In an eighteenth aspect, the invention features a method for treating congestive heart failure, the method comprising administering a complete or partial agonist of the intestinal guanylate cyclase (GC-C) receptor. Thus,the invention features a method for treating congestive heart failure, the method comprising administering to a patient a pharmaceutical composition comprising a purified peptide comprising, consisting of or consisting essentially of the amino acid sequence: Xaa_1 Xaa_2 Xaa_3 Xaa_4 Xaa_5 Cys_6 Cys_7 Xaa_8 Xaa_9 Cys_{10} Cys_{11} Xaa_{12} Xaa_{13} Xaa_{14} Cys_{15} Xaa_{16} Xaa_{17} Cys_{18} Xaa_{19} Xaa_{20} Xaa_{21} (I) or Xaa_1 Xaa_2 Xaa_3 Xaa_4 Xaa_5 Cys_6 Cys_7 Xaa_8 Xaa_9 Cys_{10} Cys_{11} Asn_{12} Pro_{13} Ala_{14} Cys_{15} Xaa_{16} Gly_{17} Cys_{18} Xaa_{19} Xaa_{20} Xaa_{21} (II) or Cys Cys Glu Xaa_4 Cys Cys Asn Pro Ala Cys Thr Gly Cys Xaa_{14} (SEQ ID NO:XXX) as described herein. In various embodiments the congestive heart failure is categorized as Class II congestive heart failure; the congestive heart failure is categorized as Class III congestive heart failure; and the congestive heart failure is categorized as Class IV congestive heart failure. The New York Heart Association (NYHA) functional

classification system relates congestive heart failure symptoms to everyday activities and the patient's quality of life. The NYHA defines the classes of patient symptoms relating to congestive heart failure as: Class II-slight limitation of physical activity, comfortable at rest, but ordinary physical activity results in fatigue, palpitation, or dyspnea; Class III-marked limitation of physical activity, comfortable at rest, but less than ordinary activity causes fatigue, palpitation, or dyspnea and Class IV- unable to carry out any physical activity without discomfort, symptoms of cardiac insufficiency at rest, if any physical activity is undertaken, discomfort is increased. Heart failure treatment using the polypeptides and methods described herein can also be classified according to the ACC/AHA guidelines (Stage A: At risk for developing heart failure without evidence of cardiac dysfunction; Stage B: Evidence of cardiac dysfunction without symptoms; Stage C: Evidence of cardiac dysfunction with symptoms; and Stage D: Symptoms of heart failure despite maximal therapy).

In a nineteenth aspect, the invention features a method for treating BPH, the method comprising administering a complete or partial agonist of the intestinal guanylate cyclase (GC-C) receptor. The agonist can be administered alone or in combination with another agent for treatment of BPH, for example, a 5-alpha reductase inhibitor (e.g., finasteride) or an alpha adrenergic inhibitor (e.g., doxazosine).

In a twentieth aspect, the invention features isolated nucleic acid molecules comprising a sequence encoding a peptide described herein. Also within the invention are vectors, e.g., expression vectors that include such nucleic acid molecules and can be used to express a peptide described herein in a cultured cell (e.g., a eukaryotice cell or a prokaryotic cell). The vector can further include one or more regulatory elements, e.g., a heterologous promoter or elements required for translation operably linked to the sequence encoding the peptide. In some cases the nucleic acid molecule will encode an amino acid sequence that includes the amino acid sequence of a peptide described herein. For example, the nucleic acid molecule can encode a preprotein or a preproprotein that

can be processed to produce a peptide described herein. In cases where unnatural amino acids are present in the polypeptides described herein, selector codons can be utilized in the synthesis of such polypeptides similar to that described in US20060019347 (for example, paragraphs 398-408, 457-499, and 576-588) herein incorporated by reference.

A vector that includes a nucleotide sequence encoding a peptide described herein or a peptide or polypeptide comprising a peptide described herein may be either RNA or DNA, single- or double-stranded, prokaryotic, eukaryotic, or viral. Vectors can include transposons, viral vectors, episomes, (e.g., plasmids), chromosomes inserts, and artificial chromosomes (e.g. BACs or YACs). Suitable bacterial hosts for expression of the encode peptide or polypeptide include, but are not limited to, *E. coli*. Suitable eukaryotic hosts include yeast such as *S. cerevisiae*, other fungi, vertebrate cells, invertebrate cells (e.g., insect cells), plant cells, human cells, human tissue cells, and whole eukaryotic organisms. (e.g., a transgenic plant or a transgenic animal). Further, the vector nucleic acid can be used to transfect a virus such as vaccinia or baculovirus (for example using the Bac-to-Bac® Baculovirus expression system (Invitrogen Life Technologies, Carlsbad, CA)).

As noted above the invention includes vectors and genetic constructs suitable for production of a peptide described herein or a peptide or polypeptide comprising such a peptide. Generally, the genetic construct also includes, in addition to the encoding nucleic acid molecule, elements that allow expression, such as a promoter and regulatory sequences. The expression vectors may contain transcriptional control sequences that control transcriptional initiation, such as promoter, enhancer, operator, and repressor sequences. A variety of transcriptional control sequences are well known to those in the art and may be functional in, but are not limited to, a bacterium, yeast, plant, or animal cell. The expression vector can also include a translation regulatory sequence (e.g., an untranslated 5' sequence, an untranslated 3' sequence, a poly A addition site, or an internal ribosome entry site), a splicing sequence or splicing regulatory sequence, and a

transcription termination sequence. The vector can be capable of autonomous replication or it can integrate into host DNA.

The invention also includes isolated host cells harboring one of the forgoing nucleic acid molecules and methods for producing a peptide by culturing such a cell and recovering the peptide or a precursor of the peptide. Recovery of the peptide or precursor may refer to collecting the growth solution and need not involve additional steps of purification. Proteins of the present invention, however, can be purified using standard purification techniques, such as, but not limited to, affinity chromatography, thermaprecipitation, immunoaffinity chromatography, ammonium sulfate precipitation, ion exchange chromatography, filtration, electrophoresis and hydrophobic interaction chromatography.

The peptides can be purified. Purified peptides are peptides separated from other proteins, lipids, and nucleic acids or from the compounds from which is it synthesized. The polypeptide can constitute at least 10, 20, 50 70, 80 or 95% by dry weight of the purified preparation.

The invention also features deletion variants of any of the peptides described herein in which one, two, three or four amino acids (or non-natural amino acids or natural or non-natural amino acid analogs), other than a Cys (or an amino acid substituted for Cys, e.g, an amino acid capable of forming a covalent bond to another amino acid), are deleted. Where two (or more) amino acids are deleted and the peptide comprises the sequence: Cys_a Cys_b Xaa Xaa Cys_c Cys_d Xaa Xaa Xaa Cys_e Xaa Xaa Cys_f, in some embodiments two or more deletions can be located between Cys_b and Cys_c and/or between Cys_d and Cys_e and/or between Cys_e and Cys_f. However, in other embodiments there is at most one deletion between each of Cys_b and Cys_c or between Cys_d and Cys_e or between Cys_e and Cys_f. Thus, the invention includes any of the peptides described herein comprising the sequence Cys_a Cys_b Xaa Xaa Cys_c Cys_d Xaa Xaa Xaa Cys_e Xaa Xaa Cys_f wherein: a) one amino acid between Cys_b and Cys_c is deleted; b) one amino acid between Cys_d and Cys_e is deleted; c) one amino acid between Cys_e and Cys_f is deleted; d) one amino acid between Cys_b and Cys_c is deleted and one amino acid between Cys_d and Cys_e is deleted; e) one amino acid between Cys_d and Cys_e is deleted and one amino acid between Cys_e and Cys_f is deleted; f) one amino acid between Cys_b and Cys_c is deleted and one amino acid between Cys_e and Cys_f is deleted or g) one amino acid between Cys_b and Cys_c is deleted, one amino acid between Cys_d and Cys_e is deleted and one amino acid between Cys_e and Cys_f is deleted. In certain embodiments, the various deletion variants are

peptides that bind to and/or activate the GC-C receptor. In various embodiments, the various deletion variants are peptides that increase cGMP levels.

However, in other embodiments no more than one insertion is located between Cys_b and Cys_c or between Cys_d and Cys_e or between Cys_e and Cys_f. Thus, the invention features any of the peptides described herein comprising the sequence Cys_a Cys_b Xaa Xaa Cys_c Cys_d Xaa Xaa Xaa Cys_e Xaa Xaa Cys_f wherein: a) one amino acid is inserted between Cys_b and Cys_c; b) one amino acid is inserted between Cys_d and Cys_e; c) one amino acid is inserted between Cys_e and Cys_f; d) one amino acid is inserted between Cys_b and Cys_c and one amino acid is inserted between Cys_d and Cys_e; e) one amino acid is inserted between Cys_d and Cys_e and one amino acid is inserted between Cys_e and Cys_f; f) one amino acid is inserted between Cys_b and Cys_c and one amino acid is inserted between Cys_e and Cys_f; or g) one amino acid is inserted between Cys_b and Cys_c, one amino acid is inserted between Cys_d and Cys_e and one amino acid is inserted between Cys_e and Cys_f. In addition, one or more amino acids can be inserted preceding Cys_a and/or one or more amino acids can be inserted following Cys_f.

In various embodiments, the various insertion variants are peptides that bind to and/or activate the GC-C receptor. In various embodiments, the various insertion variants are peptides that increase cGMP levels.

DETAILED DESCRIPTION

The peptides described herein bind to the intestinal guanylate cyclase (GC-C) receptor, a key regulator of fluid and electrolyte balance in the intestine. When stimulated, this receptor, which is located on the apical membrane of the intestinal epithelial surface, causes an increase in intestinal epithelial cyclic GMP (cGMP). This increase in cGMP is believed to cause a decrease in water and sodium absorption and an increase in chloride and potassium ion secretion, leading to changes in intestinal fluid and electrolyte transport and increased intestinal motility. The intestinal GC-C receptor possesses an extracellular ligand binding region, a transmembrane region, an intracellular protein kinase-like region and a cyclase catalytic domain. Proposed functions for the GC-C receptor are fluid and electrolyte homeostasis, the regulation of epithelial cell proliferation and the induction of apoptosis (Shalubhai 2002 Curr Opin Drug Dis Devel 5:261-268).

In addition to being expressed in the intestine by gastrointestinal epithelial cells, GC-C is expressed in extra-intestinal tissues including kidney, lung, pancreas, pituitary, adrenal, developing liver and gall bladder (reviewed in Vaandrager 2002 Mol Cell Biochem 230:73-83, Kulaksiz et al. 2004, Gastroenterology 126:732-740) and male and female reproductive tissues (reviewed in Vaandrager 2002 Mol Cell Biochem 230:73-83). This suggests that the GC-C receptor agonists can be used in the treatment of disorders outside the GI tract, for example, congestive heart failure and benign prostatic hyperplasia.

Ghrelin, a peptide hormone secreted by the stomach, is a key regulator of appetite in humans. Ghrelin expression levels are regulated by fasting and by gastric emptying (Kim et al. 2003 Neuroreprt 14:1317-20; Gualillo et al. 2003 FEBS Letts 552: 105-9). Thus, by increasing gastrointestinal motility, GC-C receptor agonists may also be used to regulate obesity.

In humans, the GC-C receptor is activated by guanylin (Gn) (U.S. 5,96,097), uroguanylin (Ugn) (U.S. 5,140,102) and lymphoguanylin (Forte et al. 1999 *Endocrinology* 140:1800-1806). Interestingly, these agents are 10-100 fold less potent than a class of bacterially derived peptides, termed ST (reviewed in Gianella 1995 J Lab Clin Med 125:173-181). ST peptides are considered super agonists of GC-C and are very resistant to proteolytic degradation.

ST peptide is capable of stimulating the enteric nervous system (Rolfe et al., 1994, J Physiolo 475: 531-537; Rolfe et al. 1999 Gut 44: 615-619; Nzegwu et al. 1996 Exp Physiol 81: 313-315). Also, cGMP has been reported to have antinociceptive effects in multiple animal models of pain (Lazaro Ibanez et al. 2001 Eur J Pharmacol 426: 39-44; Soares et al. 2001 British J Pharmacol 134: 127-131; Jain et al. 2001 Brain Res 909:170-178; Amarante et al. 2002 Eur J Pharmacol 454:19-23). Thus, GC-C agonists may have both an analgesic as well an anti-inflammatory effect.

In bacteria, ST peptides are derived from a preproprotein that generally has at least 70 amino acids. The pre and pro regions are cleaved as part of the secretion process, and the resulting mature protein, which generally includes fewer than 20 amino acids, is biologically active.

Among the known bacterial ST peptides are: *E. coli* ST Ib (Moseley et al. 1983 Infect. Immun. 39:1167) having the mature amino acid sequence Asn Ser Ser Asn Tyr Cys Cys Glu Leu Cys Cys Asn Pro Ala Cys Thr Gly Cys Tyr (SEQ ID NO:__); *E. coli* ST Ia (So

The peptides described herein, like the bacterial ST peptides, have six Cys residues. These six Cys residues form three disulfide bonds in the mature and active form of the peptide. If the six Cys residues are identified, from the amino to carboxy terminus of the peptide, as A, B, C, D, E, and F, then the disulfide bonds form as follows: A-D, B-E, and C-F. The formation of these bonds is thought to be important for GC-C receptor binding. Certain of the peptides described herein include a potentially functional chymotrypsin cleavage site, e.g., a Trp, Tyr or Phe located between either Cys B and Cys D or between Cys E and Cys F. Cleavage at either chymotrypsin cleavage site may reduce or eliminates the ability of the peptide to bind to the GC-C receptor.

In the human body an inactive form of chymotrypsin, chymotrypsinogen is produced in the pancreas. When this inactive enzyme reaches the small intestine it is converted to active chymotrypsin by the excision of two di-peptides. Active chymotrypsin can potentially cleave peptides at the peptide bond on the carboxy-terminal side of Trp, Tyr or Phe. The presence of active chymotrypsin in the intestinal tract can potentially lead to cleavage of certain of the peptides described herein having an appropriately positioned functional chymotrypsin cleavage site. It is expected that chymotrypsin cleavage will moderate the action of a peptide described herein having an appropriately positioned chymotrypsin cleavage site as the peptide passes through the intestinal tract.

Trypsinogen, like chymotrypsin, is a serine protease that is produced in the pancreas and is present in the digestive tract. The active form, trypsin, will cleave peptides having a Lys or Arg. The presence of active trypsin in the intestinal tract can lead to cleavage of certain of the peptides described herein having an appropriately positioned functional trypsin cleavage site. It is expected that chymotrypsin cleavage will moderate the action of a peptide described herein having an appropriately positioned trypsin cleavage site as the peptide passes through the intestinal tract.

Many gastrointestinal disorders, including IBS, are associated with abdominal or visceral pain. Certain of the peptides described herein include analgesic or antinociceptive tags such as the carboxy-terminal sequence AspPhe immediately following a Trp, Tyr or Phe that creates a functional chymotrypsin cleavage site or following Lys or Arg that creates a functional trypsin cleavage site. Chymotrypsin in the intestinal tract can potentially cleave such peptides immediately carboxy terminal to the Trp, Phe or Tyr residue, releasing the dipeptide, AspPhe. This dipeptide has been shown to have analgesic activity in animal models (Abdikkahi et al. 2001 Fundam Clin Pharmacol 15:117-23; Nikfar et al 1997, 29:583-6; Edmundson et al 1998 Clin Pharmacol Ther 63:580-93). In this manner such peptides can treat both pain and inflammation. Other analgesic peptides can be present at the amino or carboxy terminus of the peptide (e.g., following a

functional cleavage site) including: endomorphin-1, endomorphin-2, nocistatin, dalargin, lupron, and substance P.

A number of the useful peptides are based on the core sequence: Cys Cys Glu Leu Cys Cys Asn Pro Ala Cys Thr Gly Cys Tyr. To create a variant having a potentially functional chymotrypsin cleavage site capable of inactivating the peptide, either the Leu (underlined) or the Thr (underlined) can be replaced by Trp, Phe or Tyr or both the Leu and the Thr can be replaced by (independently) Trp, Phe or Tyr. To create a variant having an analgesic di-peptide, the core sequence is followed by Asp Phe. The carboxy terminal Tyr in the core sequence can allow the Asp Phe dipeptide to be released by chymotrypsin in the digestive tract. The core sequence can be optionally be preceded by Asn Ser Ser Asn Tyr or Asn.

Thus, useful variants based on the core sequence include:

In some cases, the peptides described herein are produced as a prepro protein that includes the amino terminal leader sequence: mkksilfiflsvlsfspfaqdakpvesskekitleskkcniakksnksgpesmn. Where the peptide is produced by a bacterial cell, e.g., *E. coli*, the forgoing leader sequence will be cleaved and the mature peptide will be efficiently secreted from the bacterial cell. U.S. Patent No. 5,395,490 describes vectors, expression systems and methods for the efficient production of ST peptides in bacterial cells and methods for achieving efficient secretion of mature ST peptides. The vectors, expression systems and methods described in U.S. Patent No. 5,395,490 can be used to produce the ST peptides and variant ST peptides of the present invention

Variant Peptides

The invention includes variant peptides which can include one, two, three, four, five, six, seven, eight, nine, or ten (in some embodiments fewer than 5 or fewer than 3 or 2 or

fewer) amino acid substitutions and/or deletions compared to SEQ ID NOs:____ to ___. The substitution(s) can be conservative or non-conservative. The naturally-occurring amino acids can be substituted by D-isomers of any amino acid, non-natural amino acids, natural and natural amino acid analogs and other groups. A conservative amino acid substitution results in the alteration of an amino acid for a similar acting amino acid, or amino acid of like charge, polarity, or hydrophobicity. At some positions, even conservative amino acid substitutions can alter the activity of the peptide. A conservative substitution can substitute a naturally-occurring amino acid for a non-naturally-occurring amino acid. The amino acid substitutions among naturally-occurring amino acids are listed in Table II.

In some circumstances it can be desirable to treat patients with a variant peptide that binds to and activates intestinal GC-C receptor, but is less active than the non-variant form the peptide. This reduced activity can arise from reduced affinity for the receptor or a reduced ability to activate the receptor once bound or reduced stability of the peptide.

Production of peptides

Useful peptides can be produced either in bacteria including, without limitation, *E. coli*, or in other existing systems for peptide or protein production (e.g., *Bacillus subtilis*, baculovirus expression systems using Drosophila Sf9 cells, yeast or filamentous fungal expression systems, mammalian cell expression systems), or they can be chemically synthesized.

If the peptide or variant peptide is to be produced in bacteria, e.g., *E. coli*, the nucleic acid molecule encoding the peptide will preferably also encode a leader sequence that permits the secretion of the mature peptide from the cell. Thus, the sequence encoding the peptide can include the pre sequence and the pro sequence of, for example, a naturally-occurring bacterial ST peptide. The secreted, mature peptide can be purified from the culture medium.

The sequence encoding a peptide described herein is preferably inserted into a vector capable of delivering and maintaining the nucleic acid molecule in a bacterial cell. The DNA molecule may be inserted into an autonomously replicating vector (suitable vectors include, for example, pGEM3Z and pcDNA3, and derivatives thereof). The vector nucleic acid may be a bacterial or bacteriophage DNA such as bacteriophage lambda or M13 and derivatives thereof. Construction of a vector containing a nucleic acid described herein can be followed by transformation of a host cell such as a bacterium. Suitable bacterial hosts include but are not limited to, *E. coli*, *B. subtilis*, *Pseudomonas*, *Salmonella*. The genetic construct also includes, in addition to the encoding nucleic acid

molecule, elements that allow expression, such as a promoter and regulatory sequences. The expression vectors may contain transcriptional control sequences that control transcriptional initiation, such as promoter, enhancer, operator, and repressor sequences. A variety of transcriptional control sequences are well known to those in the art. The expression vector can also include a translation regulatory sequence (e.g., an untranslated 5' sequence, an untranslated 3' sequence, or an internal ribosome entry site). The vector can be capable of autonomous replication or it can integrate into host DNA to ensure stability during peptide production.

The protein coding sequence that includes a peptide described herein can also be fused to a nucleic acid encoding a polypeptide affinity tag, e.g., glutathione S-transferase (GST), maltose E binding protein, protein A, FLAG tag, hexa-histidine, myc tag or the influenza HA tag, in order to facilitate purification. The affinity tag or reporter fusion joins the reading frame of the peptide of interest to the reading frame of the gene encoding the affinity tag such that a translational fusion is generated. Expression of the fusion gene results in translation of a single polypeptide that includes both the peptide of interest and the affinity tag. In some instances where affinity tags are utilized, DNA sequence encoding a protease recognition site will be fused between the reading frames for the affinity tag and the peptide of interest.

Genetic constructs and methods suitable for production of immature and mature forms of the peptides and variants described herein in protein expression systems other than bacteria, and well known to those skilled in the art, can also be used to produce peptides in a biological system.

Mature peptides and variants thereof can be synthesized by the solid-phase chemical synthesis. For example, the peptide can be synthesized on Cyc(4-CH_2 Bxl)-OCH_2-4-(oxymethyl)-phenylacetamidomethyl resin using a double coupling program. Protecting groups must be used appropriately to create the correct disulfide bond pattern. For

example, the following protecting groups can be used: t-butyloxycarbonyl (alpha-amino groups); acetamidomethyl (thiol groups of Cys residues B and E); 4-methylbenyl (thiol groups of Cys residues C and F); benzyl (y-carboxyl of glutamic acid and the hydroxyl group of threonine, if present); and bromobenzyl (phenolic group of tyrosine, if present). Coupling is effected with symmetrical anhydride of t-butoxylcarbonylamino acids or hydroxybenzotriazole ester (for asparagine or glutamine residues), and the peptide is deprotected and cleaved from the solid support in hydrogen fluoride, dimethyl sulfide, anisole, and p-thiocresol using 8/1/1/0.5 ratio (v/v/v/w) at 0°C for 60 min. After removal of hydrogen fluoride and dimethyl sulfide by reduced pressure and anisole and p-thiocresol by extraction with ethyl ether and ethyl acetate sequentially, crude peptides are extracted with a mixture of 0.5M sodium phosphate buffer, pH 8.0 and N, N-dimethylformamide using 1/1 ratio, v/v. The disulfide bond for Cys residues B and E is the formed using dimethyl sulfoxide (Tam et al. (1991) *J. Am. Chem. Soc.* 113:6657-62). The resulting peptide is the purified by reverse-phase chromatography. The disulfide bond between Cys residues C and F is formed by first dissolving the peptide in 50% acetic acid in water. Saturated iodine solution in glacial acetic acid is added (1 ml iodine solution per 100 ml solution). After incubation at room temperature for 2 days in an enclosed glass container, the solution is diluted five-fold with deionized water and extracted with ethyl ether four times for removal of unreacted iodine. After removal of the residual amount of ethyl ether by rotary evaporation the solution of crude product is lyophilized and purified by successive reverse-phase chromatography.

Peptides can also be synthesized by many other methods including solid phase synthesis using traditional FMOC protection (i.e., coupling with DCC-HOBt and deprotection with piperdine in DMF). Cys thiol groups can be trityl protected. Treatment with TFA can be used for final deprotection of the peptide and release of the peptide from the solid-state resin. In many cases air oxidation is sufficient to achieve proper disulfide bond formation.

Example 1: Preparation of variant ST peptides and wild-type ST peptide

1a: Preparation of recombinant variant ST peptides and wild-type ST peptide

A variant ST peptide having the sequence Asn Ser Ser Asn Tyr Cys Cys Glu Tyr Cys Cys Asn Pro Ala Cys Thr Gly Cys Tyr (SEQ ID NO:5) was produced recombinantly and tested in an animal model. A peptide having the sequence of the wild-type ST peptide was also created (SEQ ID NO:4).

SEQ ID NO:5 and SEQ ID NO:4 peptides were produced as preproproteins using vectors produced as follows. A sequence encoding a heat-stable enterotoxin pre-pro sequence was amplified from pGK51/pGSK51 (ATCC 67728) using oligonucleotide MO3514 (5' CACACCATATGAAGAAATCAATATTATTTATTTTTCTTTCTG 3' (SEG ID NO:)) and oligonucelotide MO3515 (5' CACACCTCGAGTTAGGTCTCCATGCTTTCAGGACCACTTTTATTAC 3' (SEQ ID NO: __)). The amplification product fragment was digested with NdeI/XhoI and ligated to the T7 expression vector, pET26b(+) (Novagen) digested with NdeI/XhoI thereby creating plasmid MB3976. The region encoding the pre-pro protein was sequenced and found to encode the amino acid sequence: mkksilfiflsvlsfspfaqdakpagsskekitleskkcnivkksnksgpesm (SEQ ID NO: __) which differs from the amino acid sequence of heat-stable enterotoxin a2 precursor (sta2; mkksilfiflsvlsfspfaqdakpagsskekitleskkcnivkknnesspesm (SEQ ID NO:___); GenBank® Accession No. Q47185, GI: 3913876) at three positions (indicated by underlining and bold text) near the C-terminus. To create expression vectors with the pre-pro sequence, complementary oligos encoding each ST peptide variant or wild-type ST peptide were annealed and cloned into the MB3976 expression vector. To create MB3984 (encoding SEQ ID NO:4 peptide (wild-type ST peptide) as a prepro protein), containing the amino acid sequence, NSSNYCCELCCNPACTGCY (SEQ ID NO:___) fused downstream of

the pre-pro sequence, MB 3976 was digested with BsaI/XhoI and ligated to annealed oligos MO3621 (5' GCATGAATAGTAGCAATTACTGCTGTGAATTGTGTTGTAATCCTGCTTGTACCG GGTGCTATTAATAAC 3' (SEQ ID NO:__)) and MO3622 (5' TCGAGTTATTAATAGCACCCGGTACAAGCAGGATTACAACACAATTCACAGCA GTAATTGCTACTATTC 3'(SEQ ID NO:__)). To create MB3985 (encoding SEQ ID NO:5 as a prepro protein) containing the following amino acid sequence, NSSNYCCEYCCNPACTGCY fused downstream of the pre-pro sequence, MB 3976 was digested with BsaI/XhoI and ligated to annealed oligos MO3529 (5' GCATGAATAGTAGCAATTACTGCTGTGAATATTGTTGTAATCCTGCTTGTACCGG GTGCTATTAATAAC 3' (SEQ ID NO:__)) and MO3530 (5' TCGAGTTATTAATAGCACCCGGTACAAGCAGGATTACAACAATATTCACAGCAG TAATTGCTACTATTC 3'(SEQ ID NO:__)).

The SEQ ID NO:5 peptide and the SEQ ID NO:4 peptide were produced as follows. The expression vectors were transformed into *E. coli* bacterial host BL21 λ DE3 (Invitrogen). A single colony was innoculated and grown shaking overnight at 30°C in L broth + 25 mg/l kanamycin. The overnight culture was added to 3.2 L of batch medium (Glucose 25 g/l, Caseamino Acids 5 g/l, Yeast Extract 5 g/l, KH_2PO_4 13.3 g/l, $(NH_4)_2HPO_4$ 4 g/l, $MgSO_4$-$7H_20$ 1.2 g/l, Citric Acid 1.7 g/l, EDTA 8.4 mg/l, $CoCl_2$-$6H_2O$ 2.5 mg/l, $MnCl_2$-$4H_2O$ 15 mg/l, $CuCl_2$-$4H_2O$ 1.5 mg/l, H_3BO_3 3 mg/l, Na_2MoO_4-$2H_20$ 2.5 mg/l, Zn Acetate-$2H_20$ 13 mg/l, Ferric Citrate 100 mg/l, Kanamycin 25 mg/l, Antifoam DF_20_4 1 ml/l) and fermented using the following process parameters : pH 6.7 - control with base only (28% NH_4OH), 30°C, aeration : 5 liters per minute. After the initial consumption of batch glucose (based on monitoring dissolved oxygen (DO) levels), 1.5 L of feed medium (Glucose 700 g/l, Caseamino Acids 10 g/l, Yeast Extract 10 g/l, $MgSO_4$-$7H_20$ 4 g/l, EDTA 13 mg/l, $CoCl_2$-$6H_2O$ 4 mg/l, $MnCl_2$-$4H_2O$ 23.5 mg/l, $CuCl_2$-$4H_20$ 2.5 mg/l, H_3BO_3 5 mg/l, Na_2MoO_4-$2H_20$ 4 mg/l, Zn Acetate-$2H_20$ 16 mg/l, Ferric Citrate 40 mg/l, Antifoam DF_20_4 1 ml/l) was added at a feed rate controlled to maintain 20% DO. IPTG

was added to 0.2 mM 2 hours post feed start. The total run time was approximately 40-45 hours (until feed exhaustion).

Cells were collected by centrifugation at 5,000 g for 10 minutes. The cell pellet was discarded and the supernatant was passed through a 50 Kd ultrafiltration unit. The 50 Kd filtrate (0.6 liters) was loaded onto a 110 ml Q-Sepharose fast Flow column (Amersham Pharmacia, equilibrated with 20 mM Tris-HCl pH 7.5) at a flow rate of 400 ml/hour. The column was washed with six volumes of 20 mM Tris-HCl pH 7.5 and proteins were eluted with 50 mM acetic acid collecting 50 ml fractions. Fractions containing ST peptide variant or wild-type ST peptide were pooled and the solvent was removed by rotary evaporation. The dried proteins were resuspended in 10 ml of 8% acetic acid, 0.1% trifluoroacetic acid (TFA) and loaded onto a Varian Polaris C18-A column (250 X 21.2 mm 10 µm, equilibrated in the same buffer) at a flow rate of 20 ml/min. The column was washed with 100 ml of 8% methanol, 0.1% TFA and developed with a gradient (300 ml) of 24 to 48% methanol, 0.1% TFA, collecting 5-ml fractions. Fractions containing peptide were pooled and the solvent was removed by rotary evaporation. The peptides were dissolved in 0.1%TFA and lyophilized.

The SEQ ID NO:5 peptide and SEQ ID NO:4 peptide fractions were analyzed by standard LCMS and HPLC. LCMS analysis revealed that SEQ ID NO:5 peptide is more homogeneous than SEQ ID NO: 4 peptide (see Figure 1a; note that SEQ ID NO:5 peptide exhibits fewer peaks (Panel B) than SEQ ID NO:4 peptide (Panel A)).

1b: Preparation of synthetic variant ST peptides and wild-type ST peptide

Peptides were chemically synthesized by a commercial peptide synthesis company. Varying yields of peptides were obtained depending on the efficiency of chemical synthesis. Thus, the four peptides, in decreasing order of yield were: Cys Cys Glu Tyr Cys Cys Asn Pro Ala Cys Thr Gly Cys Tyr (SEQ ID NO:3), 10-20% yield; Cys Cys Glu

Leu Cys Cys Asn Pro Ala Cys Thr Gly Cys Tyr (SEQ ID NO:8); Asn Ser Ser Asn Tyr Cys Cys Glu Tyr Cys Cys Asn Pro Ala Cys Thr Gly Cys Tyr (SEQ ID NO:5); Asn Ser Ser Asn Tyr Cys Cys Glu Leu Cys Cys Asn Pro Ala Cys Thr Gly Cys Tyr (SEQ ID NO:SEQ ID NO:4), <5% yield. Thus the specific amino acid changes introduced into the peptides can create improved manufacturing properties.

Figure 1b shows the total ion chromatograph profile of synthetically manufactured SEQ ID NO:3 peptide. Figure 1c shows the total ion chromatograph profile of the control blank sample. There is one major peak present in the SEQ ID NO:3 peptide sample that is not also present in the control sample. Quantitative analysis suggests the SEQ ID NO:3 peptide is >98% pure.

Example 2: Activation of the intestinal GC-C receptor by a variant ST peptide and ST peptide

The ability of SEQ ID NO:5 , SEQ ID NO:4, SEQ ID NO:3, and SEQ ID NO:6 to activate the intestinal GC-C receptor was assessed in an assay employing the T84 human colon carcinoma cell line (American Type Culture Collection (Bethesda, Md)). For the assays cells were grown to confluency in 24-well culture plates with a 1:1 mixture of Ham's F12 medium and Dulbecco's modified Eagle's medium (DMEM), supplemented with 5% fetal calf serum and were used at between passages 54 and 60.

Briefly, monolayers of T84 cells in 24-well plates were washed twice with 1 ml/well DMEM, then incubated at 37°C for 10 min with 0.45 ml DMEM containing 1 mM isobutylmethylxanthine (IBMX), a cyclic nucleotide phosphodiesterase inhibitor. Test peptides (50µl) were then added and incubated for 30 minutes at 37°C. The media was aspirated and the reaction was then terminated by the addition of ice cold 0.5 ml of 0.1N HCl. The samples were held on ice for 20 minutes and then evaporated to dryness using a heat gun or vacuum centrifugation. The dried samples were resuspended in 0.5ml of

phosphate buffer provided in the Cayman Chemical Cyclic GMP EIA kit (Cayman Chemical, Ann Arbor, MI). Cyclic GMP was measured by EIA according to procedures outlined in the Cayman Chemical Cyclic GMP EIA kit.

Figures 2a and 2b show the activity of chemically synthesized peptide variants in this GC-C receptor activity assay. In this assay, SEQ ID NO:4 and two different SEQ ID NO:3 peptides (SEQ ID NO:3(a) and SEQ ID NO:3(b), synthesized by two different methods) had activity comparable to SEQ ID NO:4. SEQ ID NO:5 and SEQ ID NO:4 peptide were chemically synthesized in a manner identical to that of SEQ ID NO:3(b). SEQ ID NO:6 was chemically synthesized in a manner identical to that of SEQ ID NO:3(a).

Example 3: Intestinal transit in rodents can be increased by administering certain peptides

In order to determine whether the peptides increase the rate of gastrointestinal transit, the peptides and controls were tested using a murine gastrointestinal transit (GIT) assay (Moon et al. *Infection and Immunity* 25:127, 1979). In this assay, charcoal, which can be readily visualized in the gastrointestinal tract is administered to mice after the administration of a test compound. The distance traveled by the charcoal is measured and expressed as a percentage of the total length of the colon.

Mice were fasted with free access to water for 12 to 16 hours before the treatment with peptide or control buffer. The peptides were orally administered at 1μg/kg – 1mg/kg of peptide in buffer (20mM Tris pH 7.5) 7 minutes before being given an oral dose of 5% Activated Carbon (Aldrich 242276-250G). Control mice were administered buffer only before being given a dose of Activated Carbon. After 15 minutes, the mice were sacrificed and their intestines from the stomach to the cecum were dissected. The total length of the intestine as well as the distance traveled from the stomach to the charcoal

front was measured for each animal and the results are expressed as the percent of the total length of the intestine traveled by the charcoal front. All results are reported as the average of 10 mice ± standard deviation. A comparison of the distance traveled by the charcoal between the mice treated with peptide versus the mice treated with vehicle alone was performed using a Student's t test and a statistically significant difference was considered for $P<0.05$. P-values are calculated using a two-sided T-Test assuming unequal variances.

As can be seen in Figure 3a and Figure 3b, wild-type ST peptide SEQ ID NO:4, (Sigma-Aldrich, St Louis, MO); 0.1 mg/kg), synthetically manufactured SEQ ID NO:3 and Zelnorm® (0.1 mg/kg), a drug approved for IBS that is an agonist for the serotonin receptor 5HT4, increase gastrointestinal transit rate in this model. Figure 4a shows the result of a study demonstrating that intestinal transit rate increases with an increasing dosage of either recombinantly synthesized SEQ ID NO:4 or SEQ ID NO:5. Figure 4b shows the results of a study demonstrating both chemically synthesized SEQ ID NO:4 or SEQ ID NO:3 peptide increase intestinal transit rates more than either Tris buffer alone or an equivalent dose of Zelnorm®.

The identical experiment was performed to determine if SEQ ID NO:3 is effective in a chronic dosing treatment regimen. Briefly, 8 week old CD1 female mice are dosed orally once a day for 5 days with either SEQ ID NO:3 (0.06mg/kg or 0.25mg/kg in 20mM Tris pH 7.5) or vehicle alone (20mM Tris pH 7.5). On the 5th day, a GIT assay is performed identical to that above except 200µl of a 10% charcoal solution is administered. Figure 4c shows the results of a study demonstrating both chemically synthesized SEQ ID NO:3 or Zelnorm® are effective in a mouse gastrointestinal motility assay upon chronic dosing (daily for 5 days). The results are shown side by side with acute dosing (1 day).

The gastrointestinal transit assay was also performed in male and female CD rats (Charles River; Wilmington, MA) weighing between 136–191 g with an average weight

of 167.6 g. The assay was performed as described above for mice except an average of 5-8 animals were used for each test group and test peptide and 5% activated carbon were administered simultaneously (versus 7 minutes apart). In addition, the animals were sacrificed 10 minutes after the administration of peptide and test compound. Figure 4d shows the results of a study demonstrating that intestinal transit increases following the administration of SEQ ID NO:3, but not Zelnorm® in the rat GIT assay. Figure 4e shows the results of a study demonstrating that intestinal transit increases in a dose dependent manner with the administration of either SEQ ID NO:3 or SEQ ID NO:6 in female rats. Similar effects were seen in male rats.

The gastrointestinal transit assay was also performed in wild-type mice and mice lacking the guanylate cyclase C receptor (GC-C KO; Mann et al 1997 Biochem and Biophysical Research Communications 239:463). Wild type and GC-C KO mice were fasted overnight and SEQ ID NO:3 or vehicle alone were orally administered 10 minutes prior to an oral dose of a 10% Activated Carbon/10% Gum Arabic suspension. Animals were sacrificed 5 minutes after peptide or vehicle administration. Figure 4F shows the results of the gastrointestinal transit assay in 14 wild-type and 14 GC-C KO female mice. In vehicle treated animals, no difference was observed in transit rate between wild-type and GC-C KO animals. When compared to vehicle (20mM Tris pH 7.5) alone, an increase ($p<0.001$) in gastrointestinal transit rate was observed upon oral treatment with 100μg/kg of SEQ ID NO:3 in wild-type but not GC-C KO mice. Similar effects were observed in male mice.

Example 4: Certain peptides increase intestinal secretion in suckling mice (SuMi assay)

SEQ ID NO:4 peptide and SEQ ID NO:3 were tested for their ability to increase intestinal secretion using a suckling mouse model of intestinal secretion. In this model a test compound is administered to suckling mice that are between 7 and 9 days old. After

the mice are sacrificed, the gastrointestinal tract from the stomach to the cecum is dissected ("guts"). The remains ("carcass") as well as the guts are weighed and the ratio of guts to carcass weight is calculated. If the ratio is above 0.09, one can conclude that the test compound increases intestinal secretion. Figure 5a shows a dose response curve for wild-type ST peptide (SEQ ID NO:4) in this model. Figure 5b shows dose response curve for the SEQ ID NO:3 peptide in this model. These data show that wild-type ST peptide (purchased from TDT, Inc. West Chester, PA) and the SEQ ID NO:3 peptide increase intestinal secretion. The effect of Zelnorm® was also studied. As can be seen from Figure 5, Zelnorm® at 0.2 mg/kg does not increase intestinal secretion in this model. Figure 6a shows a dose response curve for the recombinant SEQ ID NO:4 peptide described above and the recombinant SEQ ID NO:5 peptide described above. As can be seen from Figure 6a, both peptides increase intestinal secretion in this model. Similarly figure 6b shows a dose response curve for chemically synthesized SEQ ID NO:5, SEQ ID NO:3 and SEQ ID NO:4 as well as wild-type ST peptide (purchased from Sigma-Aldrich, St Louis, MO). Figure 6c shows a dose response curve for chemically synthesized SEQ ID NO:3 and SEQ ID NO:6.

Colonic hyperalgesia animal models

Hypersensitivity to colorectal distension is common in patients with IBS and may be responsible for the major symptom of pain. Both inflammatory and non-inflammatory animal models of visceral hyperalgesia to distension have been developed to investigate the effect of compounds on visceral pain in IBS.

I. Trinitrobenzenesulphonic acid (TNBS)-induced rectal allodynia in two rodent models

TNBS visceral hypersensitivity rat model

Male Wistar rats (220-250 g) were premedicated with 0.5 mg/kg of acepromazine injected intraperitoneally (IP) and anesthetized by intramuscular administration of 100

mg/kg of ketamine. Pairs of nichrome wire electrodes (60 cm in length and 80 μm in diameter) were implanted in the striated muscle of the abdomen, 2 cm laterally from the white line. The free ends of electrodes were exteriorized on the back of the neck and protected by a plastic tube attached to the skin. Electromyographic (EMG) recordings were started 5 days after surgery. Electrical activity of abdominal striated muscle was recorded with an electroencephalograph machine (Mini VIII, Alvar, Paris, France) using a short time constant (0.03 sec.) to remove low-frequency signals (<3 Hz).

Ten days post surgical implantation, trinitrobenzenesulphonic acid (TNBS) was administered to induce rectal inflammation. TNBS (80 mg kg^{-1} in 0.3 ml 50 % ethanol) was administered intrarectally through a silicone rubber catheter introduced at 3 cm from the anus under light diethyl-ether anesthesia, as described (Morteau et al. 1994 Dig Dis Sci 39:1239). Following TNBS administration, rats were placed in plastic tunnels where they were severely limited in mobility for several days before colorectal distension (CRD). Experimental compound was administered one hour before CRD which was performed by insertion into the rectum, at 1 cm of the anus, a 4 cm long balloon made from a latex condom (Gue et al, 1997 *Neurogastroenterol. Motil.* 9:271). The balloon was fixed on a rigid catheter taken from an embolectomy probe (Fogarty). The catheter attached balloon was fixed at the base of the tail. The balloon, connected to a barostat, was inflated progressively by step of 15 mmHg, from 0 to 60 mmHg, each step of inflation lasting 5 min. Evaluation of rectal sensitivity, as measured by EMG, was performed before (1-2 days) and 3 days following rectal instillation of TNBS.

The number of spike bursts that corresponds to abdominal contractions was determined per 5 min periods. Statistical analysis of the number of abdominal contractions and evaluation of the dose-effects relationships was performed by a one way analysis of variance (ANOVA) followed by a post-hoc (Student or Dunnett tests) and regression analysis for ED50 if appropriate.

Figure 7a shows the results of experiment in which SEQ ID NO:3 activity was analyzed in the TNBS colorectal model. Significant decreases in abdominal response are observed at 0.3 μg/kg and 3 μg/kg SEQ ID NO:3. These results demonstrate that SEQ ID NO:3 reduces pain associated with colorectal distension in this animal model.

TNBS visceral hypersensitivity model in wild-type (WT) mice and mice lacking the guanylate-cyclase C receptor (GC-C KO)

TNBS induced visceral hypersensitivity was assessed in WT and GC-C KO mice. Two groups (WT and GC-C KO) of male mice (22-25g) were surgically prepared for electromyographic (EMG) recordings. Three electrodes were implanted in the striated muscles of the abdomen for EMG recording of abdominal contractions. Colorectal distension (CRD) was performed with a balloon inflated by 10s steps of 0.02 ml from 0 to 0.12ml. Under basal conditions mice were submitted to control CRD (time 0) followed by oral administration of SEQ ID NO:3 (0.01 and 0.3 μg/kg) or vehicle only (distilled water, 1 ml) at 3 hours. One hour post dosing the CRD procedure was repeated. Abdominal EMG contractile response to colorectal distension in basal conditions in both WT and GC-C KO mice (12-14 mice per group) was determined in the absence of vehicle and SEQ ID NO:3, and the mean +/- standard error of the mean (SEM) is graphically depicted in Figure 7c. GC-C KO mice exhibited a decreased EMG contractile response to CRD when compared to wild-type mice. SEQ ID NO:3 dosing of WT and GC-C KO mice under basal conditions decreased the EMG response to colorectal distension in WT but not GC-C KO mice.

For TNBS induced visceral hypersensitivity conditions, mice were submitted to control CRD (time 0) and TNBS (20 mg/kg) was administered at 3 days. Three days post intracolonic TNBS-induction animals were orally administered SEQ ID NO:3 (0.01 and 0.3 μg/kg) or vehicle (distilled water, 1ml) 1 hour before CRD. The effect of SEQ ID NO:3 (0.01μg/kg) on abdominal response to colorectal distension after TNBS in WT and GC-C KO mice (12-14 per group) at a volume distension of 0.8 ml was determined and the mean +/- standard error of the mean (SEM) is graphically depicted in Figure 7d. SEQ

ID NO:3 reduces the TNBS induced hypersensitivity to CRD in WT mice at 0.01μg/kg. A similar effect was not observed in GC-C KO mice.

II. Partial restraint stress-induced hyperalgesia model

Five groups of female Wistar rats (weighing 200-250g each), were surgically prepared for electromyography as described (Morteau et al. 1994 Dig Dis Sci 39:1239-48) and were used to evaluate the effects of SEQ ID NO:3 on colorectal sensitivity and compliance after a 2 hour partial restraint stress session. Partial restraint stress (PRS), a relatively mild stress, was induced as previously described (Morteau et al. 1994 Dig Dis Sci 39:1239-48). Female rats were lightly anesthetized with diethyl ether and their shoulders, upper forelimbs and thoracic trunk were wrapped in a confining harness of paper tape to restrict, but not prevent body movements. Control sham-stress animals were anesthitized but not wrapped. Animals received isobaric colorectal distensions (CRD) directly prior to (control CRD) and 15 minutes after two hours of partial restraint induced stress. Rats were treated orally with SEQ ID NO:3 (0.3, 3, 30 ug/kg) or vehicle only (distilled water 1 mL) one hour before the CRD procedure. For the CRD procedure, rats were acclimatized to restraint in polypropylene tunnels (diameter: 7 cm; length: 20 cm) periodically for several days before CRD in order to minimize recording artifacts. The balloon used for distension was 4 cm long and made from a latex condom. It was fixed on a rigid catheter taken from an embolectomy probe (Fogarty). CRD was performed by insertion of the balloon in the rectum at 1 cm from the anus. The tube was fixed at the base of the tail. Isobaric distensions were performed from 0 to 60 mmHg, with each distension step lasting 5 minutes. The first distension was performed at a pressure of 15 mmHg and an increment of 15 mmHg was added at each following step, until a maximal pressure of 60 mmHg was attained. Electromyographic recordings commenced 5 days after surgery. Electrical activity was recorded with an electroencephalograph (Mini VIII, Alvar, Paris, France) using a short time constant (0.03

sec.) to remove low-frequency signals (<3 Hz) and a paper speed of 3.6 cm/minute. Isobaric distensions of the colon were performed by connecting the balloon to a computerized barostat. Colonic pressure and balloon volume were continuously monitored on a potentiometric recorder (L6514, Linseis, Selb, Germany) with a paper speed of 1.0 cm/minute. The number of spike bursts, corresponding to abdominal contractions, was evaluated per 5-minute period. Colorectal volumes were determined as the maximal volume obtained for each stage of distension using the potentiometric recorder. Statistical analysis of these two parameters was performed using a one way analysis of variance (ANOVA) followed by an unpaired two-tailed Student's *t* test using GraphPad Prism 4.0. p values<0.05 were considered significantly different. The values were expressed as mean ± SEM. Figure 7b shows the results of an experiment in which SEQ ID NO:3 activity was analysed in the Stress-Induced Hyperalgesia model. SEQ ID NO:3 reduced the response to CRD after PRS ($p<0.0001$) at a distending pressure of 15 mm Hg when administered at doses of 0.3 and 3.0 μg/kg.

III. Water avoidance stress-induced hyperalgesia model

The effect of SEQ ID NO:3 on basal visceral nociception in a model of water avoidance stress-induced visceral hyperalgesia in adult male Wistar rats was tested. The stress involved confining rats to a platform surrounded by water for a period of 1 hour and then measuring their visceromotor response to colonic distension using electromyography (EMG).

At least 7 days prior to stress measurements, animals were deeply anesthetized with pentobarbital sodium (45 mg/kg) and equipped with electrodes implanted into the external oblique musculature, just superior to the inguinal ligament. Electrode leads were then tunneled subcutaneously and externalized laterally for future access. Following surgery, rats were housed in pairs and allowed to recover for at least 7 days. On the day of the experiment, animals were lightly anesthetized with halothane, and a lubricated latex balloon (6 cm) was inserted intra-anally into the descending colon. Animals were allowed to recover for 30 minutes, and colorectal distension (CRD) was initiated. The

CRD procedure consisted of graded intensities of phasic CRD (10, 20, 40, 60 mmHg; 20 s duration; 4 min inter-stimulus interval). Visceromotor response (VMR) to CRD was quantified by measuring EMG activity. To determine the effects of SEQ ID NO:3 on basal visceral nociception, a baseline CRD was recorded. Animals were allowed 1 hour recovery and then SEQ ID NO:3 or vehicle was orally administered. At 1 hour following administration of SEQ ID NO:3 or vehicle CRD was repeated. Administration of 30 μg/kg of SEQ ID NO:3 increased basal visceral nociception as compared to vehicle only. The mean value (+/- SEM) of in vehicle and SEQ ID NO:3 treated groups (n=7 for each group) is graphically depicted in Figure 7e. Oral administration of SEQ ID NO:3 at a lower dose (3 μg/kg) had no effects on basal visceral.

To determine the effect of SEQ ID NO:3 in a model of water avoidance stress-induced visceral hyperalgesia, a baseline CRD was recorded and then the animals were subjected to 1 hour of water avoidance stress. For water avoidance stress, the test apparatus consisted of a Plexiglas tank with a block affixed to the center of the floor. The tank was filled with fresh room temperature water (25°C) to within 1 cm of the top of the block. The animals were placed on the block for a period of 1 h. The sham water avoidance stress consisted in placing the rats on the same platform in a waterless container. A second CRD was performed at 24 hours post water avoidance stress. Following the second CRD, animals were allowed 1 hour recovery and then SEQ ID NO:3 or vehicle was orally administered. At 1 hour following administration of SEQ ID NO:3 or vehicle CRD was repeated. Following water avoidance stress, 3μg/kg of SEQ ID NO:3 exhibited anti-hyperalgesic properties, by reducing the increased visceromotor response to colorectal distension (CRD) 24 hours after stress. This effect is graphically depicted (mean +/- SEM; n=7) in Figure 7f.

Phenylbenzoquinone-induced writhing model

The PBQ-induced writhing model can be used to assess pain control activity of the peptides and GC-C receptor agonists described herein. This model is described by Siegmund et al. (1957 Proc. Soc. Exp. Bio. Med. 95:729-731). Briefly, one hour after

oral dosing with a test compound, e.g., a peptide, morphine or vehicle, 0.02% phenylbenzoquinone (PBQ) solution (12.5 mL/kg) is injected by intraperitoneal route into the mouse. The number of stretches and writhings are recorded from the 5th to the 10th minute after PBQ injection, and can also be counted between the 35th and 40th minute and between the 60th and 65th minute to provide a kinetic assessment. The results are expressed as the number of stretches and writhings (mean ± SEM) and the percentage of variation of the nociceptive threshold calculated from the mean value of the vehicle-treated group. The statistical significance of any differences between the treated groups and the control group is determined by a Dunnett's test using the residual variance after a one-way analysis of variance ($P < 0.05$) using SigmaStat Software.

Figures 8a and 8b show the effect of different doses of SEQ ID NO:5 and SEQ ID NO:3 in the PBQ writhing assay. Indomethacin, an NSAID (nonsteroidal anti-inflammatory drug) with known pain control activity, was used as the positive control in the assay. Significant reductions in writhings were observed for SEQ ID NO:5 (1 mg/kg dose) and SEQ ID NO:3 (2.5 mg/kg dose) compared to the vehicle control. Loss of efficacy at the highest dose tested has also been observed for multiple other compounds (such as 5HT-3 antagonists) tested in similar assays. The results of this study suggest that both SEQ ID NO:5 and SEQ ID NO:3 have antinociceptive effects in this visceral pain model comparable to the intermediate doses of indomethacin.

Example 5: SEQ ID NO:3 Kd determination and binding assays

To determine the affinity of SEQ ID NO:3 for GC-C receptors found in rat intestinal mucosa, a competition binding assay was performed using rat intestinal epithelial cells. Epithelial cells from the small intestine of rats were obtained as described by Kessler et al. (*J. Biol. Chem.* 245: 5281-5288 (1970)). Briefly, animals were sacrificed and their abdominal cavities exposed. The small intestine was rinsed with 300 ml ice cold saline or PBS. 10 cm of the small intestine measured at 10 cm from the pylorus was removed

and cut into 1 inch segments. Intestinal mucosa was extruded from the intestine by gentle pressure between a piece of parafilm and a P-1000 pipette tip. Intestinal epithelial cells were placed in 2 ml PBS and pipetted up and down with a 5 ml pipette to make a suspension of cells. Protein concentration in the suspension was measured using the Bradford method (*Anal. Biochem.* 72: 248-254 (1976)).

A competition binding assay was performed based on the method of Giannella et al. (*Am. J. Physiol.* 245: G492-G498) between [^{125}I] labeled SEQ ID NO:4 and SEQ ID NO:3. The assay mixture contained: 0.5 ml of DME with 20 mM HEPES-KOH pH 7.0, 0.9 mg of the cell suspension listed above, 21.4 fmol [^{125}I]-SEQ ID NO:4 (42.8 pM), and different concentrations of competitor SEQ ID NO:3 (0.01 to 1000 nM). The mixture was incubated at room temperature for 1 hour, and the reaction stopped by applying the mixture to GF/B glass-fiber filters (Whatman). The filters were washed with 5 ml ice-cold PBS and radioactivity was measured. Figure 9a shows that the Kd for SEQ ID NO:3 in this assay is 4.5 nm. %B/Bo is the percentage of the ratio of radioactivity trapped in each sample (B) compared to the radioactivity retained in a control sample with no cold competitor (Bo). Giannella et al. (*Am. J. Physiol.*245: G492-G498) observed that the Kd for wild-type ST peptide in this same assay was ~13 nm.

Similar competition binding assays were performed in intestinal epithelial cells from wild-type and guanylate cyclase C knockout (GC-C KO; Mann et al. 1997 Biochem and Biophysical Research Communications 239:463) mice. Mouse intestinal epithelial cells were prepared identical to that above as for rat intestinal epithelial cells except the cells were homogenized with an Omni homogenizer for 20 seconds on the maximum setting to make a suspension of cells. A competition binding assay was performed identical to that described above between ^{125}I labeled SEQ ID NO:3 and unlabeled SEQ ID NO:3 (competitor). Figure 9b shows the results of an assay in which ^{125}I-SEQ ID NO:3 was prepared and incubated alone or with an excess of unlabeled SEQ ID NO:3 with isolated intestinal epithelial cells from two female wild-type and two female GC-C KO mice.

There is a reduction in SEQ ID NO:3 binding to intestinal epithelial cells from GC-C KO mice when compared to wild-type mice.

The binding of SEQ ID NO:3 and SEQ ID NO:6 to GC-C receptors on the cell surface of human colonic cells (T84 cellsl ATCC Catalog No. CCL-248) was characterized in a competitive radioligand-binding assay at pH conditions of 5, 7 and 8. The radiolabeled tracer used in these experiments was ^{125}I- SEQ ID NO:7. To determine binding constants, competitive inhibition of binding was used. T84 cells were cultured in T-150 plastic flasks in DMEM and Ham's F-12 medium containing 5% fetal bovine serum. Monolayers at 60-70% confluency (approximately 10^7 cells) were collected by gentle scraping followed by centrifugation, and washed twice in 50 mL of phosphate-buffered saline (PBS). The cells were resuspended in 1 mL DMEM containing 20 mM *N*-(2-hydroxymethyl)piperazine-*N'*-(2-ethanesulfonic acid) (Hepes), pH 7.0 and 0.5% bovine serum albumin (BSA). T84 cells were incubated with a constant amount of ^{125}I- SEQ ID NO:7 containing various concentrations of cold competitor. Free ^{125}I- SEQ ID NO:7 was separated from bound tracer by rapid suction filtration. The binding reactions were carried out in 1.5 mL microfuge tubes in 0.24 mL of DMEM/20 mM Hepes pH 7.0/0.5% BSA containing: 2.5 X 10^5 T84 cells (0.25 mg protein), 200,000 cpm ^{125}I- SEQ ID NO:7 (41 fmol, 170 pM), and 0.01 to 1,000 nM competitor. Binding assays at pH 5.0 were done in DMEM/20 mM 2-(*N*-morpholino) ethanesulfonic acid (Mes), pH 5.0. Binding assays in pH 8.0 were done in DMEM/20 mM Hepes/50 mM sodium bicarbonate pH 8.0. One sample contained no competitor (B_0) and another contained no cells. After incubation at 37 °C for 1 h, the reaction mixtures were applied to Whatman GF/B glass-fiber filters by suction filtration. The filters were then rinsed with 10 mL ice-cold PBS buffer, inserted into plastic tubes, and added to 2 mL scintillation fluid. Radioactivity was measured in a LS 6500 liquid scintillation counter (Beckman-Coulter). The percent bound in each sample is calculated by the equation:

$$\% B/B_0 = (\text{sample cpm} - \text{no cells cpm}) \times 100 / (B_0 \text{ cpm} - \text{no cells cpm})$$

Competitive radioligand-binding curves were generated using the Graphpad PRISM™ computer program. Nonlinear regression analysis of the binding data was used to calculate the concentration of competitor that resulted in 50% radioligand bound (IC_{50}). The apparent dissociation equilibrium constant (K_i) for each competitor was obtained from the IC_{50} values and the previously reported estimate of the dissociation constant for the radioligand, $K_d \cong 15$ nM (Hamra et al. 1997 PNAS 2705-10) and the method of Cheng and Prusoff 1973 Biochem Pharmacol 22:3099-108. Using a two site model, high and low affinity-binding sites were identified on T84 cells (K_{i1} and K_{i2}) for all the test agents. At pH 7.0. for SEQ ID NO:3 K_{i1} ranged from 0.89-1.23 nM and K_{i2} ranged from 88.9-156 nM. The SEQ ID NO:6 binding affinities at pH 7.0 were $K_{i1} = 1.57$ nM and $K_{i2} = 446$ nM. The SEQ ID NO:3 binding affinities at pH 5.0 were $K_{i1} = 1.38$ nM and $K_{i2} = 17$ nM. At pH 8.0 the high and low affinity binding sites were $K_{i1} = 0.6$ and $K_{i2} = 94.4$ nM respectively. Thus, binding of SEQ ID NO:3 to the high affinity site, K_{i1}, was not affected by pH.

Example 6: Pharmacokinetic properties of SEQ ID NO:3

To study the pharmacokinetics of SEQ ID NO:3, absorbability studies in mice were performed by administering SEQ ID NO:3 intravaneously via tail vein injection or orally by gavage to 8-week-old CD1 mice. Serum was collected from the animals at various time points and tested for the presence of SEQ ID NO:3 using a competitive enzyme-linked immunoabsorbent assay (Oxoid, ST EIA kit, Cat#TD0700). The assay utilized monoclonal antibodies against ST peptide (antibodies are provided in the Oxoid kit) and synthetically manufactured SEQ ID NO:3. Figure 10a shows absorption data for intravenously and orally administered SEQ ID NO:3 as detected by the ELISA assay. SEQ ID NO:3 appears to be minimally systemically absorbed and is < 2.2% bioavailable.

A similar bioavailability study was performed in which LCMS rather than ELISA was used to detect SEQ ID NO:3. Initially, serum samples were extracted from the whole blood of exposed and control mice, then injected directly (10mL) onto an in-line solid phase extraction (SPE) column (Waters Oasis HLB 25µm column, 2.0 x 15mm direct connect) without further processing. The sample on the SPE column was washed with a 5% methanol, 95% dH_2O solution (2.1 mL/min, 1.0 minute), then loaded onto an analytical column using a valve switch that places the SPE column in an inverted flow path onto the analytical column (Waters Xterra MS C8 5µm IS column, 2.1 x 20mm). The sample was eluted from the analytical column with a reverse phase gradient (Mobile Phase A: 10 mM ammonium hydroxide in dH_2O, Mobile Phase B: 10 mM ammonium hydroxide in 80% acetonitrile and 20% methanol; 20% B for the first 3 minutes then ramping to 95% B over 4 min. and holding for 2 min., all at a flow rate of 0.4 mL/min.). At 9.1 minutes, the gradient returns to the initial conditions of 20%B for 1 min. SEQ ID NO:3 eluted from the analytical column at 1.45 minutes, and was detected by triple-quadrapole mass spectrometry (MRM, 764 (+2 charge state)>182 (+1 charge state) Da; cone voltage = 30V; collision = 20 eV; parent resolution = 2 Da at base peak; daughter resolution = 2 Da at base peak). Instrument response was converted into concentration units by comparison with a standard curve using known amounts of chemically synthesized SEQ ID NO:3 prepared and injected in mouse serum using the same procedure.

Figure 10b shows absorption data for IV and orally administered SEQ ID NO:3 as detected by LCMS. In this assay, SEQ ID NO:3 appears similarly minimally systemically absorbed and is < 0.11 % bioavailable.

Similarly, oral bioavailabity was determined in rats using LCMS methodology. Rat plasma samples containing SEQ ID NO:3 and/or SEQ ID NO:6 were extracted using a Waters Oasis MAX 96 well solid phase extraction (SPE) plate. A 200 µL volume of rat plasma was mixed with 200 µL of $^{13}C_9$, ^{15}N - SEQ ID NO:3 in the well of a prepared SPE

plate. The samples were drawn through the stationary phase with 15 mm Hg vacuum. All samples were rinsed with 200 µL of 2% ammonium hydroxide in water followed by 200 µL of 20% methanol in water. The samples were eluted with consecutive 100 µL volumes of 5/20/75 formic acid/water/methanol and 100 µL 5/15/80 formic acid/water/methanol. The samples were dried under nitrogen and resuspended in 100 µL of 20% methanol in water. Samples were analyzed by a Waters Quattro Micro mass spectrometer coupled to a Waters 1525 binary pump with a Waters 2777 autosampler. A 40 µL volume of each sample was injected onto a Thermo Hypersil GOLD C18 column (2.1x50 mm, 5 um). SEQ ID NO:3 and SEQ ID NO:6 were eluted by a gradient over 3 minutes with acetonitrile and water containing 0.05% trifluoroacetic acid. The Quattro Micro mass spectrometer was run in multiple reaction monitoring (MRM) mode using the mass transitions of 764>182 and 682>136 for SEQ ID NO:3 and SEQ ID NO:6 respectively. Using this methodology, SEQ ID NO:3 was dosed orally and by IV to rats at 10 mg/kg. The area under the curve (AUC) for orally dosed SEQ ID NO:3 was 776.6 nM-min, while the AUC for intravenously administered SEQ ID NO:3 was 738,855 nM-min. In addition, SEQ ID NO:6 was detected in the plasma of rats dosed with SEQ ID NO:3, showing that this is a metabolite in rats. The AUC for SEQ ID NO:6 in rats dosed orally with SEQ ID NO:3 was 216 nM-min and the AUC for SEQ ID NO:6 in SEQ ID NO:3 intravenously dosed rats was 3580 nM-min. From the AUC values, the 6 h bioavailability of SEQ ID NO:3 determined by circulating plasma levels is 0.11%. When AUC values for SEQ ID NO:6 are included in the calculation, the 6 h bioavailability increases to 0.13%. To determine the oral biovailability of SEQ ID NO:6, this peptide was dosed to rats at 10 mg/kg. In this experiment, the limit of detection (LOD) for SEQ ID NO:6 was 0.78 nM. SEQ ID NO:6 was detected at all time points for the intravenous dose and was not detected beyond 240 min for the oral dose. For non-detected values, the LOD was used as an upper estimate of the concentration of SEQ ID NO:6. The calculated value for $AUC_{p.o.,(0-6h)}$ was < 1308 nM-min and $AUC_{i.v.,(0-6h)}$ was 1,590,000 nM-min. The 6 h bioavailability of SEQ ID NO:6 determined by circulating plasma levels was 0.08%

Oral bioavailability was also determined using a radioimmunoassay (RIA) detection method. Female CD-1 mice (Charles River, Wilmington, MA) weighing approximately 25 g (7-8 weeks old) or female CD rats (Charles River, Wilmington, MA) weighing approximately 153 g were included in this study. Monoclonal antibody, 20C1 (Brandwein et al. 1985 *Infect Immun.* 47:242-246), which recognizes SEQ ID NO:7 and ^{125}I labeled- SEQ ID NO:7, a labeled tracer, were used in these experiments. The labeled tracer was purified by HPLC using a Waters C-18u Bondapak® column (25 cm) previously equilibrated with 10 mM ammonium acetate pH 5.8. A gradient from 0 to 25% acetonitrile was applied to the column in 60 min, followed by isocratic elution at 25% acetonitrile for another 20 min. This method separated two monoiodinated forms from each other and from unlabeled precursor (Thompson et al. 1985 Anal Biochem. 148:26-36). The first monoiodinated peak (Peak 1) had a retention time of 60 min and corresponded to iodination of the C-terminal tyrosine, and was used as the labeled tracer in this study. The labeled tracer had a specific activity of 2200 Ci/mmol. The tracer was stored in aliquots at –20 °C. Animals were fasted overnight before administration of compounds. Animals received SEQ ID NO:3 (rats-10 mg/kg; mice 8 mg/kg) or vehicle alone (20 mM Tris-HCl, ph7.5) intravenously or orally. Blood was drawn from all dosed animals by retro-orbital eye bleeding at specific intervals and test compound levels were analyzed by radioimmunoassay (RIA). SEQ ID NO:3 was extracted from the serum or plasma using Amersham Biosciences Amprep C18 columns (100 mg). Samples (80 µL) were first diluted to 0.5 mL with start buffer (8% methanol, 0.095% TFA in water) and applied to C18 columns previously conditioned with 1 mL methanol and equilibrated with 2 mL of start buffer. After washing with 1 mL start buffer, SEQ ID NO:3 was eluted with 0.8 mL of 80% methanol, 0.05% TFA and dried down in a centrifugal evaporator. Samples were reconstituted in 0.194 mL assay buffer (PBS buffer, pH 7.4, containing 10% fetal bovine serum). Standard dilutions of SEQ ID NO:3 (0 to 256 nM) were made in rat plasma. To perform RIA analysis, samples from dosed animal and standards were mixed with 5 µL diluted antibody (in RIA wash buffer; phosphate-

buffered saline (PBS) containing 0.1% bovine serum albumin (BSA), 1:40,000 final dilution, 0.0022 μg), and incubated 1 to 4 h at 4 °C. One tube contained the zero standard (B_0) and another no standard and no antibody (non-specific binding, NSB). Labeled tracer (0.018 μCi, diluted in RIA wash buffer) was then added and incubated at 4 °C for 12 to 18 h. The antibody bound fraction containing SEQ ID NO:3 was collected by magnetic separation using 10 μL of sheep anti-mouse IgG beads previously washed twice in 10 volumes RIA assay buffer. The beads were then washed twice with 1 mL of RIA wash buffer, collected by magnetic separation, resuspended in 0.1 mL of RIA wash buffer, and added to 2 mL scintillation fluid. Radioactivity was measured in a LS 6500 scintillation counter (Beckman-Coulter). The binding efficiency is defined as the percent radioactivity in the B_0 sample compared to the input counts. The percent bound in each sample was calculated by the equation:

$$\% B/B_0 = (\text{sample cpm} - \text{NSB cpm}) \times 100 / (B_0 \text{ cpm} - \text{NSB cpm})$$

A standard curve was prepared by plotting % B/B_0 as a function of the log SEQ ID NO:3 concentration. A concentration vs. time plot was generated from the data in GraphPad Prism or Summit Software PK Solutions 2.0 to generate oral and i.v. PK curves. The area under the curve from T = 0 to 4 hours ($AUC_{0\text{-}4h}$) was calculated by the software for both p.o. and i.v. dosed animals. If the values were below the lower limit of detection (LOD) than the LOD was used to estimate the value (in this experiment 2 nM). Oral Bioavailabilty (F) is calculated using the equation:

$$F = (AUC_{p.o.,(0\text{-}4h)} * D_{i.v.}) / (AUC_{i.v.,(0\text{-}4h)} * D_{p.o.})$$

where $D_{i.v.}$ and $D_{p.o.}$ equal the intravenous and oral dose, respectively. For SEQ ID NO:3 administed to mice, the calculated $AUC_{p.o.,(0\text{-}4h)}$ was ≤ 0.69 ug-min/mL, the $AUC_{i.v.,(0\text{-}4h)}$ was 1660.98 ug-min/mL and the bioavailability (F) was ≤ 0.04%. The estimated bioavailability of 8 mg/kg SEQ ID NO:3 in mice using the RIA method is not more than

0.04% over 4 hours. For SEQ ID NO:3 administed to rats, the calculated value of $AUC_{p.o.,(0\text{-}6h)}$ was 2.90 ug-min/mL, the $AUC_{i.v.,(0\text{-}6h)}$ was 1422.64 ug-min/mL and the bioavailability was 0.20%. The estimated bioavailability of 10 mg/kg SEQ ID NO:3 in rats using the RIA method is not more than 0.20% over 6 hours.

EXAMPLE 7: In vitro proteolytic stability of SEQ ID NO:3

The stability of SEQ ID NO:3 in the presence of several mammalian digestive enzymes was determined. SEQ ID NO:3 was exposed to a variety of *in vitro* conditions including digestive enzymes and low ph environments designed to simulate gastric fluid. SEQ ID NO:3 was incubated with chymotrypsin, trypsin, pepsin, aminopeptidase, carboxypeptidase A, and simulated gastric fluid (sgf) at ph 1.0. Samples were collected at 0, 3, and 24 h for all conditions except pepsin digestion and the SGF. For the latter two conditions, samples were obtained at 0, 1, and 3 h. Negative control samples were prepared for initial and final time points. A separate, positive activity control was run in parallel to SEQ ID NO:3. All samples were analyzed by LC/MS

Chymotrypsin

500 µl samples of 0.01 mg/mL SEQ ID NO:3 and guanylin (Sigma-Aldrich, G116; positive control) were prepared in the chymotrypsin reaction buffer (100 mM Tris-HCl, 10 mM $CaCl_2$, pH 7.5) in 2 mL eppendorf tubes. Zero and 24 h control samples were prepared by adding 5 µL of a 10 mM chymostatin (Sigma-Alrich, C7268; a chymotrypsin inhibitor) stock for a final concentration of 100 µM. All samples were incubated at 37 °C for 5 min. 20 µL of a 0.01 mg/mL chymotrypsin stock (α-chympotrypsin from bovine pancreas; Sigma-Aldrich, C6423) were added to each sample for a 0.0004 mg/mL final concentration. Samples were returned to the 37° C water bath. The reaction was quenched with 5 µL of a 10 mM chymostatin stock at each time point for a final concentration of 100 µM. No extra chymostatin was added to the control samples as they

already had inhibitor. Samples were subsequently flash frozen in liquid nitrogen, and stored at –80 °C until analysis. Upon analysis, samples were thawed and transferred to a 1 mL 96-well plate. Standards of SEQ ID NO:3 and guanylin were prepared in chymotrypsin reaction buffer at 0.625, 1.25, 2.50, 5.00, and 10.00 μg/mL concentrations. These standards were used to generate a standard curve for quantification of samples. When necessary, the standard curves were also used to calculate the concentration of the corresponding digestion product. 10 μL injections were made of each sample and standard.

Trypsin

500 μL samples of 0.01 mg/mL SEQ ID NO:3 and BAEE (N_{alpha} Benzoyl-L-arginine ethyl ester hydrochloride; Sigma-Aldrich, B4500; positive control) were prepared with trypsin reaction buffer (100 mM Tris-HCl, pH 7.5) in 2 mL eppendorf tubes. Zero and 24 h time point control samples were prepared were prepared (N = 1) with 5 μL of a 100 mg/mL AEBSF (4-(2-Aminoethyl)benzenesulfonyl fluoride hydrochloride; a trypsin inhibitor) stock for a final concentration of 1 mg/mL. All control and test samples (0, 3, and 24 h) were incubated at 37 °C for 5 min. Twenty (20) μL of a 0.01 mg/mL trypsin (Sigma-Aldrich, T6467) stock were added to each sample for a final concentration of 0.0004 mg/mL. Samples were returned to the 37°C water bath. The reaction was quenched with 5 μL of a 100 mg/mL AEBSF stock, which was added to each sample at the indicated timepoint, for a final concentration of 1 mg/mL. No extra AEBSF was added to the control samples as they already had inhibitor. Samples were subsequently flash frozen in liquid nitrogen, and stored at –80 °C until analysis. Upon analysis, samples were thawed and transferred to a 1 mL 96-well plate. Standards of SEQ ID NO:3 and BAEE were prepared in trypsin reaction buffer at 0.625, 1.25, 2.50, 5.00, and 10.00 μg/mL concentrations. These standards were used to generate a standard curve for quantification of samples. When necessary, the standard curves were also used to calculate the concentration of the corresponding digestion product. Ten (10) μL injections were made of each sample and standard.

Pepsin

500 µL samples of 100 U/mL pepsin (Pepsin porcine gastric mucosa; Sigma-Aldrich, P68871; U = release of 0.01 absorbance at 280 nM (A280) as TCA soluble hydrolysis products per min at 37 °C of hemoglobin) were prepared in the pepsin reaction buffer (100 mM HCl-KCl, pH 2.0) in 5 mL polystyrene round bottom tubes. To the control samples (0 and 24 h), 500 µL of a 1 M ammonium acetate (pepsin inhibitor) stock were added, for a final concentration of 0.5 M. All control and test samples (0, 1, and 3 h) were incubated at 37 °C for 5 min, while shaking. Fifty (50) µL of 0.1 mg/mL SEQ ID NO:3 and Insulin B chain, oxidized (Sigma-Aldrich, I6383; positive control), stocks were added to the respective tubes. Samples were returned to the 37 °C shaking water bath. Reactions were quenched by the addition of 500 µL of 1 M ammonium acetate for a final concentration of 0.5 M (except to the control samples, which already contained 0.5 M ammonium acetate). Samples were cooled on ice and stored at 4 °C until analysis. Upon analysis, samples were transferred to a 1 mL 96-well plate. Standards of SEQ ID NO:3 and Insulin B chain, oxidized, were prepared in 25 mM Tris-hydrochloric acid, 500 mM sodium chloride, pH 7.5 buffer at 0.625, 1.25, 2.50, 5.00, and 10.00 µg/mL concentrations. These standards were used to generate a standard curve for quantification of samples. Ten (10) µL injections were made of each sample and standard.

Aminopeptidase

500 µL samples of 0.01 mg/mL SEQ ID NO:3 and chemically synthesized SEQ ID NO:4 (wild type ST; positive control) were prepared in the aminopeptidase reaction buffer (5 mM Tris-HCl, 5 mM $MgCl_2$, pH 7.5) in 2 mL eppendorf tubes. 5 µL of a 5 mg/mL Bestatin hydrochloride (BioChemika, 08170; an aminopeptidase inhibitor) stock was added to each control sample (0 and 24 h), for a final concentration of 0.05 mg/mL. All control and test samples (0, 3, and 24 h) were incubated at 37 °C for 5 min. 0.02 U aminopeptidase (Aminopeptidase M, amino acid aryl amidase (Roche, 102768; U = hydrolysis of 1.0 umol of L-leucinamide to leucine and NH3 per min at pH 8.5 at 25 °C)

were added to each sample. Samples were returned to the 37 °C water bath. The reaction was quenched with 5 µL of a 5 mg/mL Bestatin hydrochloride stock at the proper time point. No extra Bestatin hydrochloride was added to the control samples since they already had inhibitor present. Samples were subsequently flash frozen in liquid nitrogen, and stored at –80 °C until analysis. Upon analysis, samples were thawed and transferred to a 1 mL 96-well plate. Standards of SEQ ID NO:3 and SEQ ID NO:4 were prepared in aminopeptidase reaction buffer at 0.625, 1.25, 2.50, 5.00, and 10.00 µg/mL concentrations. These standards were used to generate a standard curve for quantification of samples. When necessary, the standard curves were also used to calculate the concentration of the corresponding digestion product. Ten (10) µL injections were made of each sample and standard.

Carboxypeptidase A

500 µL samples of 0.01 mg/mL SEQ ID NO:3 and N-CBZ-Glycine-Glycine-Leucine (Z-Gly-Gly-Leu; Sigma-Aldrich, C8501; postive control) were prepared in the carboxypeptidase A reaction buffer (25 mM Tris-HCl, 500 mM NaCl, pH 7.5) in 2 mL eppendorf tubes. Five (5) µL of a 40 µg/mL carboxypeptidase inhibitor (carboxypeptidase inhibitor from potato tuber (Sigma-Aldrich, C0279) stock was added to each control sample (0 and 24 h), for a final concentration of 0.4 µg/mL. All control and test (0, 3 and 24 h) samples were incubated at 37 °C for 5 min. Twenty (20) µL of a 0.01 mg/mL carboxypeptidase A (Carboxypeptidase A from human pancreas; Sigma-Aldrich, C5358) stock was added to each sample. The samples were returned to the 37 °C water bath. The reaction was quenched with 5 µL of a 40 µg/mL carboxypeptidase inhibitor at the proper time point. No extra carboxypeptidase inhibitor was added to the control samples since there was already inhibitor present. Samples were subsequently flash frozen in liquid nitrogen, and stored at –80 °C until analysis. Upon analysis, samples were thawed and transferred to a 1 mL 96-well deep microtiter plate. Standards of SEQ ID NO:3 and Z-Gly-Gly-Leu were prepared in carboxypeptidase A reaction buffer at 0.625, 1.25, 2.50, 5.00, and 10.00 µg/mL concentrations. These standards were

used to generate a standard curve for quantification of samples. When necessary, the standard curves were also used to calculate the concentration of the corresponding digestion product. Ten (10) µL injections were made of each sample and standard. As shown in Figure 13a, Z-Gly-Gly-Leu, was proteolyzed by carboxypeptidase A. The Z-Gly-Gly-Leu T0 control and T0 samples had average calculated concentrations of 7.1 (+/- 0.30) µg/mL. No precursor mass was detected in T3 h and T24 h samples. The calculated concentrations of the Z-Gly-Gly-Leu products for T3 h and T24 h samples were 2.2 (+/- 0.10) µg/mL. As shown in Figure 13b, some proteolysis of SEQ ID NO:3 was observed upon treatment with carboxypeptidase A. The SEQ ID NO:3 calculated concentrations of all samples were 8.4 (+/- 1.2) µg/mL. For the SEQ ID NO:3 time 0 control and time 0 samples the calculated concentrations for the SEQ ID NO:3 products were 0.8 (+/- 0.02) µg/mL and 0.8 (+/- 0.01) µg/mL, respectively. The T3 h and T24 h samples had average calculated SEQ ID NO:3 product concentrations of 1.3 (+/- 0.06) µg/mL and 1.3 (+/- 0.04) µg/mL, respectively.

Carboxypeptidase A - Identification of Proteolysis Product

To further study the SEQ ID NO:3 carboxypeptidase A digestion product, samples of 0.01 mg/mL SEQ ID NO:3 were prepared in the carboxypeptidase A reaction buffer at a total volume of 500 µL in 2 mL eppendorf tubes. Triplicate samples were prepared for the following time points: 0, 15, 30, 60, 120, 180 and 240 min. The samples were incubated at 37 °C for 5 min. Twenty (20) µL of a 0.01 mg/mL carboxypeptidase A stock were added to each sample and returned to the 37 °C water bath. The reactions were quenched with 5 µL of a 40 µg/mL carboxypeptidase inhibitor at the proper time points. Samples were subsequently flash frozen in liquid nitrogen, and stored at –80 °C until analysis. Upon analysis, samples were thawed and transferred to a 1 mL 96-well plate. Standards of SEQ ID NO:3 were prepared in carboxypeptidase A reaction buffer at 0.625, 1.25, 2.50, 5.00, and 10.00 µg/mL concentrations. These standards were used to generate a standard curve for quantification of samples. When necessary, the standard curves were also used to calculate the concentration of the corresponding digestion

product. Ten (10) μL injections were made of each sample and standard. If the formation of a digestion product was evident, then a spectral analysis was used to determine the mass of the digestion product, and predict its possible identity. Direct comparison between the total ion current (TIC) chromatograms from digestion at time 0 min (T0) and 240 min (T240) revealed a peak at 3.3 min in the T240 chromatogram (upper panel, Figure 13c) that was not present in the T0 chromatogram (lower panel, Figure 13c). The retention time of SEQ ID NO:3 was 3.51 min. A spectral view of the 3.3 min peak indicates the mass of the digestion product is 1362 Da. The spectrum shows 3 singly charged species representing protonated, ammoniated, and sodiated ions with mass/charge (m/z) ratio of 1363 ($[M+H]^+$), 1380 ($[M+NH_4]^+$), 1385 ($[M+Na]^+$) (Figure 13d). The sum of the areas of all 3 adducts increased over time (Figure 13e). A digestion product mass of 1362 Da corresponds to the loss of the carboxy-terminal tyrosine residue of (SEQ ID NO:6), the first expected product of carboxypeptidase A proteolysis. SEQ ID NO:6 is a peptide that corresponds to the proposed SEQ ID NO:3 carboxypeptidase A cleavage product (it is sequentially identical to SEQ ID NO:3 minus the carboxy-terminal tyrosine residue). This peptide was used as a standard to quantify digestion product formation. The increase in concentration of SEQ ID NO:6 was proportional to the disappearance of SEQ ID NO:3. Based on these findings, SEQ ID NO:6 appears to be the sole digestion product of SEQ ID NO:3 under these *in vitro* conditions. The SEQ ID NO:3 average concentration at T0 was 5115 (+/- 121) nM. The concentration decreased with time, with the T240 average concentration calculated to be 4438 (+/- 188) nM. The average concentration of SEQ ID NO:6 at T0 was 108 (+/- 2) nM. The concentration increased with time, with the T240 average concentration calculated to be 726 (+/- 138) nM. When comparing the rate of disappearance of SEQ ID NO:3 with the rate of formation of SEQ ID NO:6, both rates decreased at 60 min and leveled off at 120 min. In addition, the sum of the concentration of SEQ ID NO:3 and SEQ ID NO:6 remains essentially constant over the 4 h incubation. A graphical representation of the data is shown in Figure 13f. The initial SEQ ID NO:3 concentration used was 5113 nM.

Simulated Gastric Fluid (SGF)

Samples of 153 μg/mL SEQ ID NO:3 were prepared in the simulated gastric fluid buffer (0.2% NaCl (w/v), 0.7% HCl (v/v), pH 1) to a total volume of 500 μL in 2 mL eppendorf tubes. The reference control and test samples (0, 1 and 3 h) were incubated at 37 °C for the time point indicated. The reference control sample was diluted 10-fold (1000 μL volume) in distilled water for a final concentration of 10 μM and chilled on ice. At each time point, samples were diluted 10-fold (1000 μL volume) in distilled water for an expected concentration of 10 μM, and chilled on ice, until analysis. Upon analysis, samples were transferred to a 1 mL 96-well plate. Standards of SEQ ID NO:3 were prepared in distilled water at 0.625, 1.25, 2.50, 5.00, and 10.00 μM concentrations. These standards were used to generate a standard curve for quantification of samples. Ten (10) μL injections were made of each sample and standard.

Example 8: SEQ ID NO:3 results in an increase in Bristol Stool Form Scale scores for consistency of bowel movements in humans after a single dose

Single doses of 30, 100, 300, 1000 or 3000 μg of chemically synthesized SEQ ID NO:3 were given to 30 healthy males and postmenopausal females. At each dose level (100 μg

was done twice) SEQ ID NO:3 or placebo (vehicle) was administered orally in 5.0 mL 50 mM phosphate buffer (pH 6.0) plus 3x20mL water rinses and 175 mL water after at least a 10-hour fast. In each dosing group, subjects were randomized to receive either placebo (1 subject) or SEQ ID NO:3 (3-4 subjects). Bowel habits (including Bristol Stool Form Scale score (BSFS; Figure 14a), stool frequency, and stool weight) were evaluated for each collected bowel movement 48 hours prior to dose and up to approximately 48 hours postdose.

Administration of a single dose of SEQ ID NO:3 resulted in an increase in maximum BSFS score (Figure 14b). Higher BSFS post-dose scores correlated with a higher dose of the SEQ ID NO:3. Figure 14c shows the percent of subjects with at least a 2-point increase in BSFS consistency score (mean pre-dose compared to peak 48 hours post-dose). The highest percent of subjects with a 2-point or greater increase in BSFS score are found in the 1000 μg dose group.

Example 9: SEQ ID NO:3 alters the consistency and timing of bowel movements in humans after a seven-day dosing period.

Seven daily doses of 30, 100, 300, or 1000 μg of chemically synthesized SEQ ID NO:3 were given to 48 healthy subjects. SEQ ID NO:3 or placebo (vehicle) was administered orally in 5.0 mL 50 mM phosphate buffer (pH 6.0) plus 3x20mL water rinses and 175 mL water after at least a 10-hour fast. In each dosing group, 8 subjects were randomized to receive SEQ ID NO:3 and 4 subjects were randomized to receive placebo. Figure 15a shows the daily mean BSFS scores for the different dosing groups the seven days prior to and the seven days during dosing with SEQ ID NO:3. Figure 15b shows the Mean Stool Frequency (stools per week) for the subjects over the seven-day treatment period. An increase in Mean Stool Frequency score was observed with higher doses of SEQ ID NO:3. Figure 15C shows the Mean Stool Weight (in grams) of the subjects' stools over the seven-day SEQ ID NO:3 dosing period. An increase in Mean Stool Weight was

observed with higher doses of SEQ ID NO:3. The Mean Ease of Passage (Figure 15d) of stools was tested for subjects treated with 30-1000μg SEQ ID NO:3. In Figure 15e, the 1000 μg dose group shows the greatest difference in baseline versus treatment values between placebo and SEQ ID NO:3 for Mean Ease of Passage of stools. Figure 15F shows the mean time to first bowel movement for each of the different doses.

Example 10: SEQ ID NO:3 effects in a rat model of postoperative ileus.

Female CD rats were used to test the effect of SEQ ID NO:3 on delayed transit induced by abdominal surgery and manual manipulation of the small intestine. Groups of at least nine rats underwent abdominal surgery under isoflurane anesthesia. Surgery consisted of laparotomy and 5 minutes of gentle manual intestinal massage. Following recovery from anesthesia, rats were dosed orally with either 10 μg/kg SEQ ID NO:3 or vehicle (20mM Tris) in a volume of 300μl. 1 hour after dosing, intestinal transit rate was measured. Animals were again dosed with 300μl of the test article followed immediately by 500μl of a charcoal meal (10% charcoal, 10% gum arabic in water). To calculate the distance of the small intestine traveled by the charcoal front, after 20 minutes, the total length of the intestine as well as the distance traveled from the stomach to the charcoal front were measured for each animal. Animals dosed with 10μg/kg SEQ ID NO:3 experienced an increase in transit following abdominal surgery compared to animals dosed with vehicle alone (Figure 16). Charcoal transit in SEQ ID NO:3 dosed animals was measured at 37.3 + 3.0% (mean + SEM) of the small intestine compared with vehicle at 24.7 + 1.4% (mean + SEM) of the small intestine .

Example 11: SEQ ID NO:3 effect on cGMP levels and secretion in ligated loops rodent models

The effect of SEQ ID NO:3 on cGMP levels and secretion were studied by injecting SEQ ID NO:3 directly into an isolated loop in either wild-type or GC-C KO mice. This was done by surgically ligating a loop in the small intestine of the mouse.

The methodology for ligated loop formation was a similar to that described in London et al. 1997 Am J Physiol p.G93-105. The loop was roughly centered and was a length of 1-3 cm. The loops were injected with 100µl of either SEQ ID NO:3 (5µg) or vehicle (20 mM Tris, pH 7.5 or Krebs Ringer, 10mM Glucose, HEPES buffer (KRGH)). Following a recovery time of 90 minutes the loops were excised. Weights were recorded for each loop before and after removal of the fluid contained therein. The length of each loop was also recorded. A weight to length ratio (W/L) for each loop was calculated to determine the effects of SEQ ID NO:3 on secretion.

To determine the effect of SEQ ID NO:3 on cGMP activity, fluid from the loop was collected in ice-cold trichloracetic acid (TCA) and stored at –80°C for use in an assay to measure cGMP levels in the fluid. Intestinal fluid samples were TCA extracted, and cyclic GMP was measured by EIA according to procedures outlined in the Cayman Chemical Cyclic GMP EIA kit (Cayman Chemical, Ann Arbor, MI) to determine cyclic GMP levels in the intestinal fluid of the mouse in the presence of either SEQ ID NO:3 or vehicle. Figure 17a depicts the effects of SEQ ID NO:3 in wild-type and GC-C KO mice ligated loops with regards to cGMP activity and secretion (n=5-7 animal/group for secretion assays; n=4-7 animals/group for cGMP assays). In contrast to wild-type mice, SEQ ID NO:3 has no effect on cGMP activity or secretion in GC-C KO mice.

The effects of SEQ ID NO:3 on cGMP levels and secretion in ligated loops in female CD rats was also determined using protocols similar to those described above. In the case of the rat, however four loops of intestine were surgically ligated. The first three loops were distributed equally in the small intestine and the fourth loop was located in colon. Loops were 1 to 3 centimeters, and were injected with 200µL of either SEQ ID NO:3 (5µg) or vehicle (Krebs Ringer, 10mM glucose, HEPES buffer (KRGH)). SEQ ID NO:3 increases cGMP levels and secretion in the center loop of the rat small intestine as shown in figure 17b (n=9-10 animal per group for secretion assays; n=7-8 animals for cGMP assays). Similar experiments were performed to determine the effect of SEQ ID NO:6 on cGMP levels and secretion in ligated loops in female CD rats. Experimental

results comparing the effects of SEQ ID NO:3, SEQ ID NO:6 and vehicle only on secretion and cGMP production are shown in figures 17c and 17d.

Example 11. SEQ ID NO:3 effects on opioid induced constipation

The effect of SEQ ID NO:3 on opioid induced constipation was studied by dosing female rats (~160g each) with 300µl of the opiate, morphine (2.5mg/kg) via intra-peritoneal injection. Thirty minutes post dosing, animals were treated with 300 µl of SEQ ID NO:3 or vehicle only. Ten minutes later, the animals were orally dosed with 500µl 10% charcoal, 10% gum arabic meal. After ten minutes, the animals were sacrificed and gastrointestinal transit was measured as in Example 3 above. Experimental results are shown in Figure 21.

Example 13. Mass Spectrometry Characterization of Disulfide Bonds in SEQ ID NO:3

The position of disulfide bonds in SEQ ID NO:3 was determined. To identify the optimal conditions required to partially reduce SEQ ID NO:3, chemically synthesized peptide was alkylated with iodoacetamide after TCEP (tris(2-carboxyethyl) phosphine) treatment (0.1 to 10 mM for 20 minutes at room temperature). After TCEP reduction, the reaction was adjusted to pH 8.0 with Tris and iodoacetamide was added to 50 mM. The reaction products were analyzed by LC-MS. 0.1 mM TCEP did not reduce SEQ ID NO:3 while 10 mM reduced all three disulfide bonds in the molecule. 1mM TCEP resulted in a mixture of molecules containing native SEQ ID NO:3, one reduced disulfide bond (3 species), two reduced disulfide bonds (3 species) and three reduced bonds (one species).

Partially reduced SEQ ID NO:3 was then cyanylated, cleaved with base and completely reduced to separate fragments. After partial reduction, cyanylation, and cleavage of SEQ ID NO:3 were performed either in a test tube or in an HPLC column, a modified method of Wu and Watson ((2002) *Methods Mol. Biol.* 194: 1-22) was used to determine the position of the disulfide bonds. The steps were carried out manually, with isolation of the alkylation products by solid phase extraction (SPE), or in-line

(automated), with reactions occurring in an SPE column. Briefly, the manual procedure comprised the following. Chemically synthesized SEQ ID NO:3 (162 µg) was partially reduced with 1 mM tris(2-carboxyethyl) phosphine (TCEP) at pH 3. The sulfhydryl groups of partially reduced SEQ ID NO:3 were cyanylated with 2.1 µmoles 1-cyano-4-dimethylamino-pyridinium tetrafluoroborate (CDAP) for 15 minutes. The reaction mixture was then diluted to 0.5 mL with 10 mM ammonium acetate pH 5.8 and applied to an Amprep octadecyl C18 minicolumn (100 mg, GE HealthTech). The minicolumn was washed with 1 mL of 10 mM ammonium acetate pH 5.8 and peptides eluted with 0.6 mL methanol. After drying, the peptides were cleaved in 1 M NH4OH and fully reduced with 0.1 M TCEP. After drying, the peptide fragments were reconstituted in 0.1% formic acid and analyzed by LC-MS. Briefly, the automated procedure comprised the following. SEQ ID NO:3 (16.2 mg, 0.01 mmole) was loaded onto an Oasis HLB 2 X 15 mm column (Waters). Reactions were carried out by filling a 5 mL sample loop with 1.2 mM TCEP, 2.4 mM CDAP, 2 M NH4OH or 6 mM TCEP and pushing each reagent through the column with 0.1% formic acid in 5% methanol at a flow rate of 0.3 mL/min. The column was then back-flushed and the cleaved peptides analyzed by LC-MS.

LC-MS procedures comprised the following. An Atlantis dC18 2.1 X 50 mm column (Waters) equilibrated in 98% buffer A (0.1 % formic acid), 2% buffer B (0.1% formic acid: 85% methanol, 15% CH3CN) at a flow rate of 0.3 mL/min. After a 4 min wash with the same buffers, peptides were eluted with a linear gradient of 2% buffer B to 40% buffer B over 38 min with a constant flow rate of 0.3 mL/min. Cleaved peptide masses were determined using a Micromass Q-Tof II instrument equipped with an electrospray ionization (ESI) source operating in positive ion mode. The instrument was programmed to scan in the mass range of *m/z* 100 to 1000. Molecular weight predictions and data analysis were carried out with MassLynx version 4.0 software. NMR analysis of SEQ ID NO:3 was performed. Briefly, SEQ ID NO:3was was dissolved at 7.5 mg/mL in D2O (pD of 5 adjusted with NaOD). Nuclear Overhauser Enhancement Spectroscopy (NOESY) spectrum was acquired at 500 MHz. NOE-based distance restraints were collected from the NOESY spectra. The peptide structure was determined using the

programs. Based on the method of Wu and Watson (supra), a list of possible fragments resulting from CN-induced cleavage of singly reduced and cyanylated species of SEQ ID NO:3 with all possible disulfide linkage combinations was generated. The list included the signature fragments for each possible structure. Figure 22 is a table which presents a list of the observed fragments of SEQ ID NO:3 after partial reduction, cyanylation, and cleavage. These results indicate that the disulfide structure of SEQ ID NO:3 is Cys1-Cy6, Cys2-Cys10, and Cys5-Cys13.

Example 14. Diuresis and Naturesis Assays

Effect on Diuresis and Natriuresis

The effect of polypeptides/GC-agonists described herein on diuresis and natriuresis can be determined using methodology similar to that described in WO06/001931 (examples 6 (p. 42) and 8 (p.45)). Briefly, the polypeptide/agonist described herein (180-pmol) is infused for 60 min into a group of 5 anesthetized rats. Given an estimated rat plasma volume of 10 mL, the infusion rate is approximately 3 pmol/mL/min. Blood pressure, urine production, and sodium excretion are monitored for approximately 40 minutes prior to the infusion, during the infusion, and for approximately 50 minutes after the infusion to measure the effect of the polypeptide/GC-C agonist on diuresis and natriuresis. For comparison, a control group of five rats is infused with regular saline. Urine and sodium excretion can be assessed. Dose response can also be determined. polypeptide/GC-C agonist described herein is infused intravenously into rats over 60 minutes. Urine is collected at 30 minute intervals up to 180 minutes after termination of polypeptide/GC-C agonist infusion, and urine volume, sodium excretion, and potassium excretion are determined for each collection interval. Blood pressure is monitored continuously. For each dose a dose-response relationship for urine volume, sodium and potassium excretion can be determined. Plasma concentration of the polypeptide/GC-agonist is also determined before and after iv infusion.

Rat Diuresis Experiment:

Female Sprague-Dawley rats (> 170 g, 2-8 per group) are given 3.0mL of iosotonic saline perorally, and then anesthetized with isoflurane /oxygen. Once an appropriate level of anesthesia has been achieved, a sterile polyurethane catheter (~16 cm, 0.6mm ID, 0.9mm OD) is inserted 1.5-2.0 cm into the urethra and secured using 1 – 2 drops of veterinary bond adhesive applied to urethra/catheter junction. Rats are then dosed with either vehicle or test article via the intravenous or intraperitoneal route. Rats are then placed in appropriately sized rat restraint tubes, with the catheter protruding out of the restraint tube into a 10 mL graduated cylinder. Rats are allowed to regain consciousness, and the volume of urine excreted over a 1-5 hour duration is recorded periodically for each rat.

Administration of peptides and GC-C receptor agonists

For treatment of gastrointestinal disorders, the peptides and agonists described herein are preferably administered orally, e.g., as a tablet or cachet containing a predetermined amount of the active ingredient, pellet, gel, paste, syrup, bolus, electuary, slurry, sachet; capsule; powder; lyophilized powder; granules; as a solution or a suspension in an aqueous liquid or a non-aqueous liquid; as an oil-in-water liquid emulsion or a water-in-oil liquid emulsion, via a liposomal formulation (see, e.g., EP 736299) or in some other form. Orally administered compositions can include binders, lubricants, inert diluents, lubricating, surface active or dispersing agents, flavoring agents, and humectants. Orally administered formulations such as tablets may optionally be coated or scored and may be formulated so as to provide sustained, delayed or controlled release of the active ingredient therein. The peptides and agonists can be co-administered with other agents used to treat gastrointestinal disorders including but not limited to the agents described herein. The peptides and agonists can also be administered by rectal suppository. For the treatment of disorders outside the gastrointestinal tract such as congestive heart failure

and benign prostatic hypertrophy, peptides and agonists are preferably administered parenterally or orally.

The peptides described herein can be administered alone or in combination with other agents. For example, the peptides can be administered together with an analgesic peptide or compound. The analgesic peptide or compound can be covalently attached to a peptide described herein or it can be a separate agent that is administered together with or sequentially with a peptide described herein in a combination therapy.

Combination therapy can be achieved by administering two or more agents, e.g., a peptide described herein and an analgesic peptide or compound, each of which is formulated and administered separately, or by administering two or more agents in a single formulation. Other combinations are also encompassed by combination therapy. For example, two agents can be formulated together and administered in conjunction with a separate formulation containing a third agent. While the two or more agents in the combination therapy can be administered simultaneously, they need not be. For example, administration of a first agent (or combination of agents) can precede administration of a second agent (or combination of agents) by minutes, hours, days, or weeks. Thus, the two or more agents can be administered within minutes of each other or within 1, 2, 3, 6, 9, 12, 15, 18, or 24 hours of each other or within 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 14 days of each other or within 2, 3, 4, 5, 6, 7, 8, 9, or 10 weeks of each other. In some cases even longer intervals are possible. While in many cases it is desirable that the two or more agents used in a combination therapy be present in within the patient's body at the same time, this need not be so.

Combination therapy can also include two or more administrations of one or more of the agents used in the combination. For example, if agent X and agent Y are used in a combination, one could administer them sequentially in any combination one or more times, e.g., in the order X-Y-X, X-X-Y, Y-X-Y, Y-Y-X, X-X-Y-Y, etc.

Combination therapy can also include the administration of two or more agents via different routes or locations. For example, (a) one agent is administered orally and another agents is administered intravenously or (b) one agent is administered orally and another is administered locally. In each case, the agents can either simultaneously or sequentially. Approximated dosages for some of the combination therapy agents described herein are found in the "BNF Recommended Dose" column of tables on pages 11-17 of WO01/76632 (the data in the tables being attributed to the March 2000 British National Formulary) and can also be found in other standard formularies and other drug prescribing directories. For some drugs, the customary presecribed dose for an indication will vary somewhat from country to country.

The agents, alone or in combination, can be combined with any pharmaceutically acceptable carrier or medium. Thus, they can be combined with materials that do not produce an adverse, allergic or otherwise unwanted reaction when administered to a patient. The carriers or mediums used can include solvents, dispersants, coatings, absorption promoting agents, controlled release agents, and one or more inert excipients (which include starches, polyols, granulating agents, microcrystalline cellulose (e.g. celphere, Celphere beads®), diluents, lubricants, binders, disintegrating agents, and the like), etc. If desired, tablet dosages of the disclosed compositions may be coated by standard aqueous or nonaqueous techniques.

Compositions of the present invention may also optionally include other therapeutic ingredients, anti-caking agents, preservatives, sweetening agents, colorants, flavors, desiccants, plasticizers, dyes, glidants, anti-adherents, anti-static agents, surfactants (wetting agents), anti-oxidants, film-coating agents, and the like. Any such optional ingredient must be compatible with the compound described herein to insure the stability of the formulation.

The composition may contain other additives as needed, including for exanple lactose, glucose, fructose, galactose, trehalose, sucrose, maltose, raffinose, maltitol, melezitose,

stachyose, lactitol, palatinite, starch, xylitol, mannitol, myoinositol, and the like, and hydrates thereof, and amino acids, for example alanine, glycine and betaine, and peptides and proteins, for example albumen.

The agents either in their free form or as a salt can be combined with a polymer such as polylactic-glycoloic acid (PLGA), poly-(I)-lactic-glycolic-tartaric acid (P(I)LGT) (WO 01/12233), polyglycolic acid (U.S. 3,773,919), polylactic acid (U.S. 4,767,628), poly(ε-caprolactone) and poly(alkylene oxide) (U.S. 20030068384) to create a sustained release formulation. Such formulations can be used to implants that release a peptide or another agent over a period of a few days, a few weeks or several months depending on the polymer, the particle size of the polymer, and the size of the implant (see, e.g., U.S. 6,620,422). Other sustained release formulations and polymers for use in are described in EP 0 467 389 A2, WO 93/24150, U.S. 5,612,052, WO 97/40085, WO 03/075887, WO 01/01964A2, U.S. 5,922,356, WO 94/155587, WO 02/074247A2, WO 98/25642, U.S. 5,968,895, U.S. 6,180,608, U.S. 20030171296, U.S. 20020176841, U.S. 5,672,659, U.S. 5,893,985, U.S. 5,134,122, U.S. 5,192,741, U.S. 5,192,741, U.S. 4,668,506, U.S. 4,713,244, U.S. 5,445,832 U.S. 4,931,279, U.S. 5,980,945, WO 02/058672, WO 9726015, WO 97/04744, and. Additional controlled release formulations are described in U.S. 6,734,188, WO 02/38129, EP 326 151, U.S. 5,236,704, WO 02/30398, WO 98/13029; U.S. 20030064105, U.S. 20030138488A1, U.S. 20030216307A1, U.S. 6,667,060, WO 01/49249, WO 01/49311, WO 01/49249, WO 01/49311, and U.S. 5,877,224.

The agents can be administered, e.g., by intravenous injection, intramuscular injection, subcutaneous injection, intraperitoneal injection, topical, sublingual, intraarticular (in the joints), intradermal, buccal, ophthalmic (including intraocular), intranasaly (including using a cannula), intraspinally, intrathecally, or by other routes. The agents can be administered orally, e.g., as a tablet or cachet containing a predetermined amount of the active ingredient, gel, pellet, paste, syrup, bolus, electuary, slurry, capsule, powder, lyophilized powder, granules, sachet, as a solution or a suspension in an aqueous liquid or a non-aqueous liquid, as an oil-in-water liquid emulsion or a water-in-oil liquid emulsion, via a micellar formulation (see, e.g. WO 97/11682) via a liposomal formulation (see, e.g., EP 736299,WO 99/59550 and WO 97/13500), via formulations described in WO 03/094886, via bilosome (bile-salt based vesicular system), via a dendrimer, or in some other form. Orally administered compositions can include binders, lubricants, inert diluents, lubricating, surface active or dispersing agents, flavoring agents, and humectants. Orally administered formulations such as tablets may optionally be coated or scored and may be formulated so as to provide sustained, delayed or controlled release of the active ingredient therein. The agents can also be administered transdermally (i.e. via reservoir-type or matrix-type patches, microneedles, thermal poration, hypodermic needles, iontophoresis, electroporation, ultrasound or other forms of sonophoresis, jet injection, or a combination of any of the preceding methods (Prausnitz et al. 2004, Nature Reviews Drug Discovery 3:115-124)). The agents can be administered using high-velocity transdermal particle injection techniques using the hydrogel particle formulation described in U.S. 20020061336. Additional particle formulations are described in WO 00/45792, WO 00/53160, and WO 02/19989. An example of a transdermal formulation

containing plaster and the absorption promoter dimethylisosorbide can be found in WO 89/04179. WO 96/11705 provides formulations suitable for transdermal adminisitration. The agents can be administered in the form a suppository or by other vaginal or rectal means. The agents can be administered in a transmembrane formulation as described in WO 90/07923. The agents can be administed non-invasively via the dehydrated particicles described in U.S. 6,485,706. The agent can be administered in an enteric-coated drug formulation as described in WO 02/49621. The agents can be administered intranassaly using the formulation described in U.S. 5,179,079. Formulations suitable for parenteral injection are described in WO 00/62759. The agents can be administered using the casein formulation described in U. S. 20030206939 and WO 00/06108. The agents can be administered using the particulate formulations described in U.S. 20020034536.

The agents, alone or in combination with other suitable components, can be administered by pulmonary route utilizing several techniques including but not limited to intratracheal instillation (delivery of solution into the lungs by syringe), intratracheal delivery of liposomes, insufflation (administration of powder formulation by syringe or any other similar device into the lungs) and aerosol inhalation. Aerosols (e.g., jet or ultrasonic nebulizers, metered-dose inhalers (MDIs), and dry-powder inhalers (DPIs)) can also be used in intranasal applications. Aerosol formulations are stable dispersions or suspensions of solid material and liquid droplets in a gaseous medium and can be placed into pressurized acceptable propellants, such as hydrofluroalkanes (HFAs, i.e. HFA-134a and HFA-227, or a mixture thereof), dichlorodifluoromethane (or other chlorofluocarbon propellants such as a mixture of Propellants 11, 12, and/or 114), propane, nitrogen, and the like. Pulmonary formulations may include permeation enhancers such as fatty acids, saccharides, chelating agents, enzyme inhibitors (e.g., protease inhibitors), adjuvants (e.g., glycocholate, surfactin, span 85, and nafamostat), preservatives (e.g., benzalkonium chloride or chlorobutanol), and ethanol (normally up to 5% but possibly up to 20%, by weight). Ethanol is commonly included in aerosol compositions as it can improve the

function of the metering valve and in some cases also improve the stability of the dispersion. Pulmonary formulations may also include surfactants which include but are not limited to bile salts and those described in U.S. 6,524,557 and references therein. The surfactants described in U.S. 6,524,557, e.g., a C8-C16 fatty acid salt, a bile salt, a phospholipid, or alkyl saccaride are advantageous in that some of them also reportedly enhance absorption of the peptide in the formulation. Also suitable in the invention are dry powder formulations comprising a therapeutically effective amount of active compound blended with an appropriate carrier and adapted for use in connection with a dry-powder inhaler. Absorption enhancers which can be added to dry powder formulations of the present invention include those described in U.S. 6,632,456. WO 02/080884 describes new methods for the surface modification of powders. Aerosol formulations may include U.S. 5,230,884, U.S. 5,292,499, WO 017/8694, WO 01/78696, U.S. 2003019437, U. S. 20030165436, and WO 96/40089 (which includes vegetable oil). Sustained release formulations suitable for inhalation are described in U.S. 20010036481A1, 20030232019A1, and U.S. 20040018243A1 as well as in WO 01/13891, WO 02/067902, WO 03/072080, and WO 03/079885. Pulmonary formulations containing microparticles are described in WO 03/015750, U.S. 20030008013, and WO 00/00176. Pulmonary formulations containing stable glassy state powder are described in U.S. 20020141945 and U.S. 6,309,671. Other aerosol formulations are desribed in EP 1338272A1 WO 90/09781, U. S. 5,348,730, U.S. 6,436,367, WO 91/04011, and U.S. 6,294,153 and U.S. 6,290,987 describes a liposomal based formulation that can be administered via aerosol or other means. Powder formulations for inhalation are described in U.S. 20030053960 and WO 01/60341. The agents can be administered intranasally as described in U.S. 20010038824.

The agents can be incorporated into microemulsions, which generally are thermodynamically stable, isotropically clear dispersions of two immiscible liquids, such as oil and water, stabilized by an interfacial film of surfactant molecules (Encyclopedia of Pharmaceutical Technology (New York: Marcel Dekker, 1992), volume 9). For the preparation of microemulsions, surfactant (emulsifier), co-surfactant (co-emulsifier), an

oil phase and a water phase are necessary. Suitable surfactants include any surfactants that are useful in the preparation of emulsions, e.g., emulsifiers that are typically used in the preparation of creams. The co-surfactant (or "co-emulsifer") is generally selected from the group of polyglycerol derivatives, glycerol derivatives and fatty alcohols. Preferred emulsifier/co-emulsifier combinations are generally although not necessarily selected from the group consisting of: glyceryl monostearate and polyoxyethylene stearate; polyethylene glycol and ethylene glycol palmitostearate; and caprilic and capric triglycerides and oleoyl macrogolglycerides. The water phase includes not only water but also, typically, buffers, glucose, propylene glycol, polyethylene glycols, preferably lower molecular weight polyethylene glycols (e.g., PEG 300 and PEG 400), and/or glycerol, and the like, while the oil phase will generally comprise, for example, fatty acid esters, modified vegetable oils, silicone oils, mixtures of mono- di- and triglycerides, mono- and di-esters of PEG (e.g., oleoyl macrogol glycerides), etc.

The agents described herein can be incorporated into pharmaceutically-acceptable nanoparticle, nanosphere, and nanocapsule formulations (Delie and Blanco-Prieto 2005 Molecule 10:65-80). Nanocapsules can generally entrap compounds in a stable and reproducible way (Henry-Michelland et al., 1987; Quintanar-Guerrero et al., 1998; Douglas et al., 1987). To avoid side effects due to intracellular polymeric overloading, ultrafine particles (sized around 0.1 μm) can be designed using polymers able to be degraded in vivo (e.g. biodegradable polyalkyl-cyanoacrylate nanoparticles). Such particles are described in the prior art (Couvreur et al, 1980; 1988; zur Muhlen et al., 1998; Zambaux et al. 1998; Pinto-Alphandry et al., 1995 and U.S. Pat. No. 5,145,684).

The agents described herein can be formulated with pH sensitive materials which may include those described in WO04041195 (including the seal and enteric coating described therein) and pH-sensitive coatings that achieve delivery in the colon including those described in US4910021 and WO9001329. US4910021 describes using a pH-sensitive material to coat a capsule. WO9001329 describes using pH-sensitive coatings on beads

containing acid, where the acid in the bead core prolongs dissolution of the pH-sensitive coating. U. S. Patent No. 5,175, 003 discloses a dual mechanism polymer mixture composed of pH-sensitive enteric materials and film-forming plasticizers capable of conferring permeability to the enteric material, for use in drug-delivery systems; a matrix pellet composed of a dual mechanism polymer mixture permeated with a drug and sometimes covering a pharmaceutically neutral nucleus; a membrane-coated pellet comprising a matrix pellet coated with a dual mechanism polymer mixture envelope of the same or different composition; and a pharmaceutical dosage form containing matrix pellets. The matrix pellet releases acid-soluble drugs by diffusion in acid pH and by disintegration at pH levels of nominally about 5.0 or higher. The agents described herein may be formulated in the pH triggered targeted control release systems described in WO04052339. The agents described herein may be formulated according to the methodology described in any of WO03105812 (extruded hyrdratable polymers); WO0243767 (enzyme cleavable membrane translocators); WO03007913 and WO03086297 (mucoadhesive systems); WO02072075 (bilayer laminated formulation comprising pH lowering agent and absorption enhancer); WO04064769 (amidated peptides); WO05063156 (solid lipid suspension with pseudotropic and/or thixotropic properties upon melting); WO03035029 and WO03035041 (erodible, gastric retentive dosage forms); US5007790 and US5972389 (sustained release dosage forms); WO04112711 (oral extended release compositions); WO05027878, WO02072033, and WO02072034 (delayed release compositions with natural or synthetic gum); WO05030182 (controlled release formulations with an ascending rate of release); WO05048998 (microencapsulation system); US Patent 5,952, 314 (biopolymer); US5108758 (glassy amylose matrix delivery); US 5840860 (modified starch based delivery). JP10324642 (delivery system comprising chitosan and gastric resistant material such as wheat gliadin or zein); US5866619 and US6368629 (saccharide containing polymer); US 6531152 (describes a drug delivery system containing a water soluble core (Ca pectinate or other water-insoluble polymers) and outer coat which bursts (eg hydrophobic polymer-Eudragrit)); US 6234464; US 6403130 (coating with polymer

containing casein and high methoxy pectin; WO0174175 (Maillard reaction product); WO05063206 (solubility increasing formulation); WO04019872 (transferring fusion proteins). The agents described herein may be formulated using gastrointestinal retention system technology (GIRES; Merrion Pharmaceuticals). GIRES comprises a controlled–release dosage form inside an inflatable pouch, which is placed in a drug capsule for oral administration. Upon dissolution of the capsule, a gas-generating system inflates the pouch in the stomach where it is retained for 16-24 hours, all the time releasing agents described herein.

The agents described herein can be formulated in an osmotic device including the ones disclosed in US4503030, US5609590 and US5358502. US4503030 discloses an osmotic device for dispensing a drug to certain pH regions of the gastrointestinal tract. More particularly, the invention relates to an osmotic device comprising a wall formed of a semi-permeable pH sensitive composition that surrounds a compartment containing a drug, with a passageway through the wall connecting the exterior of the device with the compartment. The device delivers the drug at a controlled rate in the region of the gastrointestinal tract having a pH of less than 3.5, and the device self- destructs and releases all its drug in the region of the gastrointestinal tract having a pH greater than 3.5, thereby providing total availability for drug absorption. U. S. Patent Nos. 5,609, 590 and 5, 358,502 disclose an osmotic bursting device for dispensing a beneficial agent to an aqueous environment. The device comprises a beneficial agent and osmagent surrounded at least in part by a semi-permeable membrane. The beneficial agent may also function as the osmagent. The semi-permeable membrane is permeable to water and substantially impermeable to the beneficial agent and osmagent. A trigger means is attached to the semi-permeable membrane (e. g. , joins two capsule halves). The trigger means is activated by a pH of from 3 to 9 and triggers the eventual, but sudden, delivery of the beneficial agent. These devices enable the pH-triggered release of the beneficial agent core as a bolus by osmotic bursting.

The agents described herein may be formulated based on the invention described in U. S. Patent No. 5,316, 774 which discloses a composition for the controlled release of an active substance comprising a polymeric particle matrix, where each particle defines a network of internal pores. The active substance is entrapped within the pore network together with a blocking agent having physical and chemical characteristics selected to modify the release rate of the active substance from the internal pore network. In one embodiment, drugs may be selectively delivered to the intestines using an enteric material as the blocking agent. The enteric material remains intact in the stomach but degrades under the pH conditions of the intestines. In another embodiment, the sustained release formulation employs a blocking agent, which remains stable under the expected conditions of the environment to which the active substance is to be released. The use of pH-sensitive materials alone to achieve site-specific delivery is difficult because of leaking of the beneficial agent prior to the release site or desired delivery time and it is difficult to achieve long time lags before release of the active ingredient after exposure to high pH (because of rapid dissolution or degradation of the pH-sensitive materials).

The agents may also be formulated in a hybrid system which combines pH-sensitive materials and osmotic delivery systems. These hybrid devices provide delayed initiation of sustained-release of the beneficial agent. In one device a pH-sensitive matrix or coating dissolves releasing osmotic devices that provide sustained release of the beneficial agent see U. S. Patent Nos. 4,578, 075, 4,681, 583, and 4,851, 231. A second device consists of a semipermeable coating made of a polymer blend of an insoluble and a pH-sensitive material. As the pH increases, the permeability of the coating increases, increasing the rate of release of beneficial agent see U. S. Patent Nos. 4,096, 238,4, 503,030, 4, 522, 625, and 4,587, 117.

The agents described herein may be formulated in terpolumers according to U. S. Patent No. 5,484, 610 which discloses terpolymers which are sensitive to pH and temperature which are useful carriers for conducting bioactive agents through the gastric juices of the

stomach in a protected form. The terpolymers swell at the higher physiologic pH of the intestinal tract causing release of the bioactive agents into the intestine. The terpolymers are linear and are made up of 35 to 99 wt % of a temperature sensitive component, which imparts to the terpolymer LCST (lower critical solution temperature) properties below body temperatures, 1 to 30 wt % of a pH sensitive component having a pKa in the range of from 2 to 8 which functions through ionization or deionization of carboxylic acid groups to prevent the bioactive agent from being lost at low pH but allows bioactive agent release at physiological pH of about 7.4 and a hydrophobic component which stabilizes the LCST below body temperatures and compensates for bioactive agent effects on the terpolymers. The terpolymers provide for safe bioactive agent loading, a simple procedure for dosage form fabrication and the terpolymer functions as a protective carrier in the acidic environment of the stomach and also protects the bioactive agents from digestive enzymes until the bioactive agent is released in the intestinal tract.

The agents described herein may be formulated in pH sensitive polymers according to those described in U. S. Patent No. 6,103, 865. U. S. Patent No. 6,103, 865 discloses pH-sensitive polymers containing sulfonamide groups, which can be changed in physical properties, such as swellability and solubility, depending on pH and which can be applied for a drug-delivery system, bio-material, sensor, and the like, and a preparation method therefore. The pH-sensitive polymers are prepared by introduction of sulfonamide groups, various in pKa, to hydrophilic groups of polymers either through coupling to the hydrophilic groups of polymers, such as acrylamide, N, N- dimethylacrylamide, acrylic acid, N-isopropylacrylamide and the like or copolymerization with other polymerizable monomers. These pH-sensitive polymers may have a structure of linear polymer, grafted copolymer, hydrogel or interpenetrating network polymer.

The agents described herein may be formulated according U. S. Patent No. 5, 656, 292 which discloses a composition for pH dependent or pH regulated controlled release of active ingredients especially drugs. The composition consists of a compactable mixture of

the active ingredient and starch molecules substituted with acetate and dicarboxylate residues. The preferred dicarboxylate acid is succinate. The average substitution degree of the acetate residue is at least 1 and 0. 2-1. 2 for the dicarboxylate residue. The starch molecules can have the acetate and dicarboxylate residues attached to the same starch molecule backbone or attached to separate starch molecule backbones. The present invention also discloses methods for preparing said starch acetate dicarboxylates by transesterification or mixing of starch acetates and starch dicarboxylates respectively.

The agents described herein may be formulated according to the methods described in U. S. Patent Nos. 5,554, 147,5, 788, 687, and 6,306, 422 which disclose a method for the controlled release of a biologically active agent wherein the agent is released from a hydrophobic, pH-sensitive polymer matrix. The polymer matrix swells when the environment reaches pH 8.5, releasing the active agent. A polymer of hydrophobic and weakly acidic comonomers is disclosed for use in the controlled release system. Also disclosed is a specific embodiment in which the controlled release system may be used. The pH-sensitive polymer is coated onto a latex catheter used in ureteral catheterization. A ureteral catheter coated with a pH-sensitive polymer having an antibiotic or urease inhibitor trapped within its matrix will release the active agent when exposed to high pH urine.

The agents described herein may be formulated in/with bioadhesive polymers according to US Patent No. 6,365, 187. Bioadhesive polymers in the form of, or as a coating on, microcapsules containing drugs or bioactive substances which may serve for therapeutic, or diagnostic purposes in diseases of the gastrointestinal tract, are described in US6365187. The polymeric microspheres all have a bioadhesive force of at least 11 mN/cm^2 (110 N/m2) Techniques for the fabrication of bioadhesive microspheres, as well as a method for measuring bioadhesive forces between microspheres and selected segments of the gastrointestinal tract in vitro are also described. This quantitative method provides a means to establish a correlation between the chemical nature, the surface

morphology and the dimensions of drug-loaded microspheres on one hand and bioadhesive forces on the other, allowing the screening of the most promising materials from a relatively large group of natural and synthetic polymers which, from theoretical consideration, should be used for making bioadhesive microspheres. Solutions of medicament in buffered saline and similar vehicles are commonly employed to generate an aerosol in a nebulizer. Simple nebulizers operate on Bernoulli's principle and employ a stream of air or oxygen to generate the spray particles. More complex nebulizers employ ultrasound to create the spray particles. Both types are well known in the art and are described in standard textbooks of pharmacy such as Sprowls' American Pharmacy and Remington's The Science and Practice of Pharmacy. Other devices for generating aerosols employ compressed gases, usually hydrofluorocarbons and chlorofluorocarbons, which are mixed with the medicament and any necessary excipients in a pressurized container, these devices are likewise described in standard textbooks such as Sprowls and Remington.

The agents can be a free acid or base, or a pharmacologically acceptable salt thereof. Solids can be dissolved or dispersed immediately prior to administration or earlier. In some circumstances the preparations include a preservative to prevent the growth of microorganisms. The pharmaceutical forms suitable for injection can include sterile aqueous or organic solutions or dispersions which include, e.g., water, an alcohol, an organic solvent, an oil or other solvent or dispersant (e.g., glycerol, propylene glycol, polyethylene glycol, and vegetable oils). The formulations may contain antioxidants, buffers, bacteriostats, and solutes that render the formulation isotonic with the blood of the intended recipient, and aqueous and non-aqueous sterile suspensions that can include suspending agents, solubilizers, thickening agents, stabilizers, and preservatives. Pharmaceutical agents can be sterilized by filter sterilization or by other suitable means. The agent can be fused to immunoglobulins or albumin, albumin variants or fragments thereof, or incorporated into a liposome to improve half-life. Thus the peptides described herein may be fused directly or via a peptide linker, water soluble polymer, or prodrug

linker to albumin or an analog, fragment, or derivative thereof. Generally, the albumin proteins that are part of the fusion proteins of the present invention may be derived from albumin cloned from any species, including human. Human serum albumin (HSA) consists of a single non-glycosylated polypeptide chain of 585 amino acids with a formula molecular weight of 66,500. The amino acid sequence of human HSA is known [See Meloun, et al. (1975) FEBS Letters 58:136; Behrens, et al. (1975) Fed. Proc. 34:591; Lawn, et al. (1981) Nucleic Acids Research 9:6102-6114; Minghetti, et al. (1986) J. Biol. Chem. 261:6747, each of which are incorporated by reference herein]. A variety of polymorphic variants as well as analogs and fragments of albumin have been described. [See Weitkamp, et al., (1973) Ann. Hum. Genet. 37:219]. For example, in EP 322,094, various shorter forms of HSA. Some of these fragments of HSA are disclosed, including HSA(1-373), HSA(1-388), HSA(1-389), HSA(1-369), and HSA(1-419) and fragments between 1-369 and 1-419. EP 399,666 discloses albumin fragments that include HSA(1-177) and HSA(1-200) and fragments between HSA(1-177) and HSA(1-200). Methods related to albumin fusion proteins can be found in US 7,056,701, US 6,994,857, US 6,946,134, US 6,926,898, and US 6,905,688 and the related priority documents and references cited therein. The agent can also be conjugated to polyethylene glycol (PEG) chains. Methods for pegylation and additional formulations containing PEG-conjugates (i.e. PEG-based hydrogels, PEG modified liposomes) can be found in Harris and Chess, Nature Reviews Drug Discovery 2: 214-221 and the references therein. Peptides can also be modified with alkyl groups (e.g., C1-C20 straight or branched alkyl groups); fatty acid radicals; and combinations of PEG, alkyl groups and fatty acid radicals (see U.S. Patent 6,309,633; Soltero et al., 2001 Innovations in Pharmaceutical Technology 106-110). The agent can be administered via a nanocochleate or cochleate delivery vehicle (BioDelivery Sciences International). The agents can be delivered transmucosally (i.e. across a mucosal surface such as the vagina, eye or nose) using formulations such as that described in U.S. 5,204,108. The agents can be formulated in microcapsules as described in WO 88/01165. The agent can be administered intra-orally using the formulations

described in U.S. 20020055496, WO 00/47203, and U.S. 6,495,120. The agent can be delivered using nanoemulsion formulations described in WO 01/91728A2.

Controlled release formulations

In general, one can provide for controlled release of the agents described herein through the use of a wide variety of polymeric carriers and controlled release systems including erodible and non-erodible matrices, osmotic control devices, various reservoir devices, enteric coatings and multiparticulate control devices.

Matrix devices are a common device for controlling the release of various agents. In such devices, the agents described herein are generally present as a dispersion within the polymer matrix, and are typically formed by the compression of a polymer/drug mixture or by dissolution or melting. The dosage release properties of these devices may be dependent upon the solubility of the agent in the polymer matrix or, in the case of porous matrices, the solubility in the sink solution within the pore network, and the tortuosity of the network. In one instance, when utilizing an erodible polymeric matrix, the matrix imbibes water and forms an aqueous-swollen gel that entraps the agent. The matrix then gradually erodes, swells, disintegrates or dissolves in the GI tract, thereby controlling release of one or more of the agents described herein. In non-erodible devices, the agent is released by diffusion through an inert matrix.

Agents described herein can be incorporated into an erodible or non-erodible polymeric matrix controlled release device. By an erodible matrix is meant aqueous-erodible or water-swellable or aqueous-soluble in the sense of being either erodible or swellable or dissolvable in pure water or requiring the presence of an acid or base to ionize the polymeric matrix sufficiently to cause erosion or dissolution. When contacted with the aqueous environment of use, the erodible polymeric matrix imbibes water and forms an aqueous-swollen gel or matrix that entraps the agent described herein. The aqueous-swollen matrix gradually erodes, swells, disintegrates or dissolves in the environment of

use, thereby controlling the release of a compound described herein to the environment of use.

The erodible polymeric matrix into which an agent described herein can be incorporated may generally be described as a set of excipients that are mixed with the agent following its formation that, when contacted with the aqueous environment of use imbibes water and forms a water-swollen gel or matrix that entraps the drug form. Drug release may occur by a variety of mechanisms, for example, the matrix may disintegrate or dissolve from around particles or granules of the agent or the agent may dissolve in the imbibed aqueous solution and diffuse from the tablet, beads or granules of the device. One ingredient of this water-swollen matrix is the water-swellable, erodible, or soluble polymer, which may generally be described as an osmopolymer, hydrogel or water-swellable polymer. Such polymers may be linear, branched, or crosslinked. The polymers may be homopolymers or copolymers. In certain embodiments, they may be synthetic polymers derived from vinyl, acrylate, methacrylate, urethane, ester and oxide monomers. In other embodiments, they can be derivatives of naturally occurring polymers such as polysaccharides (e.g. chitin, chitosan, dextran and pullulan; gum agar, gum arabic, gum karaya, locust bean gum, gum tragacanth, carrageenans, gum ghatti, guar gum, xanthan gum and scleroglucan), starches (e.g. dextrin and maltodextrin), hydrophilic colloids (e.g. pectin), phosphatides (e.g. lecithin), alginates (e.g. ammonium alginate, sodium, potassium or calcium alginate, propylene glycol alginate), gelatin, collagen, and cellulosics. Cellulosics are cellulose polymer that has been modified by reaction of at least a portion of the hydroxyl groups on the saccharide repeat units with a compound to form an ester-linked or an ether-linked substituent. For example, the cellulosic ethyl cellulose has an ether linked ethyl substituent attached to the saccharide repeat unit, while the cellulosic cellulose acetate has an ester linked acetate substituent. In certain embodiments, the cellulosics for the erodible matrix comprises aqueous-soluble and aqueous-erodible cellulosics can include, for example, ethyl cellulose (EC), methylethyl cellulose (MEC), carboxymethyl cellulose (CMC), CMEC, hydroxyethyl

cellulose (HEC), hydroxypropyl cellulose (HPC), cellulose acetate (CA), cellulose propionate (CP), cellulose butyrate (CB), cellulose acetate butyrate (CAB), CAP, CAT, hydroxypropyl methyl cellulose (HPMC), HPMCP, HPMCAS, hydroxypropyl methyl cellulose acetate trimellitate (HPMCAT), and ethylhydroxy ethylcellulose (EHEC). In certain embodiments, the cellulosics comprises various grades of low viscosity (MW less than or equal to 50,000 daltons, for example, the Dow Methocel™ series E5, E15LV, E50LV and K100LY) and high viscosity (MW greater than 50,000 daltons, for example, E4MCR, E10MCR, K4M, K15M and K100M and the Methocel™ K series) HPMC. Other commercially available types of HPMC include the Shin Etsu Metolose 90SH series. The choice of matrix material can have a large effect on the maximum drug concentration attained by the device as well as the maintenance of a high drug concentration. The matrix material can be a concentration-enhancing polymer, for example, as described in WO05/011634.

Other materials useful as the erodible matrix material include, but are not limited to, pullulan, polyvinyl pyrrolidone, polyvinyl alcohol, polyvinyl acetate, glycerol fatty acid esters, polyacrylamide, polyacrylic acid, copolymers of ethacrylic acid or methacrylic acid (EUDRAGITO, Rohm America, Inc., Piscataway, New Jersey) and other acrylic acid derivatives such as homopolymers and copolymers of butylmethacrylate, methylmethacrylate, ethylmethacrylate, ethylacrylate, (2-dimethylaminoethyl) methacrylate, and (trimethylaminoethyl) methacrylate chloride.

The erodible matrix polymer may contain a wide variety of the same types of additives and excipients known in the pharmaceutical arts, including osmopolymers, osmagens, solubility-enhancing or-retarding agents and excipients that promote stability or processing of the device.

Alternatively, the agents of the present invention may be administered by or incorporated into a non-erodible matrix device. In such devices, an agent described herein is distributed in an inert matrix. The agent is released by diffusion through the inert matrix.

Examples of materials suitable for the inert matrix include insoluble plastics (e.g methyl acrylate-methyl methacrylate copolymers, polyvinyl chloride, polyethylene), hydrophilic polymers (e.g. ethyl cellulose, cellulose acetate, crosslinked polyvinylpyrrolidone (also known as crospovidone)), and fatty compounds (e.g. carnauba wax, microcrystalline wax, and triglycerides). Such devices are described further in Remington: The Science and Practice of Pharmacy, 20th edition (2000).

Matrix controlled release devices may be prepared by blending an agent described herein and other excipients together, and then forming the blend into a tablet, caplet, pill, or other device formed by compressive forces. Such compressed devices may be formed using any of a wide variety of presses used in the fabrication of pharmaceutical devices. Examples include single-punch presses, rotary tablet presses, and multilayer rotary tablet presses, all well known in the art. See for example, Remington: The Science and Practice of Pharmacy, 20th Edition, 2000. The compressed device may be of any shape, including round, oval, oblong, cylindrical, or triangular. The upper and lower surfaces of the compressed device may be flat, round, concave, or convex.

In certain embodiments, when formed by compression, the device has a strength of at least 5 Kiloponds (Kp)/cm^2 (for example, at least 7 Kp/cm^2). Strength is the fracture force, also known as the tablet hardness required to fracture a tablet formed from the materials, divided by the maximum cross-sectional area of the tablet normal to that force. The fracture force may be measured using a Schleuniger Tablet Hardness Tester, Model 6D. The compression force required to achieve this strength will depend on the size of the tablet, but generally will be greater than about 5 kP/cm^2. Friability is a well-know measure of a device's resistance to surface abrasion that measures weight loss in percentage after subjecting the device to a standardized agitation procedure. Friability values of from 0.8 to 1.0% are regarded as constituting the upper limit of acceptability. Devices having a strength of greater than 5 kP/cm^2 generally are very robust, having a friability of less than 0. 5%. Other methods for forming matrix controlled-release devices

are well known in the pharmaceutical arts. See for example, Remington: The Science and Practice of Pharmacy, 20th Edition, 2000.

As noted above, the agents described herein may also be incorporated into an osmotic control device. Such devices generally include a core containing one or more agents as described herein and a water permeable, non-dissolving and non-eroding coating surrounding the core which controls the influx of water into the core from an aqueous environment of use so as to cause drug release by extrusion of some or all of the core to the environment of use. In certain embodiments, the coating is polymeric, aqueous-permeable, and has at least one delivery port. The core of the osmotic device optionally includes an osmotic agent which acts to imbibe water from the surrounding environment via such a semi-permeable membrane. The osmotic agent contained in the core of this device may be an aqueous-swellable hydrophilic polymer or it may be an osmogen, also known as an osmagent. Pressure is generated within the device which forces the agent(s) out of the device via an orifice (of a size designed to minimize solute diffusion while preventing the build-up of a hydrostatic pressure head).

Osmotic agents create a driving force for transport of water from the environment of use into the core of the device. Osmotic agents include but are not limited to water- swellable hydrophilic polymers, and osmogens (or osmagens). Thus, the core may include water-swellable hydrophilic polymers, both ionic and nonionic, often referred to as osmopolymers and hydrogels. The amount of water-swellable hydrophilic polymers present in the core may range from about 5 to about 80 wt% (including for example, 10 to 50 wt%). Nonlimiting examples of core materials include hydrophilic vinyl and acrylic polymers, polysaccharides such as calcium alginate, polyethylene oxide (PEO), polyethylene glycol (PEG), polypropylene glycol (PPG), poly (2-hydroxyethyl methacrylate), poly (acrylic) acid, poly (methacrylic) acid, polyvinylpyrrolidone (PVP) and crosslinked PVP, polyvinyl alcohol (PVA), PVA/PVP copolymers and PVA/PVP copolymers with hydrophobic monomers such as methyl methacrylate, vinyl acetate, and the like, hydrophilic polyurethanes containing large PEO blocks, sodium croscarmellose,

carrageenan, hydroxyethyl cellulose (HEC), hydroxypropyl cellulose (HPC), hydroxypropyl methyl cellulose (HPMC), carboxymethyl cellulose (CMC) and carboxyethyl cellulose (CEC), sodium alginate, polycarbophil, gelatin, xanthan gum, and sodium starch glycolat. Other materials include hydrogels comprising interpenetrating networks of polymers that may be formed by addition or by condensation polymerization, the components of which may comprise hydrophilic and hydrophobic monomers such as those just mentioned. Water-swellable hydrophilic polymers include but are not limited to PEO, PEG, PVP, sodium croscarmellose, HPMC, sodium starch glycolate, polyacrylic acid and crosslinked versions or mixtures thereof.

The core may also include an osmogen (or osmagent). The amount of osmogen present in the core may range from about 2 to about 70 wt% (including, for example, from 10 to 50 wt%). Typical classes of suitable osmogens are water-soluble organic acids, salts and sugars that are capable of imbibing water to thereby effect an osmotic pressure gradient across the barrier of the surrounding coating. Typical useful osmogens include but are not limited to magnesium sulfate, magnesium chloride, calcium chloride, sodium chloride, lithium chloride, potassium sulfate, sodium carbonate, sodium sulfite, lithium sulfate, potassium chloride, sodium sulfate, mannitol, xylitol, urea, sorbitol, inositol, raffinose, sucrose, glucose, fructose, lactose, citric acid, succinic acid, tartaric acid, and mixtures thereof. In certain embodiments, the osmogen is glucose, lactose, sucrose, mannitol, xylitol, sodium chloride, including combinations thereof.

The core may include a wide variety of additives and excipients that enhance the performance of the dosage form or that promote stability, tableting or processing. Such additives and excipients include tableting aids, surfactants, water- soluble polymers, pH modifiers, fillers, binders, pigments, disintegrants, antioxidants, lubricants and flavorants. Nonlimiting examples of additives and excipients include but are not limited to those described elsewhere herein as well as microcrystalline cellulose, metallic salts of acids (e.g. aluminum stearate, calcium stearate, magnesium stearate, sodium stearate, zinc stearate), pH control agents (e.g. buffers, organic acids, organic acid salts, organic and

inorganic bases), fatty acids, hydrocarbons and fatty alcohols (e.g. stearic acid, palmitic acid, liquid paraffin, stearyl alcohol, and palmitol), fatty acid esters (e.g. glyceryl (mono- and di-) stearates, triglycerides, glyceryl (palmiticstearic) ester, sorbitan esters (e.g. sorbitan monostearate, saccharose monostearate, saccharose monopalmitate, sodium stearyl fumarate), polyoxyethylene sorbitan esters), surfactants (e.g. alkyl sulfates (e.g. sodium lauryl sulfate, magnesium lauryl sulfate), polymers (e.g. polyethylene glycols, polyoxyethylene glycols, polyoxyethylene, polyoxypropylene ethers, including copolymers thereof), polytetrafluoroethylene), and inorganic materials (e.g. talc, calcium phosphate), cyclodextrins, sugars (e.g. lactose, xylitol), sodium starch glycolate). Nonlimiting examples of disintegrants are sodium starch glycolate (e. g., Explotab™ CLV, (microcrystalline cellulose (e. g., Avicel™), microcrystalline silicified cellulose (e.g., ProSolv™), croscarmellose sodium (e. g., Ac-Di-Sol™). When the agent described herein is a solid amorphous dispersion formed by a solvent process, such additives may be added directly to the spray-drying solution when forming an agent described herein/concentration-enhancing polymer dispersion such that the additive is dissolved or suspended in the solution as a slurry, Alternatively, such additives may be added following the spray-drying process to aid in forming the final controlled release device.

A nonlimiting example of an osmotic device consists of one or more drug layers containing an agent described herein, such as a solid amorphous drug/polymer dispersion, and a sweller layer that comprises a water-swellable polymer, with a coating surrounding the drug layer and sweller layer. Each layer may contain other excipients such as tableting aids, osmagents, surfactants, water-soluble polymers and water-swellable polymers.

Such osmotic delivery devices may be fabricated in various geometries including bilayer (wherein the core comprises a drug layer and a sweller layer adjacent to each other), trilayer (wherein the core comprises a sweller layer sandwiched between two drug layers) and concentric (wherein the core comprises a central sweller agent surrounded by the

drug layer). The coating of such a tablet comprises a membrane permeable to water but substantially impermeable to drug and excipients contained within. The coating contains one or more exit passageways or ports in communication with the drug-containing layer(s) for delivering the drug agent. The drug-containing layer(s) of the core contains the drug agent (including optional osmagents and hydrophilic water-soluble polymers), while the sweller layer consists of an expandable hydrogel, with or without additional osmotic agents.

When placed in an aqueous medium, the tablet imbibes water through the membrane, causing the agent to form a dispensable aqueous agent, and causing the hydrogel layer to expand and push against the drug-containing agent, forcing the agent out of the exit passageway. The agent can swell, aiding in forcing the drug out of the passageway. Drug can be delivered from this type of delivery system either dissolved or dispersed in the agent that is expelled from the exit passageway.

The rate of drug delivery is controlled by such factors as the permeability and thickness of the coating, the osmotic pressure of the drug-containing layer, the degree of hydrophilicity of the hydrogel layer, and the surface area of the device. Those skilled in the art will appreciate that increasing the thickness of the coating will reduce the release rate, while any of the following will increase the release rate: increasing the permeability of the coating; increasing the hydrophilicity of the hydrogel layer; increasing the osmotic pressure of the drug-containing layer; or increasing the device's surface area.

Other materials useful in forming the drug-containing agent, in addition to the agent described herein itself, include HPMC, PEO and PVP and other pharmaceutically acceptable carriers. In addition, osmagents such as sugars or salts, including but not limited to sucrose, lactose, xylitol, mannitol, or sodium chloride, may be added. Materials which are useful for forming the hydrogel layer include sodium CMC, PEO (e.g. polymers having an average molecular weight from about 5,000,000 to about 7,500,000

daltons), poly (acrylic acid), sodium (polyacrylate), sodium croscarmellose, sodium starch glycolat, PVP, crosslinked PVP, and other high molecular weight hydrophilic materials.

In the case of a bilayer geometry, the delivery port(s) or exit passageway(s) may be located on the side of the tablet containing the drug agent or may be on both sides of the tablet or even on the edge of the tablet so as to connect both the drug layer and the sweller layer with the exterior of the device. The exit passageway(s) may be produced by mechanical means or by laser drilling, or by creating a difficult-to-coat region on the tablet by use of special tooling during tablet compression or by other means.

The osmotic device can also be made with a homogeneous core surrounded by a semipermeable membrane coating, as in US3845770. The agent described herein can be incorporated into a tablet core and a semipermeable membrane coating can be applied via conventional tablet-coating techniques such as using a pan coater. A drug delivery passageway can then be formed in this coating by drilling a hole in the coating, either by use of a laser or mechanical means. Alternatively, the passageway may be formed by rupturing a portion of the coating or by creating a region on the tablet that is difficult to coat, as described above. In one embodiment, an osmotic device comprises: (a) a single-layer compressed core comprising: (i) an agent described herein, (ii) a hydroxyethylcellulose, and (iii) an osmagent, wherein the hydroxyethylcellulose is present in the core from about 2.0% to about 35% by weight and the osmagent is present from about 15% to about 70% by weight; (b) a water-permeable layer surrounding the core; and (c) at least one passageway within the water-permeable layer (b) for delivering the drug to a fluid environment surrounding the tablet. In certain embodiments, the device is shaped such that the surface area to volume ratio (of a water-swollen tablet) is greater than 0.6 mm^{-1} (including, for example, greater than 1.0 mm^{-1}). The passageway connecting the core with the fluid environment can be situated along the tablet band area. In certain embodiments, the shape is an oblong shape where the ratio of the tablet tooling

axes, i.e., the major and minor axes which define the shape of the tablet, are between 1.3 and 3 (including, for example, between 1.5 and 2.5). In one embodiment, the combination of the agent described herein and the osmagent have an average ductility from about 100 to about 200 Mpa, an average tensile strength from about 0.8 to about 2.0 Mpa, and an average brittle fracture index less than about 0.2. The single-layer core may optionally include a disintegrant, a bioavailability enhancing additive, and/or a pharmaceutically acceptable excipient, carrier or diluent.

In certain embodiments, entrainment of particles of agents described herein in the extruding fluid during operation of such osmotic device is desirable. For the particles to be well entrained, the agent drug form is dispersed in the fluid before the particles have an opportunity to settle in the tablet core. One means of accomplishing this is by adding a disintegrant that serves to break up the compressed core into its particulate components. Nonlimiting examples of standard disintegrants include materials such as sodium starch glycolate (e. g. , Explotab™ CLV), microcrystalline cellulose (e. g., Avicel™), microcrystalline silicified cellulose (e. g., ProSolv™) and croscarmellose sodium (e. g., Ac-Di-Sol™), and other disintegrants known to those skilled in the art. Depending upon the particular formulation, some disintegrants work better than others. Several disintegrants tend to form gels as they swell with water, thus hindering drug delivery from the device. Non-gelling, non-swelling disintegrants provide a more rapid dispersion of the drug particles within the core as water enters the core. In certain embodiments, non-gelling, non-swelling disintegrants are resins, for example, ion-exchange resins. In one embodiment, the resin is Amberlite™ IRP 88 (available from Rohm and Haas, Philadelphia, PA). When used, the disintegrant is present in amounts ranging from about 50-74% of the core agent.

Water-soluble polymers are added to keep particles of the agent suspended inside the device before they can be delivered through the passageway(s) (e.g., an orifice). High viscosity polymers are useful in preventing settling. However, the polymer in

combination with the agent is extruded through the passageway(s) under relatively low pressures. At a given extrusion pressure, the extrusion rate typically slows with increased viscosity. Certain polymers in combination with particles of the agent described herein form high viscosity solutions with water but are still capable of being extruded from the tablets with a relatively low force. In contrast, polymers having a low weight-average, molecular weight (< about 300,000) do not form sufficiently viscous solutions inside the tablet core to allow complete delivery due to particle settling. Settling of the particles is a problem when such devices are prepared with no polymer added, which leads to poor drug delivery unless the tablet is constantly agitated to keep the particles from settling inside the core. Settling is also problematic when the particles are large and/or of high density such that the rate of settling increases.

In certain embodiments, the water-soluble polymers for such osmotic devices do not interact with the drug. In certain embodiments the water-soluble polymer is a non-ionic polymer. A nonlimiting example of a non-ionic polymer forming solutions having a high viscosity yet still extrudable at low pressures is Natrosol™ 250H (high molecular weight hydroxyethylcellulose, available from Hercules Incorporated, Aqualon Division, Wilmington, DE; MW equal to about 1 million daltons and a degree of polymerization equal to about 3,700). Natrosol 250H™ provides effective drug delivery at concentrations as low as about 3% by weight of the core when combined with an osmagent. Natrosol 250H™ NF is a high-viscosity grade nonionic cellulose ether that is soluble in hot or cold water. The viscosity of a 1% solution of Natrosol 250H using a Brookfield LVT (30 rpm) at 25°C is between about 1, 500 and about 2,500 cps.

In certain embodiments, hydroxyethylcellulose polymers for use in these monolayer osmotic tablets have a weight-average, molecular weight from about 300,000 to about 1.5 million. The hydroxyethylcellulose polymer is typically present in the core in an amount from about 2.0% to about 35% by weight.

Another example of an osmotic device is an osmotic capsule. The capsule shell or portion of the capsule shell can be semipermeable. The capsule can be filled either by a powder or liquid consisting of an agent described herein, excipients that imbibe water to provide osmotic potential, and/or a water-swellable polymer, or optionally solubilizing excipients. The capsule core can also be made such that it has a bilayer or multilayer agent analogous to the bilayer, trilayer or concentric geometries described above.

Another class of osmotic device useful in this invention comprises coated swellable tablets, for example, as described in EP378404. Coated swellable tablets comprise a tablet core comprising an agent described herein and a swelling material, preferably a hydrophilic polymer, coated with a membrane, which contains holes, or pores through which, in the aqueous use environment, the hydrophilic polymer can extrude and carry out the agent. Alternatively, the membrane may contain polymeric or low molecular weight water-soluble porosigens. Porosigens dissolve in the aqueous use environment, providing pores through which the hydrophilic polymer and agent may extrude. Examples of porosigens are water-soluble polymers such as HPMC, PEG, and low molecular weight compounds such as glycerol, sucrose, glucose, and sodium chloride. In addition, pores may be formed in the coating by drilling holes in the coating using a laser or other mechanical means. In this class of osmotic devices, the membrane material may comprise any film-forming polymer, including polymers which are water permeable or impermeable, providing that the membrane deposited on the tablet core is porous or contains water-soluble porosigens or possesses a macroscopic hole for water ingress and drug release. Embodiments of this class of sustained release devices may also be multilayered, as described, for example, in EP378404.

When an agent described herein is a liquid or oil, such as a lipid vehicle formulation, for example as described in WO05/011634, the osmotic controlled-release device may comprise a soft-gel or gelatin capsule formed with a composite wall and comprising the liquid formulation where the wall comprises a barrier layer formed over the external

surface of the capsule, an expandable layer formed over the barrier layer, and a semipermeable layer formed over the expandable layer. A delivery port connects the liquid formulation with the aqueous use environment. Such devices are described, for example, in US6419952, US6342249, US5324280, US4672850, US4627850, US4203440, and US3995631.

The osmotic controlled release devices of the present invention can also comprise a coating. In certain embodiments, the osmotic controlled release device coating exhibits one or more of the following features: is water-permeable, has at least one port for the delivery of drug, and is non-dissolving and non-eroding during release of the drug formulation, such that drug is substantially entirely delivered through the delivery port(s) or pores as opposed to delivery primarily via permeation through the coating material itself. Delivery ports include any passageway, opening or pore whether made mechanically, by laser drilling, by pore formation either during the coating process or *in situ* during use or by rupture during use. In certain embodiments, the coating is present in an amount ranging from about 5 to 30 wt% (including, for example, 10 to 20 wt%) relative to the core weight.

One form of coating is a semipermeable polymeric membrane that has the port(s) formed therein either prior to or during use. Thickness of such a polymeric membrane may vary between about 20 and 800 μm (including, for example, between about 100 to 500 μm). The diameter of the delivery port (s) may generally range in size from 0.1 to 3000 μm or greater (including, for example, from about 50 to 3000 μm in diameter). Such port(s) may be formed post-coating by mechanical or laser drilling or may be formed *in situ* by rupture of the coatings; such rupture may be controlled by intentionally incorporating a relatively small weak portion into the coating. Delivery ports may also be formed *in situ* by erosion of a plug of water-soluble material or by rupture of a thinner portion of the coating over an indentation in the core. In addition, delivery ports may be formed during coating, as in the case of asymmetric membrane coatings of the type disclosed in US5612059 and US5698220. The delivery port may be formed *in situ* by rupture of the

coating, for example, when a collection of beads that may be of essentially identical or of a variable agent are used. Drug is primarily released from such beads following rupture of the coating and, following rupture, such release may be gradual or relatively sudden. When the collection of beads has a variable agent, the agent may be chosen such that the beads rupture at various times following administration, resulting in the overall release of drug being sustained for a desired duration.

Coatings may be dense, microporous or asymmetric, having a denser region supported by a thick porous region such as those disclosed in US5612059 and US5698220. When the coating is dense the coating can be composed of a water-permeable material. When the coating is porous, it may be composed of either a water-permeable or a water-impermeable material. When the coating is composed of a porous water-impermeable material, water permeates through the pores of the coating as either a liquid or a vapor. Nonlimiting examples of osmotic devices that utilize dense coatings include US3995631 and US3845770. Such dense coatings are permeable to the external fluid such as water and may be composed of any of the materials mentioned in these patents as well as other water-permeable polymers known in the art.

The membranes may also be porous as disclosed, for example, in US5654005 and US5458887 or even be formed from water-resistant polymers. US5120548 describes another suitable process for forming coatings from a mixture of a water-insoluble polymer and a leachable water-soluble additive. The porous membranes may also be formed by the addition of pore-formers as disclosed in US4612008. In addition, vapor-permeable coatings may even be formed from extremely hydrophobic materials such as polyethylene or polyvinylidene difluorid that, when dense, are essentially water-impermeable, as long as such coatings are porous. Materials useful in forming the coating include but are not limited to various grades of acrylic, vinyls, ethers, polyamides, polyesters and cellulosic derivatives that are water-permeable and water-insoluble at physiologically relevant pHs, or are susceptible to being rendered water-insoluble by chemical alteration such as by crosslinking. Nonlimiting examples of

suitable polymers (or crosslinked versions) useful in forming the coating include plasticized, unplasticized and reinforced cellulose acetate (CA), cellulose diacetate, cellulose triacetate, CA propionate, cellulose nitrate, cellulose acetate butyrate (CAB), CA ethyl carbamate, CAP, CA methyl carbamate, CA succinate, cellulose acetate trimellitate (CAT), CA dimethylaminoacetate, CA ethyl carbonate, CA chloroacetate, CA ethyl oxalate, CA methyl sulfonate, CA butyl sulfonate, CA p-toluene sulfonate, agar acetate, amylose triacetate, beta glucan acetate, beta glucan triacetate, acetaldehyde dimethyl acetate, triacetate of locust bean gum, hydroxiated ethylene-vinylacetate, EC, PEG, PPG, PEG/PPG copolymers, PVP, HEC, HPC, CMC, CMEC, HPMC, HPMCP, HPMCAS, HPMCAT, poly (acrylic) acids and esters and poly- (methacrylic) acids and esters and copolymers thereof, starch, dextran, dextrin, chitosan, collagen, gelatin, polyalkenes, polyethers, polysulfones, polyethersulfones, polystyrenes, polyvinyl halides, polyvinyl esters and ethers, natural waxes and synthetic waxes. In various embodiments, the coating agent comprises a cellulosic polymer, in particular cellulose ethers, cellulose esters and cellulose ester-ethers, i.e., cellulosic derivatives having a mixture of ester and ether substituents, the coating materials are made or derived from poly (acrylic) acids and esters, poly (methacrylic) acids and esters, and copolymers thereof, the coating agent comprises cellulose acetate, the coating comprises a cellulosic polymer and PEG, the coating comprises cellulose acetate and PEG.

Coating is conducted in conventional fashion, typically by dissolving or suspending the coating material in a solvent and then coating by dipping, spray coating or by pan-coating. In certain embodiments, the coating solution contains 5 to 15 wt% polymer. Typical solvents useful with the cellulosic polymers mentioned above include but are not limited to acetone, methyl acetate, ethyl acetate, isopropyl acetate, n-butyl acetate, methyl isobutyl ketone, methyl propyl ketone, ethylene glycol monoethyl ether, ethylene glycol monoethyl acetate, methylene dichloride, ethylene dichloride, propylene dichloride, nitroethane, nitropropane, tetrachloroethane, 1,4-dioxane, tetrahydrofuran, diglyme, water, and mixtures thereof. Pore-formers and non- solvents (such as water, glycerol and

ethanol) or plasticizers (such as diethyl phthalate) may also be added in any amount as long as the polymer remains soluble at the spray temperature. Pore-formers and their use in fabricating coatings are described, for example, in US5612059. Coatings may also be hydrophobic microporous layers wherein the pores are substantially filled with a gas and are not wetted by the aqueous medium but are permeable to water vapor, as disclosed, for example, in US5798119. Such hydrophobic but water-vapor permeable coatings are typically composed of hydrophobic polymers such as polyalkenes, polyacrylic acid derivatives, polyethers, polysulfones, polyethersulfones, polystyrenes, polyvinyl halides, polyvinyl esters and ethers, natural waxes and synthetic waxes. Hydrophobic microporous coating materials include but are not limited to polystyrene, polysulfones, polyethersulfones, polyethylene, polypropylene, polyvinyl chloride, polyvinylidene fluoride and polytetrafluoroethylene. Such hydrophobic coatings can be made by known phase inversion methods using any of vapor-quench, liquid quench, thermal processes, leaching soluble material from the coating or by sintering coating particles. In thermal processes, a solution of polymer in a latent solvent is brought to liquid-liquid phase separation in a cooling step. When evaporation of the solvent is not prevented, the resulting membrane will typically be porous. Such coating processes may be conducted by the processes disclosed, for example, in US4247498, US4490431 and US4744906. Osmotic controlled-release devices may be prepared using procedures known in the pharmaceutical arts. See for example, Remington: The Science and Practice of Pharmacy, 20th Edition, 2000.

As further noted above, the agents described herein may be provided in the form of microparticulates, generally ranging in size from about 10μm to about 2mm (including, for example, from about 100μm to 1mm in diameter). Such multiparticulates may be packaged, for example, in a capsule such as a gelatin capsule or a capsule formed from an aqueous-soluble polymer such as HPMCAS, HPMC or starch; dosed as a suspension or slurry in a liquid ; or they may be formed into a tablet, caplet, or pill by compression or other processes known in the art. Such multiparticulates may be made by any known

process, such as wet- and dry-granulation processes, extrusion/spheronization, roller-compaction, melt-congealing, or by spray-coating seed cores. For example, in wet-and dry- granulation processes, the agent described herein and optional excipients may be granulated to form multiparticulates of the desired size. Other excipients, such as a binder (e. g., microcrystalline cellulose), may be blended with the agent to aid in processing and forming the multiparticulates. In the case of wet granulation, a binder such as microcrystalline cellulose may be included in the granulation fluid to aid in forming a suitable multiparticulate. See, for example, Remington : The Science and Practice of Pharmacy, 20"Edition, 2000. In any case, the resulting particles may themselves constitute the therapeutic composition or they may be coated by various film-forming materials such as enteric polymers or water-swellable or water-soluble polymers, or they may be combined with other excipients or vehicles to aid in dosing to patients. Suitable pharmaceutical compositions in accordance with the invention will generally include an amount of the active compound(s) with an acceptable pharmaceutical diluent or excipient, such as a sterile aqueous solution, to give a range of final concentrations, depending on the intended use. The techniques of preparation are generally well known in the art, as exemplified by Remington's Pharmaceutical Sciences (18th Edition, Mack Publishing Company, 1995).

Kits

The agents described herein and combination therapy agents can be packaged as a kit that includes single or multiple doses of two or more agents, each packaged or formulated individually, or single or multiple doses of two or more agents packaged or formulated in combination. Thus, one or more agents can be present in first container, and the kit can optionally include one or more agents in a second container. The container or containers are placed within a package, and the package can optionally include administration or dosage instructions. A kit can include additional components such as syringes or other means for administering the agents as well as diluents or other means for formulation.

Thus, the kits can comprise: a) a pharmaceutical composition comprising a compound described herein and a pharmaceutically acceptable carrier, vehicle or diluent; and b) a container or packaging. The kits may optionally comprise instructions describing a method of using the pharmaceutical compositions in one or more of the methods described herein (e.g. gastrointestinal motility disorders, chronic intestinal pseudo-obstruction, colonic pseudo-obstruction, Crohn's disease, duodenogastric reflux, dyspepsia, functional dyspepsia, nonulcer dyspepsia, a functional gastrointestinal disorder, functional heartburn, gastroesophageal reflux disease (GERD), gastroparesis, irritable bowel syndrome, post-operative ileus, ulcerative colitis, chronic constipation, and disorders and conditions associated with constipation (e.g. constipation associated with use of opiate pain killers, post-surgical constipation, and constipation associated with neuropathic disorders as well as other conditions and disorders described herein). The kit may optionally comprise a second pharmaceutical composition comprising one or more additional agents including but not limited to those including analgesic peptides and compounds, a phosphodiesterase inhibitor, an agent used to treat gastrointestinal and other disorders (including those described herein), an agent used to treat constipation, an antidiarrheal agent, an insulin or related compound (including those described herein), an anti-hypertensive agent, an agent useful in the treatment of respiratory and other disorders, an anti-obesity agent, an anti-diabetic agents, an agent that activates soluble guanylate cyclase and a pharmaceutically acceptable carrier, vehicle or diluent. The pharmaceutical composition comprising the compound described herein and the second pharmaceutical composition contained in the kit may be optionally combined in the same pharmaceutical composition.

A kit includes a container or packaging for containing the pharmaceutical compositions and may also include divided containers such as a divided bottle or a divided foil packet. The container can be, for example a paper or cardboard box, a glass or plastic bottle or jar, a re-scalable bag (for example, to hold a "refill" of tablets for placement into a different container), or a blister pack with individual doses for pressing out of the pack

according to a therapeutic schedule. It is feasible that more than one container can be used together in a single package to market a single dosage form. For example, tablets may be contained in a bottle which is in turn contained within a box.

An example of a kit is a so-called blister pack. Blister packs are well known in the packaging industry and are being widely used for the packaging of pharmaceutical unit dosage forms (tablets, capsules, and the like). Blister packs generally consist of a sheet of relatively stiff material covered with a foil of a preferably transparent plastic material. During the packaging process, recesses are formed in the plastic foil. The recesses have the size and shape of individual tablets or capsules to be packed or may have the size and shape to accommodate multiple tablets and/or capsules to be packed. Next, the tablets or capsules are placed in the recesses accordingly and the sheet of relatively stiff material is sealed against the plastic foil at the face of the foil which is opposite from the direction in which the recesses were formed. As a result, the tablets or capsules are individually sealed or collectively sealed, as desired, in the recesses between the plastic foil and the sheet. Preferably the strength of the sheet is such that the tablets or capsules can be removed from the blister pack by manually applying pressure on the recesses whereby an opening is formed in the sheet at the place of the recess. The tablet or capsule can then be removed via said opening.

It maybe desirable to provide a written memory aid containing information and/or instructions for the physician, pharmacist or subject regarding when the medication is to be taken. A "daily dose" can be a single tablet or capsule or several tablets or capsules to be taken on a given day. When the kit contains separate compositions, a daily dose of one or more compositions of the kit can consist of one tablet or capsule while a daily dose of another one or more compositions of the kit can consist of several tablets or capsules. A kit can take the form of a dispenser designed to dispense the daily doses one at a time in the order of their intended use. The dispenser can be equipped with a memory-aid, so as to further facilitate compliance with the regimen. An example of such a memory-aid is a

mechanical counter which indicates the number of daily doses that have been dispensed. Another example of such a memory-aid is a battery-powered micro-chip memory coupled with a liquid crystal readout, or audible reminder signal which, for example, reads out the date that the last daily dose has been taken and/or reminds one when the next dose is to be taken.

Glycyrrhizinate can also be used as an absorption enhancer (see, e.g., EP397447). WO 03/004062 discusses Ulex europaeus I (UEAI) and UEAI mimetics which may be used to target the agents described herein to the GI tract. The bioavailability of the agents described herein can also be incrased by addition of oral bioavailability-enhancing agents such as those described in U.S. 6,818,615 including but not limited to: cyclosporins (including cyclosporins A through Z as defined in Table 1 of U.S. 6,818,615), for example, cyclosporin A (cyclosporin), cyclosporin F, cyclosporin D, dihydro cyclosporin A, dihydro cyclosporin C, acetyl cyclosporin A, PSC-833, (Me-Ile-4)-cyclosporin (SDZ-NIM 811) (both from Sandoz Pharmaceutical Corp.), and related oligopeptides produced by species in the genus Topycladium); antifungals including but not limited to ketoconazole; cardiovascular drug including but not limited to MS-209 (BASF), amiodarone, nifedipine, reserpine, quinidine, nicardipine, ethacrynic acid, propafenone, reserpine, amiloride; anti-migraine natural products including but not limited to ergot alkaloids; antibiotics including but not limited to cefoperazone,

The precise amount of each of the two or more active ingredients in a dosage unit will depend on the desired dosage of each component. Thus, it can be useful to create a dosage unit that will, when administered according to a particular dosage schedule (e.g., a dosage schedule specifying a certain number of units and a particular timing for administration), deliver the same dosage of each component as would be administered if

the patient was being treated with only a single component. In other circumstances, it might be desirable to create a dosage unit that will deliver a dosage of one or more components that is less than that which would be administered if the patient was being treated only with a single component. Finally, it might be desirable to create a dosage unit that will deliver a dosage of one or more components that is greater than that which would be administered if the patient was being treated only with a single component. The pharmaceutical composition can include additional ingredients including but not limited to the excipients described herein. In certain embodiments, one or more therapeutic agents of the dosage unit may exist in an extended or control release formulation and additional therapeutic agents may not exist in extended release formulation. For example, a peptide or agonist described herein may exist in a controlled release formulation or extended release formulation in the same dosage unit with another agent that may or may not be in either a controlled release or extended release formulation. Thus, in certain embodiments, it may be desirable to provide for the immediate release of one or more of the agents described herein, and the controlled release of one or more other agents.

In certain embodiments the dosage unit and daily dose are equivalent. In certain embodiments the dosage unit and the daily dose are not equivalent. In various embodiments, the dosage unit is administered twenty minutes prior to food consumption, twenty minutes after food consumption, with food at anytime of the day, without food at anytime of the day, with food after an overnight fast (e.g. with breakfast), at bedtime after a low fat snack. In various embodiments, the dosage unit is administered once a day, twice a day, three times a day, four times a day, five times a day, six times a day.

When two or more active ingredients are combined in single dosage form, chemical interactions between the active ingredients may occur. For example, acidic and basic active ingredients can react with each other and acidic active ingredients can facilitate the degradation of acid labile substances. Thus, in certain dosage forms, acidic and basic

substances can be physically separated as two distinct or isolated layers in a compressed tablet, or in the core and shell of a press-coated tablet. Additional agents that are compatible with acidic as well as basic substances, have the flexibility of being placed in either layer. In certain multiple layer compositions at least one active ingredient can be enteric-coated. In certain embodiments thereof at least one active ingredient can be presented in a controlled release form. In certain embodiments where a combination of three or more active substances are used, they can be presented as physically isolated segments of a compressed mutlilayer tablet, which can be optionally film coated.

The therapeutic combinations described herein can be formulated as a tablet or capsule comprising a plurality of beads, granules, or pellets. All active ingredients including the vitamins of the combination are formulated into granules or beads or pellets that are further coated with a protective coat, an enteric coat, or a film coat to avoid the possible chemical interactions. Granulation and coating of granules or beads is done using techniques well known to a person skilled in the art. At least one active ingredient can present in a controlled release form. Finally these coated granules or beads are filled into hard gelatin capsules or compressed to form tablets.

The therapeutic combinations described herein can be formulated as a capsule comprising microtablets or minitablets of all active ingredients. Microtablets of the individual agents can be prepared using well known pharmaceutical procedures of tablet making like direct compression, dry granulation or wet granulation. Individual microtablets can be filled into hard gelatin capsules. A final dosage form may comprise one or more microtablets of each individual component. The microtablets may be film coated or enteric coated.

The therapeutic combinations described herein can be formulated as a capsule comprising one or more microtablets and powder, or one or more microtablets and granules or beads. In order to avoid interactions between drugs, some active ingredients of a said combination can be formulated as microtablets and the others filled into capsules as a

powder, granules, or beads. The microtablets may be film coated or enteric coated. At least one active ingredient can be presented in controlled release form.

The therapeutic combinations described herein can be formulated wherein the active ingredients are distributed in the inner and outer phase of tablets. In an attempt to divide chemically incompatible components of proposed combination, few interacting components are converted in granules or beads using well known pharmaceutical procedures in prior art. The prepared granules or beads (inner phase) are then mixed with outer phase comprising the remaining active ingredients and at least one pharmaceutically acceptable excipient. The mixture thus comprising inner and outer phase is compressed into tablets or molded into tablets. The granules or beads can be controlled release or immediate release beads or granules, and can further be coated using an enteric polymer in an aqueous or non-aqueous system, using methods and materials that are known in the art.

The therapeutic combinations described herein can be formulated as single dosage unit comprising suitable buffering agent. All powdered ingredients of said combination are mixed and a suitable quantity of one or more buffering agents is added to the blend to minimize possible interactions.

The agents described herein, alone or in combination, can be combined with any pharmaceutically acceptable carrier or medium. Thus, they can be combined with materials that do not produce an adverse, allergic or otherwise unwanted reaction when administered to a patient. The carriers or mediums used can include solvents, dispersants, coatings, absorption promoting agents, controlled release agents, and one or more inert excipients (which include starches, polyols, granulating agents, microcrystalline cellulose, diluents, lubricants, binders, disintegrating agents, and the like), etc. If desired, tablet dosages of the disclosed compositions may be coated by standard aqueous or nonaqueous techniques.
