1449 (6 pages);

4. A compact Disc labeled "Disc 3" in PDF format (which contains electronic copies of the cited documents);

5. Copies of cited documents: AA56, AB56, AC56, AD56, AE56, AN59; and

6. Return postcard.

Please Date Stamp and Return to Our Courier

SORRELLS et al.

Appl. No.: 09/632,856

Filed: August 4, 2000

For: Wireless Local Area Network (WLAN) Using Universal

Frequency Translation Technology

Including Multi-Phase Embodiments and Circuit

Implementation

Confirmation No.: 2377

Art Unit: 2634

Examiner: Kim, Kevin

Atty. Docket: 1744.0630003

Third Supplemental Information Disclosure Statement

Commissioner for Patents PO Box 1450 Alexandria, VA 22313-1450

Sir:

Listed on accompanying Form PTO-1449 are documents that may be considered material to the examination of this application, in compliance with the duty of disclosure requirements of 37 C.F.R. §§ 1.56, 1.97 and 1.98. The numbering on this Third Supplemental Information Disclosure Statement is a continuation of the numbering in Applicants' Second Supplemental Information Disclosure Statement filed on January 23, 2004 in connection with the above-captioned application.

Applicants have listed publication dates on the attached PTO-1449 based on information presently available to the undersigned. However, the listed publication dates should not be construed as an admission that the information was actually published on the date indicated.

Applicants reserve the right to establish the patentability of the claimed invention over any of the information provided herewith, and/or to prove that this information may not be prior art, and/or to prove that this information may not be enabling for the teachings purportedly offered.

Applicants provide the following comments regarding the documents:

Documents AL23, AI56, AA57, AB57, AO59, and AF61 were cited in an Office Action in related U.S. Patent Application No. 09/669,634, filed September 26, 2000, entitled "High Frequency Translator and Method of High Frequency Translation," directed to related subject matter. Also cited in said Office Action were U.S. Patent Nos. 6,049,706; 6,421,534; and 6,560,301, which have already been cited in the present application.

Documents AF56, AG56, AAC7, and AD57 are co-owned patents which are directed to related subject matter.

Documents AF56, AG56, AC57, AD57, and AI59 were cited in a Notice of Allowance in related U.S. Patent Application No. 09/838,387, filed April 20, 2001, entitled "Method and System for Down-Converting and Up-Converting an Electromagnetic Signal, and Transforms for Same," directed to related subject matter. Also cited in said Notice of Allowance were U.S. Patent Nos. 5,937,013; 6,061,551; and 6,647,250, which have already been cited in the present application.

Document AH56 was cited in an Office Action in related U.S. Patent Application No. 09/567,977, filed May 10, 2000, entitled "Optical Down-converter Using Universal Frequency Translation Technology," directed to related subject matter.

Documents AE57-AH57 were cited in an Office Action in related U.S. Patent Application No. 09/567,978, filed May 10, 2000, entitled "Carrier and Clock Recovery Using Universal Frequency Translation," directed to related subject matter. Also cited in said Office Action was U.S. Patent No. 5,937,013, which has already been cited in the present application.

Documents AI57 and AA58 were cited in a Notice of Allowance in related U.S. Patent Application No. 10/330,219, filed December 30, 2002, entitled "Methods and Systems for Down-Converting Electromagnetic Signals, and Applications Thereof," directed to related subject matter.

Documents AB58-AI58 and AA59-AD59 were cited in an Office Action in related U.S. Patent Application No. 09/566,188, filed May 5, 2000, entitled "Integrated Frequency Translation and Selectivity with Gain Control Functionality, and Applications Thereof," directed to related subject matter.

Documents AE59-AG59 were cited in an Office Action in related U.S. Patent Application No. 09/569,044, filed May 10, 2000, entitled "Universal Platform Module and Methods and Apparatuses Relating Thereto Enabled by Universal Frequency Translation Technology," directed to related subject matter. Also cited in said Office Action were U.S. Patent Nos. 2,057,613; 2,241,078; 2,283,575; 2,358,152; 2,410,350; 2,451,430; 2,472,798; 4,653,117; and 5,241,561, which have already been cited in the present application.

Document AH59 was cited in an Office Action in related U.S. Patent Application No. 10/289,377, filed November 7, 2002, entitled "Method and Apparatus for Reducing DC Offsets in a Communication System," directed to related subject matter. Also cited

in said Office Action were U.S. Pat. Nos. 5,471,665; 5,793,817; and 5,898,912, which have already been cited in the present application.

Documents AA60 and AB60 were cited in an Office Action in related U.S. Patent Application No. 09/525,185, filed March 14, 2000, entitled "Spread Spectrum Applications of Universal Frequency Translation Technology," directed to related subject matter. Also cited in said Office Action were U.S. Patent Nos. 5,339,459; 5,369,789; and 5,937,013, which have already been cited in the present application.

Documents AC60-AF60 were cited in an Office Action in related U.S. Patent Application No. 09/569,045, filed May 10, 2000, entitled "Methods and Apparatuses Relating to a Universal Platform Module and Enabled by Universal Frequency Translation Technology," directed to related subject matter. Also cited in said Office Action were U.S. Patent Nos. 5,339,459 and 5,557,641, which have already been cited in the present application.

Documents AG60-AI60 were cited in an Office Action in related U.S. Patent Application No. 09/590,955, filed June 9, 2000, entitled "Phase-Shifting Applications of Universal Frequency Translation," directed to related subject matter. Also cited in said Office Action was U.S. Patent No. 5,339,459, which has already been cited in the present application in a previous Information Disclosure Statement.

Documents AA61-AC61 were cited in an Office Action in related U.S. Patent Application No. 09/550,642, filed April 14, 2000, entitled, "Method and System for Down-Converting an Electromagnetic Signal, and Transforms for Same," directed to related subject matter.

Documents AD61 and AE61 were cited in an Office Action in related U.S. Patent Application No. 10/317,165, filed December 12, 2002, entitled, "Method and Apparatus for Reducing DC Offsets in Communication Systems Using Universal Frequency Translation Technology," directed to related subject matter.

The other documents in the PTO-1449 do not fall within the above categories.

It is noted that some of these documents could be classified in more than one of the above categories.

This statement should not be construed as a representation that information more material to the examination of the present patent application does not exist. The Examiner is specifically requested not to rely solely on the material submitted herewith.

Applicants have checked the appropriate boxes below.

- 1. Statement under 37 C.F.R. 1.704(d). Each item of information contained in this Information Disclosure Statement was cited in a communication from a foreign patent office in a counterpart application and this communication was not received by any individual designated in 37 C.F.R. § 1.56(c) more than thirty days prior to the filing of this information disclosure statement.
- 2. Filing under 37 C.F.R. § 1.97(b). This Information Disclosure Statement is being filed before the mailing date of a first Office Action on the merits. No statement or fee is required.
- - a. Statement under 37 C.F.R. § 1.97(e)(1). I hereby state that each item of information contained in this Information Disclosure Statement was first

cited in any communication from a foreign patent office in a counterpart foreign application not more than three months prior to the filing of this Information Disclosure Statement. 37 C.F.R. § 1.97(e)(1). b. Statement under 37 C.F.R. § 1.97(e)(2). I hereby state that no item of information in this Information Disclosure Statement was cited in a communication from a foreign patent office in a counterpart foreign application and, to my knowledge after making reasonable inquiry, was known to any individual designated in 37 C.F.R. § 1.56(c) more than three months prior to the filing of this Information Disclosure Statement. 37 C.F.R. § 1.97(e)(2). C. Attached is our PTO-2038 Credit Card Payment Form in the amount of **\$180.00** in payment of the fee under 37 C.F.R. § 1.17(p). 4. Filing under 37 C.F.R. § 1.97(d) This Information Disclosure Statement is being filed more than three months after the U.S. filing date and after the mailing date of a Final Rejection or Notice of Allowance, but before payment of the Issue Fee. Enclosed find our PTO-2038 Credit Card Payment Form in the amount of in payment of the fee under 37 C.F.R. § 1.17(p); in addition: a. Statement under 37 C.F.R. § 1.97(e)(1). I hereby state that each item of information contained in this Information Disclosure Statement was cited in a communication from a foreign patent office in a counterpart foreign application not more than three months prior to the filing of this Information Disclosure Statement. 37 C.F.R. § 1.97(e)(1).

b. Statement under 37 C.F.R. § 1.97(e)(2). I hereby state that no item of

information in this Information Disclosure Statement was cited in a communication from a foreign patent office in a counterpart foreign application and, to my knowledge after making reasonable inquiry, was known to any individual designated in 37 C.F.R. § 1.56(c) more than

	The document(s) was/were cited in a search report by a foreign patent office in a counterpart foreign application. Submission of an English language version of the search report that indicates the degree of relevance found by the foreign office is provided in satisfaction of the requirement for a concise explanation of relevance. 1138 OG 37, 38.
⊠ 6.	A concise explanation of the relevance of the non-English language documents appears below:
	Document AL23 (DE 196 48 915 A1) appears to describe a process of frequency conversion. An English-language translation of document AL23 is enclosed as document AO59.
7 .	Copies of the documents are submitted herewith.
⊠ 8.	Copies of the documents were cited by or submitted to the Office in an IDS that complies with 37 C.F.R. § 1.98(a)-(c) in Application No <u>09/525,615</u> , filed March 14, 2000, which is relied upon for an earlier filing date under 35 U.S.C. § 120. Thus, copies of these documents are not attached. 37 C.F.R. § 1.98(d).
9.	No copies of U.S. patents and patent application publications cited on the attached Form PTO-1449 are submitted in accordance with 1276 OG 55 because this application was filed after June 30, 2003.

∑ 10. It is expected that the examiner will review the prosecution and cited art in the parent application nos. 09/525,615 and 09/526,041 in accordance with MPEP 2001.06(b), and indicate in the next communication from the office that the art cited in the earlier prosecution history has been reviewed in connection with the present application.

It is respectfully requested that the Examiner initial and return a copy of the enclosed PTO-1449, and indicate in the official file wrapper of this patent application that the documents have been considered.

The U.S. Patent and Trademark Office is hereby authorized to charge any fee deficiency, or credit any overpayment, to our Deposit Account No. 19-0036.

Respectfully submitted,

STERNE, KESSLER, GOLDSTEIN & FOX P.L.L.C.

IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

In re application of:

Sorrells et al.

Appl. No.: 09/632,856

Filed: August 4, 2000

For: Wireless Local Area Network

(WLAN) Using Universal Frequency Translation Technology Including Multi-Phase Embodiments and Circuit

Implementation

Confirmation No.: 2377

Art Unit: 2634

Examiner: Kim, Kevin

Atty. Docket: 1744.0630003

Fourth Supplemental Information Disclosure Statement

Commissioner for Patents PO Box 1450 Alexandria, VA 22313-1450

Sir:

Listed on accompanying Form PTO-1449 are documents that may be considered material to the examination of this application, in compliance with the duty of disclosure requirements of 37 C.F.R. §§ 1.56, 1.97 and 1.98. The numbering on this Fourth Supplemental Information Disclosure Statement is a continuation of the numbering in Applicants' Third Supplemental Information Disclosure Statement filed on August 19, 2004 in connection with the above-captioned application.

Applicants have listed publication dates on the attached Form PTO-1449 based on information presently available to the undersigned. However, the listed publication dates should not be construed as an admission that the information was actually published on the date indicated.

Applicants reserve the right to establish the patentability of the claimed invention over any of the information provided herewith, and/or to prove that this information may

not be prior art, and/or to prove that this information may not be enabling for the teachings purportedly offered.

Applicants provide the following comments regarding the documents:

Documents AP59 and AE63 were cited in an Office Action, mailed September 21, 2004, in related U.S. Patent Application No. 09/567,977, filed May 10, 2000, entitled "Optical Down-converter Using Universal Frequency Translation," directed to related subject matter.

Document AG61 was cited in an Office Action, mailed August 17, 2004, in related U.S. Patent Application No. 09/476,093, filed January 3, 2000, entitled "Communication System Method With Multi-Mode and Multi-Band Functionality and Embodiments Thereof, Such as the Family Radio Service," directed to related subject matter.

Documents AH61 and AI61 were cited in a Notice of Allowance, mailed August 18, 2004, in related U.S. Patent Application No. 09/525,615, filed March 14, 2000, entitled "Method, System, and Apparatus for Balanced Frequency Up-conversion of a Baseband Signal and 4-Phase Receiver and Transceiver Embodiments," directed to related subject matter.

Documents AA62-AF62, mailed August 25, 2004, were cited in an Office Action in related U.S. Patent Application No. 10/290,323, filed November 8, 2002, entitled "Method and Apparatus for DC Offset Removal in a Radio Frequency Communication Channel," directed to related subject matter.

Documents AG62-AI62 were cited in an Office Action, mailed September 8, 2004, in related U.S. Patent Application No. 09/632,857, filed August 4, 2000, entitled "Wireless Local Area Network (WLAN) Technology and Applications Including Techniques of Universal Frequency Translation," directed to related subject matter.

Documents AA63-AD63 were cited in an Office Action, mailed September 8, 2004, in related U.S. Patent Application No. 09/986,764, filed November 9, 2001, entitled "Method and Apparatus for Reducing DC Offsets in a Communication System," directed to related subject matter.

Documents AF63-AI63 were cited in a Notice of Allowance, mailed September 27, 2004, in related U.S. Patent Application No. 09/987,193, filed November 13, 2001, entitled "Method and Apparatus for a Parallel Correlator and Applications Thereof," directed to related subject matter.

Document AA64 was cited in an Office Action, mailed September 29, 2004, in related U.S. Patent Application No. 09/632,857, filed August 4, 2000, entitled "Wireless Local Area Network (WLAN) Technology and Applications Including Techniques of Universal Frequency Translation," directed to related subject matter.

This statement should not be construed as a representation that information more material to the examination of the present patent application does not exist. The Examiner is specifically requested not to rely solely on the material submitted herewith.

Applicants have checked the appropriate boxes below.

☐ 1. Statement under 37 C.F.R. 1.704(d). Each item of information contained in this Information Disclosure Statement was cited in a communication from a foreign patent office in a counterpart application and this communication was not

received by any individual designated in 37 C.F.R. § 1.56(c) more than thirty days prior to the filing of this information disclosure statement. 2. Filing under 37 C.F.R. § 1.97(b). This Information Disclosure Statement is being filed within three months of the date of filing of a national application other than a continued prosecution application (CPA), OR within three months of the date of entry of the national stage as set forth in 37 C.F.R. § 1.491 in an international application, OR before the mailing date of a first Office Action on the merits OR before the mailing of a first Office Action after the filing of a request for continued examination under 37 C.F.R. § 1.114. No statement or fee is required. 3. Filing under 37 C.F.R. § 1.97(c). This Information Disclosure Statement is being filed more than three months after the U.S. filing date AND after the mailing date of the first Office Action on the merits, but before the mailing date of a Final Rejection, or Notice of Allowance, or an action that otherwise closes prosecution in the application. a. Statement under 37 C.F.R. § 1.97(e)(1). I hereby state that each item of information contained in this Information Disclosure Statement was first cited in any communication from a foreign patent office in a counterpart foreign application not more than three months prior to the filing of this Information Disclosure Statement. 37 C.F.R. § 1.97(e)(1). b. Statement under 37 C.F.R. § 1.97(e)(2). I hereby state that no item of information in this Information Disclosure Statement was cited in a communication from a foreign patent office in a counterpart foreign application and, to my knowledge after making reasonable inquiry, was known to any individual designated in 37 C.F.R. § 1.56(c) more than three months prior to the filing of this Information Disclosure Statement.

37 C.F.R. § 1.97(e)(2).

	c.	Attached is our PTO-2038 Credit Card Payment Form in the amount of in payment of the fee under 37 C.F.R. § 1.17(p).
	filed nof a Fi	under 37 C.F.R. § 1.97(d) This Information Disclosure Statement is being more than three months after the U.S. filing date and after the mailing date and Rejection or Notice of Allowance, but before payment of the Issue Fee. sed find our PTO-2038 Credit Card Payment Form in the amount of in payment of the fee under 37 C.F.R. § 1.17(p); in addition:
	a.	Statement under 37 C.F.R. § 1.97(e)(1). I hereby state that each item of information contained in this Information Disclosure Statement was cited in a communication from a foreign patent office in a counterpart foreign application not more than three months prior to the filing of this Information Disclosure Statement. 37 C.F.R. § 1.97(e)(1).
	⋈ b.	Statement under 37 C.F.R. § 1.97(e)(2). I hereby state that no item of information in this Information Disclosure Statement was cited in a communication from a foreign patent office in a counterpart foreign application and, to my knowledge after making reasonable inquiry, was known to any individual designated in 37 C.F.R. § 1.56(c) more than three months prior to the filing of this Information Disclosure Statement. 37 C.F.R. § 1.97(e)(2).
	the sea	ocument(s) was/were cited in a search report by a foreign patent office in a expart foreign application. Submission of an English language version of arch report that indicates the degree of relevance found by the foreign office vided in satisfaction of the requirement for a concise explanation of the centre. 1138 OG 37, 38.
☐ 6.		ncise explanation of the relevance of non-English language documents rs below:
⊠ 7.	§ 1.98	y of document AP59 is submitted. However, in accordance with 37 C.F.R. (a)(2), no copies of U.S patents and patent application publications cited on ached Form PTO-1449 are submitted

	Appl. 140. 09/032
8 .	Copies of the documents were cited by or submitted to the Office in an IDS that
	complies with 37 C.F.R. § 1.98(a)-(c) in Application No, filed
	, which is relied upon for an earlier filing date under 35 U.S.C.
	§ 120. Thus, copies of these documents are not attached. 37 C.F.R. § 1.98(d).
9.	It is expected that the examiner will review the prosecution and cited art in the parent application no, filed, and indicate in the next communication from the office that the art cited in the earlier prosecution histories have been reviewed in connection with the present application.
	It is respectfully requested that the Examiner initial and return a copy of the
enclos	ed Form PTO-1449, and indicate in the official file wrapper of this patent
applica	ation that the documents have been considered.
	The U.S. Patent and Trademark Office is hereby authorized to charge any fee
deficie	ncy, or credit any overpayment, to our Deposit Account No. 19-0036.
	Respectfully submitted,
	Sterne, Kessler, Goldstein & Fox p.l.l.c.

WRITER'S DIRECT NUMBER:

Commissioner for Patents PO Box 1450 Alexandria, VA 22313-1450

Re:

U.S. Utility Patent Application

Application No. 09/632,856; Filed: August 4, 2000

For: Wireless Local Area Network (WLAN) Using Universal Frequency

Translation Technology Including Multi-Phase Embodiments and

Circuit Implementation

Inventors:

Sorrells et al.

Our Ref:

1744.0630003

Sir:

Transmitted herewith for appropriate action are the following documents:

- 1. Fee Transmittal (Form PTO/SB/17);
- 2. Fourth Supplemental Information Disclosure Statement;
- 3. Form PTO-1449 (4 pages);
- 4. Copy of (1) cited document (Document No. AP59);
- 5. Return postcard; and
- 6. PTO-2038 Credit Card Payment Form for \$180.00 to cover: \$180.00 for submission of an Information Disclosure Statement.

It is respectfully requested that the attached postcard be stamped with the date of filing of these documents, and that it be returned to our courier. In the event that extensions of time are necessary to prevent abandonment of this patent application, then such extensions of time are hereby petitioned.

Sterne, Kessler, Goldstein & Fox P.L.C.: 1100 New York Avenue, NW: Washington, DC 20005: 202.371.2600 f 202.371.2540: www.skqf.com

Commissioner for Patents November 12, 2004 Page 2

The U.S. Patent and Trademark Office is hereby authorized to charge any fee deficiency, or credit any overpayment, to our Deposit Account No. 19-0036.

Respectfully submitted,

STERNE, KESSLER, GOLDSTEIN & FOX P.L.L.C.

Jeffrey T. Helvey

Attorney for Applicants Registration No. 44,757

JTH/agj 333749_1.DOC DEC 15 2004 W

Applicants: Sorrells et al.

Application No.: 09/632,856

Filed: August 4, 2000

For: Wireless Local Area Network (WLAN)

Using Universal Frequency Translation Technology Including Multi-Phase

Embodiments and Circuit Implementation

When receipt stamp is placed hereon, the USPTO acknowledges receipt of the following documents:

SKGF Cover Letter;

2. Fee Transmittal (Form PTO/SB/17);

3. Fourth Supplemental Information Disclosure Statement;

4. Form PTO-1449 (4 pages);

5. Copy of (1) cited document (Document No. AP59);

6. Return postcard; and

7. PTO-2038 Credit Card Payment Form for \$180.00 to cover:

\$180.00 for submission of an Information Disclosure Statement.

Due Date: NONE

Art Unit: 2634

Examiner: Kim, Kevin
