Purchase Information - [here]

paper softwall is a beautiful, lightweight, freestanding wall that can be arranged into almost any shape, or easily compressed into a compact sheaf and stored away. softwall dampens sound and can both absorb and transmit light. The standard paper softwall is made from 400 layers of honeycombed translucent white, fire-retardant paper, bounded by natural wool felt ends. The thick felt ends fold to create handles when the wall is open, and form a casing when the wall is compressed. paper softwall is modular, as the felt ends have velcro fasteners which can link walls together. The paper softwall is delicate, yet its honeycomb design makes it surprisingly resilient to normal handling. standard paper softwall is available in two heights.

paper softwall 6' (1.8m) tall At 6 feet tall, above typical sight lines, this softwall can be used to literally transform a space by creating a dynamic partition, or sculptural backdrop. This softwall is 12" thick (30cm), and can be readily expanded from a mere 1.5" (3cm) to form a freestanding wall of anywhere between 8 to 20 feet in length (2.5m-6m). It is available in white paper with medium grey natural wool felt ends, and weighs just 17lbs (7.7kg).
