### **DETAILED ACTION**

This application is the national stage entry of PCT/US04/09387, filed 26 Mar 2004; and claims benefit of provisional application 60/458,922, filed 28 Mar 2003; and claims benefit of provisional application 60/484,756, filed 02 July 2003; and claims benefit of provisional application 60/541,247, filed 04 Feb 2004.

Claims 1-35 and 56-98 are pending in the current application. Claims 13-35 and 67-81, drawn to non-elected inventions, are withdrawn. Claims 1-12, 56-66, and 82-98 are examined on the merits herein.

However, the parent applications provisional application 60/458,922, filed 28 Mar 2003; provisional application 60/484,756, filed 02 July 2003; and provisional application 60/541,247, filed 04 Feb 2004; upon which priority is claimed fail to provide adequate support under 35 U.S.C. 112 for the instant claims 1-12, 56-66, and 82-98 of this application since parent applications 60/458,922, filed 28 Mar 2003; and 60/484,756, filed 02 July 2003 are not seen to disclose the amorphous cladribine-cyclodextrin complex of in the independent claims 1, 56 and 82. Written description for claims 1-11 and 56-65 may be found in provisional application 60/541,247, filed 04 Feb 2004, however no support is found for the percent by weight present in the inclusion complex and the non-inclusion complex of instant claims 12 and 66, the temperature range of about 40 to about 80 °C of claims 82 and 83, the temperature range of about 45 to about 50 °C of claim 85, or the temperature range of about -40 to about -80 °C of claim 89. Thus, the filing date of the instant claims 12, 66, 82, 83, 85, 88 and 89 are deemed to be the filing date of the instant application, 14 Nov 2006. The filing date of instant

Application/Control Number: 10/551,205 Page 3

Art Unit: 1623

claims 1-11, 56-65, 84, 86 and 87 are deemed to be the filing date of provisional application 60/541,247, filed 04 Feb 2004. If applicant disagrees, applicant should present a detailed analysis as to why the claimed subject matter has clear support in the earlier priority applications. Applicant is reminded that such priority for the instant limitations requires written description and enablement under 35 U.S.C. § 112, first paragraph.

#### Election/Restrictions

Applicant's election with traverse of the invention of Group I, claims 1-12, 56-66, and 82-98, in the reply filed on 04 Jan 2008 is acknowledged. The traversal is on the ground(s) that the amorphous nature of the complex is part of the special technical feature of the cladribine-cyclodextrin complex in a solid oral dosage form. This is not found persuasive because Schultz et al. (US Patent 6,194,395, of record) explicitly discloses a cladribine-cyclodextrin complex in a solid oral dosage form (column 5, lines 50-52). Further, Schultz et al. references the method of making said solid oral dosage form disclosed in WIPO Publication WO97/18839 (cited in PTO-892), which is drawn to the embodiment wherein the melt-extruded forms consist essentially of amorphous material (page 8, lines 14-15). Therefore WIPO Publication WO97/18839 provides evidence that it was recognized in the prior art that the product disclosed by Schultz et al. inherently includes amorphous cladribine-cyclodextrin complex in a solid oral dosage form. While the International Search Report is factually correct in stating that Schultz et al. is silent about specific ratios of cladribine to cyclodextrin and amorphous forms, a

patent need not teach, and preferably omits, what is well known in the art. By referencing WIPO Publication WO97/18839 Schultz et al. demonstrates that the <u>amorphous</u> cladribine-cyclodextrin complex produced by the melt-extrusion method is well known in the prior art. Finally, to address the scientific issue regarding the equilibrium presence of both the inclusion and non-inclusion complex, while the mathematical equation for the equilibrium of the cladribine-cyclodextrin inclusion complex and the cladribine-cyclodextrin non-inclusion complex would be different for cladribine and cyclodextrin in a solvent versus cladribine and cyclodextrin in a molten state, ie. a liquid mixture absent solvent, the equilibrium and thus equilibrium products would still be present.

The requirement is still deemed proper and is therefore made FINAL.

Claims 13-35 and 67-81 are withdrawn from further consideration pursuant to 37 CFR 1.142(b), as being drawn to a nonelected inventions, there being no allowable generic or linking claim. Applicant timely traversed the restriction requirement in the reply filed on 04 Jan 2008.

# Specification

The disclosure is objected to because of the following informalities:

- a) The blanks identifying the provisional patent application numbers on page 23, lines 25 and 27 must be replaced with the application numbers.
  - b) The minor typographical error "comples" on page 22, line 12.

Art Unit: 1623

Appropriate correction is required.

# Claim Rejections - 35 USC § 112

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 2, 11 and 57 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

The term "saturated" in claims 2, 11 and 57 is a relative term which renders the claim indefinite. The term "saturated" is not defined by the claim, the specification does not provide a standard for ascertaining the requisite degree, and one of ordinary skill in the art would not be reasonably apprised of the scope of the invention. The following definition for "saturated" is provided in the specification, page 10 lines 1-13:

The term "saturated" when used in conjunction with a complex of cladribine in amorphous cyclodextrin means that the complex is saturated with cladribine, that is, the complex contains the maximum amount of cladribine which can be complexed (by means of both inclusion and non-inclusion complexes) with a given amount of cyclodextrin under the conditions of complexation used. A phase solubility study can be used to provide this information, as described in more detail hereinafter. (Conditions for the complexation are also described in more detail below.) Alternatively, a saturated complex may be arrived at empirically by simply adding cladribine to an aqueous solution of the selected cyclodextrin until no more cladribine goes into solution; ultimately, excess cladribine, if any, is removed (by filtration or centrifugation) and the solution lyophilized to provide the dry saturated complex.

The saturated complex is defined in relation to a maximum amount of cladribine which can be complexed under the conditions of complexation used. However, this amount is defined only empirically. A saturated aqueous solution is invoked with regard to this empirically defined maximum amount of cladribine which can be complexed, but the

claims are drawn to a saturated complex in a solid oral dosage form, not a saturated solution. Therefore one of ordinary skill in the art would not be reasonably apprised of the scope of the invention because the maximum amount would have to be determined empirically for each composition. For the purpose of furthering prosecution, Examiner has interpreted the "maximum amount of cladribine which can be complexed" to be the weight ratio of 1:10 for the cladribine:cyclodextrin complex, based on guidance given on page 31, lines 18-20.

Claim 2 recites the limitation "the complex" in line 2. There is insufficient antecedent basis for this limitation in the claim. It is unclear which complex is referred to by the term "the complex," the inclusion complex (a), the non-inclusion complex (b), both complexes or the complex cladribin-cyclodextrin complex.

Similarly, claim 11 recites the limitation "saturated complexes" in line 3. There is insufficient antecedent basis for this limitation in the claim. It is unclear which complex is referred to by the term "complexes," the inclusion complex (a), the non-inclusion complex (b), both complexes or the complex cladribin-cyclodextrin complex.

The term "a point located on a phase solubility diagram for saturated complexes of cladribine in varying concentrations of the cyclodextrin" in claim 11 is a relative term which renders the claim indefinite. The term "a point located on a phase solubility diagram for saturated complexes of cladribine in varying concentrations of the cyclodextrin" is not defined by the claim, the specification does not provide a standard for ascertaining the requisite degree, and one of ordinary skill in the art would not be reasonably apprised of the scope of the invention. The broadness of the term "a point

located on a phase solubility diagram" does not necessarily render the term indefinite. However, no standard is given for what "phase solubility diagram for saturated complexes of cladribine in varying concentrations of the cyclodextrin" is referred to in the claim, such as what temperature, pressure, or solvent this phase solubility diagram describes. Therefore one of ordinary skill in the art would not be reasonably apprised of the scope of the invention from the term "a point located on a phase solubility diagram for saturated complexes of cladribine in varying concentrations of the cyclodextrin".

# Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-5, 11, 56-60, 82-90 and 94-98 are rejected under 35 U.S.C. 102(b) as being anticipated by Schultz et al. (US Patent 6,194,395, published 27 Feb 2001, of record) as evidenced by Baert et al. (WIPO Publication WO97/18839, published 29 May 1997, cited in PTO-892).

Schultz et al. discloses a solid pharmaceutical oral dosage form of cladribine comprising cladribine and cyclodextrin (column 2, lines 31-39), meeting the limitations of instant claims 1 and 56. The disclosed product is substantially identical to a product-by-process meeting the limitations of instant claims 82-90 and 94-96. Schultz et al. discloses the use of  $\beta$ - and  $\gamma$ -cyclodextrins (column 2, lines 56-58) and derivatives

Application/Control Number: 10/551,205

Art Unit: 1623

wherein one or more cyclodextrin hydroxy groups are replaced with groups such as methyl, hydroxypropyl, carboxymethyl (column 3, lines 26-27) or sulfobutylcyclodextrins (column 4, lines 22-24), meeting the limitations of instant claims 3-5 and 58-60. The phrase "one or more cyclodextrin hydroxy groups" combined with the absence of specific structural details of which hydroxyl group is substituted with a methyl group meets the limitation of "randomly methylated β-cyclodextrins" of instant claims 3 and 58. Schultz et al. discloses the solid oral dosage form in the form of a tablet (column 5, lines 37-38) including the excipients sorbitol and magnesium stearate (column 6, lines 2-7), disclosing a product that is substantially identical to a product-by-process meeting the limitations of instant claims 97 and 98. Schultz et al. discloses an oral dosage form comprising up to 15 mg cladribine and cyclodextrin from 100 to 500 mg, which would lead one of skill in the art to instantly envision a cladribine to cyclodextrin ratio ranging from 15 mg:100 mg to 15mg:500 mg, or 1:6.67 to 1:33.3 by weight (column 6, lines 23-31). These values molar ratios that correspond to "a point located on a phase solubility diagram for saturated complexes of cladribine in varying concentrations of the cyclodextrin," meeting the limitations of instant claim 11. The language of instant claim 11 as disclosed requires only that the point be located on a phase solubility diagram for said complexes, not that the point be located on the curve defining a saturated complex such as the curve disclosed in the Figure, meaning that any composition according to claim 1 necessarily meets the limitations of instant claim 11 as disclosed. The instant specification suggests that maximum amount of cladribine which can be complexed gives a weight ratio of 1:10 for the cladribine:cyclodextrin complex. Therefore a

Page 8

Art Unit: 1623

composition comprising the cladribine:cyclodextrin complex that contains a cladribine to cyclodextrin ratio of 1:6.67 describes a composition that comprises a "saturated" complex and meets the limitations of instant claims 2 and 57. The open language of "comprising" allows for the presence of uncomplexed cladribine in the composition.

Schultz et al. incorporates-by-reference the method of making said solid oral dosage form (Schultz et al.column 5, lines 50-52) disclosed in WIPO Publication WO97/18839, Baert et al., which provides evidence in the embodiment wherein the melt-extruded forms consist essentially of amorphous material (Baert et al. page 8, lines 14-15). Therefore Baert et al. provides evidence that it was recognized in the prior art that the product disclosed by Schultz et al. inherently includes amorphous cladribine-cyclodextrin complex in a solid oral dosage form.

To address the scientific issue regarding the equilibrium presence of both the inclusion and non-inclusion complex, while the equation for the equilibrium of the cladribine-cyclodextrin inclusion complex and the cladribine-cyclodextrin non-inclusion complex would be different for cladribine and cyclodextrin in a solvent versus cladribine and cyclodextrin in a molten state due to the lack of a solvent, the equilibrium and thus equilibrium products, the cladribine-cyclodextrin inclusion complex and the cladribine-cyclodextrin non-inclusion complex, would still be inherent in the product disclosed by Schultz et al.

Claims 82-90 and 94-98 are drawn to a product-by-process. The disclosed product is substantially identical to the instantly claimed product-by-process, an amorphous solid pharmaceutical oral dosage form comprising cladribine and

Art Unit: 1623

cyclodextrin. "[E]ven though product-by-process claims are limited by and defined by the process, determination of patentability is based on the product itself. The patentability of a product does not depend on its method of production. If the product in the product-by-process claim is the same as or obvious from a product of the prior art, the claim is unpatentable even though the prior product was made by a different process." In re Thorpe, 777 F.2d 695, 698, 227 USPQ 964, 966 (Fed. Cir. 1985) (citations omitted) (Claim was directed to a novolac color developer. The process of making the developer was allowed. The difference between the inventive process and the prior art was the addition of metal oxide and carboxylic acid as separate ingredients instead of adding the more expensive pre-reacted metal carboxylate. The product-by-process claim was rejected because the end product, in both the prior art and the allowed process, ends up containing metal carboxylate. The fact that the metal carboxylate is not directly added, but is instead produced in-situ does not change the end product.). See MPEP 2113.

# Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of

Application/Control Number: 10/551,205 Page 11

Art Unit: 1623

the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 1, 6-10, 12, 56, 61-66, 82 and 91-93 are rejected under 35 U.S.C. 103(a) as being unpatentable over Schultz et al. (US Patent 6,194,395, published 27 Feb 2001, of record) in view of Baert et al. (WIPO Publication WO97/18839, published 29 May 1997, cited in PTO-892).

Schultz et al. as evidenced by Baert et al. discloses as above. Schultz et al. implicitly discloses an oral dosage form comprising up to 15 mg cladribine and cyclodextrin from 100 to 500 mg, or a cladribine to cyclodextrin ratio ranging from 1:6.67 to 1:33.3 by weight (column 6, lines 23-31).

Schultz et al. does not specifically disclose the composition comprising a cladribine to cyclodextrin ratio from about 1:10 to about 1:16 (instant claims 6, 7, 10, 61, 62 and 65), or a ratio of about 1:14 (instant claims 8 and 63) or about 1:11 (instant claims 9 and 64). Schultz et al. does not specifically disclose the complex wherein from about 30 to about 40 percent by weight of the cladribine is in the inclusion complex (a) and from about 70 to about 60 percent by weight of the cladribine is in the non-inclusion complex (b) (instant claims 12 and 66). Schultz et al. does not specifically disclose the product-by-process wherein 12.00 parts by weight of cladribine and 172.50 parts by

Art Unit: 1623

weight of hydroxypropyl-β-cyclodextrin are introduced in step (i) of the process (instant claim 91 and 93), to give a cladribine to cyclodextrin ratio of 1:14.38.

Schultz et al. does not specifically disclose the product-by-process wherein 16.35 parts by weight of cladribine and 172.50 parts by weight of the hydroxypropyl-β-cyclodextrin are introduced in step (i) of the process (instant claim 92), to give a cladribine to cyclodextrin ratio of 1:10.55.

Baert et al. discloses a solid mixture comprising one or more cyclodextrins and an insoluble active ingredient embedded into the cyclodextrin carrier (abstract), and teaches ratios of active ingredient to cyclodextrin of from about 1:100 to 100:1, from about 1:5 and 5:1 and from about 1:3 to 3:1 (page 11, lines 1-5). These ratios are interpreted as mole ratios because Baert et al. teaches the use of different active ingredients with different molecular weights. A mole ratio of active ingredient to cyclodextrin of about 1:3 for cladribine (MW 285.7 g/mol) and  $\beta$ -cyclodextrin (MW 1135 g/mol) gives a ratio by weight of approximately 1:11.9. The ratio of 1:11.9 meets the limitation of both a ratio of about 1:11 and a ratio of about 1:14 according to the non-limiting definition of "about" as a variance of 20% provided in the instant specification page 9, lines 6-11.

It would have been obvious to one of ordinary skill in the art at the time of the invention to practice the solid pharmaceutical oral dosage form of cladribine comprising cladribine and cyclodextrin disclosed by Schultz et al. in the ratios of cladribine and cyclodextrin taught by Baert et al. One of ordinary skill in the art would be motivated to combine the Schultz et al. and Baert et al. because Schultz et al. incorporates-by-

Application/Control Number: 10/551,205 Page 13

Art Unit: 1623

reference Baert et al. and because Baert et al. suggests that improving a similar product according to the teachings of Baert et al. has beneficial properties such as high bioavailability and dissolution rate (Baert et al. page 7, lines 25-27). One of ordinary skill in the art would have an expectation of success because the ratios taught by Baert et al. fall within the range of ratios that is implicitly disclosed by Schultz et al. Schultz et al. in view of Baert et al. does not teach the specific cladribine to cyclodextrin ratios of 1:14.38 or 1:10.55, however these ratios are encompassed by the prior art and Baert et al. suggests optimization of the ratio (Baert et al. page 11, lines 1-5). See also MPEP 2144.05 II.A, "Generally, differences in concentration or temperature will not support the patentability of subject matter encompassed by the prior art unless there is evidence indicating such concentration or temperature is critical." Schultz et al. in view of Baert et al. does not specifically disclose the complex wherein from about 30 to about 40 percent by weight of the cladribine is in the inclusion complex (a) and from about 70 to about 60 percent by weight of the cladribine is in the non-inclusion complex (b). However, it is well known in the art that the formation of an inclusion complex from a non-inclusion complex is an equilibrium process, and the position of this equilibrium is dependent on the concentrations of the cladribine and cyclodextrin. This molecular inclusion equilibrium is a process inherent in the formation of the inclusion complex in both aqueous solutions and hot melt liquid mixtures, and Baert et al. teaches variation of the ratio of cladribine to cyclodextrin and hence their relative concentration.

It is noted that In re Best (195 USPQ 430) and In re Fitzgerald (205 USPQ 594) discuss the support of rejections wherein the prior art discloses subject matter which

Application/Control Number: 10/551,205 Page 14

Art Unit: 1623

there is reason to believe inherently includes functions that are newly cited or is identical to a product instantly claimed, namely the position of the equilibrium process governing formation of an inclusion complex and a non-inclusion complex. In such a situation the burden is shifted to the applicants to "prove that subject matter shown to be in the prior art does not possess characteristic relied on" (205 USPQ 594, second column, first full paragraph).

#### Conclusion

No claim is found to be allowable.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jonathan S. Lau whose telephone number is 571-270-3531. The examiner can normally be reached on Monday - Thursday, 9 am - 4 pm EST.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Shaojia Anna Jiang can be reached on 571-272-0627. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

WO 97/18839 PCT/EP96/05118

-1-

#### SOLID MIXTURES OF CYCLODEXTRINS PREPARED VIA MELT-EXTRUSION

- The present invention involves a process for preparing solid mixtures by melt-extrusion comprising one or more active ingredients, preferably one or more practically insoluble active ingredients and one or more cyclodextrins. The invention further concerns pharmaceutical compositions comprising the above mixture.
- WO 94/11031, published on May 5, 1994, discloses a method of manufacturing a high-quality enclosure compound using extrusion techniques. In this document the extrusion of cyclodextrins together with an active ingredient is mentioned. However, the document discloses the use of a wet mixture (i.e. including water or another solvent) to feed into the extruder.

15

20

French patent application 2,705,677 published on December 2, 1994 describes microgranules obtained by extrusion-spheronisation containing a cyclodextrin. The extrusion-spheronisation technique is the combination of an agglomeration technique, i.e. extrusion, and a shaping technique, i.e. the spheronisation. Said patent application actually teaches the formation of microgranulates containing  $\beta$ -cyclodextrin (Kleptose®) and microcrystalline cellulose (Avicel®) and as active ingredients ketoprofen and paracetamol. The extrusion technique used in the above-mentioned patent application consists in preforming a humid mass by forcing said human mass through a nozzle thus forming long strands of extruded material. The document does not mention melt-extrusion at all.

25

EP 0,665,009, published as international application on April 24, 1994, discloses a method of dislocating the crystalline condition of crystalline medicine by extruding said crystalline material as such, i.e. without any excipient such as cyclodextrins.

30

- In J. Pharm. Pharmacolog., vol 44, No 2, pages 73-8, Uekama *et al* show how amorphous nifedipine powders were prepared by spray-drying with hydroxypropyl-β-cyclodextrins. The document does not mention melt-extrusion.
- 35 In Pharm. Weekbl. Sci. Ed., 1988, vol 10, No 2, page(s) 80-85, Van Doorne *et al*, the complex formation between β-cyclodextrins and six antimicotic imidazole derivatives was studied. In said study gels and creams comprising antimicotics were prepared

5

20

25

30

35

whereby a 1.8 % solution of  $\beta$ -cyclodextrin was added instead of purified water. There is no mentioning of extrusion at all.

- In J. Antimicrob. Chemother., 1993, vol 32, No 3, pages 459-463, Hostetler *et al* describe the effect of hydroxypropyl-β-cyclodextrin on the efficacy of oral itraconazole in disseminated murine cryptococcosis. In said document the authors describe how itraconazole is solubilized in hydroxypropyl-β-cyclodextrin resulting in a 100 ml solution. There is no mentioning at all of an extrusion process.
- In Jpn. J. Med. Mycol., 1994, vol 35, No 3, page 263-267, Mikami *et al* describe the effect of carrier solvents on the efficacy of oral itraconazole therapy in aspergilossis in mice. Again this document discloses itraconazole being solubilized in hydroxypropyl-β-cyclodextrin. There is no mentioning of extrusion techniques.
- In "Effect of 2-Hydroxypropyl-β-cyclodextrin on Crystallization and Polymorphic Transition of Nifedipine in Solid State", Pharmaceutical research, vol 11, No 12, 1994, Uekama et al. describe a glassy mixture of 2-hydroxypropyl-β-cyclodextrin obtained by heating said mixture and immediately cooling said mixture to 0 degrees Celsius. There is no teaching that this mixture can be extruded.

US 5,009,900 describe glassy matrices that are useful for introducing and/or retaining and/or stabilizing the volatile and/or labile components in cooked and uncooked food products. These glassy matrices comprise chemically modified starch having a dextrose equivalent not greater than about 2; maltodextrin, corn syrup solids or a polydextrose, and a mono- or disaccharide. The document does disclose extrusion to form glassy matrices. However, there is no specific mentioning of cyclodextrins and of therapeutically or pharmaceutically active ingredients.

None of the above mentioned documents disclose the present invention.

Although WO 94/11031 and French patent application 2,705,677 disclose extrusion of mixtures of cyclodextrins and actives ingredients, said documents do not mention the use of meltextrusion. The technique described in WO 94/11031 and French patent application 2,705,677 has a main disadvantage, that a humid mass needs to be prepared which requires adding to the cyclodextrin and the active ingredient a certain amount of water and in most cases others solvents such as ethanol or methanol. Removing the water and/or other solvents is often a troublesome production step, which often leads to

irreproducibility because not all of the solvent can be removed. Moreover, with practically insoluble active ingredients the amounts of water and/or adjuvant solvents needed make the above technique unpractical on a production scale. Another disadvantage of the technique described in the prior art is that the drying step can induce unwanted crystallization of the active ingredient.

These problems are solved in the present invention by the use of a melt-extrusion process to form solid mixtures comprising one or more cyclodextrins and insoluble active ingredients.

10

15

25

5

The present process is advantageously applicable when said active ingredient is sensitive to a solvent such as water or an organic solvent, because it does not require any solvent. The term "sensitive" used herein means that the active ingredient is readily (e.g. within about one hour) influenced by a solvent to such an extent that its physical, chemical and/or biological properties are substantially modified or changed.

The present process is further advantageous because it does not require a drying step, during which insoluble active ingredients often tend to crystallize.

The term "insoluble" hereinabove and hereinunder refers to three categories of compounds, i.e. the "very slightly soluble", "practically insoluble" and "insoluble".

The terms "very slightly soluble", "practically insoluble" or "insoluble" are to be understood as defined in the United States Pharmacopeia 23, NF 18 (1995) page 7, i.e. a "very slightly soluble" compound requires from 1000 to 10,000 parts of solvent for 1 part of solute; a "practically insoluble" or "insoluble" compound requires more than 10,000 parts of solvent for 1 part of solute. The solute referred to in these cases are water or aqueous solutions.

- Three examples of this type of insoluble compounds are: itraconazole, loviride and (±)-ethyl (R\*,R\*)-4-[5-[1-[1-[(4-chlorophenyl)hydroxymethyl]propyl]-1,5-dihydro-5-oxo-4H-1,2,4-triazol-4-yl]-2-pyridinyl]-1-piperazinecarboxylate (hereinafter referred to as compound 1).
- Itraconazole is an art-known antifungal. Loviride is an art-known anti-retrovirally active compound, particularly useful in treating HIV-infected patients.

15

20

35

- (±)-Ethyl (R\*,R\*)-4-[5-[1-[1-[(4-chlorophenyl)hydroxymethyl]propyl]-1,5-dihydro-5- $0x0-4\underline{H}-1,2,4$ -triazol-4-yl]-2-pyridinyl]-1-piperazinecarboxylate is described as compound No. 3, in WO 95/27704 published on October 19, 1995.
- The compounds that are suitable to be used in this technique are compounds that show no appreciable decomposition at the temperatures needed to melt and extrude the mixture of said one or more active ingredients with the cyclodextrin or cyclodextrins.
- The term "active ingredient" further refers to compounds or mixtures of compounds which are pharmaceutically or therapeutically or cosmetically active for treating humans or animals.
  - The present invention provides a process for preparing a solid mixture comprising one or more cyclodextrins and an (insoluble) active ingredient, comprising a melt-extrusion step wherein one or more cyclodextrins are combined with the one or more active ingredients.
  - Melt-extrusion is a polymer extrusion technique which involves embedding an active ingredient in one or more carriers. In this technique the active ingredient and excipients are molten in the extruder and hence embedded in thermoplastic and thermomelting polymers. The resulting molten mass is then forced through one or more nozzles resulting in a thermoplastic strand or strands.
- An extruder comprises an inlet structure, a cylindrical structure called "barrel", a die and a screw or screws. A schematic overview is shown in Figure 1.
  - The inlet structure mostly is funnel shaped.
- The barrel may comprise one or more barrel units and the screw or screws extend through them.
  - Extruders are available in two general types, namely a single-screw extruder comprising one screw and a multi-screw extruder comprising two or more screws. While this invention can be carried out using either type of extruder, the use of a multi-screw extruder, particularly a twin-screw extruder is preferred. A twin-screw extruder (and a multi-screw extruder) is more efficient in that the plural screws interferring with

each other precludes follow-up movement of the active ingredient and, moreover, the intermeshing of the screws provides a high energy output physically.

An interesting mode of operating the screws is to operate them in a corotating mode.

5

The screw or screws may have different shapes such as, for example, a trapezoidal screw, a trapezoidal cut screw, trapezoidal reverse cut screw, ball screw, kneading paddle and these may be used in the desired combination.

- The load fed into the extruder via the inlet structure is forced by the screw or screws to advance, shorn and blended by the screw within the barrel and extruded from the orifice or orifices of the die. The temperature of the barrel or of the barrel units can be controlled via a heating element or even if necessary by a cooling element.
- The rotational speed of the screw can be set within the allowable range of the extruder used.

A person skilled in the art is able to select the screw geometry and combination of unit screws. The principal function of the screw is to transport, crush and knead the material that is being extruded.

The orifice configuration may be circular, elliptical, rectangular or hexagonal.

Hence, said melt-extrusion step comprises the following substeps:

- a) mixing one or more cyclodextrins with the active ingredient or active ingredients,
  - b) optionally mixing additives,
  - c) heating the thus obtained mixture until melting of one of the components,
  - d) forcing the thus obtained mixture through one or more nozzles;
  - e) cooling the mixture till it solidifies.

30

35

20

If desired, as mentioned above, the thermomelting mixture comprising one or more cyclodextrins and active ingredient(s) may comprise any suitable additive. When, for instance, the cyclodextrin(s) or the active ingredient(s) or one of the other possible additives is apt to be oxidized, an anti-oxidizing agent may be incorporated, preferably in small amounts, such as, for instance 100 to 5000 ppm when compared to the total weight of the mixture. Furthermore, conventional auxiliary additives such as pigments, flavors, stabilizers, preservatives and buffers may be added.

If necessary conventional pharmacologically acceptable plasticizers, such as long chain alcohols, ethylene glycol, propylene glycol, thriethylene glycol, butanediols, pentanols, hexanols, polyethylene glycols, aromatic carboxylates (e.g. dialkyl phthalates,

trimellitates, benzoates or terephthalates), aliphatic dicarboxylates or fatty acid esters can also be added. Preferably however, a plasticizer is not needed.

The term "melting" should be broadly interpreted. "Melting" can also refer to the fact that some transition is made to a glassy state, in which it is possible for one component of the mixture to get embedded into the other. In particular cases, one component will melt and the other component(s) will dissolve in the melt thus forming solid solutions, which show advantageous dissolution properties.

The possible formation of these solid solutions is one of the further advantages of the present invention. It will be appreciated by a person skilled in the art that mixing two or more solids, i.e. one or more cyclodextrins and the active ingredient or ingredients, and subsequently melting these solids together will give rise to different products than when the said solids are first brought into contact with water or another solvent and then extruded.

20

15

5

10

A characteristic of the melt extruded mixtures of the present invention is the fact that they contain substantially less water or any other solvent than mixtures being extruded in an other way.

25 Preferably the present melt extruded mixtures contain no water or solvent, apart from the water or solvent that eventually is contained in the crystal structure of the active ingredient.

It will be appreciated that the temperature inside the extruder is an important parameter.

When different barrel units are present, different temperatures can be applied. A person skilled in the art is able to establish the required temperatures by taking the desired type of cyclodextrin or cyclodextrins or even the complete mixture that is going to be extruded and observing the behaviour as a function of temperature with the aid of a melting point measuring instrument, such as a Kofler hot bench, a microscope hot stage type or a differential scanning calorimeter, e.g. type DSC 7 Series - Perkin Elmer.

20

30

The cooling can be performed without using any auxiliary means, i.e. it most often suffices to let the thermoplastic strand coming out of the extruder cool down to the ambient temperature of the production site. Of course, cooling aids may be used.

Once these thermoplastic strands are cooled down these strands can be milled to obtain a powdered form of the mixture of cyclodextrin or cyclodextrins and the active ingredient.

A person skilled in the art will appreciate that the milling can influence the physical characteristics of the extrudate. During milling the temperature of the material can rise because of the friction and also high shear forces are exerted on the material that is to be milled. Both temperature and mechanical or shear forces can result in a transition of the physical state of the material that is to be milled. A person skilled in the art has sufficient means at his disposal to control temperature and shear forces and thus to control the milling process.

The two processes, i.e. melt extrusion and milling can be combined into one configuration as is shown in Figure 1. The mixture of one or more cyclodextrins and one or more active ingredients in combination with possible other additives is feed via a funnel like inlet. The mixture is then melt-extruded and the mixture is forced through a nozzle onto a conveyor belt. While being transported on the conveyor belt the extrudate cools down. The cooled melt extrudate is fed into a chopper which forms pellets. These pellets may be further milled if required.

This powdered material still has the beneficial properties (high bioavailability, dissolution rate, etc.) and it can be used in the conventional way to prepare pharmaceutical, therapeutical or cosmetical solid dosage forms.

An additional advantage of the present invention is that the active ingredient as well as the cyclodextrins may be transformed in a amorphous form or even that a solid solution is formed. A person skilled in the art will appreciate that this modification of physical state from crystalline to amorphous or to solid solutions is highly advantageous for the dissolution.

35 The fact whether the melt extruded mixture contains amorphous material or contains a solid solution or consists essentially of amorphous material or a solid solution can be measured or checked using differential scanning calorimetry. When there is crystalline

material present in the melt extruded mixture a differential scanning calorimeter will show an endothermic melting peak. When amorphous material or a solid solution is mainly present in the melt extruded mixture a differential scanning calorimeter will not show an endothermic melting peak. Visual inspection of the melt extrudate allows for a distinction between amorphous material and a solid solution. In case the melt extrudate is opaque then both the cyclodextrin(s) and the active ingredient are in a amorphous form. In case melt extrudate is clear then a solid solution was formed.

Curves of differential scanning calorimetry are shown in Figures 2 to 7.

10

5

Interesting embodiments of the present invention are these melt extruded mixtures which consist mainly of amorphous material.

More interesting embodiments of the present invention are these melt extruded mixtures which consist essentially of amorphous material.

Even more interesting embodiments of the present invention are those melt extruded mixtures which consist mainly of a solid solution of the active ingredient or active ingredients in the cyclodextrin or the cyclodextrins.

20

Preferred embodiments of the present invention are those melt extruded mixtures which consist essentially of a solid solution of the active ingredient or active ingredients in the cyclodextrin or the cyclodextrins.

- Another advantage of the present invention is that the granulation step in forming pharmaceutical, therapeutical or cosmetical compositions can be omitted, because the powdered material can simply be mixed with other excipients and compressed into, for instance, tablets or another solid pharmaceutical, therapeutical or cosmetical form.
- Depending upon the characteristics of the melt extruded mixture, the size of the pellets of said melt extruded mixture or the mesh of the powder of said melt extruded mixture and, of course, dependent upon the other auxiliaries that are added to the unit dosage forms the unit dosage form may give immediate release or sustained release.
- If desired, said solid pharmaceutical form may also be provided with a conventional coating to improve the appearance and/or the flavor (coated tablets) or additionally to target the release of the active ingredient.

Suitable tablets may have the following compositions and may be prepared in a conventional way. The amounts given are of course dependent upon the dose required for the pharmaceutical, therapeutic or cosmetic activity.

	sterotex	2 - 10 mg

# Composition B

15

20

25

35

milled melt extrudate	100 - 500 mg
Microcelac (TM) (1)	200 - 300 mg
crospovidone	70 - 200 mg
talc	20 - 50 mg
sterotex	7 - 10 mg
colloidal silicon dioxide	1 - 5 mg
magnesium stearate	2 - 10 mg

The cyclodextrin to be used in the aforementioned compositions include the pharmaceutically acceptable unsubstituted and substituted cyclodextrins known in the art, more particularly  $\alpha$ ,  $\beta$  or  $\gamma$  cyclodextrins or the pharmaceutically acceptable derivatives thereof.

Substituted cyclodextrins which can be used in the invention include polyethers
described in U.S. Patent 3,459,731. In general, unsubstituted cyclodextrins are reacted with an alkylene oxide, preferably under superatmospheric pressure and at an elevated temperature, in the presence of an alkaline catalyst.

Since a hydroxy moiety of the cyclodextrin can be substituted by an alkylene oxide which itself can react with yet another molecule of alkylene oxide, the average molar substitution (MS) is used as a measure of the average number of moles of the substituting agent per glucose unit. The MS can be greater than 3 and theoretically has no limit.

Further substituted cyclodextrins are ethers wherein the hydrogen of one or more cyclodextrin hydroxy groups is replaced by C<sub>1-6</sub>alkyl, hydroxyC<sub>1-6</sub>alkyl, carboxy-C<sub>1-6</sub>alkyl or C<sub>1-6</sub>alkyloxycarbonylC<sub>1-6</sub>alkyl or mixed ethers thereof. In particular such substituted cyclodextrins are ethers wherein the hydrogen of one or more cyclodextrin hydroxy groups is replaced by C<sub>1-3</sub>alkyl, hydroxyC<sub>2-4</sub>alkyl or carboxyC<sub>1-2</sub>alkyl or more in particular by methyl, ethyl, hydroxyethyl, hydroxypropyl, hydroxybutyl, carboxy-methyl or carboxyethyl.

In the foregoing definitions the term "C<sub>1-6</sub>alkyl" is meant to include straight and branched saturated hydrocarbon radicals, having from 1 to 6 carbon atoms, such as, methyl, ethyl, 1-methylethyl, 1,1-dimethylethyl, propyl, 2-methylpropyl, butyl, pentyl, hexyl and the like.

Such ethers can be prepared by reacting the starting cyclodextrin with an appropriate O-alkylating agent or a mixture of such agents in a concentration being selected so that the desired cyclodextrin ether is obtained. The said reaction is preferably conducted in a suitable solvent in the presence of an appropriate base. With such ethers, the degree of substitution (DS) is the average number of substituted hydroxy functions per glucose unit, the DS being thus 3 or less.

20

5

10

15

In the cyclodextrin derivatives for use in the compositions according to the present invention, the DS preferably is in the range of 0.125 to 3, in particular 0.3 to 2, more in particular 0.3 to 1 and the MS is in the range of 0.125 to 10, in particular of 0.3 to 3 and more in particular 0.3 to 1.5.

25

**3**0

35

Of particular utility in the invention are the  $\beta$ -cyclodextrin ethers, e.g. dimethyl- $\beta$ -cyclodextrin as described in Drugs of the Future, Vol. 9, No. 8, p. 577-578 by M. Nogradi (1984) and polyethers, e.g. hydroxypropyl  $\beta$ -cyclodextrin and hydroxyethyl  $\beta$ -cyclodextrin, being examples. Such an alkyl ether may be a methyl ether with a degree of substitution of about 0.125 to 3, e.g. about 0.3 to 2. Such a hydroxypropyl cyclodextrin may for example be formed from the reaction between  $\beta$ -cyclodextrin an propylene oxide and may have a MS value of about 0.125 to 10, e.g. about 0.3 to 3.

A more novel type of substituted cyclodextrins is sulfobutylcyclodextrines. These type are also envisaged in the present invention.

The ratio of active ingredient over cyclodextrin may vary widely. For example ratios of 1/100 to 100/1 may be applied. Interesting ratios of active ingredient over cyclodextrin range from about 1/10 to 10/1. More interesting ratios of active ingredient over cyclodextrin range from about 1/5 to 5/1. Most interesting ratios range from about 1/3 to 3/1. Preferred ratio is aabout 1/1.

The use of a mixture of cyclodextrins, either different types  $(\alpha, \beta, \gamma)$  or different substitution (2-hydropropyl or methyl) or different substitution grades in sometimes recommendable to decrease the melting point.

10

5

### Description of the drawings

Figure 1 is a schematic representation of a configuration for carrying out the present invention.

15

- Figure 5 is a differential scanning calorimetry curve of of Batch No 3 material (see Example 1)
  - Figure 6 is a differential scanning calorimetry curve of of Batch No 4 material (see Example 1)

30

40

Figure 7 is a differential scanning calorimetry curve of of Batch No 5 material (see Example 1)

#### 35 Example 1

Extruded samples of active ingredient with hydroxypropyl-β-cyclodextrin (HP-β-CD) were obtained using a Twin Screw Extruder type MP19 APV Baker (commercially available from the company APV Baker) with a die having a orifice of 3 mm. The process parameters for each individual experiment are shown in the table 1. This type of extruder has a L/D ratio of 15 and a screw pattern: 4D FS - 4x30 FP - 4x60 FP - 4x90 P - 4x60 RP - 2.5D FS - 2x30 FP - 2x60 FP - 2x90 P - 3x60 RP - 3 DFS. (4D refers to a transportelement having a length of 4 times the screw diameter of the feed screw type; 4x30 FP refers to 4 forward paddles positioned with mutual angle of 30

degrees, 4x60 RP refers to a working zone having reverse paddles positioned with a mutual angle of 60 degrees)

- In this type of extruder the mixture is fed by a feeding screw turning a constant feeding speed (v1) ( A feeding speed of 10 revolutions per minute amounts to a feeding speed of 1,5 kg per hour) onto the twin transporter screws having a diameter of 18 mm turning at a transporter speed (v2). These speeds are rotational speeds (revolutions per minute).
- The mixture is then transported into a first heating zone (t1). Here the rate of transport diminished by a difference of the configuration of the twin transporter screws i.e. the rotational transporter speed v2 remains the same but the material does not progress as quickly.
- Subsequently, the molten mass is transported by again normal configuration twin transporter screws to a second heating zone (t2) where the rate of transport is again diminished by a difference of configuration of the twin transporter screws.

After this second heating the thermomelting mixture is transported to the nozzle of the apparatus.

Table 1

mixture	Batch. No	t <sub>1</sub> (°C)	t2 (°C)	t <sub>p</sub> (°C)	v <sub>1</sub> (rpm)*	v2 (rpm)*
$\frac{\text{compound 1}}{\text{HP-}\beta\text{-CD}} \cdot \frac{1}{3}$	1	256	283	280	10	100
$\frac{\text{itraconazole}}{\text{HP-}\beta\text{-CD}} : \frac{1}{1}$	2	263	265	279	10	20
$\frac{\text{itraconazole}}{\text{HP-}\beta\text{-CD}} : \frac{1}{3}$	3	264	265	280	10	20
$\frac{\text{loviride}}{\text{HP-}\beta\text{-CD}}:\frac{1}{1}$	4	274	285	292	10	80
$\frac{\text{loviride}}{\text{HP-}\beta\text{-CD}}:\frac{1}{3}$	5	258	265	274	10	20

\* rpm = revolutions per minute

- t<sub>1</sub>: temperature of the first heating zone

- t2: temperature of the second heating zone

WO 97/18839 PCT/EP96/05118

-13-

- t<sub>p</sub>: temperature inside the barrel

- v1: rate of feeding screw

- v2: twin transporter screws speed(rotational).

5 In every case the mixture of active ingredient and 2-hydroxypropyl-β-CD gave a solid solution.

### Example 2

Extruded samples of active ingredient with dimethyl-β-cyclodextrin (DM-β-CD) were obtained using extruder type MP19 - APV Baker with the process parameters as shown in the table 2.

### Table 2

15

mixture	Batch. No.	t1 (°C)	t2 (°C)	t <sub>p</sub> (°C)	v1 (1) (rpm)*	v <sub>2</sub> (rpm)*
$\frac{\text{compound 1}}{\text{DM-}\beta\text{-CD}} : \frac{1}{1}$	6	241	245	254	0	20
$\frac{\text{itraconazole}}{\text{DM-}\beta\text{-CD}}:\frac{1}{1}$	7	239	240	253	0	20
$\frac{\frac{\text{loviride}}{\text{DM-}\beta\text{-CD}} : \frac{1}{l}$	8	248	250	263	0	20

<sup>\*</sup> rpm = revolutions per minute

(1) The apparatus was fed manually, without using the feeding screw. In every case the mixture of active ingredient and DM- $\beta$ -CD.

20 - t1: temperature of the first heating zone

- t2: temperature of the second heating zone

- t<sub>D</sub>: temperature inside the barrel

- v<sub>1</sub>: feeding screw speed (rotational)

- v<sub>2</sub>: twin transporter screw speed (rotational).

25

# Example 3

The dissolution of the melt extrudate of Batch No 1 was compared with the dissolution of the "physical mixture" (i.e. the mixture of the two component in the ratio as shown for Batch No. 1, but not melt extruded).

30

An amount of 100 mg of milled melt extrudate of Batch No 1 was added to a volume of 900 ml of artificial gastric juice at a temperature of 37 degrees Celsius. The stirring method used was the peddle method with a peddle moving at 100 rotations per minute. Using UV spectrometry the relative amount of dissolved extrudate was measured during 1 hour.

The same procedure for the "physical mixture" was followed.

The results of this dissolution process are shown in Table 3

10

20

25

5

Table 3

time mixture (minutes)	milled extrudate Batch No 1 (% of total amount dissolved)	corresponding physical (% of total amount dissolved)
0	0.00	0.00
5	62.10	1.71
15	70.20	14.67
30	72.63	21.06
45	74.07	26.10
60	74.25	28.35

#### Example 4

The melting behaviour was measured by using differential scanning calorimetry. The calorimeter used is the Perkin-Elmer 7 Series Thermal Analysis System. In all cases the rate of heating was set at 20 degrees Celsius per minute.

Figure 2 shows the DSC curve of melt extrudate of Batch No 1 before milling. The curve shows no endothermic or exothermic peaks and it was established by visual inspection that the molten material was a clear solution, thus indicating that the non-milled melt extrudate of Batch No 1 is a solid solution.

Figure 3 shows the DSC curve of melt extrudate of Batch No 1 after milling. The curve shows no endothermic or exothermic peaks and it was established by visual inspection that the molten material was a clear solution, thus indicating that the milled melt extrudate of Batch No 1 is a solid solution.

Figure 4 shows the DSC curve of meltextrudate of Batch No 2 before milling. The curve shows no endothermic or exothermic peaks and it was established by visual inspection that the molten material was <u>not</u> a clear solution, thus indicating that the non-milled melt extrudate of Batch No 2 is a mixture of amorphous material.

5

10

15

20

25

Figure 5 shows the DSC curve of meltextrudate of Batch No 3 before milling. The curve shows a small endothermic peak. The data on said small peak are as follows: X1 = 117.600 degrees Celsius, X2 = 143.200 degrees Celsius, Peak at 132.695 degrees Celsius, Area is 38.126 mJ,  $\Delta H$  is 3.768 J/g, Height is 1.520 mW and the onset is at 125.816 degrees Celsius. Said small peak is very probably due to an impurity in the cyclodextrins. It was established that the non-milled melt extrudate of Batch No 3 is a mixture of amorphous material.

Figure 6 shows the DSC curve of meltextrudate of Batch No 4 before milling. The curve shows a few small endothermic peaks. Hence, it was established that the non-milled melt extrudate of Batch No 4 is a mixture of amorphous material containing small amounts of crystalline material

Figure 7 shows the DSC curve of meltextrudate of Batch No 5 before milling. The curve shows no endothermic or exothermic peaks and it was established by visual inspection that the molten material was <u>not</u> a clear solution, thus indicating that the non-milled melt extrudate of Batch No 5 is a mixture of amorphous material.

#### Example 5

The melt extrudate of Batch No. 1 was milled and sieved. By mixing the appropriate amounts a tablet having the following composition was prepared in an art-known way:

	milled extrudate batch No 1	480 mg
	microcrystalline cellulose	218 mg
30	Aerosil	3 mg
	magnesium stearate	5 mg
	crospovidone	144 mg

#### **Claims**

- Process for preparing a solid mixture comprising one or more cyclodextrins and
   one or more active ingredients characterized in that said process encompasses a melt-extrusion step, wherein the active ingredient is embedded into the cyclodextrin carrier.
- 2. A process as claimed in claim 1, wherein the melt-extrusion process comprises thefollowing substeps:
  - a) mixing one or more cyclodextrins with one or more active ingredients, and
  - b) optionally mixing additives;
  - c) heating the thus obtained mixture until melting of one of the components;
  - d) forcing the thus obtained mixture through one or more nozzles;
- e) cooling the mixture till it solidifies.
  - 3. A solid mixture obtainable by the process as described in any of claims 1 or 2, with the proviso that nifedipine in combination with 2-hydroxypropyl-β-cyclodextrin is excluded.

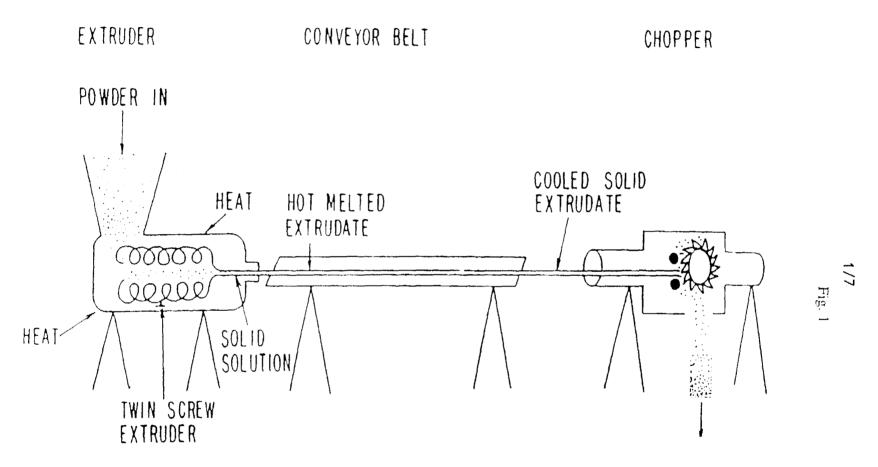

20

- 4. A solid mixture as claimed in claim 3 characterized in that the active ingredient or active ingredients are insoluble according to the definition of US Pharmacopeia.
- 5. A solid mixture as claimed in claims 3 or 4, wherein substantially only one type of cyclodextrin is present.
  - A solid mixture as claimed in any of claims 3 to 5 wherein a cyclodextrin is hydroxypropyl-β-cyclodextrin.
- A solid mixture as claimed in any of claim 3 to 5 wherein a cyclodextrin is dimethyl-β-cyclodextrin.
  - 8. A solid mixture as claimed in any of claims 3 to 7, wherein the active ingredient is itraconazole.

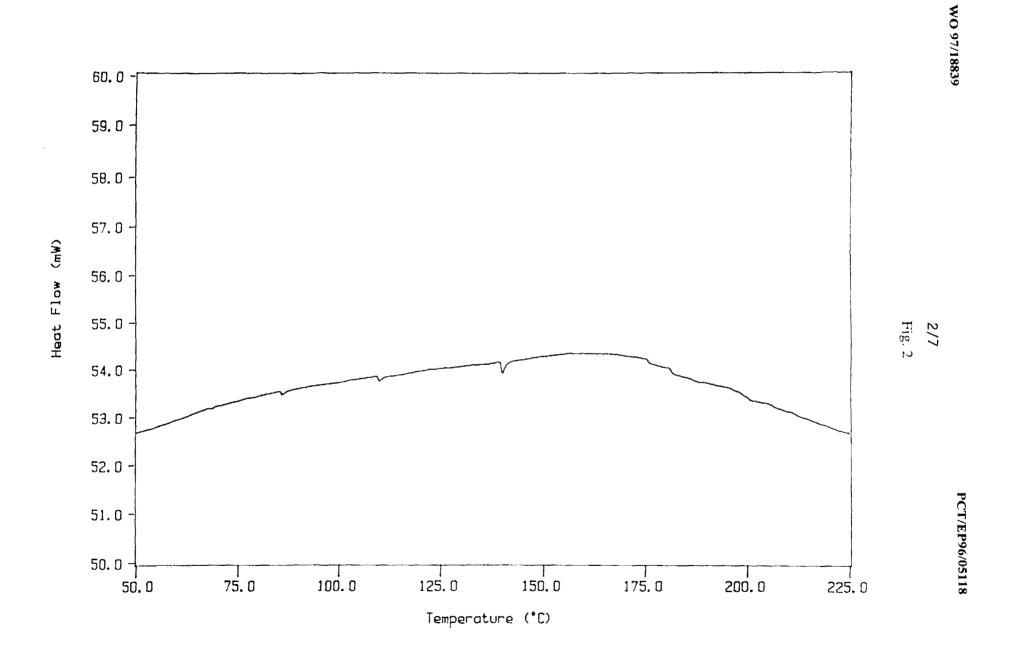

35

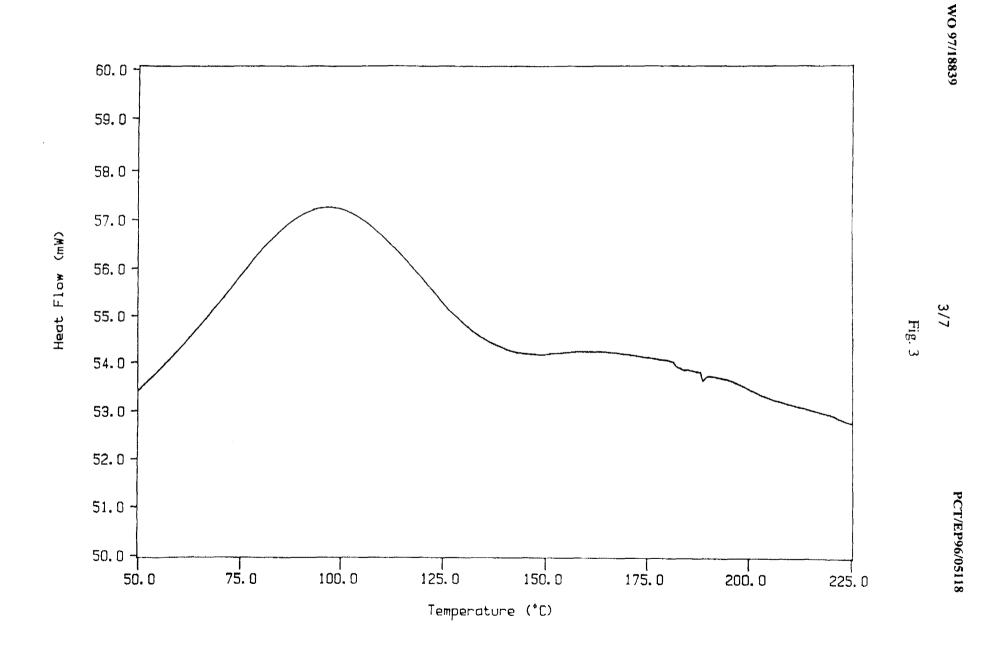

9. A solid mixture as claimed in any of claims 3 to 7 wherein the active ingredient is loviride.

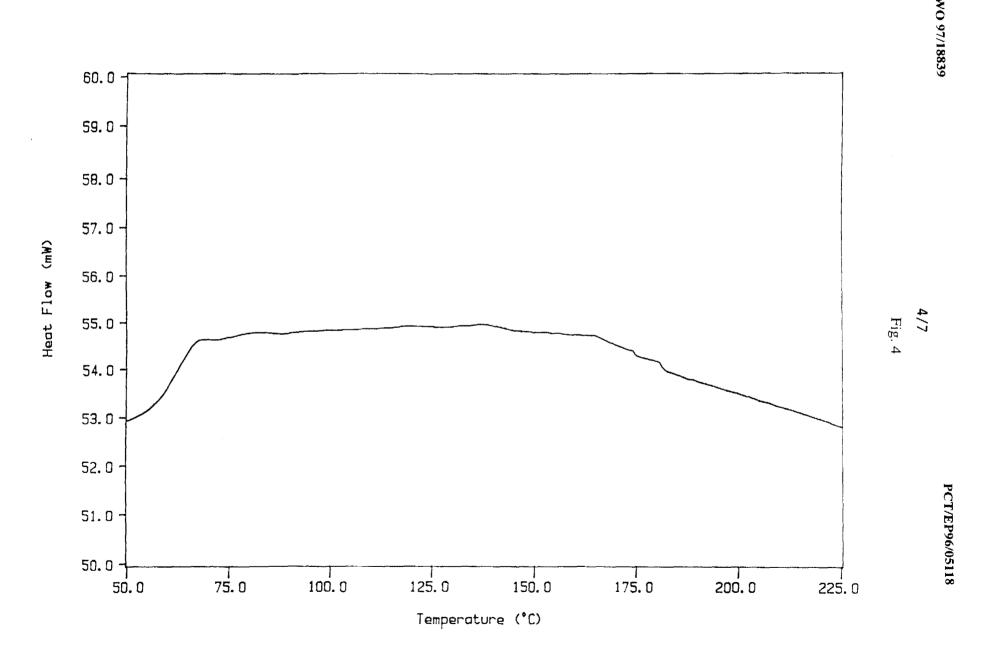

- 10. A solid mixture as claimed in any of claims 3 to 7 wherein the active ingredient is (±)-ethyl (R\*,R\*)-4-[5-[1-[1-[(4-chlorophenyl)hydroxymethyl]propyl]-1,5-dihydro-5-oxo-4H-1,2,4-triazol-4-yl]-2-pyridinyl]-1-piperazinecarboxylate.
- 5 11. A pharmaceutical composition comprising milled melt extrudate and other excipients.
- 12. A process for preparing a pharmaceutical composition as claimed in claim 11 characterized by milling appropriately the solid mixture as claimed in any of
   10 claims 4 to 10, intimately mixing the thus obtained powdered material with other pharmaceutically acceptable excipients and further processing into pharmaceutical dosage forms.

## INTERNATIONAL SEARCH REPORT

PCT/EP 96/05118

Box I	Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)
This Int	ernational Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:
1.	Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:
2. <b>X</b>	Claims Nos.: 1-7, 11-12 because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
	In view of the large number of compounds, which are defined by the general definition of the active ingredient used in the claims, the search had to be restricted for economic reasons. The search was limited to the compounds for which pharmacological data was given and/or the compounds mentioned
3.	Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).
Box II	Observations where unity of invention is lacking (Continuation of item 2 of first sheet)
This Int	ernational Searching Authority found multiple inventions in this international application, as follows:
1.	As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2.	As all searchable claims could be searches without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3.	As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4.	No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:
Remark	on Protest  The additional search fees were accompanied by the applicant's protest.
	No protest accompanied the payment of additional search fees.

RTHER INFORMATION CONTINUED FROM PCT/ISA/210					
in the claims, and to the general idea underlying the application (see Guidelines, chapter III, paragraph 2.3).					
Claims searched incompletely: 1-7,11-12

## SECOND INFORMATION DISCLOSURE STATEMENT

Commissioner for Patents P.O. Box 1450 Alexandria, VA 22313-1450

Sir:

In accordance with the duty of disclosure as set forth in 37 C.F.R. § 1.56, the accompanying information is being submitted in accordance with 37 C.F.R. §§ 1.97 and 1.98.

Applicants request the Examiner's consideration of the enclosed publication cited during prosecution of the corresponding Chinese application in an Official Action dated May 11, 2007. The publication is listed on the accompanying Form PTO-1449. The reference is in Chinese; therefore, the cited section (page 105, lines 25-29) is accompanied by an English translation thereof. This reference was cited as relevant only to some of the process and product-by-process claims.

This statement, Form PTO-1449 and enclosed citation and translation are believed to be filed prior to an action on the merits. In addition, the undersigned hereby states under 37 C.F.R. § 1.97(e) that each item of information contained in this information disclosure statement was first cited in any communication from a patent office in a counterpart foreign application not more than three months prior to the filing of this information disclosure statement. Therefore, no fee is required to obtain consideration under 37 C.F.R. §1.97(b) or (c), whichever is applicable.

Second Information Disclosure Statement Application No. <u>10/551,205</u> Attorney Docket No. <u>0056192-000024</u> Page 2

It is respectfully requested that the Examiner returned an initialed copy of applicants' enclosed Form PTO-1449 with the next official communication or with the first Action on the merits.

Respectfully submitted,

BUCHANAN INGERSOLL & ROONEY PC

## FIRST INFORMATION DISCLOSURE STATEMENT

Commissioner for Patents P.O. Box 1450 Alexandria, VA 22313-1450

Sir:

In accordance with the duty of disclosure as set forth in 37 C.F.R. § 1.56, the accompanying information is being submitted in accordance with 37 C.F.R. §§ 1.97 and 1.98. Applicants request the Examiner's consideration of the documents listed on the accompanying Form PTO-1449. All of these documents are cited in the instant specifiation, including the documents cited in the International Search Report (copy enclosed) which was issued in connection with PCT/US2004/009387, filed March 26, 2004, of which this application is the national phase.

Pursuant to 37 C.F.R. § 1.98, a copy of each of the documents cited is enclosed. However, copies of any listed U.S. patents and U.S. patent application publications are not enclosed since it is no longer required according to the July 11, 2003 waiver of the requirement for copies of cited U.S. patents and U.S. patent application publications in national patent applications filed after June 30, 2003 and international applications entering the national stage under 35 U.S.C. § 371 after June 30, 2003.

This Statement, Form PTO-1449 and documents are being submitted within three (3) months of the filing or entry of the national stage of this application or before the first Office Action on the merits, whichever is later. Since these documents are being filed within the time period set forth in 37 C.F.R. § 1.97(b), no fee or statement is required.

. The following remarks are offered with respect to the listed documents which are not in English:

First Information Disclosure Statement Application No. <u>10/551,205</u> Attorney's Docket No. <u>0056192-000024</u> Page 2

<u>DE 31 18 218</u> is in German. Applicants do not have an English translation. However, an English abstract, together with the citation of the document in the instant specification, are provided to serve as a brief statement of relevance. Applicants consider this a general state of the art reference.

<u>DE 33 17 064</u> is in German. Applicants do not have an English translation but provides herewith an English abstract. The abstract and citation of the document in the specification serve as a brief statement of relevance. Applicants consider this a general state of the art reference.

EP 0 149 197 B1 is in German, although the claims are also present in English. Applicants enclose a full English translation of this document, which is cited in the instant specification and which applicants consider to be a general state of the art reference.

It is respectfully requested that an Examiner-initialed copy of the accompanying Form PTO-1449 be returned to the undersigned.

Respectfully submitted,

**BUCHANAN INGERSOLL AND ROONEY PC** 

Date: <u>November 14, 2006</u>

## **REPLY AND AMENDMENT**

Commissioner for Patents P.O. Box 1450 Alexandria, VA 22313-1450

Sir:

In response to the Office Action dated April 4, 2008, please first amend the above-identified patent application as follows:

## AMENDMENTS TO THE SPECIFICATION:

Please replace the paragraph at page 22, lines 8-16 of the specification with the following amended paragraph:

The compositions of the invention are particularly suitable as modalities for the treatment of any cladribine-responsive disease. Several disease states responsive to cladribine are well-documented in the literature (see *infra*). For any target disease state, an effective amount of the complex cladribine-cyclodextrin complex complex, *i.e.* the amorphous mixture of the optimized amorphous saturated cladribine-amorphous cyclodextrin complex with amorphous free cladribine as described above is used (e.g., an amount affective effective for the treatment of multiple sclerosis, rheumatoid arthritis, or leukemia).

Please replace the paragraph at page 23, lines 7-28, of the specification with the following amended paragraph:

Moreover, the route of administration for which the therapeutically effective dosages are taught in the literature should be taken into consideration. While the instant compositions optimize the bioavailability of cladribine following oral administration, it will be appreciated that even optimal bioavailability from oral dosage forms is not expected to approach bioavailability obtain obtained after intravenous administration, particularly at early time points. Thus, it is often appropriate to increase a dosage suggested for intravenous administration to arrive at a suitable dosage for incorporation into a solid oral dosage form. At the present time, it is envisioned that, for the treatment of multiple sclerosis, 10 mg of cladribine in the instant complex cladribine-cyclodextrin complex in the instant solid dosage form would be administered once per day for a period of five to seven days in the first month, repeated for another period of five to seven days in the second month, followed by ten months of no treatment. Alternatively the patient would

Attorney's Docket No. 0056192-000024 Application No. 10/551,205 Page 3

be treated with 10 mg of cladribine in the	instant complex cladribine-
cyclodextrin complex in the instant dosag	ge form once per day for a period of
five to seven days per month for a total of	of six months, followed by eighteen
months of no treatment. For further dosi	ng information, see also U.S.

#### **AMENDMENTS TO THE CLAIMS:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

#### **LISTING OF CLAIMS:**

- 1. (Currently Amended) A pharmaceutical composition comprising a complex cladribine-cyclodextrin complex which is an intimate amorphous admixture consisting of (a) an amorphous inclusion complex of cladribine with an amorphous cyclodextrin and (b) amorphous free cladribine associated with amorphous cyclodextrin as a non-inclusion complex, formulated into a solid oral dosage form, said composition comprising no significant amount of free crystalline cladribine therein.
- 2. (Currently Amended) The pharmaceutical composition according to Claim 1, wherein the <u>complex cladribine-cyclodextrin</u> complex is saturated with cladribine.
- 3. (Previously Presented) The composition according to Claim 1, wherein the amorphous cyclodextrin is hydroxypropyl-β-cyclodextrin, hydroxypropyl-γ-cyclodextrin, randomly methylated β-cyclodextrin, carboxymethyl-β-cyclodextrin or sulfobutyl-β-cyclodextrin.
- 4. (Previously Presented) The composition according to Claim 1, wherein the amorphous cyclodextrin is hydroxypropyl-β-cyclodextrin.
- 5. (Previously Presented) The composition according to Claim 1, wherein the amorphous cyclodextrin is hydroxypropyl-γ-cyclodextrin.
- 6. (Previously Presented) The composition according to Claim 1, wherein the weight ratio of cladribine to amorphous cyclodextrin is from about 1:10 to about 1:16.

- 7. (Original) The composition according to Claim 6, wherein the amorphous cyclodextrin is hydroxypropyl-β-cyclodextrin.
- 8. (Original) The composition according to Claim 7, wherein the weight ratio of cladribine to hydroxypropyl-β-cyclodextrin is about 1:14.
- 9. (Original) The composition according to Claim 7, wherein the weight ratio of cladribine to hydroxypropyl-β-cyclodextrin is about 1:11.
- 10. (Original) The composition according to Claim 6, wherein the amorphous cyclodextrin is hydroxypropyl-y-cyclodextrin.
- 11. (Currently Amended) The composition according to Claim 1 Claim 2, wherein the approximate molar ratio of cladribine to amorphous cyclodextrin corresponds to a point located on the curve of a phase solubility diagram for saturated complex cladribine-cyclodextrin complexes, said curve defining complex saturated complexes of cladribine in varying concentrations of the cyclodextrin.
- 12. (Previously Presented) The composition according to Claim 1, wherein from about 30 to about 40 percent by weight of the cladribine is in the inclusion complex (a) and from about 70 to about 60 percent by weight of the cladribine is in the non-inclusion complex (b).
- 13. (Withdrawn and Currently Amended) A method for enhancing the oral bioavailability of cladribine comprising orally administering to a subject in need thereof a pharmaceutical composition comprising a complex cladribine-cyclodextrin complex which is an intimate amorphous admixture consisting of (a) an amorphous inclusion complex of cladribine with an amorphous cyclodextrin and (b) amorphous free cladribine associated with amorphous cyclodextrin as a non-inclusion complex, formulated into a solid oral dosage form, said composition comprising no significant amount of free crystalline cladribine therein.

- 14. (Withdrawn and Currently Amended) The method according to Claim 13, wherein the <u>complex cladribine-cyclodextrin</u> complex is saturated with cladribine.
- 15. (Withdrawn) The method according to Claim 13, wherein the amorphous cyclodextrin is hydroxypropyl-β-cyclodextrin, hydroxypropyl-γ-cyclodextrin, randomly methylated β-cyclodextrin, carboxymethyl-β-cyclodextrin or sulfobutyl-β-cyclodextrin.
- 16. (Withdrawn) The method according to Claim 13, wherein the amorphous cyclodextrin is hydroxypropyl-β-cyclodextrin.
- 17. (Withdrawn) The method according to Claim 13, wherein the amorphous cyclodextrin is hydroxypropyl-y-cyclodextrin.
- 18. (Withdrawn) The method according to Claim 13, wherein the weight ratio of cladribine to amorphous cyclodextrin is from about 1:10 to about 1:16.
- 19. (Withdrawn) The method according to Claim 18, wherein the amorphous cyclodextrin is hydroxypropyl-β-cyclodextrin.
- 20. (Withdrawn) The method according to Claim 19, wherein the weight ratio of cladribine to hydroxypropyl-β-cyclodextrin is about 1:14.
- 21. (Withdrawn) The method according to Claim 19, wherein the weight ratio of cladribine to hydroxypropyl-β-cyclodextrin is about 1:11.
- 22. (Withdrawn) The method according to Claim 18, wherein the amorphous cyclodextrin is hydroxypropyl-γ-cyclodextrin.

- 23. (Withdrawn and Currently Amended) The method according to Claim 13 Claim 14, wherein the approximate molar ratio of cladribine to amorphous cyclodextrin corresponds to a point located on the curve of a phase solubility diagram for saturated complex cladribine-cyclodextrin complexes, said curve defining complex saturated complexes of cladribine in varying concentrations of the cyclodextrin.
- 24. (Withdrawn) The method according to Claim 13, wherein from about 30 to about 40 percent by weight of the cladribine is in the inclusion complex (a) and from about 70 to about 60 percent by weight of the cladribine is in the non-inclusion complex (b).
- 25. (Withdrawn and Currently Amended) A method for the treatment of symptoms of a cladribine-responsive condition in a subject suffering from said symptoms comprising orally administering to said subject a pharmaceutical composition comprising a complex cladribine-cyclodextrin complex which is an intimate amorphous admixture consisting of (a) an amorphous inclusion complex of cladribine with an amorphous cyclodextrin and (b) amorphous free cladribine associated with amorphous cyclodextrin as a non-inclusion complex, formulated into a solid oral dosage form, said composition comprising no significant amount of free crystalline cladribine therein.
- 26. (Withdrawn and Currently Amended) The method according to Claim 25, wherein the <u>complex cladribine-cyclodextrin</u> complex is saturated with cladribine.
- 27. (Withdrawn) The method according to Claim 25, wherein the cladribine-responsive condition is selected from the group consisting of multiple sclerosis, rheumatoid arthritis and leukemia.
- 28. (Withdrawn) The method according to Claim 27, wherein the cladribine-responsive condition is multiple sclerosis.

- 29. (Withdrawn) The method according to Claim 25, wherein the amorphous cyclodextrin is hydroxypropyl-β-cyclodextrin, hydroxypropyl-γ-cyclodextrin, randomly methylated β-cyclodextrin, carboxymethyl-β-cyclodextrin or sulfobutyl-β-cyclodextrin.
- 30. (Withdrawn) The method according to Claim 25, wherein the weight ratio of cladribine to amorphous cyclodextrin is from about 1:10 to about 1:16.
- 31. (Withdrawn) The method according to Claim 25, wherein the amorphous cyclodextrin is hydroxypropyl-β-cyclodextrin.
- 32. (Withdrawn) The method according to Claim 31, wherein the weight ratio of cladribine to hydroxypropyl-β-cyclodextrin is about 1:14.
- 33. (Withdrawn) The method according to Claim 31, wherein the weight ratio of cladribine to hydroxypropyl-β-cyclodextrin is about 1:11.
- 34. (Withdrawn) The method according to Claim 25, wherein the amorphous cyclodextrin is hydropropyl-y-cyclodextrin.
- 35. (Withdrawn) The method according to Claim 25, wherein from about 30 to about 40 percent by weight of the cladribine is in the inclusion complex (a) and from about 70 to about 60 percent by weight of the cladribine is in the non-inclusion complex (b).

#### 36.-55. (Cancelled)

56. (Currently Amended) A complex cladribine-cyclodextrin complex which is an intimate amorphous admixture <u>consisting</u> of (a) an amorphous inclusion complex of cladribine with an amorphous cyclodextrin and (b) amorphous free cladribine associated with amorphous cyclodextrin as a non-inclusion complex.

- 57. (Currently Amended) The <u>complex cladribine-cyclodextrin</u> complex according to Claim 56, saturated with cladribine.
- 58. (Currently Amended) The <u>complex cladribine-cyclodextrin</u> complex according to Claim 56, wherein the amorphous cyclodextrin is hydroxypropyl-β-cyclodextrin, hydroxypropyl-γ-cyclodextrin, randomly methylated β-cyclodextrin, carboxymethyl-β-cyclodextrin or sulfobutyl-β-cyclodextrin.
- 59. (Currently Amended) The <u>complex cladribine-cyclodextrin</u> complex according to Claim 56, wherein the amorphous cyclodextrin is hydroxypropyl-β-cyclodextrin.
- 60. (Currently Amended) The <u>complex cladribine-cyclodextrin</u> complex according to Claim 56, wherein the amorphous cyclodextrin is hydroxypropyl-γ-cyclodextrin.
- 61. (Currently Amended) The <u>complex cladribine-cyclodextrin</u> complex according to Claim 56, wherein the weight ratio of cladribine to amorphous cyclodextrin is from about 1:10 to about 1:16.
- 62. (Currently Amended) The <u>complex cladribine-cyclodextrin</u> complex according to Claim 61, wherein the amorphous cyclodextrin is hydroxypropyl-β-cyclodextrin.
- 63. (Currently Amended) The <u>complex cladribine-cyclodextrin</u> complex according to Claim 62, wherein the weight ratio of cladribine to hydroxypropyl-β-cyclodextrin is about 1:14.
- 64. (Currently Amended) The <u>complex cladribine-cyclodextrin</u> complex according to Claim 62, wherein the weight ratio of cladribine to hydroxypropyl-β-cyclodextrin is about 1:11.

- 65. (Currently Amended) The <u>complex cladribine-cyclodextrin</u> complex according to Claim 61, wherein the amorphous cyclodextrin is hydroxypropyl-γ-cyclodextrin.
- 66. (Currently Amended) The <u>complex cladribine-cyclodextrin</u> complex according to Claim 56, wherein from about 30 to about 40 percent by weight of the cladribine is in the inclusion complex (a) and from about 70 to about 60 percent by weight of the cladribine is in the non-inclusion complex (b).
- 67. (Withdrawn and Currently Amended) A process for the preparation of a complex cladribine-cyclodextrin complex as claimed in Claim 56, which comprises the steps of:
- (i) combining cladribine and an amorphous cyclodextrin in water at a temperature of from about [[40]] <u>45</u> to about 80°C and maintaining said temperature for a period of from about 6 to about 24 hours;
  - (ii) cooling the resultant aqueous solution to room temperature; and
  - (iii) lyophilizing the cooled solution to afford an amorphous product.
- 68. (Withdrawn) A process according to Claim 67, further comprising a filtration step following step (ii).
- 69. (Withdrawn) A process according to Claim 67, wherein step (i) is performed at a temperature of from about 45 to about 60°C.
- 70. (Withdrawn) A process according to Claim 67, wherein step (i) is performed at a temperature of from about 45 to about 50°C.
- 71. (Withdrawn) A process according to Claim 69, wherein step (i) is performed with stirring.

- 72. (withdrawn) A process according to Claim 71, wherein step (i) is performed for a period of from about 6 to about 9 hours.
- 73. (Withdrawn) A process according to Claim 67, wherein step (ii) is performed for a period of from about 6 to about 9 hours.
- 74. (Withdrawn) A process according to Claim 67, wherein step (iii) comprises an initial freezing stage in which the solution is cooled to from about -40 to about -80° C, and held at said temperature for a period of from about 2 to about 4 hours.
- 75. (Withdrawn) A process according to Claim 74, wherein, in the initial freezing stage of step (iii), the solution is cooled to about -45°C.
- 76. (Withdrawn) A process according to Claim 67, wherein 12.00 parts by weight of cladribine and 172.50 parts by weight of hydroxypropyl-β-cyclodextrin are introduced in step (i).
- 77. (Withdrawn) A process according to Claim 67, wherein 16.35 parts by weight of cladribine and 172.50 parts by weight of hydroxypropyl-β-cyclodextrin are introduced in step (i).
- 78. (Withdrawn) A process according to Claim 76, wherein 825 parts by volume of water are introduced in step (i).
- 79. (Withdrawn) A process according to Claim 67, wherein the lyophilization step (iii) comprises:
- (a) an initial freezing stage in which the complexation solution is brought to from about -40°C to about -80°C for approximately 2 to 4 hours;
- (b) a primary drying stage at about -25°C for approximately 80 to 90 hours; and
  - (c) a secondary drying stage at about 30°C for approximately 15 to 20 hours.

- 80. (Withdrawn) A process according to Claim 79, wherein stage (a) of the lyophilization is conducted at about -45°C for approximately 3 to 4 hours.
- 81. (Withdrawn) A process according to Claim 79, wherein stage (b) of the lyophilization is conducted under a pressure of about 100 mTorr.
- 82. (Currently Amended) A pharmaceutical composition obtainable by a process comprising the steps of:
- (i) combining cladribine and an amorphous cyclodextrin in water at a temperature of from about [[40]] <u>45</u> to about 80°C and maintaining said temperature for a period of from about 6 to about 24 hours;
  - (ii) cooling the resultant aqueous solution to room temperature;
  - (iii) lyophilizing the cooled solution to afford an amorphous product; and
  - (iv) formulating the amorphous product into a solid oral dosage form.
- 83. (Original) A pharmaceutical composition according to Claim 82, wherein the process further comprises a filtration step following step (i) or (ii).
- 84. (Previously Presented) A pharmaceutical composition according to Claim 82, wherein step (i) of the process is performed at a temperature of from about 45 to about 60°C.
- 85. (Previously Presented) A pharmaceutical composition according to Claim 82, wherein step (i) of the process is performed at a temperature of from about 45 to about 50°C.
- 86. (Previously Presented) A pharmaceutical composition according to Claim 84, wherein step (i) of the process is performed with stirring.

- 87. (Original) A pharmaceutical composition according to Claim 86, wherein step (i) of the process is performed for a period of from about 6 to about 9 hours.
- 88. (Previously Presented) A pharmaceutical composition according to Claim 82, wherein step (ii) of the process is performed for a period of from about 6 to about 9 hours.
- 89. (Previously Presented) A pharmaceutical composition according to Claim 82, wherein step (iii) comprises an initial freezing stage in which the solution is cooled to from about -40 to about -80°C, and held at said temperature for a period of from about 2 to about 4 hours.
- 90. (Original) A pharmaceutical composition according to Claim 89, wherein, in the initial freezing stage of step (iii), the solution is cooled to about -45°C.
- 91. (Previously Presented) A pharmaceutical composition according to Claim 82, wherein 12.00 parts by weight of cladribine and 172.50 parts by weight of the hydroxypropyl-β-cyclodextrin are introduced in step (i) of the process.
- 92. (Previously Presented) A pharmaceutical composition according to Claim 82, wherein 16.35 parts by weight of cladribine and 172.50 parts by weight of the hydroxypropyl-β-cyclodextrin are introduced in step (i) of the process.
- 93. (Previously Presented) A pharmaceutical composition according to Claim 91, wherein 825 parts by volume of water are introduced in step (i) of the process.
- 94. (Previously Presented) A pharmaceutical composition according to Claim 82, wherein the lyophilization step (iii) of the process comprises:
- (a) an initial freezing stage in which the complexation solution is brought to from about -40°C to about -80°C for approximately 2 to 4 hours;

Attorney's Docket No. 0056192-000024 Application No. 10/551,205 Page 14

- (b) a primary drying stage at about -25°C for approximately 80 to 90 hours; and
  - (c) a secondary drying stage at about 30°C for approximately 15 to 20 hours.
- 95. (Original) A pharmaceutical composition according to Claim 94, wherein stage (a) of the lyophilization is conducted at about -45°C for approximately 3 to 4 hours.
- 96. (Previously Presented) A pharmaceutical composition according to Claim 94, wherein stage (b) of the lyophilization is conducted under a pressure of about 100 mTorr.
- 97. (Previously Presented) A pharmaceutical composition according to Claim 82, wherein the formulation step (iv) of the process comprises blending the complex with magnesium stearate and compressing into tablets.
- 98. (Original) A pharmaceutical composition according to Claim 97, wherein magnesium stearate is pre-mixed with sorbitol powder before blending with the complex.

#### REMARKS

Entry of the foregoing and reexamination and reconsideration of the subject application, as amended, pursuant to and consistent with 37 C.F.R. § 1.112, are respectfully requested in light of the following remarks.

#### THE DRAWINGS

Applicants appreciate the Examiner's acceptance of the drawing as filed.

#### INFORMATION DISCLOSURE STATEMENTS

Applicants thank the Examiner for considering the four Information Disclosure Statements previously filed herein.

#### FILING DATES TO WHICH CLAIMS ARE ENTITLED

The Examiner has assessed the filing dates to which he believes the claims which he has examined are entitled. Thus, Claims 1-12, 56-66 and 82-98 have been assessed by the Examiner in regard to the earliest filing date to which he believes they are entitled.

Applicants have amended Claim 82 hereinabove so that step (i) is conducted at a temperature from about 45 to about 80°C rather than from about 40 to about 80°C as previously recited. This revised range is not only supported by the instant application (e.g., page 13, lines 21-25) but also by page 12, lines 20-23, of Provisional Appln. No. 60/541,247, filed February 4, 2004; moreover, step (ii) is disclosed at least on page 14, line 3 and in Example 2 of 60/541,247; step (iii) at least on page 14, line 6 and Example 2 of 60/541,247; and step (iv) at least on page 17, lines 25-27, page 18, lines 7-10 and Example 3 of 60/541,247. Claim 88 is supported at least by page 12, lines 20-22 of 60/541,247. Thus, applicants concur with the Examiner that the filing dates of Claims 1-11, 56-65, 84, 86 and 87 are the filing date of Application No. 60/541,247, filed February 4, 2004, but add that the filing dates of Claims 82 and 88 are also the February 4, 2004 filing date of Application No. 60/541,247.

Applicants concur with the Examiner's assessment that <u>Claims 12, 66, 83, 85</u> and 89 are entitled to the effective filing date of the present application; however, as

a national phase application, this application and thus Claims 12, 66, 83, 85 and 89 are entitled to the international filing date of PCT/US04/09387, that is, March 26, 2004. The Examiner's reference to November 14, 2006 as the filing date for these claims is incorrect, that date simply being the date on which the requirements of the last of the 371(c)(1), (c)(2) and (c)(4) requirements were received by the USPTO. In the official Notice of Acceptance of Application under 35 U.S.C. 371 and 37 C.F.R. 1.495, it is clearly stated: "The filing date of the above identified application is the international filing date of the international application (Article 11(3) and 35 U.S.C. 363)."

Despite the foregoing, it is not understood why the Examiner has found it necessary to assess the priority dates of the examined claims, as no art has been cited which would make it necessary to make such an assessment.

#### **ELECTIONS/RESTRICTIONS**

Applicants' election, with traverse, of the invention of Group I, Claims 1-12, 56-66 and 82-98 has been acknowledged and acted upon. Applicants continue to maintain that the amorphous nature of the various entities which make up the complex, that is the intimate amorphous admixture of (a) an amorphous inclusion complex of cladribine with amorphous cyclodextrin and (b) amorphous free cladribine associated with amorphous cyclodextrin as a non-inclusion complex which is formulated into a solid dosage form is not disclosed or suggested by Schultz et al. even when read in conjunction with WO 97/18839, as Schultz et al.'s melt extrusion product would not be inherently the same as applicants' Claim 1 product. Applicants' reasons for so stating are set forth in the discussion of the references herein below. Based on the discussion below, applicants submit that because the elected claims are in fact patentable over the art of record, there is indeed the unifying feature to all of the claims which applicants pointed to earlier. Therefore, the withdrawn claims should be rejoined and examined.

#### **OBJECTIONS TO THE SPECIFICATION**

The disclosure has been objected to because of the blanks identifying provisional application numbers on page 23. By the foregoing amendment,

applicants have deleted the entire sentence containing the blanks because the applications in question have been abandoned.

The disclosure has also been objected to because of a typographical error on page 22, line 12. Applicants have corrected the error by the foregoing amendment.

It is believed that these amendments overcome the objections to the specification.

#### CLAIM REJECTIONS - 35 U.S.C. § 112

Claims 2, 11 and 57 are also rejected under 35 U.S.C. § 112, second paragraph, as being indefinite because of use of the term "saturated." Applicants submit that the claims are indeed clear and particularly point out and distinctly claim what applicants regard as their invention.

The Federal Circuit has made it very clear that definiteness of claim language must not be analyzed in a vacuum but rather (1) in light of applicants' specification, (2) in light of the prior art, and (3) in light of the manner in which the claims would be interpreted by one of ordinary skill in the relevant art. When analyzed in accord with Federal Circuit decisions, applicants' claims are definite. Applicants' claims are understandable and define what they regard as their invention; according to the C.C. P.A. decision In re Kamal et al. (CCPA 1968) 158 USPQ 120, such claims meet the requirements of the second paragraph of 35 U.S.C. § 112. In an effort to make these claims and others containing similar language even clearer, applicants have modified the language that refers to the saturated complexes to make it clear that it is the complex cladribine-cyclodextrin complexes which are saturated. Applicants have also modified the language of Claim 11; it would of course be apparent to the person of ordinary skill that applicants were referring to a point on the curve of the phase solubility diagram. The claims as amended have the same scope as prior to the amendment; these are not narrowing amendments but merely clarification of the subject matter to which the claims were previously directed.

The Examiner has noted that the term "saturated" is not defined in the claims, but applicants submit that it is the function of the specification, not the claims, to define terms. Applicants have certainly explained what they mean by saturated, not only by the disclosure at page 10, lines 1-13, but also by the disclosure at page 6,

line 20 to page 7, line 2; by the disclosure beginning at page 13, line 14 through page 14, line 16, which details the procedure used to develop the phase solubility curve; and by the disclosure at page 15, lines 5-29. Very specific information is given, not only as to time and temperature and subsequent filtration, on page 13, lines 21-26, but also in the discussion extending from page 16, line 1 to page 17, line 14. The phase solubility diagram and the discussion of the phase solubility diagram in Example 1 (and by reference, the complexation portion of Example 2) describe exactly how this phase solubility diagram/curve was generated. One of ordinary skill need only select a point on the phase solubility curve to identify the proportion of cladribine and cyclodextrin appropriate for the described saturated complexes for the conditions used in applicants' study. Alternatively, one of ordinary skill can repeat applicants' study to obtain the same curve, or can create his/her own phase solubility diagram for other conditions which he/she selects. The point is that applicants' work is reproducible, based on the teachings of their specification; selection of the same conditions as described will afford the same results; thus, the meaning of the claims which use the word "saturated" and which refer to the phase solubility diagram is clear to one of ordinary skill. As to the Examiner's complaint that no standard is given such as temperature, pressure or solvent, this is manifestly untrue for it is perfectly clear that the solvent disclosed in the specification is water and that the temperature and time are discussed with particularity in the specification, including the Examples, as already pointed out. Pressure is not mentioned because the work was carried out at atmospheric pressure, as would be understood by the skilled worker (who would know that pressure need be indicated only if it deviates from atmospheric pressure). Therefore, while there is no need to determine the amounts for each composition, at least when the cyclodextrin is hydroxypropyl-β-cyclodextrin or even hydroxypropyl-y-cyclodextrin (page 17, lines 9-14) and the phase solubility curve provided by applicants can be used, it would be a very routine matter for one of ordinary skill to create such a curve for other amorphous cyclodextrins or to merely combine cladribine with the chosen cyclodextrin using the conditions specified by applicants and then remove excess cladribine. This is a simple procedure given all of applicants' teachings; it is not rocket science but rather is well within the skill in the art.

For at least the reasons set forth above, applicants submit that the 35 U.S.C. § 112, second paragraph, rejection is untenable and should be withdrawn.

#### **CLAIM REJECTIONS - 35 U.S.C. § 102**

Claims 1-15, 11, 56-60, 82-90 and 84-98 have been rejected under 35 U.S.C. § 102(b) as being anticipated by Schultz et al. U.S. Patent No. 6,194,395, as evidenced by Baert et al. WO 97/18839.

Before discussing the cited references, applicants would like to discuss the amendments made to the claims hereinabove which make clearer what applicants regard as their invention. The Examiner is thanked for his very thorough review of the specification and the claim language, which has made it possible for applicants to see that some of their original language might have been open to misinterpretation while other language could be interpreted more broadly than they had intended. The amendments to Claims 2, 11 and 57 (as well as to withdrawn claims containing corresponding language) clarify that it is the entire complex cladribine-cyclodextrin complex which is saturated and that the point is located on the curve defining the saturated complexes as in the Figure. Applicants have also amended Claims 1 and 56 (and thus their dependent claims as well), as well as corresponding withdrawn claims, so that both Claims 1 and 56 now specify that the complex cladribinecyclodextrin complex is an intimate amorphous admixture consisting of (a) an amorphous inclusion complex of cladribine with an amorphous cyclodextrin and (b) amorphous free cladribine associated with amorphous cyclodextrin as a noninclusion complex. This of course excludes anything else from the complex. Claim 1, drawn to a pharmaceutical composition comprising the complex, has been further amended (as have the withdrawn claims containing corresponding language) to specify that the composition comprises no significant amount of free crystalline cladribine therein. This means that no significant amount of free cladribine can be detected considering the sensitivity of the analytical method; see Example 2, page 31, lines 3-13, where this language finds specific support. Applicants teach throughout this application that free crystalline cladribine which is not in the complex is excluded; see for example, page 13, lines 19-28; page 16, lines 1-12 and 13-28; page 20, line 28 to page 21, line 11; page 21, lines 24-29; Example 1, pages 26-28;

and Example 2, page 28, line 3 to page 29, line 26 and of course page 31, lines 3-13. As described, excess cladribine is typically removed from solutions of the complex by filtering it off after the complex complex has been formed in water; subsequent lyophilization of the filtered solution and minimal further processing affords the claimed solid oral dosage form. Therefore, the claim amendments clearly do not introduce new matter.

The Examiner states that Schultz et al. disclose a solid pharmaceutical oral dosage form comprising cladribine and cyclodextrin and applicants agree. However, the Examiner claims that Schultz et al.'s disclosure meets the limitations of instant Claims 1 and 56, which applicants regard as an unwarranted conclusion. Similarly, applicants find no evidence in Schultz et al. that the Schultz et al. solid product is substantially identical to a product-by-process meeting the limitations of instant Claims 82-90 and 94-96.

Schultz et al. disclose the use of either crystalline or amorphous cyclodextrins for their compositions, since some of those named by the patentees are known to be crystalline while others are known to be amorphous. Applicants' complexes and compositions utilize only amorphous cyclodextrins. Thus, many cyclodextrins disclosed by Schultz et al. would be inoperative in the present invention, as they would afford crystalline rather than amorphous products. In stating that the limitations of Claims 3-5 and 58-60 are met by Schultz et al., the Examiner is focusing only on the cyclodextrins in common; he does not address the basic differences between the Schultz et al. solid dosage form and applicants' products. Applicants will agree, however, that Schultz et al.'s preferred cyclodextrin is hydroxypropyl- β -cyclodextrin, which is a cyclodextrin also specified in many of applicants' claims. Again, applicants do not dispute that the excipients may be (but are not necessarily) the same, but this does not arrive at the products of instant Claims 3 and 58 or 97 or 98. As to the amounts of cladribine and cyclodextrin, Schultz et al. disclose weight ratios of from 1 to about 15 mg, of cladribine to about 100 to 500 mg. of a cyclodextrin; this can give a cladribine:cyclodextrin ratio of anywhere from 1:500 to 15:100, or from 1:500 to 1:6.67. If one took the lower limits of each in ratio to the upper limits of each, one would arrive at ratios from 1:100 to 15:500, or from 1:100 to 1:33.34. Most of the 1:500 to 1:6.67 ratio does not even

encompass applicants' ratio, while the 1:100 to 1:33.34 does not embrace it at all. Certainly no guidance in this respect is given by Schultz et al. Moreover, Claim 11 herein has been reworded to clarify that the point is on the curve, as described in the instant specification, and certainly this feature is not disclosed in any way by Schultz et al. Moreover, the instant claims no longer allow for the presence uncomplexed cladribine in either the composition or the complex.

The Examiner correctly states that the Schultz et al. patent incorporates by reference the method of making their solid oral dosage form by utilizing the meltextrusion process of Baert et al. The Baert et al. process is carried out by mixing the cyclodextrin and the active ingredient, heating until melting one of the components, forcing the mixture through one or more nozzles, and cooling until the mixture solidifies (page 5, line 24-29). Milling may follow. The term "melting" is used broadly by Baert et al. and includes transition to a glass; in particular cases, one component melts and the other dissolves therein forming solid solutions (page 5, lines 8-12). The extruded material may contain amorphous material or a solid solution (page 7, line 35 to page 8, line 7). While amorphous products are of interest, those which are mainly a solid solution are preferred (page 8, lines 11-23). In Table 1, on page 30, several different mixtures of hydroxypropyl- β -cyclodextrin and selected drugs were subjected to the Baert et al. process. As noted on page 13, lines 5-6, in every case, the mixture using this cyclodextrin gave a solid solution. The Examiner will note from Table 1 that the temperatures used, regardless of the identity of the drug, went as high as 292°C., with the temperatures for the itraconazole/HPβCD mixtures reaching 279°C-280°C. According to *The Merck Index* (copy of excerpt enclosed), itraconazole melts at 166.2°C while HPBCD melts at 278°C according to LookChem (copy of excerpt also attached).

In addition to the teachings of Baert et al. noted above, applicants draw the Examiner's attention to three of Baert et al.'s teachings which are of particular importance here:

1. On page 4, lines 5-7, Baert et al state:

The compounds that are suitable to be used in this technique are compounds that show no appreciable decomposition at the temperatures needed to melt and extrude the mixture of said

one or more active ingredients with the cyclodextrin or cyclodextrins.

2. On page 6, lines 14-19, Baert et al. state:

The possible formation of these solid solutions is one of the further advantages of the present invention. It will be appreciated by a person skilled in the art that mixing two or more solids, i.e., one or more cyclodextrins and the active ingredient or ingredients, and subsequently melting these solids together give rise to different products than when the said solids are first brought into contact with water or another solvent and then extruded.

3. While Baert et al. have general teachings regarding ratios of from 1:100 to 100:1, particularly 1:10 to 10:1, especially 1:5 to 5:1, 1:3 to 3:1, preferably 1:1, Table 1 therein uses ratios of active ingredient: HPβCD of 1:3 or 1:1. Table 2 utilizes 1:1 ratios.

The only solid dosage form envisioned by Schultz et al. is a melt-extrusion product of cladribine and cyclodextrin prepared according to Baert et al. There is no evidence that such a product was ever prepared. Indeed, cladribine melts at 220-235°C with decomposition; see the enclosed excerpt from Linscott's Directory (copy attached) as well as that from The Merck Index (also enclosed). Thus, cladribine decomposes well below the 278°C melting point of HPβCD and well below the temperature used by Baert et al. for their melt extrusion; cladribine is therefore not suitable for the Baert et al. process, according to Baert et al.'s teaching that suitable compounds show no appreciable decomposition at the temperature they use (point 1 above).

Furthermore, Baert et al.'s teaching on page 6 that their melt-extrusion process affords different products than when their solids are first brought into contact with water (point 2 above) militates against the Examiner's finding that a cladribine/cyclodextrin product prepared by Baert et al.'s process is the same as applicants' product, which is, in fact, prepared by first contacting cyclodextrin with water. Indeed, it is the use of water that enables the formation of cyclodextrin-drug complexes; it is by complex formation that the water solubility of many drugs has

been previously improved. There is no teaching by Baert et al. that would lead one of ordinary skill to conclude that Baert et al made solid <u>complexes</u>; indeed, Baert et al. specifically teach on page 6 that their products are different from products obtained by first dissolving cyclodextrin and drug in water. Thus, a melt-extrusion product of cladribine and cyclodextrin cannot anticipate applicants' product which comprises a complex cladribine-cyclodextrin complex which is an intimate amorphous admixture consisting of (a) an amorphous inclusion complex of cladribine with an amorphous cyclodextrin and (b) amorphous free cladribine associated with amorphous cyclodextrin as a non-inclusion complex, formulated into a solid oral dosage form, said composition comprising no significant amount of free crystalline cladribine therein. Applicants' product is prepared by preparing the complex in water; Baert et al. teach they obtain a different product than one that can be obtained from water; moreover, applicants' process uses temperatures up to only about 80°C, far below the decomposition temperature for cladribine and far below the temperatures used by Baert et al. See Claims 82-89 herein.

Further, for an anticipation to be inherent, the reference must <u>always</u> provide applicants' product. There is no reason to assume that Schultz et al's solid product <u>ever</u> is the same as applicants'; indeed, Baert et al. clearly teach that it is <u>different</u>.

For at least the reasons set forth above, the anticipation rejection of Claims 1-5, 11, 56-60, 82-90 and 94-98 based on Schultz et al. as evidenced by Baert et al. is untenable and should be withdrawn.

#### **CLAIM REJECTIONS - 35 U.S.C.§ 103**

Claims 1, 6-10, 12, 56, 61-66, 82 and 91-93 have been rejected under 35 U.S.C. § 103(a) as being unpatentable over Schultz et al. in view of Baert et al. We respectfully disagree.

Both Schultz et al. and Baert et al. are fully discussed above. In referring to the ratios disclosed by Schultz et al. for their melt extrusion solid dosage form, the Examiner has chosen to ignore the 1 mg. dosage at which the amount of cladribine begins; therefore, the range disclosed by Schultz et al. for cladribine:cyclodextrin varies from about 1:500 to 1:6.67. This is not even in accord with Baert et al.'s ratio of from about 1:1 to about 1:3. And if one uses Schultz et al's ratios proportionately,

low:low and high:high, one arrives at from 1:100 to 15:500 (1:33.34). In the former case, there is absolutely nothing in Schultz et al. that would lead to a specific ratio of from about 1:10 to about 1:16 or about 1:11 or about 1:14; it is applicants' own teachings which lead to these ratios. Likewise, the features of the other claims rejected under 35 U.S.C. § 103 are not disclosed by Schultz et al. Certainly Baert et al doesn't teach these ratios and if one looks at Schultz et al.'s suggested amounts proportionately, applicants' ratios are not even broadly encompassed by the reference. Still further, as noted earlier, Baert et al. clearly teach that the drug-cyclodextrin solid products of their melt extrusion process are distinctly different from products prepared in water; since applicants' products are prepared in water, they cannot possibly be the same as those obtained by the Baert et al. process incorporated by reference by Schultz et al.

Baert et al.'s ratios of active ingredient have been interpreted as mole ratios by the Examiner. There is no good reason for such an interpretation. The Examiner reasons that the fact that the active ingredients have different molecular weights leads to this interpretation, yet there are cyclodextrins of different molecular weights contemplated by Schultz et al. and by the present inventors and the ratios of Schultz et al. are clearly by weight (col. 6, lines 23-31), just as applicants' ratios are clearly weight ratios, e.g., Claim 8. Absent a teaching to the contrary, one of ordinary skill would assume that the ratios of Baert et al. are also weight ratios. At any rate, the Baert et al. melt-extrusion product is not one obtained by complexation in water; Baert et al. teach their melt-extrusion product is different from a product whose preparation begins by dissolving the drug and cyclodextrin in water. Therefore, any product that Schultz et al. might produce from cladribine and cyclodextrin subjected to Baert et al.'s melt extrusion product cannot be the same as applicants' complex cladribine-cyclodextrin complex which must be obtained from an aqueous solution which is treated in a specific manner. Baert et al. never suggests that they obtain a complex by their melt-extrusion process, much less one meeting the requirements of applicants' claims. Indeed, Baert et al. emphasize that their process, which is different, affords a different product than that obtained by first dissolving the drug and cyclodextrin. Likewise, applicants emphasize that applicants' process is strikingly different from Baert et al.'s process and thus logically would not afford the

Attorney's Docket No. 0056192-000024 Application No. 10/551,205

Page 25

product which Schultz et al. would be expected to obtain by subjecting cladribine and cyclodextrin to Baert et al.'s process. Moreover, applicants have formed a very special complex which contains a large amount of cladribine as an amorphous inclusion complex and as amorphous free cladribine associated with the cyclodextrin as a non-inclusion complex. Note too that the <u>free</u> cladribine associated with the non-inclusion product is amorphous, in contrast to the cladribine starting material, which is crystalline. Note also that applicants produce their product by first complexing in water at temperatures of from about 45°C to about 80°C, far below the temperatures used by Baert et al. Cladribine actually decomposes at temperatures below that used by Baert et al.

It is clear from the foregoing that a molecular inclusion complexation process, let alone the particular inclusion process utilized by applicants to form their unique complex cladribine-cyclodextrin complex, is <u>not inherent</u> in Baert et al.'s melt extrusion process and that Baert et al.'s process gives a different product. To hold otherwise would be to ignore Baert et al.'s own teachings.

In view of the foregoing, it is submitted that the present application is free of all record rejections and objections. Further, favorable action in the form of a Notice of Allowance is believed to be next in order and is earnestly solicited.

Respectfully submitted,

BUCHANAN INGERSOLL & ROONEY PC

α-citronellal. [141-26-4] 3,7-Dimethyl-7-octenal; rhodinal. Liquid. bp<sub>1.4</sub> 51°,  $n_{\rm p}^{20}$  1.4410. [α]<sub>0</sub><sup>20</sup> +9.75°. USE: In soap perfumes; insect repellent

2354. β-Citronellol. [106-22-9] 3,7-Dimethyl-6-octen-1-ol; 2,6-dimethyl-2-octen-8-ol; citronellol; cephrol. C<sub>10</sub>H<sub>20</sub>O; mol wt 156.26. C 76.86%, H 12.90%, O 10.24%. *1*-Form is a constituent of rose and geranium oils. d-Form occurs in Ceylon and Java citronella oils. History: J. L. Simonsen, L. N. Owen, and Java the dependence of the form of the Terpenes vol. I (University Press, Cambridge, 2nd ed. 1947). Prepn of (±)-form: Adams, Garvey, J. Am. Chem. Soc. 48, 477 (1926); Ofner et al., Helv. Chim. Acta 42, 2577 (1959). Prepn of (+)-form: Rienäcker, Ohloff, Angew. Chem. 73, 240 (1961); Naves, Tullen, Helv. Chim. Acta 44, 1867 (1961); Eschinazi, J. Org. Chem. 26, 3072 (1961); Rienäcker, Chimia 27, 97 (1973); C. G. Overberger, J. L. Weise, J. Am. Chem. Soc. 90, 3525 (1968); T. Sato et al., Tetrahedron Letters 1980, 3377. Prepn of (-)-form: Ohloff, loc. cit.; Rienäcker, loc. cit.; Shono et al., Tetrahedron Letters 1974, 1295; K. Mori, T. Sugai, Synthesis 1982, 752. Synthesis of (+) or (-)-form from isoprene: Hidai et al., Chem. Commun. 1975, 170. Stereospecific prepn via microbiological (Saccharomyces cerevisiae) reduction: P. Gramatica et al., Experientia 38, 775 (1982). Manuf: Woroch et al.; Bain; Webb, US 2990422; US 3005845; US 3028431 (1961, 1961, 1962, all to Glidden); Eschinasi, US 3052730 (1962 to Givaudan). Abs config of the (+)-form: Freudenberg, Hohmann, Ann. 584, 54 (1953); Freudenberg, Lwowski, ibid. 587, 213 (1954). NMR, HPLC determin of R/S enantiomer ratios: D. Valentine et al., J. Org. Chem. 41, 62 (1976). See also Rhodinol.

R-(+)-β-Citronellol

(+)-Form. Oily liquid, bp 224.5°, bp<sub>10</sub> 108.4°,  $d_4^{20}$  0.8550.  $n_0^{20}$  1.4559.  $[\alpha]_0^{20}$  +5.22°. Very slightly sol in water, miscible Very slightly sol in water, miscible with with alcohol, ether.

(-)-Form.  $\beta$ -Rhodinol; Levocitrol. bp<sub>10</sub> 108-109°. d<sub>4</sub><sup>18</sup> 1.4576.  $[\alpha]_0^{20}$  -4.76°.

(±)-Form. Dihydrogeraniol.  $d_4^{23.5}$  0.851.  $n_D^{23.5}$  1.454. USE: In perfumery.

2355. Citrulline. [372-75-8] N<sup>5</sup>-(Aminocarbonyl)-L-ornithine;  $\delta$ -ureidonorvaline;  $\alpha$ -amino- $\delta$ -ureidovaleric acid;  $N^{\delta}$ carbamylornithine. C<sub>6</sub>H<sub>13</sub>N<sub>3</sub>O<sub>3</sub>; mol wt 175.19. C 41.13%, H 7.48%, N 23.99%, O 27.40%.  $H_2$ NCONH(C $H_2$ )<sub>3</sub>CH(N $H_2$ )-COOH. An amino acid, first isolated from the juice of watermelon, Citrullus vulgaris Schrad., Cucurbitaceae: Biochem. Z. 224, 420 (1930); isoln from casein: Wada, ibid. 257, 1 (1933). Synthesis from ornithine through copper complexes: Kurtz, J. Biol. Chem. 122, 477 (1938); by alkaline hydrolysis of arginine: Fox, ibid. 123, 687 (1938); from cyclopentanone oxime: Fox et al., J. Org. Chem. 6, 410 (1941). Crystallization: Matsuda et al., JP 71 174 (1971 to Ajinomoto), C.A. 74, 126056u (1971). Crystal and molecular structure: Naganathan, Venkatesan, Acta Crystallogr. 27B, 1079 (1971); Ashida et al., ibid. 28B, 1367 (1972). Use in asthenia and he patic insufficiency: FR 2198739 (1974 to Hublot & Vallet), C.A. 82, 144952e (1975). Clinical trial in treatment of lysinuric protein intolerance: J. Rajantie et al., J. Pediarr. 97, 927 (1980); T. O. Carpenter et al., N. Engl. J. Med. 312, 290 (1985).

Prisms from methanol + water, mp 222°  $[\alpha]_D^{20} + 3.7$ ° (c = 2). pK<sub>1</sub> 2.43; pK<sub>2</sub> 9.41. Sol in water. Insol in methanol, ethanol

Hydrochloride. [34312-10-2] C<sub>6</sub>H<sub>13</sub>N<sub>3</sub>O<sub>3</sub> HCl. Crystals, dec 185°.  $[\alpha]_D^{22} + 17.9$ ° (c = 2).

Malate (salt). [54940-97-5] Stimol.  $C_6H_{13}N_3O_3.C_4H_6O_5$ ; mol wt 309.27

IHERAP CAT: Treatment of asthenia.

2356. Citrullol. [1390-93-8] C<sub>22</sub>H<sub>38</sub>O<sub>4</sub>; mol wt 366.53. C 72.09%, H 10.45%, O 17.46%. From fruit pulp of Citrullus colocynthis Schrad., Cucurbitaceae: Power, Moore, J. Chem. Soc. 97, 99 (1910); Power, Salway, ibid. 103, 399, 1022 (1913); Khadem, Rahman, Tetrahedron Letters 1962, 1137. Crystals, mp 282-283°. uv max: 242, 272, 282 nm (log &

2.85, 2.68, 2.68). Sol in pyridine; practically insol in usual or-

ganic solvents.

Diacetate. C<sub>26</sub>H<sub>42</sub>O<sub>6</sub>. Crystals, mp 162°.

2357. Citrus Red 2. [6358-53-8] 1-[(2,5-Dimethoxyphenyl)azo]-2-naphthalenol; C.I. Solvent Red 80; C.I. 12156. C<sub>18</sub>-H<sub>16</sub>N<sub>2</sub>O<sub>3</sub>; mol wt 308.33. C 70.12%, H 5.23%, N 9.09%, O 15.57%. Prepn: H. W. Elley, H. W. Daudt, US 2224904 (1940 to Du Pont). Metabolism: J. L. Radomski, J. Pharmacol. Exp. Ther. 134, 100 (1961); 136, 378 (1962). Toxicology: M. Shartatt et al., Food Cosmet. Toxicol. 4, 493 (1966). Review of carcinogenicity studies: IARC Monographs 8, 101-106. See also Colour Index vol. 4 (3rd ed., 1971) p 4033.

Crystals, mp 155-157°. Slightly sol in water; partially sol in ethanol and vegetable oils

USE: To color orange skins.

2358. Civet. Zibeth. Unctuous secretion from receptacles between the anus and genitalia of both male and female civet cat. Constit. Civetone and similar compds.

Semi-solid, yellowish to brown unctuous substance; unpleasant, subacrid, bitter taste; fusible and burns without leaving much residue. Insol in water; partly sol in hot alcohol or in ether.

USE: As a fixative in perfumery.

2359. Civetone. [542-46-1] (Z)-9-Cycloheptadecen-1one. C<sub>17</sub>H<sub>30</sub>O; mol wt 250.42. C 81.54%, H 12.07%, O 6.39%. 17-Membered macrocyclic musk, constituent of civet: Ruzicka, Helv. Chim. Acta 9, 230 (1926); Ruzicka et al., ibid. 10, 695 (1927). Occurs in nature as cis-form. Synthesis of cis-civetone: Stoll et al., ibid. 31, 543 (1948); J. Tsuji, T. Mondai, Tetrahedron Letters 1977, 3285; E. Seoane et al., Chem. & Ind. (London) 1978, 165. Synthesis of trans-form: H. Hunsdiecker, Ber. 77, 185 (1944); H. H. Mathur, S. C. Bhattacharyya, J. Chem. Soc. 1968, 114. Crystal and molecular structure of cis-civetone: G. Bernardinelli, R. Gerdil, Helv. Chim. Acta 65, 558 (1982).

Crystals, mp 31-32°. Musky odor becoming pleasant in extreme dilns.  $d_4^{33}$  0.917.  $bp_{742}$  342°;  $bp_2$  59°.  $n_D^{33}$  1.4830. USE: In perfumery

2360. Cladribine. [4291-63-8] 2-Chloro-2'-deoxyadenosine; 2-chloro-6-amino-9-(2-deoxy-β-D-erythro-pentofuran-

Consult the Name Index before using this section.

Page 407

osyl)purine; 2-chlorodeoxyadenosine; 2-CdA; CldAdo; NSC-105014-F; Leustatin.  $C_{10}H_{12}\text{ClN}_2O_3$ ; mol wt 285.69. C 42.04%, H 4.23%, Cl 12.41%, N 24.51%, O 16.80%. Substituted purine nucleoside with antileukemic activity. Prepn as intermediate in synthesis of 2-deoxynucleosides: H. Venner, Ber. 93, 140 (1960); M. Ikehara, H. Tada, J. Am. Chem. Soc. 85, 2344 (1963); eidem, ibid. 87, 606 (1965). Synthesis and biological activity: L. F. Christensen et al., J. Med. Chem. 15, 735 (1972). Stereospecific synthesis: Z. Kazimierczuk et al., J. Am. Chem. Soc. 106, 6379 (1984); R. K. Robins, G. R. Revankar, EP 173059; eidem, US 4760137 (1986, 1988 both to Brigham Young Univ). Specific toxicity to lymphocytes: D. A. Carson et al., Proc. Nat. Acad. Sci. USA 77, 6865 (1980); eidem, Blood 62, 737 (1983). Mechanism of action: S. Seto et al., J. Clin. Invest. 75, 377 (1985). Clinical evaluation in chronic lymphocytic leukemia: L. D. Piro et al., Blood 72, 1069 (1988); in hairy cell leukemia: eidem, N. Engl. J. Med. 322, 1117 (1990).

Crystals from water, softens at 210-215°, solidifies and turns brown (Christensen). Also reported as crystals from ethanol, mp 220° (softens), resolidifies, turns brown and does not melt below 300° (Kazimierczuk).  $[\alpha]_D^{25} = 18.8^\circ$  (c = 1 in DMF). uv max in 0.1N NaOH: 265 nm; in 0.1N HCl: 265 nm.

THERAP CAT: Antineoplastic

2361. Clanobutin. [30544-61-7] 4-[(4-Chlorobenzoyl)-(4-methoxyphenyl)amino]butanoic acid; 4-[p-chloro-N-(p-methoxyphenyl)benzamido]butyric acid; N-(p-chlorobenzoyl)-y-(p-anisidino)butyric acid; Bykahepar. C<sub>18</sub>H<sub>18</sub>ClNO<sub>4</sub>; mol wt 347.80. C 62.16%, H 5.22%, Cl 10.19%, N 4.03%, O 18.40%. Prepn: K. Klemm et al., DE 1917036 corresp to US 3780095 (1971, 1973 both to Byk-Gulden). Series of articles on synthesis, physical and pharmacological properties: Arzneimittel-Forsch. 29, 1-15 (1979). In vitro biochemical study: H. Wolf et al., Biochem. Pharmacol. 29, 1649 (1980). Effect on bile excretion in rats, dogs: P. Berchtold et al., Arzneimittel-Forsch. 30, 1878 (1980).

Cryst from ethyl acetate, mp 115-116°. pKa 5.04. Soly in water at 37°:  $4.02\times10^{-2}$  mol/l at pH 7. LD<sub>50</sub> in rats (mg/kg): >2000 orally; 570 i.v. (Klemm).

THERAP CAT: Choleretic.

THERAP CAT (VET): Choleretic; in treatment of piroplasmosis and anaplasmosis.

2362. Clarithromycin. [81103-1I-9] 6-O-Methylerythromycin; A-56268; TE-031; Biaxin; Clathromycin; Cyllind; Klacid; Klaricid; Macladin; Naxy; Veclam; Zeclar. C<sub>38</sub>H<sub>69</sub>·NO<sub>13</sub>; mol wt 747.95. C 61.02%, H 9.30%, N 1.87%, O 27.81%. Semisynthetic macrolide antibiotic; derivative of erythromycin, q.v. Prepn: Y. Watanabe et al., EP 41355; eidem, US 4331803 (1981, 1982 both to Taisho); and in vitro antibacterial activity: S. Morimoto et al., J. Antibiot. 37, 187 (1984). In vitro and in vivo antibacterial activity: P. B. Fernan-

des et al., Antimicrob. Ag. Chemother. 30, 865 (1986). Comparative antibacterial spectrum in vitro: C. Benson et al., Eur. J. Clin. Microbiol. 6, 173 (1987); H. M. Wexler, S. M. Finegold ibid. 492. HPLC determn in biological fluids: D. Croteau et al., J. Chromatog. 419, 205 (1987). Acute toxicity study: 8, Abe et al., Chemotherapy (Tokyo) 36, Suppl. 3, 274 (1988). Symposium on pharmacology and comparative clinical studies. J. Antimicrob. Chemother. 27, Suppl. A, 1-124 (1991). Comprehensive description: I. I. Salem, Anal. Profiles Drug Subs. Excip., 24, 45-85, (1996).

Colorless needles from chloroform + diisopropyl ether (1:2), mp 217-220° (dec). Also reported as crystals from ethanol, mp 222-225° (Morimoto). uv max (CHCl<sub>3</sub>): 288 nm ( $\epsilon$  27.9). uv max (CHCl<sub>3</sub>): 240, 288 nm; (methanol): 211, 288 nm. [ $\epsilon$ ] $^{1}$  $^{$ 

THERAP CAT: Antibacterial.

2363. Clathrates. Compounds that are capable of trapping other substances within their own crystal lattices. The cavities of the host molecules are classified as cages, tunnels, or layered types, depending on the way they include guest molecules. The geometry of the cavities limits the guest molecules by size and shape, rather than by chemical similarity with the host molecules. Among common clathrates are molecules sieves, cyclotriphosphazenes, and Dianin's compound, as well as hydroquinone, cyclodextrins, o-thymotide, and deoxycholic acid, q.q.v. Cavitands are organic hosts with enforced (rigid) cavities: D. J. Cram, Science 219, 1177 (1983); R. C. Helgeson et al., Chem. Commun. 1983, 101. Comprehensive book: Clathrate Compounds, V. M. Bhatnagar, Ed. (Chemical Pub. Co., New York, 1970) 244 pp. Reviews: D. D. MacNicol et al., Chem. Soc. Rev. 7, 65-87 (1978); E. C. Makin, "Clathration" in Kirk-Othmer Encyclopedia of Chemical Technology Vol. 6 (Wiley-Interscience, New York, 3rd ed., 1979) pp 178-189.

USE: As complexing agent; stabilizing agent. In analytical separations.

2364. Clavulanic Acid. [58001-44-8] [2R-(2α,3Z,5α)]. 3-(2-Hydroxyethylidene)-7-0x0-4-0xa-1-azabicyclo-[3.2.0]heptane-2-carboxylic acid; MM 14151. C<sub>8</sub>H<sub>8</sub>NO<sub>5</sub>; mol wt 199.16. C 48.25%, H 4.55%, N 7.03%, O 40.17%. β-Lactamase inhibitor. Antibiotic produced by Streptomyces clavuligerus; first reported naturally occurring fused β-lactam containing oxygen. Isoln: M. Cole et al., DE 2517316 (1975 to Beecham), C.A. 84, 72635t (1976); A. G. Brown et al., J. Antibiot. 29, 668 (1976). Structure, x-ray crystallography: T.T. Howarth et al., Chem. Commun. 1976, 266. Total synthesis of (±)-form: P. H. Bentley et al., ibid. 1977, 748, 905; eidem, Tetrahedron Letters 1979, 1889. β-Lactamase inhibition and antibacterial spectrum: C. Reading, M. Cole, Antimicrob. Ag. Chemother. 11, 852 (1977). Mechanism of action: B. G. Spratt et al., ibid. 12, 406 (1977). Antibacterial activity, pharmacology and clinical efficacy of combination with amoxicillin: A. P. Ball et al., Lancet 1, 620 (1980); R. N. Brogden et al., Drugs 23, 337-362 (1981). In vitro and in vivo synergism with ticarcillin. R. Sutherland et al., Am. J. Med. 79, Suppl. 5B, 13 (1985).

### Hydroxypropyl-beta-cyclodextrin CAS No:94035-02-6

Name: Hydroxypropyl-beta-cyclodextrin

Synonyms: beta-Hydroxypropylcyclodextrin

beta-Cyclodextrin, 2-hydroxypropyl ether

**HPB** 

2-Hydroxypropyl-beta-cyclodextrin

128446-35-5

CAS Number: 94035-02-6

Molecular Formula:  $C_{42}$  (H)<sub>70-n</sub>  $O_{35}$  ( $C_3H_7$ )<sub>n</sub>

Melting Point: 278 °C

Safety Description: S24/25 Details

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

#### New Applications Under 35 U.S.C. 111

If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

#### National Stage of an International Application under 35 U.S.C. 371

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

#### New International Application Filed with the USPTO as a Receiving Office

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

#### **DETAILED ACTION**

This Office Action is responsive to Applicant's Amendment and Remarks, filed 03 Oct 2008, in which claims 1, 2, 11, 13, 14, 23, 25, 26, 56-67 and 82 are amended to change the scope and breadth of the claim.

This application is the national stage entry of PCT/US04/09387, filed 26 Mar 2004; and claims benefit of provisional application 60/458,922, filed 28 Mar 2003; and claims benefit of provisional application 60/484,756, filed 02 July 2003; and claims benefit of provisional application 60/541,247, filed 04 Feb 2004.

The filing date of the instant claims 12, 66, 83, 85 and 89 are deemed to be the filing date of the instant application which is the filing date of PCT/US04/09387, 26 Mar 2004. The filing date of instant claims 1-11, 56-65, 82, 84 and 86-88 are deemed to be the filing date of provisional application 60/541,247, filed 04 Feb 2004.

Claims 1-35 and 56-98 are pending in the current application. Claims 13-35 and 67-81, drawn to non-elected inventions, are withdrawn.

#### Election/Restrictions

Applicant's remarks regarding the requirement for restriction are moot as the requirement was made FINAL in the Office Action mailed 04 Apr 2008.

As recited in the Office Action mailed 06 Dec 2006, where applicant elects claims directed to the product, and the product claims are subsequently found allowable,

Art Unit: 1623

withdrawn process claims that depend from or otherwise require all the limitations of the allowable product claim will be considered for rejoinder. All claims directed to a nonelected process invention must require all the limitations of an allowable product claim for that process invention to be rejoined.

#### Objections Withdrawn

Applicant's Amendment, filed 03 Oct 2008, with respect to objections to the specification has been fully considered and is persuasive, as the identified informalities are corrected.

This rejection has been withdrawn.

#### Rejections Withdrawn

Applicant's Amendment, filed 03 Oct 2008, with respect to claims 2, 11 and 57 rejected under 35 U.S.C. 112, second paragraph, as being indefinite has been fully considered and is persuasive, as amended claims 2 and 11 recite the complex cladribin-cyclodextrin complex and amended claim 11 recites the definite term of a point on a specifically defined curve on a phase solubility diagram for saturated complexes of cladribine in varying concentrations of the cyclodextrin and Applicant's remarks regarding the definition of saturated is persusaive.

This rejection has been withdrawn.

Applicant's Amendment, filed 03 Oct 2008, with respect to claims 1-5, 11, 56-60, 82-90 and 94-98 rejected under 35 U.S.C. 102(b) as being anticipated by Schultz et al. (US Patent 6,194,395, published 27 Feb 2001, of record) has been fully considered and is persuasive, as Schultz et al. is not seen to disclose the composition comprising no significant amount of free crystalline cladribine therein (amended claim 1) or the complex consisting of (a) an amorphous inclusion complex of cladribine with an amorphous cyclodextrin and (b) amorphous free cladribine associated with amorphous cyclodextrin as a non-inclusion complex (amended claim 56) explicitly, implicitly or inherently.

This rejection has been withdrawn.

The following are new or modified grounds of rejection necessitated by Applicant's Amendment, filed 03 Oct 2008, in which claims 1, 2, 11, 13, 14, 23, 25, 26, 56-67 and 82 are amended to change the scope and breadth of the claim. Claims 2-12, 57-66 and 82-83 depend from claims 1 and 56 directly or indirectly, and incorporate all limitations therein, including changes to the scope and breadth of the claim.

#### Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Art Unit: 1623

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Amended claims 1-12, 56-66 and 82-83 are rejected under 35 U.S.C. 103(a) as being unpatentable over Schultz et al. (US Patent 6,194,395, published 27 Feb 2001, of record) in view of Baert et al. (WIPO Publication WO97/18839, published 29 May 1997, of record).

Schultz et al. discloses a solid pharmaceutical oral dosage form of cladribine comprising cladribine and cyclodextrin (column 2, lines 31-39). The disclosed product is substantially identical to the product-by-process. Schultz et al. discloses the use of  $\beta$ - and  $\gamma$ -cyclodextrins (column 2, lines 56-58) and derivatives wherein one or more cyclodextrin hydroxy groups are replaced with groups such as methyl, hydroxypropyl, carboxymethyl (column 3, lines 26-27) or sulfobutylcyclodextrins (column 4, lines 22-24). The phrase "one or more cyclodextrin hydroxy groups" combined with the absence of specific structural details of which hydroxyl group is substituted with a methyl group meets the limitation of "randomly methylated  $\beta$ -cyclodextrins". Schultz et al. discloses the solid oral dosage form in the form of a tablet (column 5, lines 37-38) including the

excipients sorbitol and magnesium stearate (column 6, lines 2-7), disclosing a product that is substantially identical to a product-by-process meeting the limitations of the instant claims invention. Schultz et al. discloses an oral dosage form comprising up to 15 mg cladribine and cyclodextrin from 100 to 500 mg, which would lead one of skill in the art to instantly envision a cladribine to cyclodextrin ratio ranging from 15 mg:100 mg to 15mg:500 mg, or 1:6.67 to 1:33.3 by weight (column 6, lines 23-31). The instant specification suggests that maximum amount of cladribine which can be complexed gives a weight ratio of 1:10 for the cladribine:cyclodextrin complex. Therefore a composition comprising the cladribine:cyclodextrin complex that contains a cladribine to cyclodextrin ratio of 1:6.67 describes a composition that comprises a "saturated" complex and meets the limitations of instant claims 2 and 57. Schultz et al. incorporates-by-reference the method of making said solid oral dosage form (Schultz et al.column 5, lines 50-52) disclosed in WIPO Publication WO97/18839, Baert et al., which provides evidence in the embodiment wherein the melt-extruded forms consist essentially of amorphous material (Baert et al. page 8, lines 14-15). Therefore Baert et al. provides evidence that it was recognized in the prior art that the product disclosed by Schultz et al. inherently includes amorphous cladribine-cyclodextrin complex in a solid oral dosage form. Schultz et al. implicitly discloses an oral dosage form comprising up to 15 mg cladribine and cyclodextrin from 100 to 500 mg, or a cladribine to cyclodextrin ratio ranging from 1:6.67 to 1:33.3 by weight (column 6, lines 23-31).

To address the scientific issue regarding the equilibrium presence of both the inclusion and non-inclusion complex, while the equation for the equilibrium of the

Art Unit: 1623

cladribine-cyclodextrin inclusion complex and the cladribine-cyclodextrin non-inclusion complex would be different for cladribine and cyclodextrin in a solvent versus cladribine and cyclodextrin in a molten state due to the lack of a solvent, the equilibrium and thus equilibrium products, the cladribine-cyclodextrin inclusion complex and the cladribine-cyclodextrin non-inclusion complex, would still be inherent in the product disclosed by Schultz et al.

Schultz et al. does not specifically disclose the composition comprising no significant amount of free crystalline cladribine therein (instant claims 1). Schultz et al. does not specifically disclose the composition corresponding to a point located on the curve of a phase solubility diagram for saturated complex cladribine-cyclodextrin complexes, said curve defining complex saturated complexes of cladribine in varying concentrations of the cyclodextrin (instant claim 11). Schultz et al. does not specifically disclose the complex consisting of (a) an amorphous inclusion complex of cladribine with an amorphous cyclodextrin and (b) amorphous free cladribine associated with amorphous cyclodextrin as a non-inclusion complex (instant claim 56). Schultz et al. does not specifically disclose the composition comprising a cladribine to cyclodextrin ratio from about 1:10 to about 1:16 (instant claims 6, 7, 10, 61, 62 and 65), or a ratio of about 1:14 (instant claims 8 and 63) or about 1:11 (instant claims 9 and 64). Schultz et al. does not specifically disclose the complex wherein from about 30 to about 40 percent by weight of the cladribine is in the inclusion complex (a) and from about 70 to about 60 percent by weight of the cladribine is in the non-inclusion complex (b) (instant claims 12 and 66). Schultz et al. does not specifically disclose the product-by-process wherein

12.00 parts by weight of cladribine and 172.50 parts by weight of hydroxypropyl- $\beta$ -cyclodextrin are introduced in step (i) of the process (instant claim 91 and 93), to give a cladribine to cyclodextrin ratio of 1:14.38. Schultz et al. does not specifically disclose the product-by-process wherein 16.35 parts by weight of cladribine and 172.50 parts by weight of the hydroxypropyl- $\beta$ -cyclodextrin are introduced in step (i) of the process (instant claim 92), to give a cladribine to cyclodextrin ratio of 1:10.55.

Page 8

Baert et al. discloses a solid mixture comprising one or more cyclodextrins and an insoluble active ingredient embedded into the cyclodextrin carrier (abstract), and teaches ratios of active ingredient to cyclodextrin of from about 1:100 to 100:1, from about 1:5 and 5:1 and from about 1:3 to 3:1 (page 11, lines 1-5). These ratios are interpreted as mole ratios because Baert et al. teaches the use of different active ingredients with different molecular weights. A mole ratio of active ingredient to cyclodextrin of about 1:3 for cladribine (MW 285.7 g/mol) and β-cyclodextrin (MW 1135 g/mol) gives a ratio by weight of approximately 1:11.9. The ratio of 1:11.9 meets the limitation of both a ratio of about 1:11 and a ratio of about 1:14 according to the nonlimiting definition of "about" as a variance of 20% provided in the instant specification page 9, lines 6-11. Such a saturated complex would consist of only (a) an amorphous inclusion complex of cladribine with an amorphous cyclodextrin and (b) amorphous free cladribine associated with amorphous cyclodextrin as a non-inclusion complex, and being a saturated complex corresponds to a point located on the curve of a phase solubility diagram for saturated complex cladribine-cyclodextrin complexes, said curve

defining complex saturated complexes of cladribine in varying concentrations of the cyclodextrin.

It would have been obvious to one of ordinary skill in the art at the time of the invention to practice the solid pharmaceutical oral dosage form of cladribine comprising cladribine and cyclodextrin disclosed by Schultz et al. in the ratios of cladribine and cyclodextrin taught by Baert et al. One of ordinary skill in the art would be motivated to combine the Schultz et al. and Baert et al. because Schultz et al. incorporates-byreference Baert et al. and because Baert et al. suggests that improving a similar product according to the teachings of Baert et al. has beneficial properties such as high bioavailability and dissolution rate (Baert et al. page 7, lines 25-27). One of ordinary skill in the art would have an expectation of success because the ratios taught by Baert et al. fall within the range of ratios that is implicitly disclosed by Schultz et al. Schultz et al. in view of Baert et al. does not teach the specific cladribine to cyclodextrin ratios of 1:14.38 or 1:10.55, however these ratios are encompassed by the prior art and Baert et al. suggests optimization of the ratio (Baert et al. page 11, lines 1-5). See also MPEP 2144.05 II.A, "Generally, differences in concentration or temperature will not support the patentability of subject matter encompassed by the prior art unless there is evidence indicating such concentration or temperature is critical." One of ordinary skill in the art would be motivated to optimize the cladribine to cyclodextrin ratio to give the composition comprising no significant amount of free crystalline cladribine therein because Schultz et al. teaches undesireable recrystallization of cladribine in tissue may occur and damage the surround tissue and that complexes with cyclodextrin are known

Art Unit: 1623

to solubilize the compound (Schultz et al. column 2, lines 1-15). Schultz et al. in view of Baert et al. does not specifically disclose the complex wherein from about 30 to about 40 percent by weight of the cladribine is in the inclusion complex (a) and from about 70 to about 60 percent by weight of the cladribine is in the non-inclusion complex (b). However, it is well known in the art that the formation of an inclusion complex from a non-inclusion complex is an equilibrium process, and the position of this equilibrium is dependent on the concentrations of the cladribine and cyclodextrin. This molecular inclusion equilibrium is a process inherent in the formation of the inclusion complex in both aqueous solutions and hot melt liquid mixtures, and Baert et al. teaches variation of the ratio of cladribine to cyclodextrin and hence their relative concentration.

It is noted that In re Best (195 USPQ 430) and In re Fitzgerald (205 USPQ 594) discuss the support of rejections wherein the prior art discloses subject matter which there is reason to believe inherently includes functions that are newly cited or is identical to a product instantly claimed, namely the position of the equilibrium process governing formation of an inclusion complex and a non-inclusion complex. In such a situation the burden is shifted to the applicants to "prove that subject matter shown to be in the prior art does not possess characteristic relied on" (205 USPQ 594, second column, first full paragraph).

Claims 82-90 and 94-98 are drawn to a product-by-process. The disclosed product is substantially identical to the instantly claimed product-by-process, an amorphous solid pharmaceutical oral dosage form comprising cladribine and cyclodextrin. "[E]ven though product-by-process claims are limited by and defined by

the process, determination of patentability is based on the product itself. The patentability of a product does not depend on its method of production. If the product in the product-by-process claim is the same as or obvious from a product of the prior art, the claim is unpatentable even though the prior product was made by a different process." In re Thorpe, 777 F.2d 695, 698, 227 USPQ 964, 966 (Fed. Cir. 1985) (citations omitted) (Claim was directed to a novolac color developer. The process of making the developer was allowed. The difference between the inventive process and the prior art was the addition of metal oxide and carboxylic acid as separate ingredients instead of adding the more expensive pre-reacted metal carboxylate. The product-by-process claim was rejected because the end product, in both the prior art and the allowed process, ends up containing metal carboxylate. The fact that the metal carboxylate is not directly added, but is instead produced in-situ does not change the end product.). See MPEP 2113.

#### **Response to Applicant's Remarks:**

Applicant's Remarks, filed 03 Oct 2008 have been fully considered and not found to be persuasive.

Applicant notes that the method of Baert et al. is drawn to compounds that show no appreciable decomposition at the temperatures needed to melt and extrude the mixture. Applicant provides evidence that cladribine melts with decomposition at 220-235 °C, below the temperatures of the working examples of Baert et al. and below the melting point of HPβCD at 278 °C. This evidence regarding the applicability of the method disclosed by Baert et al. incorporated into Schultz et al. applied to the

Art Unit: 1623

disclosure of Schultz et al. has been carefully considered in view of the absence of disclosed working examples within Schultz et al. However it is well known in that art that a mixture of compounds exhibits some magnitude of freezing point depression due to the colligative properties of the mixture (entry for liquid, Britannica Online Encyclopedia, cited in PTO-892), and conversely there is a depression in the melting point. Suzuki et al. 1988 (Chem. Pharm. Bull., 1988, 36(2), p720-725, cited in PTO-892) provides evidence that further freezing point depression is observed for mixtures of butanol and sucrose with cyclodextrins (page 720, abstract and paragraph 2-3) due to the formation of the complex. Suzuki et al. 1993 (Chem. Pharm. Bull., 1993, 41(8), p1444-1447, cited in PTO-892) discloses this freezing point depression is observed in complexes such as barbiturate/CD (page 1444, left column, paragraphs 2-3). Therefore as the evidence provided concerns the melting point of the compounds as pure compounds rather than as the mixture, and in view of the presumption of validity afforded to the issued patent Schultz et al., this remark is not persuasive.

Applicant remarks that Baert et al. teaches the method of Baert et al. gives rise to different products than when said solids are first brought into contact with water or another solvent and then extruded. However, the invention of Baert et al. suggests that the different products given rise to are the solid solutions of the immediately prior statement (page 6, lines 14-15), or a mixture consisting of amorphous material and no crystalline material implied at page 8, lines 10-20.

Applicant's remarks that there is no reason for the interpreting the ratios taught by Baert et al. as mole ratios in view of the teachings of Schultz et al. and the instant

Art Unit: 1623

application regarding the disclosure of weight ratios. However, Suzuki et al. 1988 discloses cyclodextrin complexes in terms of the mole ratio (page 722, paragraph 3) and Suzuki et al. 1993 discloses the cyclodextrin complexes in terms of the stoichimetic ratios (page 1444, left column, paragraphs 1-3), or mole ratios. Therefore the prior art teaches both the interpretation as a mole ratio and a weight ratio. Absent a teaching within Baert et al. specifying the type of ratio intended and in view of the use of both mole ratios and a weight ratios in the prior art in the area of cyclodextrin complexes, one of skill in the art would find either interpretation equally reasonable.

Applicant notes that the product made obvious by Schultz et al. in view of Baert et al. is produced by a different process than the instant product-by-process. However, absent factual evidence of how this process necessarily makes a different product, it is found that the amorphous solid pharmaceutical oral dosage form comprising cladribine and cyclodextrin made obvious by Schultz et al. in view of Baert et al. is substantially identical to the same product may be the process of the instant invention.

#### Conclusion

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within

Application/Control Number: 10/551,205 Page 14

Art Unit: 1623

TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jonathan S. Lau whose telephone number is 571-270-3531. The examiner can normally be reached on Monday - Thursday, 9 am - 4 pm EST.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Shaojia Anna Jiang can be reached on 571-272-0627. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Type: a)☐ Telephonic b)☐ Video Conference c)☒ Personal [copy given to: 1)☒ applicant 2	²)∏ applicant's representative	·]			
Exhibit shown or demonstration conducted: d) ☐ Yes If Yes, brief description: <u>n/a</u> .	e)⊠ No.				
Claim(s) discussed: <u>1</u> .					
Identification of prior art discussed: Van Axel Castelli et al.	(J. Pharm. Sci. 2008).				
Agreement with respect to the claims f) was reached. g	)⊠ was not reached. h)□ N	I/A.			
Substance of Interview including description of the general nature of what was agreed to if an agreement was reached, or any other comments: Applicant will consider filing an RCE. Applicant will consider filing an amendment to clarify claim language. Applicant explained how the physical mixture of cladribine-CD is distinguished from the complex. Applicant discussed how the data of Van Axel Castelli et al. applies to the prior art of record.  (A fuller description, if necessary, and a copy of the amendments which the examiner agreed would render the claims allowable, if available, must be attached. Also, where no copy of the amendments that would render the claims allowable is available, a summary thereof must be attached.)  THE FORMAL WRITTEN REPLY TO THE LAST OFFICE ACTION MUST INCLUDE THE SUBSTANCE OF THE INTERVIEW. (See MPEP Section 713.04). If a reply to the last Office action has already been filed, APPLICANT IS GIVEN A NON-EXTENDABLE PERIOD OF THE LONGER OF ONE MONTH OR THIRTY DAYS FROM THIS INTERVIEW DATE, OR THE MAILING DATE OF THIS INTERVIEW SUMMARY FORM, WHICHEVER IS LATER, TO FILE A STATEMENT OF THE SUBSTANCE OF THE INTERVIEW. See Summary of Record of Interview

Commissioner for Patents P.O. Box 1450 Alexandria, VA 22313-1450

Sir:

In response to the Office Action dated January 7, 2009, and in connection with Applicants' Request for Continued Examination, please first amend the above-identified patent application as follows:

#### **AMENDMENTS TO THE CLAIMS:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

#### **LISTING OF CLAIMS:**

- 1. (Currently Amended) A pharmaceutical composition comprising a complex cladribine-cyclodextrin complex which is an intimate amorphous admixture consisting of (a) an amorphous inclusion complex of cladribine with an the amorphous cyclodextrin hydroxypropyl-β-cyclodextrin and (b) amorphous free cladribine associated with said amorphous cyclodextrin as a non-inclusion complex, formulated into a solid oral dosage form, said composition comprising no significant amount of free crystalline cladribine therein, said composition having a weight ratio of cladribine to said amorphous cyclodextrin of from about 1:10 to about 1:16.
- 2. (Previously Presented) The pharmaceutical composition according to Claim 1, wherein the complex cladribine-cyclodextrin complex is saturated with cladribine.
  - 3-7. (Cancelled))
- 8. (Currently Amended) The composition according to Claim 7 Claim 1, wherein the weight ratio of cladribine to hydroxypropyl-β-cyclodextrin is about 1:14.
- 9. (Currently Amended) The composition according to Claim 7 Claim 1, wherein the weight ratio of cladribine to hydroxypropyl-β-cyclodextrin is about 1:11.
  - 10. (Cancelled)

- 11. (Currently Amended) The composition according to Claim 2, wherein the approximate molar ratio of cladribine to <u>said</u> amorphous cyclodextrin corresponds to a point located on the curve of a phase solubility diagram for saturated complex cladribine-cyclodextrin complexes, said curve defining complex saturated complexes of cladribine in varying concentrations of the cyclodextrin.
- 12. (Previously Presented) The composition according to Claim 1, wherein from about 30 to about 40 percent by weight of the cladribine is in the inclusion complex (a) and from about 70 to about 60 percent by weight of the cladribine is in the non-inclusion complex (b).
- 13. (Withdrawn and Currently Amended) A method for enhancing the oral bioavailability of cladribine comprising orally administering to a subject in need thereof a pharmaceutical composition comprising a complex cladribine-cyclodextrin complex which is an intimate amorphous admixture consisting of (a) an amorphous inclusion complex of cladribine with an the amorphous cyclodextrin hydroxypropyl-β-cyclodextrin and (b) amorphous free cladribine associated with said amorphous cyclodextrin as a non-inclusion complex, formulated into a solid oral dosage form, said composition comprising no significant amount of free crystalline cladribine therein, said composition having a weight ratio of cladribine to said amorphous cyclodextrin of from about 1:10 to about 1:16.
- 14. (Withdrawn) The method according to Claim 13, wherein the complex cladribine-cyclodextrin complex is saturated with cladribine.

15-19. (Cancelled)

20. (Withdrawn and Currently Amended) The method according to Claim 19 Claim 13, wherein the weight ratio of cladribine to hydroxypropyl-β-cyclodextrin is about 1:14.

- 21. (Withdrawn and Currently Amended) The method according to Claim 19 Claim 13, wherein the weight ratio of cladribine to hydroxypropyl-β-cyclodextrin is about 1:11.
  - 22. (Cancelled)
- 23. (Withdrawn and Currently Amended) The method according to Claim 14, wherein the approximate molar ratio of cladribine to <u>said</u> amorphous cyclodextrin corresponds to a point located on the curve of a phase solubility diagram for saturated complex cladribine-cyclodextrin complexes, said curve defining complex saturated complexes of cladribine in varying concentrations of the cyclodextrin.
- 24. (Withdrawn) The method according to Claim 13, wherein from about 30 to about 40 percent by weight of the cladribine is in the inclusion complex (a) and from about 70 to about 60 percent by weight of the cladribine is in the non-inclusion complex (b).
- 25. (Withdrawn and Currently Amended) A method for the treatment of symptoms of a cladribine-responsive condition in a subject suffering from said symptoms comprising orally administering to said subject a pharmaceutical composition comprising a complex cladribine-cyclodextrin complex which is an intimate amorphous admixture consisting of (a) an amorphous inclusion complex of cladribine with an the amorphous cyclodextrin hydroxypropyl-β-cyclodextrin and (b) amorphous free cladribine associated with said amorphous cyclodextrin as a non-inclusion complex, formulated into a solid oral dosage form, said composition comprising no significant amount of free crystalline cladribine therein, said composition having a weight ratio of cladribine to said amorphous cyclodextrin of from about 1:10 to about 1:16.
- 26. (Withdrawn) The method according to Claim 25, wherein the complex cladribine-cyclodextrin complex is saturated with cladribine.

- 27. (Withdrawn) The method according to Claim 25, wherein the cladribine-responsive condition is selected from the group consisting of multiple sclerosis, rheumatoid arthritis and leukemia.
- 28. (Withdrawn) The method according to Claim 27, wherein the cladribine-responsive condition is multiple sclerosis.

29-31. (Cancelled)

- 32. (Withdrawn and Currently Amended) The method according to Claim 31 Claim 25, wherein the weight ratio of cladribine to hydroxypropyl-β-cyclodextrin is about 1:14.
- 33. (Withdrawn and Currently Amended) The method according to Claim 31 Claim 25, wherein the weight ratio of cladribine to hydroxypropyl-β-cyclodextrin is about 1:11.
  - 34. (Cancelled)
- 35. (Withdrawn) The method according to Claim 25, wherein from about 30 to about 40 percent by weight of the cladribine is in the inclusion complex (a) and from about 70 to about 60 percent by weight of the cladribine is in the non-inclusion complex (b).

#### 36.-55. (Cancelled)

56. (Currently Amended) A complex cladribine-cyclodextrin complex which is an intimate amorphous admixture consisting of (a) an amorphous inclusion complex of cladribine with an the amorphous cyclodextrin hydroxypropyl-β-cyclodextrin and (b) amorphous free cladribine associated with said amorphous cyclodextrin as a non-inclusion complex, said complex cladribine-

cyclodextrin complex having a weight ratio of cladribine to said amorphous cyclodextrin of from about 1:10 to about 1:16.

57. (Previously Presented) The complex cladribine-cyclodextrin complex according to Claim 56, saturated with cladribine.

58-62. (Cancelled)

- 63. (Currently Amended) The complex cladribine-cyclodextrin complex according to Claim 62 Claim 56, wherein the weight ratio of cladribine to hydroxypropyl-β-cyclodextrin is about 1:14.
- 64. (Currently Amended) The complex cladribine-cyclodextrin complex according to Claim 62 Claim 56, wherein the weight ratio of cladribine to hydroxypropyl-β-cyclodextrin is about 1:11.
  - 65. (Cancelled)
- 66. (Previously Presented) The complex cladribine-cyclodextrin complex according to Claim 56, wherein from about 30 to about 40 percent by weight of the cladribine is in the inclusion complex (a) and from about 70 to about 60 percent by weight of the cladribine is in the non-inclusion complex (b).
- 67. (Withdrawn and Currently Amended) A process for the preparation of a complex cladribine-cyclodextrin complex as claimed in Claim 56, which comprises the steps of:
- (i) combining cladribine and an the amorphous cyclodextrin in water at a temperature of from about 45 to about 80°C and maintaining said temperature for a period of from about 6 to about 24 hours;
  - (ii) cooling the resultant aqueous solution to room temperature; and
  - (iii) lyophilizing the cooled solution to afford an amorphous product.

- 68. (Withdrawn) A process according to Claim 67, further comprising a filtration step following step (ii).
- 69. (Withdrawn) A process according to Claim 67, wherein step (i) is performed at a temperature of from about 45 to about 60°C.
- 70. (Withdrawn) A process according to Claim 67, wherein step (i) is performed at a temperature of from about 45 to about 50°C.
- 71. (Withdrawn) A process according to Claim 69, wherein step (i) is performed with stirring.
- 72. (Withdrawn) A process according to Claim 71, wherein step (i) is performed for a period of from about 6 to about 9 hours.
- 73. (Withdrawn) A process according to Claim 67, wherein step (ii) is performed for a period of from about 6 to about 9 hours.
- 74. (Withdrawn) A process according to Claim 67, wherein step (iii) comprises an initial freezing stage in which the solution is cooled to from about -40 to about -80° C, and held at said temperature for a period of from about 2 to about 4 hours.
- 75. (Withdrawn) A process according to Claim 74, wherein, in the initial freezing stage of step (iii), the solution is cooled to about -45°C.
- 76. (Withdrawn) A process according to Claim 67, wherein 12.00 parts by weight of cladribine and 172.50 parts by weight of hydroxypropyl-β-cyclodextrin are introduced in step (i).

- 77. (Withdrawn) A process according to Claim 67, wherein 16.35 parts by weight of cladribine and 172.50 parts by weight of hydroxypropyl-β-cyclodextrin are introduced in step (i).
- 78. (Withdrawn) A process according to Claim 76, wherein 825 parts by volume of water are introduced in step (i).
- 79. (Withdrawn) A process according to Claim 67, wherein the lyophilization step (iii) comprises:
- (a) an initial freezing stage in which the complexation solution is brought to from about -40°C to about -80°C for approximately 2 to 4 hours;
- (b) a primary drying stage at about -25°C for approximately 80 to 90 hours; and
  - (c) a secondary drying stage at about 30°C for approximately 15 to 20 hours.
- 80. (Withdrawn) A process according to Claim 79, wherein stage (a) of the lyophilization is conducted at about -45°C for approximately 3 to 4 hours.
- 81. (Withdrawn) A process according to Claim 79, wherein stage (b) of the lyophilization is conducted under a pressure of about 100 mTorr.
- 82. (Currently Amended) A pharmaceutical composition <u>according to</u>

  <u>Claim 1</u> obtainable by a process comprising the steps of:
- (i) combining cladribine and an the amorphous cyclodextrin hydroxypropyl-β-cyclodextrin in water at a temperature of from about 45 to about 80°C and maintaining said temperature for a period of from about 6 to about 24 hours;
  - (ii) cooling the resultant aqueous solution to room temperature;
  - (iii) lyophilizing the cooled solution to afford an amorphous product; and
  - (iv) formulating the amorphous product into a solid oral dosage form.

- 83. (Original) A pharmaceutical composition according to Claim 82, wherein the process further comprises a filtration step following step (i) or (ii).
- 84. (Previously Presented) A pharmaceutical composition according to Claim 82, wherein step (i) of the process is performed at a temperature of from about 45 to about 60°C.
- 85. (Previously Presented) A pharmaceutical composition according to Claim 82, wherein step (i) of the process is performed at a temperature of from about 45 to about 50°C.
- 86. (Previously Presented) A pharmaceutical composition according to Claim 84, wherein step (i) of the process is performed with stirring.
- 87. (Original) A pharmaceutical composition according to Claim 86, wherein step (i) of the process is performed for a period of from about 6 to about 9 hours.
- 88. (Previously Presented) A pharmaceutical composition according to Claim 82, wherein step (ii) of the process is performed for a period of from about 6 to about 9 hours.
- 89. (Previously Presented) A pharmaceutical composition according to Claim 82, wherein step (iii) comprises an initial freezing stage in which the solution is cooled to from about -40 to about -80°C, and held at said temperature for a period of from about 2 to about 4 hours.
- 90. (Original) A pharmaceutical composition according to Claim 89, wherein, in the initial freezing stage of step (iii), the solution is cooled to about -45°C.

- 91. (Previously Presented) A pharmaceutical composition according to Claim 82, wherein 12.00 parts by weight of cladribine and 172.50 parts by weight of the hydroxypropyl-β-cyclodextrin are introduced in step (i) of the process.
- 92. (Previously Presented) A pharmaceutical composition according to Claim 82, wherein 16.35 parts by weight of cladribine and 172.50 parts by weight of the hydroxypropyl-β-cyclodextrin are introduced in step (i) of the process.
- 93. (Previously Presented) A pharmaceutical composition according to Claim 91, wherein 825 parts by volume of water are introduced in step (i) of the process.
- 94. (Previously Presented) A pharmaceutical composition according to Claim 82, wherein the lyophilization step (iii) of the process comprises:
- (a) an initial freezing stage in which the complexation solution is brought to from about -40°C to about -80°C for approximately 2 to 4 hours;
- (b) a primary drying stage at about -25°C for approximately 80 to 90 hours; and
  - (c) a secondary drying stage at about 30°C for approximately 15 to 20 hours.
- 95. (Original) A pharmaceutical composition according to Claim 94, wherein stage (a) of the lyophilization is conducted at about -45°C for approximately 3 to 4 hours.
- 96. (Previously Presented) A pharmaceutical composition according to Claim 94, wherein stage (b) of the lyophilization is conducted under a pressure of about 100 mTorr.
- 97. (Previously Presented) A pharmaceutical composition according to Claim 82, wherein the formulation step (iv) of the process comprises blending the complex with magnesium stearate and compressing into tablets.

Attorney's Docket No. 0056192-000024 Application No. 10/551,205 Page 11

98. (Original) A pharmaceutical composition according to Claim 97, wherein magnesium stearate is pre-mixed with sorbitol powder before blending with the complex.

#### **REMARKS**

In connection with applicants' Request for Continued Examination (RCE), applicants respectfully request entry of the foregoing and reexamination and reconsideration of the subject application, as amended, pursuant to and consistent with 37 C.F.R. § 1.114, and in light of the remarks which follow.

#### STATUS OF CLAIMS

Claims 1, 2, 8, 9, 11-14, 20, 21, 23-28, 32, 33, 35, 56, 57, 63, 64 and 66-98 remain in this application. Claims 3-7, 10, 15-19, 22, 29-31, 34, 58-62 and 65 have been cancelled by the foregoing amendment, without prejudice or disclaimer, which Claims 36-55 were previously cancelled. Claims 1, 8, 9, 11, 13, 20, 21, 23, 25, 32, 33, 56, 63, 64, 67 and 82 have been amended hereinabove. Claims 1, 2, 8, 9, 11, 12, 56, 57, 63, 64, 66 and 82-98 are under examination. Claims 13, 14, 20, 21, 23-28, 32, 33, 35 and 67-81 have been withdrawn from consideration as drawn to non-elected subject matter. However, the withdrawn claims have been amended to be commensurate in scope with the examined claims as amended so that they may ultimately be rejoined.

#### STATEMENT OF SUBSTANCE OF INTERVIEW

Applicants acknowledge and thank Examiners Lau and Jiang for the courtesy of the personal interview granted to the inventor, Nicholas S. Bodor, and to applicants' undersigned representative, on June 10, 2009.

At the interview, applicants' representative indicated that an RCE would be filed. The claim language was discussed and it was agreed that support for the word "free" would be investigated and the claim clarified in this respect, if necessary. It was also proposed that in order to expedite prosecution, the independent claims be amended to recite only a particular amorphous cyclodextrin, namely hydropropyl-β-cyclodextrin, for which data was discussed, as well as a weight ratio range of cladribine to the cyclodextrin of from about 1:10 to about 1:16 (as set forth in, for

example, Claim 6); these suggestions were looked upon favorably by the Examiners following a detailed discussion, first of the references relied upon by the Examiner and then of the Van Axel Castelli et al., *J. Pharm.Sci.* 2008 submitted at the interview. The Van Axel Castelli et al. publication, a further copy of which is submitted herewith and listed on the accompanying Form PTO-1449, was shown to fully support the data in the specification for the claimed subject matter, to distinguish the instant complex from physical mixtures and to show the correctness of applicants' previous arguments with respect to the obviousness rejection based on Schultz et al. in view of Baert et al. Rather than repeating these discussions in detail, in this interview summary, applicants will repeat these discussions in detail in the remarks below. Finally, applicants provided several recent internet news reports concerning clinical trials of the product, further copies of which are appended.

#### **DISCUSSION OF CLAIM AMENDMENTS**

Claim 1 has been amended to specify "the amorphous cyclodextrin hydroxypropyl-β-cyclodextrin," rather than "an amorphous cyclodextrin"; this feature was previously recited, for example, in original Claim 4. Claim 1 has been further amended to specify that the weight ratio of cladribine to said amorphous cyclodextrin in said composition is from about 1:10 to about 1:16; this feature was previously recited, for example, in original Claim 6. As for the use of the word 'free" in association with "cladribine," the expression "free cladribine" simply means cladribine not in the inclusion complex; see page 7, lines 24-25, where "free cladribine" is clearly defined. Therefore, it is appropriate to retain this word in the claims; amorphous free cladribine is associated with the amorphous cyclodextrin as the non-inclusion complex (b) while there is no significant amount of free crystalline cladribine in the composition. As for the subject matter cancelled from Claim 1 or from any of the other claims, applicants of course reserve the right to file a continuing application thereon.

Claims 3-7 have been cancelled as either outside the scope of the claims or redundant in light of the amendment of Claim 1.

Claims 8 and 9 have been amended so that they depend from Claim 1, which contains the features of original Claim 7, and Claim 10 has been cancelled as outside the scope of amended Claim 1.

A minor linguistic amendment has been made to Claim 11 to make it more consistent with amended Claim 1.

Claim 13 has been amended to be commensurate in scope with Claim 1.

Claims 15-19 have been cancelled as either outside the scope of Claim 13 as amended or redundant in light of the amendment of Claim 13; Claims 20 and 21 have been amended so that they depend from Claim 13; and Claim 22 has been cancelled as outside the scope of amended Claim 13. All of these amendments are consistent with the amendment of Claim 1.

A minor linguistic amendment has been made to Claim 23 to make it more consistent with amended Claim 13.

Claim 25 has been amended to be commensurate in scope with Claim 1.

Claims 29-31 and 34 have been cancelled as either outside the scope of Claim 25 as amended or redundant in light of the amendment of Claim 25.

Claims 32-33 have been amended to depend from Claim 25, which contains the features of the claim upon which they previously depended.

Claim 56 has been amended to be consistent with Claim 1. Claims 58-62 and 65 have accordingly been cancelled as outside the scope of amended Claim 56 or redundant in light of the amendment of Claim 56. The dependencies of Claims 63 and 64 have been amended accordingly.

A minor linguistic amendment has been made to Claim 67 to make it more consistent with amended Claim 56.

Finally, Claim 82 has been amended so that it depends from Claim 1 and the language has been amended to specify the amorphous cyclodextrin hydroxypropyl-β-cyclodextrin consistent with Claim 1.

It is apparent from the foregoing that no new matter has been introduced by the amendments made.

#### FILING DATES ACCORDED TO CLAIMS

Applicants thank the Examiner for considering their remarks, particularly with respect to the international filing date. The PCT filing date of March 26, 2004 has been accorded to Claims 12, 66, 83, 85 and 89, while all other claims are deemed to be entitled to the February 4, 2004 filing date of U.S. Provisional Appln. No. 60/541,247.

#### **ELECTIONS/RESTRICTIONS**

As noted above, applicants have amended the withdrawn claims to be commensurate in scope with the product claims, so that the withdrawn claims can be ultimately rejoined.

#### **OBJECTIONS WITHDRAWN**

The Examiner's withdrawal of the previous objections to the specification is noted, with appreciation.

#### **REJECTIONS WITHDRAWN**

The withdrawal of the previous rejections under 35 U.S.C. §§ 112, second paragraph, and 102(b) are likewise noted, with appreciation.

#### **CLAIM REJECTIONS - 35 U.S.C. § 103**

Claims 1-12, 56-66 and 82-83 have been rejected under 35 U.S.C. § 103(a) as being unpatentable over Schultz et al. US Patent No. 6,194,395 in view of Baert et al. WO 97/18839, both previously made of record. It is submitted that this rejection cannot be maintained against any of the claims now in this application.

As explained at the interview, Schultz et al. describe two kinds of cyclodextrin formulations of cladribine, i.e., "soluble aqueous formulations of cladribine with

cyclodextrin solubilizers which are injectable in humans, as well as oral solid dosage forms containing a mixture of cladribine and cyclodextrins." (Emphasis added). See col., 1, lines 6-10, of the Schultz et al. patent. Applicants do not dispute the fact that Schultz et al. disclose hydroxypropyl-β-cyclodextrin (HPβCD), which is amorphous, but Schultz et al. disclose crystalline cyclodextrins as well. Indeed, Schultz et al. teach aqueous formulations containing a cladribine/HPBCD complex in solution for injectable use. On the other hand, Schultz et al. clearly teach that their solid oral dosage forms are mixtures of cladribine and cyclodextrin as set forth not only in col. 1, lines 8-10 ("oral solid dosage forms containing a mixture of cladribine and cyclodextrin") but also in col. 5, lines 50-64. There it is indicated that the solid oral dosage forms may be prepared as disclosed in Baert et al. WO 97/18837; this is in fact the only method disclosed by Schultz et al. for preparing the solid oral dosage forms. In col. 5, beginning at line 52, it is stated that "solid mixtures of the cyclodextrins with the active ingredient are prepared via melt-extrusion....the cladribine active ingredient and the cyclodextrins are mixed with other optional ingredients and then heated until melting occurs. The mixture is then extruded through an extruder having one or more nozzles." As set forth in col. 6 of the Schultz et al. patent, a typical oral dosage form has a formulation containing, as a milled extrudate, 1 mg to 15 mg of cladribine and 100 to 500 mg of cyclodextrin, and as excipients, 100 to 300 mg of microcrystalline cellulose, 10 to 200 mg of crospovidone, 1 to 5 mg of colloidal silicon dioxide and 2 to 10 mg of sterotex. Schultz et al. do not disclose or suggest to the ordinary skilled pharmaceutical scientist solid oral formulation of cladribine/cyclodextrin complexes as claimed herein. As noted at the interview, and as will be explained in detail below with reference to the Van Axel Castelli et al. article, the characteristics of a complex and a physical mixture are distinctly different; Schultz et al.'s solid mixtures of cladribine and cyclodextrin cannot be assumed to be the same as applicants' product, which is a complex cladribine-cyclodextrin complex. Even if the broad ratios of Schultz et al.'s mixtures encompass the ratios in applicants' complexes, having the same ratio does not give a physical mixture the same properties as a complex, a fact which is clearly shown by the Van Axel Castelli et al. document discussed in detail below.

As further noted at the interview, the Baert et al. WO document, incorporated by reference in Schultz et al., for its melt-extrusion method of making solid oral dosage forms, describes amorphous materials and solid solutions but does not teach or suggest that its solid dosage form products include amorphous cyclodextrin-drug complexes. On the contrary Baert et al. teach that:

- (a) Prior art problems are solved by Baert et al. by the use of a melt-extrusion process to form solid <u>mixtures</u> comprising one or more cyclodextrins and insoluble active ingredients (Emphasis added; see page 3, lines 7-9).
- (b) The compounds suitable for use in Baert et al.'s process "are compounds that show no appreciable decomposition at the temperatures needed to melt and extrude the mixture of said one or more active ingredients with the cyclodextrin or cyclodextrins" (page 4, lines 5-7).
- (c) Baert et al. teach that the characteristics of their products are different from those of a product obtained in water, since it is stated on page 6, lines 15-19:

It will be appreciated by a person skilled in the art that mixing two or more solids, i.e., one or more cyclodextrins and the active ingredient or ingredients, and subsequently melting these solids together will give rise to different products than when the said solids are first brought into contact with water or another solvent and then extruded.

- (d) Baert et al.'s process uses very high temperatures; note Table 1 on page 12, where several different drugs are mixed with HPβCD and melt-extruded, with temperatures of around 280°C being utilized and the products in every case as noted on page 13, lines 5-6, being solid solutions.
- (e) Baert et al. do not mention cladribine; indeed, applicants have previously shown that cladribine is known to decompose at the high temperatures used by Baert et al. and thus cladribine falls in the group of compounds Baert et al. teaches are unsuitable for use in their process [point (b) above].
- (f) Baert et al. in no way teach or suggest that their products contain complexes.

The unsuitability of Baert et al.'s temperatures and hence for the Baert et al. process as applied to cladribine with cyclodextrin, specifically with HPβCD, is furthermore proved by data in the Van Axel Castelli et al. article, as discussed in more detail below.

Also at the interview, to provide background with respect to drug/cyclodextrin complexation, applicants brought to the Examiners' attention, the Loftsson and Brewster cyclodextrin review article previously made of record in applicants' Third Information Disclosure Statement; see Loftsson et al., "Pharmaceutical Application of Cyclodextrins. 1. Drug Solubilization and Stabilization," *Journal of Pharmaceutical Sciences*, Vol. 85, No. 10, pp. 1017-1025, 1996, American Pharmaceutical Association and the American Chemical Society, US. The Loftsson and Brewster review article shows that it was known in the art that:

- (a) Cyclodextrin/drug complexation typically is carried out in aqueous media, not by mixing in the absence of water (page 1020, left column, first full paragraph).
- (b) This complexation involves many different forces (van der Waals, hydrogen bonding, etc.) and the use of water is essential to the formation of complexes (page 1018, right column, second full paragraph to page 1020, left column, noting in particular the mention of release of water molecules from the cyclodextrin cavity as a driving force for drug-cyclodextrin complex formation).
- (c) The complexes have different properties from mere physical mixtures of drugs and cyclodextrins, for example in terms of drug solubilization and drug stabilization (pages 1020-1024), a fact shown for HPβD and cladribine in the Van Axel Castelli et al. article discussed below.
- (d) The amorphous cyclodextrins such as HPβCD have almost countless isomeric and variably substituted forms and upon complexation result in amorphous products which are mixtures of countless complexes (page 1018, left column, line 12 from the bottom, to page 1018, right column line 2).

To address applicants' position that use of cladribine in Baert et al.'s melt extrusion product is inappropriate because of the fact that the decomposition temperature of cladribine is lower than the Baert et al. process's temperature, the Examiner has cited several additional documents (the Britannica Online excerpt and

the two Suzuki et al. articles). Applicants believe that these documents are irrelevant for at least the following reasons:

- (a) These references relate to freezing point depression and teach nothing about decomposition of cladribine at the high temperatures used in the Baert et al. process.
- (b) These references relate only to crystalline cyclodextrins ( $\alpha$  and  $\beta$ -cyclodextrin), which give crystalline complexes from water and not to amorphous cyclodextrins such as HP $\beta$ CD, which give amorphous complexes from water, these different kinds of complexes exhibiting different properties; moreover, neither Schultz et al. nor Baert et al. even remotely suggest that their solid oral dosage forms contain cyclodextrin/drug complexes, both characterizing their solid products as mixtures.
- (c) The experimental data provided in the Van Axel Castelli et al. article and discussed below prove that cladribine and an amorphous cyclodextrin such as HP $\beta$ CD do not form an eutectic mixture; rather, Van Axel Castelli et al. as discussed below, shows that cladribine, whether in a complex or in a mixture with HP $\beta$ CD, decomposes at temperatures far below those used for this cyclodextrin in the Baert et al. process.

Turning to the Van Axel Castelli et al. article, which was discussed in detail by Dr. Bodor at the interview, a further copy of which is provided herewith and which is listed on the accompanying form PTO-1449, the following remarks are offered:

The Van Axel Castelli et al. article shows that an inclusion complex of cladribine and 2-hydroxypropyl-β-cyclodextrin has properties which are different from those of the cyclodextrin, those of cladribine and those of physical mixtures of the cyclodextrin with cladribine. These differences were discussed at length by Dr. Bodor at the interview with respect to various analyses conducted by Van Axel Castelli et al. and can be summarized as follows:

(a) Thermo gravimetric analysis (TGA) was conducted over the temperature range from 25°C to 360°C for (a) cladribine, (b) HPβCD, (c) their inclusion complex and (d) their physical mixture and the results are shown in Fig. 2. Fig. 2a, the TGA curve for cladribine itself, shows decomposition of cladribine starting at about 200°C. Fig. 2b, the TGA curve for HPβCD, shows a mass loss of

6% at 30°C to about 140°C, due to dehydration, and decomposition at about 300°C. Fig. 2c, the TGA curve for the cladribine/HPβCD complex, shows water loss between 20°C and 100°C and a decomposition process starting at about 250°C. Fig. 2d, the TGA curve for the cladribine plus HPβCD physical mixture, shows a multi-stage decomposition pathway; the first decomposition stage between room temperature and 100°C is due to loss of water from the cyclodextrin, whereas the second decomposition stage, observed at temperatures above 200°C, is due to the decomposition of cladribine. Fig. 2d also shows that heating the mixture to high temperatures does <u>not</u> lead to complexation but rather to <u>decomposition of cladribine</u>. Comparing the TGA for the complex with that of the physical mixture shows a slower degradation for the complex than for the mixture. Nevertheless, cladribine, whether in a complex or in a mixture with HPβCD, decomposes at temperatures far below those used for HPβCD-containing products in the Baert et al. process.

(b) Differential scanning calorimetry (DSC) analysis was conducted and the results shown in Fig. 3 for (a) cladribine, (b) HPβCD, (c) cladribine/HPβCD complex, (d) cladribine plus HPBCD physical mixtures, and (e) cladribine plus HPβCD kneading product. The authors note that the DSC trace of cladribine shows two endothermic events (Fig. 3a), the first at 206.3°C being close to the cladribine decomposition onset temperature and corresponding to the melting transition, and the second at 211.9°C, which is during the decomposition process, and probably is due to a decomposition product of cladribine. The DSC profile for the cyclodextrin (Fig. 3b) confirms an endothermic event corresponding to water loss from about 40°C to about 100°C. The authors further note that the DSC curves of the inclusion complex (Fig. 3c), physical mixture (Fig. 3d) and kneading product (Fig. 3e) all show a broad thermal event from about 40 to 140°C, due to water loss in the cyclodextrin. In addition, the physical mixture and the kneading product are observed to feature two endothermic events around 200°C; these can be attributed to free cladribine in the mixture and kneading product. In contrast, Fig. 3c, the DSC trace for the complex, shows only one endothermic event, which occurs in the high temperature region, at 234.5°C; this is considerably higher than the degradation onset of pure cladribine around 200°C (Fig.2a), while the latter also characterizes the mixtures. As noted by the authors, the absence of thermal events typical of pure cladribine shows a loss of cladribine crystalline character for the complex. This also confirms DSC data for the products of instant Examples 1 and 2 reported on page 31 of the instant specification and correlates well with applicants' x-ray diffraction traces for the products of Examples 1 and 2 reported on page 31 of the specification, where no peaks for crystalline cladribine were found in the complexes;

(c) FT-IR and FT-Raman spectroscopy were also recorded by Van Axel Castelli et al. In Figures 5 and 6, the FT-IR and FT-Raman spectra of cladribine alone (a), cladribine/cyclodextrin physical mixture (b), cladribine/cyclodextrin complex (c) and cyclodextrin alone (d) were compared. The authors indicate that the IR spectrum of the physical mixture (Fig. 5b) can be interpreted as the sum of the spectra for pure crystalline cladribine (Fig. 5a) and pure HPβCD (Fig. 5d), also supported by Fig. 6. The authors continue:

In contrast, both IR and Raman spectra of the inclusion complex show clear differences with respect to those of the physical mixture. In particular, markers of the crystalline phase of cladribine (arrows on Figs. 4 and 5) cannot be found in the spectra of the inclusion complex.

The authors further find that their data suggest that, when part of an inclusion complex, cladribine is present in a different (non-crystalline) phase relative to that of pure crystalline cladribine and that direct interaction between cladribine molecules is prevented. Further, they note that the amorphous phase has to be attributed to the formation of molecular complexes where the interaction between cladribine and HPβCD shields cladribine molecules, thus preventing crystallization.

(d) Van Axel Castelli et al. also used nuclear magnetic resonance spectroscopy to better understand the molecular interactions in the cladribine/cyclodextrin complex. To obtain direct proof of complex formation, the authors conducted a 2D ROESY experiment, the results of which showed a typical inner portion of HPβCD, confirming that a host-guest inclusion complex had formed between cladribine and HPβCD. Further, the authors conducted <sup>13</sup>C CP-MAS NMR experiments and reported the spectra in Fig. 10 for cladribine (a), cladribine +

HPβCD physical mixture (b) and cladribine/ HPβCD complex (c). In the cladribine spectrum (Fig. 10a), the authors observed sharp peaks due to cladribine's high degree of crystallinity. The spectrum for the physical mixture (Fig. 10b) corresponds to the sum of the spectra of the two components, with no resonance peaks or line broadening, showing no intermolecular interaction in the mixture, the solid being composed of distinct ordered domains of each component. In the spectrum for the complex, no shift in the HPβCD signals are detected, whereas the cladribine resonances are broadened and only slightly detectable. The authors note that this indicates that no crystalline domains of cladribine are present.

- (e) Van Axel Castelli et al. also conducted DSC and TGA thermal profiles for tablets of the cladribine/ HP $\beta$ CD complex and found them comparable to those for the cladribine/ HP $\beta$ CD complex itself. Moreover, even stressed tablets showed no notable differences in the DSC thermal profile, which demonstrated that they were storage stable even under less than ideal conditions.
- (f) Van Axel Castelli et al. conclude that thermal analyses, vibrational analyses, and solid-state NMR all indicate that cladribine behaves differently when in the complex compared with the physical mixture or kneading product, while ROESY provides evidence for the existence of an internal complex between cladribine and HPβCD. They further conclude that tablets of the complex are not affected by their manufacturing from the complex itself and are storage stable. These tablets have been used in a successful clinical trial for oral treatment of patients with MS (CLARITY trial).

Information about the clinical trials of this product was presented at the interview and copies of several articles appearing on the internet are appended and listed on the accompanying Form PTO-1449. The product is expected to be the first marketed oral product for the treatment of multiple sclerosis.

In summary, applicants submit that the obviousness rejection based on Schultz et al. in view of Baert et al. is untenable and should be withdrawn. The data provided by Van Axel Castelli et al. conclusively show that cladribine, whether alone, in a physical mixture with HP $\beta$ CD, or even in a cladribine/HP $\beta$ CD complex, decomposes at temperatures far lower than those used by Baert et al. for melt extruding drugs with the same cyclodextrin. The data further show that heating a

physical mixture of cladribine with HPBCD to high temperatures does not result in a complex of cladribine and in fact the cladribine in the mixture decomposes long before the melting point for HPBCD is reached. Thus, the Baert et al. process is not suitable for making a melt extrudate of cladribine with hydroxypropyl-β-cyclodextrin and moreover such a product prepared according to Baert et al. would not contain a complex of cladribine with the cyclodextrin as claimed in this application. The Schultz et al. oral dosage form prepared by the Baert et al. process simply cannot contain a cladribine/cyclodextrin complex.

Claims 82-98 are drawn to a product-by-process. These claims have been amended above and now depend directly or indirectly from Claim 1 and thus contain all of the Claim 1 limitations. Applicants have shown that the Claim 1 composition is free of the art, therefore, the product-by-process claims are also patentable over the art.

#### CONCLUSION

In view of the foregoing, it is believed that all record rejections have been overcome. Further, favorable action in the form of a Notice of Allowance is believed to be in order and is earnestly solicited.

In the event that there are any remaining issues which could be resolved in a telephone discussion, the Examiner is urged to telephone the undersigned at the number given below so that such issues can be promptly resolved.

#### FIFTH INFORMATION DISCLOSURE STATEMENT

Commissioner for Patents P.O. Box 1450 Alexandria, VA 22313-1450

Sir:

In accordance with the duty of disclosure as set forth in 37 C.F.R. § 1.56, the accompanying information is being submitted in accordance with 37 C.F.R. §§ 1.97 and 1.98. Applicants request the Examiner's consideration of the documents listed on the accompanying Form PTO-1449.

Pursuant to 37 C.F.R. § 1.98, a copy of each of the documents cited is enclosed.

This Statement, Form PTO-1449 and the listed documents are submitted before the mailing of a first Office Action after the filing of a Request for Continued Examination under 37 C.F.R. § 1.114. Continued examination is requested and the fee required under 37 C.F.R. § 1.17(e) accompanies the present submission.

These documents are not prior art. They are submitted to support positions taken and statements made at the interview of June 10, 2009, and in the accompanying Reply and Amendment.

It is respectfully requested that an Examiner-initialed copy of the accompanying Form PTO-1449 be returned to the undersigned with the next official communication.

Fifth Information Disclosure Statement Application No. 10/551,205
Attorney Docket No. 0056192-000024

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

### New Applications Under 35 U.S.C. 111

If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

### National Stage of an International Application under 35 U.S.C. 371

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

### New International Application Filed with the USPTO as a Receiving Office

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

### **DETAILED ACTION**

### Continued Examination Under 37 CFR 1.114

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 06 July 2009 has been entered.

This Office Action is responsive to Applicant's Amendment and Remarks, filed 06 July 2009, in which claims 1 and 56 are amended to change the scope and breadth of the claim; claims 8, 9, 11, 63, 64 and 82 are amended to change dependency; claims 3-7, 10, 15-19, 22, 29-31, 34, 58-62 and 65 are canceled; and withdrawn claims 13, 20, 21, 23, 25, 32, 33 and 67 are amended.

This application is the national stage entry of PCT/US04/09387, filed 26 Mar 2004; and claims benefit of provisional application 60/458,922, filed 28 Mar 2003; and claims benefit of provisional application 60/484,756, filed 02 July 2003; and claims benefit of provisional application 60/541,247, filed 04 Feb 2004.

The filing date of the instant claims 12, 83, 85 and 89 are deemed to be the filing date of the instant application which is the filing date of PCT/US04/09387, 26 Mar 2004.

Application/Control Number: 10/551,205 Page 3

Art Unit: 1623

The filing date of instant claims 1, 2, 8, 9, 11, 56, 57, 63, 64, 82, 84 and 86-98 are deemed to be the filing date of provisional application 60/541,247, filed 04 Feb 2004.

Claims 1, 2, 8, 9, 11-14, 20, 21, 23-28, 32, 33, 35, 56, 57, 63, 64 and 67-98 are pending in the current application. Claims 13, 14, 20, 21, 23-28, 32, 33, 35 and 67-81, drawn to non-elected inventions, are withdrawn. Claims 1, 2, 8, 9, 11, 56, 57, 63, 64 and 82-98 are examined on the merits herein.

### Rejections Withdrawn

Applicant's Amendment and Remarks, filed 06 July 2009, with respect to claims 1-12, 56-66 and 82-83 are rejected under 35 U.S.C. 103(a) as being unpatentable over Schultz et al. (US Patent 6,194,395, published 27 Feb 2001, of record) in view of Baert et al. (WIPO Publication WO97/18839, published 29 May 1997, of record) has been fully considered and is persuasive, as claims 3-7, 10, 58-62 and 65 are canceled and Applicant's remarks supported by the evidence of Van Axel Castelli et al. provided by Applicant in IDS mailed 06 July 2009 is persuasive that the product taught by Schultz et al. in view of Baert et al. is structurally different from the instant invention as claimed and therefore the product taught by Schultz et al. in view of Baert et al. does not teach all limitations of the of instant invention as claimed.

This rejection has been withdrawn.

The following are new grounds of rejection.

### Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Amended Claims 1, 2, 8, 9, 11, 56, 57, 63, 64 and 82-98 are rejected under 35 U.S.C. 103(a) as being unpatentable over Schultz et al. (US Patent 6,194,395, published 27 Feb 2001, of record) in view of Wrenn Jr. (US Patent 6,174,873, issued 16 Jan 2001, cited in PTO-892) and in view of Loftsson et al. (US Patent 6,699,849, filed 16 Feb 1999, cited in PTO-892).

Schultz et al. discloses a solid pharmaceutical oral dosage form of cladribine comprising cladribine and cyclodextrin (column 2, lines 31-39). Schultz et al. teaches β-cyclodextrins are known to possess the ability to form inclusion complexes and to have concomitant solubilizing properties (column 2, lines 10-15). Schultz et al. discloses the use of β-cyclodextrins (column 2, lines 56-58) and derivatives wherein one or more cyclodextrin hydroxy groups are replaced with groups such as hydroxypropyl (column 3, lines 26-27). Schultz et al. discloses the solid oral dosage form in the form of a tablet (column 5, lines 37-38) including the excipients sorbitol and magnesium stearate (column 6, lines 2-7). Schultz et al. discloses an oral dosage form comprising up to 15 mg cladribine and cyclodextrin from 100 to 500 mg, which would lead one of skill in the art to instantly envision a cladribine to cyclodextrin ratio ranging from 15 mg:100 mg to 15mg:500 mg, or 1:6.67 to 1:33.3 by weight (column 6, lines 23-31). Schultz et al.

implicitly discloses an oral dosage form comprising up to 15 mg cladribine and cyclodextrin from 100 to 500 mg, or a cladribine to cyclodextrin ratio ranging from 1:6.67 to 1:33.3 by weight (column 6, lines 23-31).

Schultz et al. does not specifically disclose the composition comprising no significant amount of free crystalline cladribine therein (instant claims 1). Schultz et al. does not specifically disclose the composition corresponding to a point located on the curve of a phase solubility diagram for saturated complex cladribine-cyclodextrin complexes, said curve defining complex saturated complexes of cladribine in varying concentrations of the cyclodextrin (instant claim 11). Schultz et al. does not specifically disclose the complex consisting of (a) an amorphous inclusion complex of cladribine with an amorphous cyclodextrin and (b) amorphous free cladribine associated with amorphous cyclodextrin as a non-inclusion complex (instant claim 56). Schultz et al. does not specifically disclose the composition comprising a cladribine to cyclodextrin ratio from about 1:10 to about 1:16 (instant claims 6, 7, 10, 61, 62 and 65), or a ratio of about 1:14 (instant claims 8 and 63) or about 1:11 (instant claims 9 and 64). Schultz et al. does not specifically disclose the complex wherein from about 30 to about 40 percent by weight of the cladribine is in the inclusion complex (a) and from about 70 to about 60 percent by weight of the cladribine is in the non-inclusion complex (b) (instant claims 12 and 66). Schultz et al. does not specifically disclose the product-by-process wherein 12.00 parts by weight of cladribine and 172.50 parts by weight of hydroxypropyl-βcyclodextrin are introduced in step (i) of the process (instant claim 91 and 93), to give a cladribine to cyclodextrin ratio of 1:14.38. Schultz et al. does not specifically disclose

Art Unit: 1623

the product-by-process wherein 16.35 parts by weight of cladribine and 172.50 parts by weight of the hydroxypropyl-β-cyclodextrin are introduced in step (i) of the process (instant claim 92), to give a cladribine to cyclodextrin ratio of 1:10.55.

Wrenn Jr. teaches solid formulations for oral administration of adenosine analogs (abstract). Wrenn Jr. teaches the adenosine analogs include cladribine (column 6, lines 35-40). Wrenn Jr. teaches it is desirable to improve the solubility and absorption characteristics of poorly water soluble drugs by formulating the adenosine analog in an amorphous form together with solubilizing excipients (column 12, lines 25-30). Wrenn Jr. teaches the stabilization by absorption using a polymer that prevents recrystallization and the combination of the amorphous form and the solubilizing characteristics of the excipients enhances the solubility of the adenosine analog, and the amorphous drug complex may be formulated into a tablet system (column 12, lines 30-40).

Loftsson et al. teaches it is known in the art that substituted cyclodextrins show an increased aqueous solubility and that such chemical modification transforms crystalline cyclodextrins into amorphous mixtures increasing their aqueous solubility (column 1, lines 35-45). Loftsson et al. teaches it is known in the art that in aqueous solution cyclodextrins form complexes with many drugs (column 2, lines 1-10). Loftsson et al. teaches various methods of preparation of drug-cyclodextrin complexes are known in the art, including preparation of a solid complex by evaporation or freeze-drying following formation of the complex by equilibration (column 2, lines 20-40). Loftsson et al. teaches purine derivatives are compatible with said cyclodextrin complexes (column 9, lines 50-55).

Application/Control Number: 10/551,205

Page 7

Art Unit: 1623

It would have been obvious to one of ordinary skill in the art at the time of the invention to combine Schultz et al. in view of Wrenn Jr. and in view of Loftsson et al. Schultz et al. teaches solid formulations for oral administration of cladribine and cyclodextrin. Wrenn Jr. is drawn the field of solid formulations for oral administration of adenosine analogs such as cladribine. Loftsson et al. teaches the level of skill in the art with regard to cyclodextrin complexes including complexes with purine derivatives. One of ordinary skill in the art would have been motivated to combine Schultz et al. in view of Wrenn Jr. and in view of Loftsson et al. because Schultz et al. teaches Schultz et al. teaches undesirable recrystallization of cladribine in tissue may occur and damage the surrounding tissue and that complexes with cyclodextrin are known to solubilize the compound, Wrenn Jr. teaches it is desirable to improve the solubility and absorption characteristics of poorly water soluble drugs by formulating the adenosine analog in an amorphous form together with solubilizing excipients, and Loftsson et al. teaches it is known in the art that complexes with substituted cyclodextrin give amorphous mixtures increasing their aqueous solubility. One of ordinary skill in the art would have a reasonable expectation of success in combining Schultz et al. in view of Wrenn Jr. and in view of Loftsson et al. to render obvious a product that meets all limitation of the instant invention because Wrenn Jr. teaches the stabilization of the adenosine analog by absorption using a polymer that prevents recrystallization and Loftsson et al. teaches modified cyclodextrins that form amorphous mixtures and preparation of a solid complex by evaporation or freeze-drying, which is expected to give a non-crystalline product. Schultz et al. in view of Wrenn Jr. and in view of Loftsson et al. does not teach the

specific cladribine to cyclodextrin ratios of 1:14.38 or 1:10.55, however these ratios are encompassed by the prior art and Schultz et al. teaches it is within the level of skill in the art to optimize the ratio of cyclodextrin relative too cladribine (column 4, lines 35-45). See also MPEP 2144.05 II.A, "Generally, differences in concentration or temperature will not support the patentability of subject matter encompassed by the prior art unless there is evidence indicating such concentration or temperature is critical." One of ordinary skill in the art would be motivated to optimize the cladribine to cyclodextrin ratio to give the composition comprising no significant amount of free crystalline cladribine therein because Schultz et al. teaches undesirable recrystallization of cladribine in tissue may occur and damage the surrounding tissue and that complexes with cyclodextrin are known to solubilize the compound (Schultz et al. column 2, lines 1-15). Schultz et al. in view of Wrenn Jr. and in view of Loftsson et al. does not specifically disclose the complex wherein from about 30 to about 40 percent by weight of the cladribine is in the inclusion complex (a) and from about 70 to about 60 percent by weight of the cladribine is in the non-inclusion complex (b). However, Loftsson et al. teaches formation of an inclusion complex from a non-inclusion complex in an aqueous solution is an equilibrium process, and the position of this equilibrium is dependent on the concentrations of the cladribine and cyclodextrin.

Claims 82-90 and 94-98 are drawn to a product-by-process. The disclosed product is substantially identical to the instantly claimed product-by-process, a pharmaceutical solid oral dosage form comprising an amorphous inclusion complex of cladribine and cyclodextrin and a non-inclusion complex of an amorphous cladribine

Art Unit: 1623

and an amorphous cyclodextrin. "[E]ven though product-by-process claims are limited by and defined by the process, determination of patentability is based on the product itself. The patentability of a product does not depend on its method of production. If the product in the product-by-process claim is the same as or obvious from a product of the prior art, the claim is unpatentable even though the prior product was made by a different process." In re Thorpe, 777 F.2d 695, 698, 227 USPQ 964, 966 (Fed. Cir. 1985) (citations omitted) (Claim was directed to a novolac color developer. The process of making the developer was allowed. The difference between the inventive process and the prior art was the addition of metal oxide and carboxylic acid as separate ingredients instead of adding the more expensive pre-reacted metal carboxylate. The product-by-process claim was rejected because the end product, in both the prior art and the allowed process, ends up containing metal carboxylate. The fact that the metal carboxylate is not directly added, but is instead produced in-situ does not change the end product.). See MPEP 2113.

### Conclusion

No claim is found to be allowable.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jonathan S. Lau whose telephone number is 571-270-3531. The examiner can normally be reached on Monday - Thursday, 9 am - 4 pm EST.

Art Unit: 1623

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Shaojia Anna Jiang can be reached on 571-272-0627. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.

AB The present invention relates to implantable and preferably biol.

metabolizable medical products comprising nanoparticles, and the use
thereof for thermotherapeutic treatment following surgical removal of
tumors and cancers. ABSThe medical good is implanted after tumor surgery;
magnetic field causes the beads to heat the wound area; in combination
with a drug the antitumor and antimicrobial activity can be effected.
Thus iron oxide magnetic particles were prepared from iron dichloride and
iron trichloride solution by precipitation in sodium hydroxide; the suspension
was

diluted to 5 weight% iron oxide. A wound pad composed of calcium alginate and sodium CM-cellulose was impregnated with the nanoparticle-containing suspension.

OTHER SOURCE(S): MARPAT 149:17767

AB Compns. containing at least one Chk1 kinase inhibitor and at lease one cyclodextrin are disclosed. Also disclosed are methods of treating a

proliferative disorders, especially cancer or potentiating a cancer treatment with a composition comprising at least one Chk1 inhibitor and at least one cyclodextrin. Thus, an injection solution was formulated containing a disubstituted urea Chk1 inhibitor 50 mg, Captisol 16.66 mg, HCl and NaOH to pH 4.5, and water to 1 mL. Captisol improved chemical stability of the Chk1 inhibitor compared to a solution containing a Chk1 inhibitor mesylate salt and dextrose. Degradation of Chk1 inhibitor was found to be accelerated by moisture and heat. After storage at  $40^{\circ}/75^{\circ}$  RH, the Captisol-containing formulation contained 3.06 and 4.96% of related impurities after 1 and 2 mo, resp., while the non-Captisol containing formulation contained 4.41 and 7.10% of impurities at the resp. time points.

AB The present invention relates to a composition including a wax and a therapeutically effective amount of tar for topical treatment of a tar-responsive dermatol. disorder, the composition being in liquid or light gel form when at a temperature selected from room temperature and a temperature of skin of a

mammal upon application of the composition to the skin of the mammal. The invention also relates to a method of treating a tar-responsive dermatol. disorder by topically applying the composition to skin of a mammal, preferably a human, that is affected by the disorder. Thus, a fast-drying liquid tar composition was formulated containing coal tar solution 15 g, ethanol 42 g, propylene

glycol 5 g, cyclomethicone (DC 345) 15 g, tri-Et citrate 5 g, Brij 93 10 g, liquid wax DIADD (dioctyldodecyl dodecanedioate) 5 g, and an optional fragrance 3 g. Topical application of the composition for 4 mo to a human subject having plaque psoriasis resulted in 90% improvement of clin. signs of disorder.

AΒ
    The invention relates to soft tissue implants for use in cosmetic or
    growth by inflammatory scar tissue. Thus, a silicone gel containing
```

reconstructive surgery and to compns. to make the implants resistant to paclitaxel was used as a filling in breast implant.

     The present invention provides a flowable composition suitable for use as a
     controlled release implant. The composition includes: (a) a biodegradable,
     biocompatible thermoplastic polymer that is at least substantially insol.
     in aqueous medium, water or body fluid; (b) a cell-cycle dependent biol.
     agent, a schedule-dependent biol. agent, a metabolite thereof, a
     pharmaceutically acceptable salt thereof, or a prodrug thereof; and (c) a
     biocompatible organic liquid, at standard temperature and pressure, in which
the
     thermoplastic polymer is soluble  The present invention also provides a
     method of treating cancer in a mammal. The present invention also
     provides a method of blocking, impeding, or otherwise interfering with
     cell cycle progression at the G1-phase, G1/S interphase, S-phase, G2/M
     interface or M-phase of the cell cycle in a mammal. The methods includes
     administering to a mammal an effective amount of a flowable composition of the
     present invention. Examples demonstrate the feasibility and efficacy
     potential for intratumoral delivery of Floxuridine in the Atrigel
     (glycolide-lactide copolymer) delivery system to an animal tumor model.

AB The invention discloses the use of incensole and/or furanogermacrens, derivs. metabolites and precursors thereof in the treatment of neoplasia, particularly resistant neoplasia and immunodysregulatory disorders. These compds. can be administered alone or in combination with conventional chemotherapeutic, antiviral, antiparasite agents, radiation and/or surgery. Incensole and furanogermacren and their mixture showed antitumor activity against various human carcinomas and melanomas and antimicrobial activity against Staphylococcus aureus and Enterococcus faecalis.

PRIORITY APPLN. INFO.: US 1999-420159 A 19991018

AB Pharmaceutical oil-in-water emulsions for delivery of polyfunctional active ingredients with improved loading capacity, enhanced stability, and reduced irritation and local toxicity are described. Emulsions include an aqueous phase, an oil phase comprising a structured triglyceride, and an emulsifier. The structured triglyceride of the oil phase is substantially free of triglycerides having three medium chain (C6-C12) fatty acid

moieties, or a combination of a long chain triglyceride and a polarity-enhancing polarity modifier. The present invention also provides methods of treating an animal with a polyfunctional active ingredient, using dosage forms of the pharmaceutical emulsions. For example, an emulsion was prepared, with cyclosporin A as the polyfunctional active ingredient dissolved in an oil phase including a structured triglyceride (Captex 810D) and a long chain triglyceride (safflower oil). The composition contained (by weight) cyclosporin A 1.0, Captex 810D 5.0, safflower oil 5.0, BHT 0.02, egg phospholipid 2.4, dimyristoylphosphatidyl glycerol 0.2, glycerol 2.25, EDTA 0.01, and water up to 100%, resp.

AB A new method for the estimation of <u>complex</u> formation consts. is presented. The method is based on electrophoretically measured effective mobilities and applied to the estimation of the <u>complex</u> formation constant in respect to interactions between nitrogen heterocyclic bases and cyclodextrines. The calcn. of consts. is based on the linearization of the dependence between effective mobility and the cyclodextrine concentration

the application of an advanced statistical evaluation procedure. <u>Complex</u> formation consts. 14.8 and 63.2 l/mol were obtained for the interaction of pyridinium and benzylaminopurinium with dimethyl- $\beta$ -cyclodextrin (DM- $\beta$ -CD), resp. Consts. in the order of magnitude 101-102 l/mol were obtained for some other <u>purine</u> derivs. The proposed procedure, in connection with the math. software for matrix operations, is rather simple and gives much more valuable outputs than commonly used concepts.

AB Particles consisting of ≥1 mono- or oligosaccharide, which are surface-crosslinked in emulsion by esterification of primary OH groups on the saccharides with a polyfunctional acylating agent, are useful as carriers or encapsulating agents for various hydrophilic or lipophilic active substances in preparation of cosmetic, pharmaceutical, or food compns. The particles are biocompatible, biodegradable, and suitable for stabilization and protection of sensitive active substances or for their sustained release. The crosslinking reaction preferably occurs in a water-in-oil emulsion at room temperature and results in formation of a membrane

of crosslinked saccharide surrounding an aqueous phase. The saccharide may be a cyclodextrin; by forming an <code>inclusion</code> compound with an active substance, it can be used to remove or harvest the latter from a liquid medium, or alternatively can slowly release an active substance from an <code>inclusion</code> compound Thus, 6 mL of a 10% solution of dihydroxyacetone (a ketose) in 1M carbonate buffer (pH 11) was emulsified in 30 mL cyclohexane containing 5% Span 85, and with continued stirring, 40 mL of a 5% solution of terephthaloyl chloride in CHCl3-cyclohexane (1:4 by volume); after 30 min, the microcapsules were collected and washed. These microcapsules dissolved slowly in 1% Na2CO3 solution or in PEG owing to alcoholysis of the ester bonds; the released dihydroxyacetone reacted with glycine to form a brown color. The microcapsules can therefore be used in cosmetic tanning prepns.

AB Methods for enhancing the complexation efficiency of a drug with cyclodextrin and for enhancing the availability of a drug following administration of a cyclodextrin-drug **complex**.

Phenytoin-2-hydroxypropyl  $\beta$ -cyclodextrin complexes were

prepared, lyophilized to a powder which can be formulated into tablets. The bioavailability of phenytoin was enhanced.

AB Hetero- or homocoupling of protected 1,4-cis-diethynylated 1,5-anhydroglucitols leads to 2 isomeric cyclotrimers and to 4 isomeric cyclotetramers. The C1-sym. cyclotrimer I and the C1- and the C2-sym. cyclotetramers II and III, resp., were prepared The cyclotrimer I was prepared by intramol., oxidative homocoupling and, alternatively, by a 1-pot trimerization/cyclization of the monomer. Oxidative homocoupling was used for the cyclization of appropriate tetramers to II and III. The acyclic tetramers were made by sequential Cadiot-Chodkiewicz coupling or by a combination of a Cadiot-Chodkiewicz reaction and an intermol., oxidative homocoupling. The solid-state conformation of a C4-sym. cyclotetramer corresponds well to the one predicted by force-field calcns. The water-solubilities of cyclotrimers and -tetramers, their calculated

DOCUMENT TYPE: Journal LANGUAGE: English

The photophys. characteristics of 1,N6-enthenoadenosine ( $\epsilon$ Ado) AΒ show irregularities in terms of the expected photophysics from a pH equilibrium between two forms that absorb light at different wavelengths. Furthermore, a comparison between the absorption spectra of purine , adenine, and  $\epsilon$ Ado leads to the conclusion that  $\epsilon$ Ado does not follow the adenine, but rather has more in common with the purine. The adenine itself does not follow its parent compound, purine. We, therefore, reinterpret the absorption of  $\varepsilon\overline{A}$ do, such as the unprotonated form has two absorption bands, the second of which is an n  $\rightarrow$   $\pi^*$  transition, whereas the protonated form has only one  $\pi \to \pi^*$  absorption band, which overlaps with the first absorption band of the unprotonated form. The n  $\rightarrow$   $\pi^{\star}$ absorption "disappeared" upon protonation, apparently due to stabilization of the lone-pair electrons. Under these presumptions, the photophysics of  $\epsilon$ Ado is no longer peculiar. Transitions to and from both excited singlet states,  $\text{S}\pi\pi^{\star}$  and  $\text{S}\text{n}\pi^{\star},$  along with the relative order of their resp. triplets, are shown to play an active role in the photophysics of  $\epsilon Ado$ . Therefore, the reported multiple emissions from εAdo, at low temperature, are to be expected. The reported observations in the literature provide evidence for the multiple excited states of εAdo. In the present work, cyclodextrins provide a powerful tool in the photophys. study of &Ado. In particular, cyclodextrin host isolation matrix (CHIM) provides a unique environment that can be applied to mimic the photophysics of the isolated mol. in the gas phase or at low temps.

AB An anionic polymer (e.g. a heparin derivative) is linked to an active agent (especially a steroid), preferably by a selectively hydrolyzable bond, for delivery of the active agent to vascular endothelial cells. The conjugates are useful as angiogenesis inhibitors for treatment of e.g. cancer, arthritis, and diabetic blindness. Thus, heparin was condensed with adipic dihydrazide and then with cortisol; the cortisol:heparin mol ratio in the product was 8-9. This conjugate was markedly acid labile, suppressed DNA synthesis and cell migration in human umbilical vein endothelial cells, retarded or abolished the vascularization of sponges in vivo, and retarded lung tumor growth in mice by 65%. No adverse effects of the conjugate were detected, and equivalent treatments with a mixture of heparin and cortisol were significantly less effective in all cases.

TITLE: Dye transfer thermal printing process. VI. Prevention

of image decoloration in dye transfer recording

AUTHOR(S): Kusakawa, Hideaki; Enmanji, Koe

CORPORATE SOURCE: Kanazawa Inst. Technol., Nonoichi, 721, Japan SOURCE: Denshi Shashin Gakkaishi (1993), 32(1), 3-6

CODEN: DSHGDD; ISSN: 0387-916X

DOCUMENT TYPE: Journal LANGUAGE: Japanese

AB The thermal dye transfer color ink, which is developed to have same sensitivity as the com. used thermal printing paper for G-II type facsimile, is composed of dyes such as SOT-Blue 2, -Red 2G, and -Yellow 5 with suitable binder polymers. The light fastness of these dyes is low. Thus, it is necessary to improve it, especially, for -Blue 2. Decoloration of the dye is prevented either by charge-transfer <code>complex</code> formation or the <code>inclusion</code> of the dyes. For binder polymers such as PMMA, in which the dye is dissolved rather than dispersed, it is not possible to form charge-transfer <code>complexes</code> and improvement of light fastness is not observed. For polar binder polymers such as poly(vinyl alc.), in which the dye and electron-acceptor particles are dispersed rather than dissolved, it was necessary to add electron-acceptor to form

complexes. The dye mol. is too large for cyclodextrin to enclose
it, and, accordingly, the improvement in light fastness was not so
remarkable.

In re Patent Application of	MAIL STOP AMENDMENT
Nicholas Bodor et al.	Group Art Unit: 1623
Application No.: 10/551,205	Examiner: JONATHAN S LAU
Filed: November 14, 2006	Confirmation No.: 4092
For: ORAL FORMULATIONS OF CLADRIBINE	

#### **REPLY TO OFFICIAL ACTION**

Commissioner for Patents P.O. Box 1450 Alexandria, VA 22313-1450

Sir:

In response to the Office Action dated September 17, 2009, the following remarks are offered:

#### **REMARKS**

Applicants request reexamination and reconsideration of the subject application pursuant to and consistent with 37 C.F.R. § 1.112 in light of the following:

#### **STATUS OF CLAIMS**

Claims 1, 2, 8, 9, 11-14, 20, 21, 23-28, 32, 33, 35, 56, 57, 63, 64 and 66-98 remain in this application. Claims 13, 14, 20, 21, 23-28, 32, 33, 35 and 67-81 have been withdrawn from consideration. Claims 1, 2, 8, 9, 11, 12, 56, 57, 63, 64, 66 and 82-98 are under examination.

It is respectfully pointed out that, while the other claims under examination have been rejected, Claims 12 and 66 are not indicated to be rejected in the Office Action Summary or in the rejection set forth in page 4 of the Office Action.

Clarification is requested.

#### **INFORMATION DISCLOSURE STATEMENTS**

Applicants thank the Examiner for considering the documents cited in their Fifth Information Disclosure Statement filed July 6, 2009. A Sixth Information Disclosure Statement is filed herewith. The document listed on the accompanying form PTO-1449 is discussed in the remarks which follow.

#### **REJECTION WITHDRAWN**

The Examiner's previous rejection under 35 U.S.C. § 103(a) based on Schultz et al. in view of Baert et al. has been withdrawn.

#### **CLAIM REJECTIONS - 35 U.S.C. § 103**

Amended Claims 1, 2, 8, 9, 11, 56, 57, 63, 64 and 82-98 have been rejected under 35 U.S.C. § 103(a) as being unpatentable over Schultz et al. US Patent No. 6,194,395, in view of Wrenn Jr. US Patent No. 6,174,873 and in view of Loftsson et al. US Patent 6,699,849. Applicants believe that this rejection is untenable against any of the claims in this application.

#### **APPLICANTS' INVENTION**

While the Examiner has withdrawn his previous obviousness rejection based on Schultz et al. in view of Baert et al., the Examiner nevertheless clings to his interpretation of particular features of Schultz et al. to the exclusion of what the Schultz et al. patent as a whole teaches to one of ordinary skill in the art.

First, applicants would like to once again draw the Examiner's attention to the essential features of applicants' invention as set forth in independent Claims 56 and 1, as well as in Claim 82.

Claim 56 is drawn to a complex cladribine-cyclodextrin complex which is an intimate amorphous admixture consisting of: (a) an amorphous inclusion complex of cladribine with the amorphous cyclodextrin hydroxypropyl-β-cyclodextrin (HPβCD) and (b) amorphous free cladribine associated with said amorphous cyclodextrin as a non-inclusion complex, said complex cladribine-cyclodextrin complex having a weight ratio of cladribine to said amorphous cyclodextrin of from about 1:10 to about 1:16. This is a complex complex of cladribine and hydroxypropyl-β-cyclodextrin (HPβCD) in which there is an intimate mixture consisting of two different complexes, first an amorphous inclusion complex of cladribine and HPβCD (itself an amorphous cyclodextrin) and secondly a non-inclusion complex in which amorphous free cladribine is associated with the amorphous cyclodextrin HPβCD, and moreover this complex complex has a very particular weight ratio of cladribine to HPβCD of from about 1:10 to about 1:16.

The cladribine/ HPβCD complex of the invention has many properties that distinguish it from a mere mixture of hydroxypropyl-β-cyclodextrin and cladribine as was fully and convincingly shown by the data provided in the Van Axel Castelli et al. document provided with applicants' previous response and discussed in great detail therein.

The unique cladribine/hydroxypropyl-β-cyclodextrin complex defined in Claim 56 is an essential feature of applicants' unique pharmaceutical composition as claimed in Claim 1. Claim 1 is drawn to a pharmaceutical composition comprising a complex cladribine-cyclodextrin complex which is an intimate amorphous admixture consisting of (a) an amorphous inclusion complex of cladribine with the amorphous

cyclodextrin hydroxypropyl-β-cyclodextrin and (b) amorphous free cladribine associated with said amorphous cyclodextrin as a non-inclusion complex, formulated into a solid oral dosage form, said composition comprising no significant amount of free crystalline cladribine therein, said composition having a weight ratio of cladribine to said amorphous cyclodextrin of from about 1:10 to about 1:16. Thus, in addition to the special features of the complex complex itself as already discussed, it is essential that the pharmaceutical composition comprise no significant amount of free crystalline cladribine therein and that the complex complex be formulated into a solid oral dosage form. Neither the complex complex nor the pharmaceutical composition comprises any significant amount of free crystalline cladribine; this is excluded from the complex complex by use of the closed "consisting of" language in defining the components of the admixture therein.

Claim 82 is a product-by-process claim which specifies the steps applicants have found to provide the unique pharmaceutical composition of Claim 1, which in turn contains as an essential feature the precisely defined unique complex complex of Claim 56. Thus, Claim 82 is drawn to a pharmaceutical composition according to Claim 1 obtainable by a process comprising the steps of:

- (i) combining cladribine and the amorphous cyclodextrin hydroxypropyl-β-cyclodextrin in water at a temperature of from about 45 to about 80°C and maintaining said temperature for a period of from about 6 to about 24 hours;
  - (ii) cooling the resultant aqueous solution to room temperature;
  - (iii) lyophilizing the cooled solution to afford an amorphous product; and
- (iv) formulating the amorphous product into a solid oral dosage form.

  The time and temperature conditions set forth in part (i) are especially critical to formation of the Claim 56 complex complex and ultimately to formation of the Claim 1 pharmaceutical composition.

The Examiner relies upon Schultz et al. for disclosing a solid pharmaceutical dosage form comprising cladribine and cyclodextrin at column 2, lines 31-39. These lines do not indicate the nature of the relationship between the cladribine and the cyclodextrin. However, as applicants pointed out to the Examiner previously, Schultz et al. elsewhere disclose that their oral <u>solid</u> dosage forms contain a <u>mixture</u> of cladribine and cyclodextrin; see column 1, lines 8-10. Reference to <u>solid mixtures</u> is

also made by Schultz et al. in column 5, lines 50-64. Schultz et al. teach inclusion complex formation in solution but <u>only</u> to form <u>injectable solutions</u>. As to ratios, Schultz et al.'s weight ratios for their solid oral dosage form are <u>1</u> mg to 15 mg of cladribine and 100 mg to 500 mg of cyclodextrin (col. 6, lines 23-31). This does not lead one of ordinary skill to "instantly envision" a cladribine:cyclodextrin ratio ranging from 15 mg:100mg to 15 mg:500 mg, but rather from 1 mg:500 mg to 15 mg:100 mg. This is <u>not</u> 1:6.67 to 1:33.3, it is 1:500::1:6.67, a much broader ratio range than that stated by the Examiner. Further, as applicants previously pointed out, Schultz et al.'s ratio is for a <u>mixture</u>, <u>not</u> for a complex. Virtually any ratio could be present in a mixture. Such does not suggest what ratios would be not only possible but also advantageous in a complex.

While applicants agree that Schultz et al. do not disclose any of the many features noted by the Examiner in the paragraph spanning pages 5-6 of the Official Action, it is pointed out that Schultz et al. also do not suggest applicants' complex complex (as defined in Claim 56) or a pharmaceutical composition comprising applicants' complex complex formulated into a solid oral dosage form comprising no significant amount of free crystalline cladribine (as defined in Claim 1) or a process for preparing such a pharmaceutical formulation (as defined in Claim 82). However, what is missing from Schultz et al. is not supplied by the secondary references, Wrenn, Jr. and Loftsson et al.

It is agreed that the Wrenn, Jr. patent is directed to solid formulations for oral administration and that the adenosine analogs therein include cladribine. Wrenn, Jr.'s teaching in column 12, lines 25-30 is part of his discussion of an INDAS system. As noted at line 25, INDAS takes the form of a high energy matrix tablet. Production of that matrix tablet involves including adenosine analogs in an amorphous form together with a combination of energy, excipients and unique processing procedures. Wrenn, Jr. goes on to state (col. 12, lines 30-40) that once included in the desirable physical form, the resultant high energy complex may be stabilized by an absorption process that utilizes a novel polymer cross-linked technology to prevent recrystallization. The combination of the change in the physical state of the adenosine analogs coupled with the solubilizing characteristics of the excipients employed enhances the solubility of the adenosine analogs. The resulting absorbed

amorphous drug complex granulate may then, according to Wrenn, Jr., be formulated with a gel-forming erodable tablet system to promote substantially smooth or continuous absorption. As set forth in Wrenn, Jr.'s Claim 1, his oral dosage form comprises an acid-labile 2-deoxyadenosine analog which chemically decomposes in the acid environment and one or more components which inhibit that decomposition selected from the group consisting of erodible matrix, enteric coating, solid dispersion and ion exchange resin. In Claim 8, Wrenn, Jr. specifies that the composition is in a controlled-release mechanism. In Claim 10, the controlledrelease mechanism may be an INDAS system, among others. Thus, while Wrenn, Jr. suggests amorphous forms of the drug, this is in the context of its being only one part of the INDAS system he is describing. Wrenn, et al. in no way suggests cyclodextrin complexation, much less how to make or how to use the specific complex complex of applicants' claims, which has nothing to do with novel polymer cross-linking technology. Indeed, cyclodextrins are not polymers and do not provide cross-linking! Wrenn, Jr. neither discloses nor suggests what applicants have done, which is to provide an intimate admixture consisting of (a) an amorphous inclusion complex of cladribine with HPβCD, and (b) amorphous free cladribine associated with said HPBCD as a non-inclusion complex, which is formulated into a solid oral dosage form comprising no significant amount of free crystalline cladribine therein, the cladribine:HP6CD ratio being from about 1:10 to about 1:16. There is no cladribine/cyclodextrin inclusion complex in Wrenn, Jr. and there is no non-inclusion complex there either, much less the remotest suggestion of applicants' invention as claimed herein. Indeed, Wrenn, Jr. is not remotely relevant to the present invention.

We turn now to Loftsson et al., which does indeed relate to cyclodextrins. Indeed, the very Loftsson and Brewster cyclodextrin review article referenced on page 18 of applicants' July 6, 2009 response and previously made of record in applicants' Third Information Disclosure Statement is referenced in column 2, lines 20-24 of the Loftsson et al. patent relied upon by the Examiner. Applicants already acknowledged many basic teachings in the cyclodextrin art, including the amorphous nature of HPβCD. Applicants agree that the statements made by the Examiner on page 6 of the Official Action about cyclodextrins are correct, with one notable exception. Loftsson et al do not teach that purine derivatives are, without

<u>qualification</u>, compatible with cyclodextrin for forming complexes. The Examiner has taken page 9, lines 50-55 completely out of context, as explained below.

The Loftsson et al. patent is aimed at enhancing the cyclodextrin complexation efficiency of certain structural classes of drugs by relying on reversible ring opening. In the OBJECTS AND SUMMARY OF THE INVENTION in columns 4-6, the Examiner's attention is drawn in particular to column 5, line 43 to column 6. line 49, where various aspects of the Loftsson et al. invention are summarized. In each of these aspects, the drug is defined as "having a structure comprising at least one heterocyclic ring having a total of from 4 to 7 ring atoms, of which from 1 to 3 are hetero ring atoms, each of said hetero ring atoms being selected from nitrogen. oxygen and sulfur, said ring being a cyclic imine, enamine, lactone, lactam, thiolactam, anhydride, imide, hemiacetal or hemiketal..." (Emphasis added). See also the wording of the claims of Loftsson et al.'s PCT counterpart, WO 99/42111, submitted with the accompanying IDS, which repeat this language. (The US claims recite only benzodiazepines, all of which have a cycle imine structure.) Thus, when Loftsson et al. disclose in columns 8-9 groups of preferred drugs, the patentees are speaking in the context of the quoted language; in other words, their purines are not any purines but are only ones which are susceptible to reversible ring opening. In the case of purines, Loftsson et al. disclose that the drugs are preferably caffeine, theophylline, etophylline, proxyphylline or theobromine. It is immediately apparent that cladribine, whose structure is depicted on page 1 of the instant application and in column 1 of Schultz et al., does not have the requisite imine, enamine, lactone, lactam, thiolactam, anhydride, imide, hemiacetal or hemiketal structure and thus is not susceptible to reversible ring opening and it not appropriate for use in Loftsson et al.'s invention. Moreover, as would be readily apparent to one of ordinary skill, cladribine is a nucleoside analog; it is a purine base in glycosidic linkage with a sugar, which is a ribofuranose. Loftsson et al. do not remotely suggest nucleosides or nucleoside analogs.

Secondly, the process described by Loftsson et al. for complexing their drugs with cyclodextrin is conducted at a pH level below about 5, preferably between about 3 and about 5, in the case of basic drugs such as benzodiazepine. See column 10 and the Examples, especially beginning with Example 3. The work described is

carried out in solution. Generally, the suspension of drug in aqueous cyclodextrin solution is heated in a sealed container in an autoclave, presumably to encourage ring openings at acidic pH. There is no specific disclosure of a solid oral dosage form that applicants can locate Furthermore, it is well-known that cladribine is acidlabile; as noted by Schultz et al., use of the compound orally has been limited by this fact. See col. 1, lines 36-51 of Schultz et al. Thus, one of ordinary skill would not be motivated to subject cladribine to the methods of Loftsson et al.'s patent, first because it does not even meet the structural requirements for use therein and secondly because it would decompose at the low pH levels favored by Loftsson et al. There is indeed no suggestion of cladribine in the Loftsson et al. patent.

While various methods of preparing drug-cyclodextrin complexes have been known in the art, applicants have found that a very carefully controlled series of steps are required to produce the instantly claimed complex complex and pharmaceutical composition containing it. The time and temperature specified in Claim 82 in step (i) are essential, for example, for production of applicants' unique products. The sum total of the conditions used by applicants together with the fact that cladribine is a nucleoside analog and thus has not only a particular purine ring but also a ribofuranose sugar ring surprisingly gives a very complex product when combined with HPBCD, because the hydroxyl groups on the ribofuranose ring in cladribine are able to hydrogen-bond to the hydroxyls on the exterior of the cyclodextrin ring, while the purine ring of cladribine is able to be at least partially included in the cavity of the cyclodextrin ring. This provides a very unique result which could not have been predicted. The present invention takes advantage of both parts (purine base + sugar) of the structure of cladribine so as to provide an intimate amorphous admixture consisting of (a) an amorphous inclusion complex of cladribine with HPβCD and (b) amorphous free cladribine associated with HPβCD as a non-inclusion complex (which is multiple hydrogen bond mediated as explained above), which then is further formulated into a solid oral dosage form, the composition comprising no significant amount of free crystalline cladribine therein, the composition having a weight ratio of cladribine to said amorphous cyclodextrin of from about 1:10 to about 1:16. There is no suggestion in the art of this complex complex or of how to obtain it; the cited references in combination fail to lead one of

Attorney Docket No. 0056192-000024 Application No. 10/551,205 Page 9

ordinary skill to this result. Thus, the subject matter of Claims 1, 5 and 82 is free of the outstanding rejection. The same is true of independent Claims 13 and 25 which contain all of the limitations of Claim 1. The more specific claims herein are even more remote from the prior art.

With respect to the product-by-process claims, applicants agree that the product of Claim 82 is the same as the product of Claim 1. Claims 82-90 and 94-98 are, however, patentable for all of the reasons set forth above with respect to Claim 1.

#### CONCLUSION

In view of the foregoing, it is submitted that all claims in this application are free of the record rejections. Further, favorable action in the form of a Notice of Allowance is believed to be next in order and is earnestly solicited.

Respectfully submitted,

BUCHANAN INGERSOLL & ROONEY PC

#### SIXTH INFORMATION DISCLOSURE STATEMENT

Commissioner for Patents P.O. Box 1450 Alexandria, VA 22313-1450

Sir:

In accordance with the duty of disclosure as set forth in 37 C.F.R. § 1.56, the accompanying information is being submitted in accordance with 37 C.F.R. §§ 1.97 and 1.98. Applicants request the Examiner's consideration of the document listed on the accompanying Form PTO-1449.

Pursuant to 37 C.F.R. § 1.98, a copy of the document cited is enclosed.

This Statement, Form PTO-1449 and document are being submitted after the issuance of an Official Action on the merits but prior to the final action, therefore under 37 C.F.R. § 1.97(c), the fee set forth in 37 C.F.R. § 1.17(p) is enclosed.

A fee of \$ 180 as set forth in 37 C.F.R. § 1.17(p) is enclosed.

It is respectfully requested that an Examiner-initialed copy of Form PTO-1449 be returned to the undersigned.

#### HIGH-ENERGY CYCLODEXTRIN COMPLEXES

#### **BACKGROUND OF THE INVENTION**

#### Field of the Invention:

The invention relates to methods for enhancing the complexation of a heterocyclic drug with cyclodextrin and to methods for enhancing the availability of a heterocyclic drug following administration of a cyclodextrin-drug complex.

#### **Background Art:**

5

10

15

20

25

Cyclodextrins are a group of structurally related saccharides which are formed by enzymatic cyclization of starch by a group of amylases termed glycosyltransferases. Cyclodextrins are cyclic oligosaccharides, consisting of ( $\alpha$ -1,4)-linked  $\alpha$ -D-glucopyranose units, with a somewhat lipophilic central cavity and a hydrophilic outer surface. The most common naturally occurring cyclodextrins are  $\alpha$ -cyclodextrin,  $\beta$ -cyclodextrin and  $\gamma$ -cyclodextrin consisting of 6, 7 and 8 glucopyranose units, respectively. Of these three derivatives,  $\beta$ -cyclodextrin appears to be the most useful pharmaceutical complexing agent due to its cavity size, availability, low cost and other properties.

The natural cyclodextrins, in particular  $\beta$ -cyclodextrin, have limited aqueous solubility and their complex formation with lipophilic drugs often results in precipitation of solid drug-cyclodextrin complexes. Thus, the solubility of  $\beta$ -cyclodextrin in water is only about 18.5 mg/ml at room temperature. This low aqueous solubility is, at least partly, associated with strong intramolecular hydrogen bonding in the cyclodextrin crystal lattice. Substitution of any of the hydrogen bond-forming hydroxyl groups, even by hydrophobic moieties such as methoxy groups, will increase the aqueous solubility of  $\beta$ -cyclodextrin. In addition, since these manipulations frequently produce large numbers of isomeric

WO 99/42111 PCT/IS99/00003

-2-

products, chemical modification can transform the crystalline cyclodextrins into amorphous mixtures increasing their aqueous solubility.

Cyclodextrin derivatives of current pharmaceutical interest include the hydroxypropyl derivatives of  $\alpha$ -,  $\beta$ - and  $\gamma$ -cyclodextrin, sulfoalkylether cyclodextrins such as sulfobutylether β-cyclodextrin, alkylated cyclodextrins such as the randomly methylated β-cyclodextrin, and various branched cyclodextrins such as glucosyl- and maltosyl-β-cyclodextrin (T. Loftsson and M.E. Brewster, "Cyclodextrins as pharmaceutical excipients", Pharm. Technol. Eur., 9(5), 26-34 (1997); T. Loftsson and M.E. Brewster, "Pharmaceutical applications of cyclodextrins. I. Drug solubilization and stabilization", J. Pharm. Sci. 85(10), 1017-1025 (1996); R.A. Rajewski and V.J. Stella, "Pharmaceutical applications of cyclodextrins. 2. In vivo drug delivery", J. Pharm. Sci. 85(11), 1142-1169 (1996); T. Irie and K. Uekama, "Pharmaceutical applications of cyclodextrins. 3. Toxicological issues and safety evaluation", J. Pharm. Sci., 86(2), 147-162 (1997); V.J. Stella and R.A. Rajewski, "Cyclodextrins: their future in drug formulation and delivery", Pharm. Res., 14(5), 556-567 (1997); T. Loftsson, "Increasing the cyclodextrin complexation of drugs and drug bioavailability through addition of water-soluble polymers", *Pharmazie*, 53, 733-740 (1998)).

#### Preparation of cyclodextrin inclusion complexes

5

10

15

20

25

In aqueous solutions, cyclodextrins form complexes with many drugs through a process in which the water molecules located in the central cavity are replaced by either the whole drug molecule, or more frequently, by some lipophilic portion of the drug structure. Once included in the cyclodextrin cavity, the drug molecules may be dissociated through complex dilution, by replacement of the included drug by some other suitable molecule (such as dietary lipids or bile salts in the GI tract) or, if the complex is located in close approximation to a lipophilic biological membrane (such as the mucosal membrane of the GI tract),

-3-

the drug may be transferred to the matrix for which it has the highest affinity. Importantly, since no covalent bonds are formed or broken during the drug-cyclodextrin complex formation, the complexes are in dynamic equilibrium with free drug and cyclodextrin molecules (R.A. Rajewski and V.J. Stella, "Pharmaceutical applications of cyclodextrins. 2. In vivo drug delivery", *J. Pharm. Sci.* 85(11), 1142-1169 (1996)).

5

10

15

20

25

Various methods have been applied to the preparation of drug-cyclodextrin complexes (T. Loftsson and M.E. Brewster, "Pharmaceutical applications of cyclodextrins. I. Drug solubilization and stabilization", J. Pharm. Sci. 85(10), 1017-1025 (1996); T. Loftsson and M.E. Brewster, "Cyclodextrins as pharmaceutical excipients", Pharm. Technol. Eur., 9(5), 26-34 (1997)). In solution, the complexes are usually prepared by addition of an excess amount of the drug to an aqueous cyclodextrin solution. The suspension formed is equilibrated (for periods of up to one week at the desired temperature) and then filtered or centrifuged to form a clear drug-cyclodextrin complex solution. Since the rate determining step in complex formation is often the phase to phase transition of the drug molecule, it is sometimes possible to shorten this process by formation of supersaturated solutions through sonication followed by precipitation. For preparation of the solid complexes, the water is removed from the aqueous drug-cyclodextrin solutions by evaporation or sublimation, e.g. spray-drying or freeze-drying. Other methods can also be applied to prepare solid drugcyclodextrin complexes including kneading methods, co-precipitation, neutralization and grinding techniques. In the kneading method, the drug is added to an aqueous slurry of a poorly water-soluble cyclodextrin such as β-cyclodextrin. The mixture is thoroughly mixed, often at elevated temperatures, to yield a paste which is then dried. This technique can frequently be modified so that it can be accomplished in a single step with the aid of commercially available mixers which can be operated at temperatures over 100 °C and under vacuum. The kneading

-4-

method is a cost-effective means for preparing solid cyclodextrin complexes of poorly water-soluble drugs. Co-precipitation of a cyclodextrin complex through addition of organic solvent is also possible. Unfortunately, the organic solvents used as precipitants can interfere with complexation which makes this approach less attractive than the kneading method. However, we have discovered that some organic solvents under some specific conditions, e.g. 10% (v/v) aqueous acetic acid solution, can enhance the complexation. Solid complexes of ionizable drugs can sometimes be prepared by the neutralization method wherein the drug is dissolved in an acidic (for basic drugs) or basic (for acidic drugs) aqueous cyclodextrin solution. The solubility of the drug is then lowered through appropriate pH adjustments (i.e. formation of the unionized drug) to force the complex out of solution. Finally, solid drug-cyclodextrin complexes can be formed by the grinding of a physical mixture of the drug and cyclodextrin and then heating the mixture in a sealed container to 60 to 90 °C.

## 15 Methods for enhancing cyclodextrin complexation

5

10

20

25

For a variety of reasons including cost, production capabilities and toxicology, the amounts of cyclodextrin which can be used in most drug formulations is limited (T. Loftsson and M.E. Brewster, "Cyclodextrins as pharmaceutical excipients", *Pharm. Technol. Eur.*, 9(5), 26-34 (1997); T. Loftsson, "Increasing the cyclodextrin complexation of drugs and drug bioavailability through addition of water-soluble polymers", *Pharmazie*, 53, 733-740 (1998)).

If one drug molecule (D) forms a complex with one cyclodextrin molecule (CD), then the complexation efficiency ([D-CD]/[CD]) will be equal to the intrinsic solubility of the drug ( $S_0$ ) times the stability constant of the drug-cyclodextrin complex ( $K_C$ ). In aqueous cyclodextrin solutions saturated with drug, the concentration of free drug ([D]) is approximately equal to  $S_0$ . Thus,

-5-

increased complexation efficiency can be obtained by either increasing  $S_0$  or by increasing K<sub>C</sub> or by increasing both simultaneously. Addition of organic solvents, such as ethanol, to the aqueous complexation media can result in enhanced complexation efficiency through increase in  $S_0$ . Drug ionization can increase the complexation efficiency through increase in S<sub>0</sub>. Addition of certain low molecular weight acids, such as acetic, citric, malic, or tartaric acid, to aqueous complexation media can enhance cyclodextrin solubilization of basic drugs through increase in S<sub>0</sub> (i.e. salt formation, pH changes and lowering melting point) and/or increase in the apparent K<sub>C</sub>. Water-soluble polymers can increase the complexation efficiency through increase in the apparent K<sub>C</sub>. Furthermore, it is often possible to enhance cyclodextrin complexation even further by using several different methods simultaneously to enhance the cyclodextrin complexation. Pharmaceutical applications of these and other methods have been reviewed (See T. Loftsson, "Increasing the cyclodextrin complexation of drugs and drug bioavailability through addition of water-soluble polymers", *Pharmazie*, 53, 733-740 (1988); T. Loftsson and M.E. Brewster, "Cyclodextrins as pharmaceutical excipients", Pharm. Technol. Eur., 9(5), 26-34 (1997); T. Loftsson and M.E. Brewster, "Pharmaceutical applications of cyclodextrins. I. Drug solubilization and stabilization", J. Pharm. Sci. 85(10), 1017-1025 (1996)).

#### 20 Permeability of drugs through biological membranes

5

10

15

25

The cyclodextrin molecules are relatively large (molecular weight ranging from almost 1000 to over 1500), with a hydrated outer surface, and under normal conditions, cyclodextrin molecules will only permeate biological membranes with considerable difficulty (R.A. Rajewski and V.J. Stella, "Pharmaceutical applications of cyclodextrins. 2. In vivo drug delivery", *J. Pharm. Sci.* 85(11), 1142-1168 (1996); T. Irie and K. Uekama, "Pharmaceutical applications of cyclodextrins. 3. Toxicological issues and safety evaluation", *J. Pharm. Sci.* 

-6-

86(2), 147-162 (1997); K.-H. Frömming and J. Szeitli. Cyclodextrins in pharmacy, Kluwer Academic Publishers, Dordrecht, The Netherlands, 1994; T. Loftsson and J.H. Ólafsson, "Cyclodextrins: new drug delivery systems in dermatology", Int. J. Dermatol., 37, 241-246 (1998); T. Loftsson and E. Stefánsson, "Effect of cyclodextrins on topical drug delivery to the eye", Drug Dev. Ind. Pharm. 23(5), 473-481 (1997)). It is generally recognized that cyclodextrins act as true carriers by keeping the hydrophobic drug molecules in solution and deliver them to the surface of the biological membrane, e.g. skin, mucosa or the eye cornea, where they partition into the membrane. The relatively lipophilic membrane has low affinity for the hydrophilic cyclodextrin molecules and therefore they remain in the aqueous membrane exterior, e.g. the aqueous vehicle system, salvia or the tear fluid. Conventional penetration enhancers, such as alcohols and fatty acids, disrupt the lipid layers of the biological barrier. Cyclodextrins, on the other hand, act as penetration enhancers by increasing drug availability at the surface of the biological barrier. Furthermore, addition of water-soluble polymer, such as polyvinylpyrrolidone, apparently increase even further the availability of the drug molecules at the surface of the biological membrane resulting in enhanced drug bioavailability (T. Loftsson, "Increasing the cyclodextrin complexation of drugs and drug bioavailability through addition of water-soluble polymers", *Pharmazie*, 53, 733-740 (1998); T. Loftsson, M. Másson and E. Stefánsson, "Cyclodextrins as Permeation enhancers", Proceedings of the 17<sup>th</sup> Pharmaceutical Technology Conference and Exhibition, Volume 2, Dublin, 24-26 March, 1998, pp. 313-324).

#### **OBJECTS AND SUMMARY OF THE INVENTION**

# 25 Enhancing complexation efficiency

5

10

15

20

It is possible to enhance the cyclodextrin (CD) complexation efficacy, or efficiency, of drugs (D), and other "guest" molecules, by either increasing the

-7-

5

10

15

20

25

apparent stability constant (K<sub>C</sub>) of the drug-cyclodextrin complex (D-CD) or increasing the apparent intrinsic solubility (S<sub>0</sub>) of the drug. For example, K<sub>C</sub> can be increased by addition of water-soluble polymers to the aqueous complexation media and S<sub>0</sub> can be increased by ionization of the drug molecule, as described previously. However, increased complexation efficiency by itself does not necessarily result in increased drug availability in the aqueous complexation media or increased drug availability from solid drug-cyclodextrin complexes. On the other hand, if the drug-cyclodextrin complexes are prepared under conditions which ensure enhanced complexation and if the complexation efficiency decreases upon administration, then enhanced drug availability will be observed. Thus, the present invention involves: i) enhancement of the complexation efficiency and ii) reduction of the complexation efficiency after administration. For example, it is possible to enhance the complexation efficiency of many ionizable drugs by preparing the complexes at a pH where the drug is ionized but obtain decreased efficiency upon administration due to pH changes and consequent decreased ionization. One example of such a drug is phenytoin (pKa 8.1). Its solubility in water at room temperature (25 °C) is only 18  $\mu$ g/ml at pH 5 and 32  $\mu$ g/ml at pH 8 (P.A. Schwartz, C.T. Rhodes and J.W. Cooper, "Solubility and ionisation characters of phenytoin", J. Pharm. Sci., 66, 994-997 (1977)). Addition of 25% (w/v) 2-hydroxypropyl- $\beta$ -cyclodextrin to the aqueous solutions increases the solubility of phenytoin to 5.0 mg/ml at pH 5 and 6.4 mg/ml at pH 8, which is 280and 200-fold solubility enhancement, respectively. Although the apparent stability constant (K<sub>C</sub>) of the phenytoin-cyclodextrin complex is much larger for the drug in the unionized form than for the anionic form, it is possible to obtain much higher total solubility by increasing the apparent intrinsic solubility  $(S_0)$  of the drug  $(T, S_0)$ Loftsson and N. Bodor, "Effects of 2-hydroxypropyl-β-cyclodextrin on the aqueous solubility of drugs and transdermal delivery of 17β-estradiol", Acta Pharm. Nord., 1, 185-194 (1989)). However, if the pH 8.0 solution was placed in

-8-

5

10

15

20

an environment which would decrease the pH from 8 to 5 (e.g. topical application to the skin), then a supersaturated solution would be formed which would result in enhanced drug availability (e.g. it would result in enhanced transdermal drug delivery). Other means to enhance  $S_0$  include reversible derivation (e.g. prodrug formation) of the guest molecule and addition of certain low molecular weight acids. The value of K<sub>C</sub> can, for example, be increased by addition of certain low molecular weight acids, by addition of water-soluble polymers to the aqueous complexation media or by using mixed solvent systems such as aqueous 10% (v/v) acetic acid. For example, addition of the polymers and heating in an autoclave (to 120-140°C for 20-40 minutes) does not only increase the complexation but it has also been shown to enhance transdermal and transcorneal drug delivery (T. Loftsson and A.M. Sigurdardottir, "Cyclodextrins as skin penetration enhancers", in J. Szejtli and L. Szente (Eds.) Proceedings of the Eighth International Symposium on Cyclodextrins, Kluwer Academic Publishers, 1996, pp. 403-406; T. Loftsson and E. Stefansson, "Effect of cyclodextrins on topical drug delivery to the eye", Drug Devel. Ind. Pharm., 23(5), 473-481 (1997)). As shown in Table 1 below, it is not enough to add the polymers to the complexation medium. Addition of polymers to the unheated vehicles did not enhance the transdermal delivery of enalaprilat. However, heating the vehicles after addition of the polymers resulted in significant enhancement. The effect of the polymers on the transdermal delivery of enalaprilat can, at least partly, be explained by decreased complexation efficiency (i.e. decrease in  $K_C$ ) at the skin surface.

-9-

Table 1. The effect of heating on transdermal delivery of enalaprilat from 10% (w/v) HP $\beta$ CD solutions at pH 5.0 containing 2.5% enalaprilat in a suspension. The concentration of dissolved enalaprilat was between 2.0 and 2.3% (w/v).

Donor phase	Flux (mg h <sup>-1</sup> cm	-2)	Ratio
(w/v per cent)	Un-heated	Heated	
нрвср	18±2	. <del>"</del>	-
HPβCD, 0.25% PVP	16±6	$23\pm7$	1.4
HPβCD, 0.10% HPMC	14±3	$37\pm12$	2.6

5

In one aspect of the present invention there is provided a method for enhancing the complexation efficacy, i.e. efficiency, of a drug with cyclodextrin, said drug having a structure comprising at least one heterocyclic ring having a total of from 4 to 7 ring atoms, of which from 1 to 3 are hetero ring atoms, each of said hetero ring atoms being selected from nitrogen, oxygen and sulfur, said ring being a cyclic imine, enamine, lactone, lactam, thiolactam, anhydride, imide, hemiacetal or hemiketal, said method comprising subjecting said drug to chemically reversible ring-opening so that at least a portion (at least 0.1% by weight) thereof is in ring-opened form, and complexing said drug with cyclodextrin.

20

25

15

In a related aspect of the invention, there is provided a method for enhancing the complexation efficiency of a drug with cyclodextrin, said drug having a structure comprising at least one heterocyclic ring having a total of from 4 to 7 ring atoms, of which from 1 to 3 are hetero ring atoms, each of said hetero ring atoms being selected from nitrogen, oxygen and sulfur, said ring being a cyclic imine, enamine, lactone, lactam, thiolactam, anhydride, imide, hemiacetal

-10-

or hemiketal, said method comprising complexing said drug with cyclodextrin in an aqueous medium under conditions which effect chemically reversible ring-opening of at least a portion (at least 0.1% by weight) of said drug.

5

10

15

20

25

In another aspect of the invention, there is provided a method for enhancing the availability of a drug following administration of a cyclodextrindrug complex to a warm-blooded animal in need of same, said drug having a structure comprising at least one heterocyclic ring having a total of from 4 to 7 ring atoms of which from 1 to 3 are hetero ring atoms, each of said hetero ring atoms being selected from nitrogen, oxygen and sulfur, said ring being a cyclic imine, enamine, lactone, lactam, thiolactam, anhydride, imine, hemiacetal or hemiketal, said method comprising complexing said drug with cyclodextrin in an aqueous medium under conditions which effect chemically reversible ring-opening of at least a portion (at least 0.1% by weight) of said drug to enhance the complexation efficiency, followed by administering the cyclodextrin-drug complex thus obtained to said animal under conditions which reduce the complexation efficiency.

In still another aspect, the present invention provides a method for enhancing the availability of a basic drug (i.e. a proton acceptor) following administration of a cyclodextrin-drug complex to a warm-blooded animal in need of same, said basic drug having a structure comprising at least one heterocyclic ring having a total of from 4 to 7 ring atoms, of which from 1 to 3 are hetero ring atoms, each of said hetero ring atoms being selected from nitrogen, oxygen and sulfur, said ring being a cyclic imine, enamine, lactone, lactam, thiolactam, anhydride, imide, hemiacetal or hemiketal, said method comprising subjecting said basic drug to complexation in an aqueous medium at a pH level below the pKa+2 value of said basic drug to enhance the complexation efficiency, followed by administering the cyclodextrin-drug complex thus obtained to said animal under conditions which reduce the complexation efficiency.

In yet another aspect, the present invention provides a method for enhancing the availability of an acidic drug following administration of a cyclodextrin-drug complex to a warm-blooded animal in need of same, said acidic drug having a structure comprising at least one heterocyclic ring having a total of 4 to 7 ring atoms, of which from 1 to 3 are hetero ring atoms, each of said hetero ring atoms being selected from nitrogen, oxygen and sulfur, said ring being a cyclic imine, enamine, lactone, lactam, thiolactam, anhydride, imide, hemiacetal or hemiketal, said method comprising subjecting said acidic drug to complexation in an aqueous medium at a pH level above the pKa-2 value of said acidic drug to enhance the complexation efficiency, followed by administering the cyclodextrindrug complex thus obtained to said animal under conditions which reduce the complexation efficiency.

#### BRIEF DESCRIPTION OF THE DRAWINGS

Fig. 1 is a graph illustrating the effect of pH on the phase-solubility of phenytoin (pKa 8.1) in aqueous hydroxypropyl- $\beta$ -cyclodextrin (HP $\beta$ CD) solutions at 25°C at pH 10.19 ( $\spadesuit$ ); pH 7.55 ( $\blacksquare$ ) and pH 2.74 ( $\spadesuit$ );

Fig. 2 is a graph illustrating the effect of pH on the solubility of alprazolam (pKa 2.4) in aqueous 10% (w/v) HP $\beta$ CD solutions at room temperature;

Fig. 3 is a graph illustrating the effect of pH (i.e. the diazepine ring-opening) on the solubility of midazolam (pKa 6.2) in pure aqueous buffer solutions ( $\bullet$ ), aqueous buffer solutions containing 10% (w/v) HP $\beta$ CD ( $\blacksquare$ ) and aqueous buffer solutions containing both 10% (w/v) HP $\beta$ CD and 0.10% (w/v) hydroxypropyl methylcellulose (HPMC) ( $\bullet$ ) at room temperature;

Fig. 4 is a graph illustrating the effects of cyclodextrins, pH and 10% (v/v) acetic acid on the solubility of midazolam in aqueous solutions: pure aqueous buffer solution ( $\triangle$ ); aqueous 10% (v/v) acetic acid solution ( $\bigcirc$ ); 10% w/v HP $\beta$ CD solution containing 0.10% (w/v) HPMC in aqueous 10% (v/v) acetic acid solution

-12-

( $\blacksquare$ ); 10% (w/v) aqueous sulfobutyl ether- $\beta$ -cyclodextrin (SBE $\beta$ CD) solution in aqueous 10% (v/v) acetic acid solution ( $\spadesuit$ ); and

Fig. 5 is a graph plotting the concentration in ng/ml of midazolam in serum after intravenous administration of 2 mg of a commercial intravenous formulation of midazolam (O) and nasal administration of 4.8 mg of a nasal formulation of midazolam prepared in accord with the present invention ( $\Delta$ ), against time in minutes, where each point represents the mean value and error bars represent standard deviation.

## **DETAILED DESCRIPTION OF THE INVENTION**

The following table (**Table 2**) lists some of the currently available cyclodextrins contemplated for use in the present invention.

5.

5

PCT/IS99/00003

Table 2. Some of the currently available cyclodextrins obtained by substitution of the OH-groups located on the edge of the cyclodextrin ring. Since both the number of substituents and their location will affect the physicochemical properties of the cyclodextrin molecules, such as their aqueous solubility and complexing abilities, each derivative listed should be regarded as a group of closely related cyclodextrin derivatives.

Particularly preferred cyclodextrins for use herein are hydroxypropyl- $\beta$ -cyclodextrin,  $\beta$ -cyclodextrin sulfobutyl ether, the branched  $\beta$ -cyclodextrins (especially glucosyl- $\beta$ -cyclodextrin and maltosyl- $\beta$ -cyclodextrin, hydroxypropyl- $\gamma$ -cyclodextrin and  $\gamma$ -cyclodextrin.

5

10

15

20

25

In preferred aspects of the present invention, the drug for use herein is one having a structure comprising at least one heterocyclic ring. The heterocyclic ring generally has a total of 4 to 7 ring atoms, of which from 1 to 3 are hetero ring atoms. While each hetero ring atom can be nitrogen, oxygen or sulfur, heterocycles having at least one nitrogen or oxygen ring atom are preferred. Preferably, the drug has at least one heterocyclic ring which is a cyclic imine, enamine, lactone, lactam, thiolactam, anhydride, imide, hemiacetal or hemiketal.

Especially desirable drugs for use in accord with the present invention are benzodiazepines. Benzodiazepines contain a benzene ring fused with a diazepine ring which is a 7-membered ring with nitrogen atoms in positions 1 and 4. By way of example, the chemical name of alprazolam is 8-chloro-1-methyl-6-phenyl-4H-s-triazolo[4,3-a][1,4]benzodiazepine, the chemical name of midazolam is 8chloro-6-(2-fluorophenyl)-1-methyl-4H-imidazo[1,5-a][1,4]benzodiazepine and that of triazolam is 8-chloro-6-(o-chlorophenyl)-1-methyl-4H-s-triazolo[4,3al[1,4]benzodiazepine. Thus, all of these compounds have the 1,4-benzodiazepine structure with a double bond between nitrogen atom number 4 and carbon atom number 5 (which gives the molecule a cyclic imine structure). The benzodiazepines are cyclic imines. They are all basic, i.e. they are proton acceptors. Preferred benzodiazepines for use herein are alprazolam, brotizolam, chlordiazepoxide, clobazam, clonazepam, clorazepam, demoxazepam, flumazenil, flurazepam, halazepam, midazolam, nordazepam, medazepam, diazepam, nitrazepam, oxazepam, midazepam, lorazepam, prazepam, quazepam, triazolam, temazepam and lorazolam. Especially preferred are midazolam, alprazolam, clonazepam, lorazepam and triazolam.

Another group of preferred drugs for use herein consists of the barbituric acid derivatives. The barbituric acids contain a 2,4,6-trihydroxypyrimidine (also called 2,4,6-trioxohexahydropyrimidine) ring in their structure, a 6-member ring with nitrogen in positions 1 and 3. Thus, the chemical name of barbital is 5,5-diethyl-2,4,6(1H,3H,5H)-pyrimidinetrione and that of phenobarbital is 5-ethyl-5-phenyl-2,4,6(1H,3H,5H)-pyrimidinetrione. The barbituric acids can be characterized as cyclic amides or lactams (cyclic amides are called lactams) or imides (which are nitrogen analogues of cyclic anhydrides). Barbituric acids are weak acids. Preferred barbituric acid derivatives are barbital, butobarbital, amobarbital, phenobarbital, aprobarbital, secobarbital, crotylbarbital, cyclobarbital, phenobarbital, hexobarbital, methylphenobarbital, thiopental, isopropylbromallylbarbituric acid, cyclohexenylallylthiobarbituric acid and their salts. Thiopental is 5-ethyldihydro-5-(1-methylbutyl)-2-thioxo-4,6(1H,5H)-pyrimidinedione, i.e. one = O moiety in the barbituric acid structure has been replaced by = S.

5

10

15

20

25

Yet another group of preferred drugs for use in the present invention consists of the hydantoins. Hydantoins are, like barbituric acids, cyclic urea derivatives. The ring-opened acyl derivatives of hydantoins and barbituric acids are sometimes called ureides. Both hydantoins and barbituric acids can form urea upon hydrolysis. Hydantoins contain a 2,4-imidazolidinedione ring in their structure, a 5-membered ring with nitrogen in positions 1 and 3. The chemical name of, for example, phenytoin, is 5,5-diphenyl-2,4-imidazolidinedione. Hydantoins are closely related to barbituric acids and are acids like them.

Still another group of preferred drugs for use in the present invention consists of pyrazole derivatives. The expression "pyrazole derivatives" as used herein includes drugs containing a pyrazole ring, 3-pyrazoline ring or pyrazolidine ring in their structure, all of which are 5-membered rings with nitrogens in positions 1 and 2. These compounds are either basic or acidic. Preferred pyrazole

-16-

derivatives for use herein include phenazone, phenylphenazone, metamidazole, phenylbutazone, oxyphenbutazone and sulfinpyrazone.

Yet another group of drugs preferred for use herein consists of imidazole derivatives. The expression "imidazole derivatives" as used herein includes drugs containing an imidazole, imidazoline or imidazolidine ring in their structure. These are 5-membered rings with nitrogen atoms in positions 1 and 3. These compounds are either basic or acidic. Preferred compounds of this type include histamine, miconazole, pilocarpine, naphazoline and clonidine.

5

10

15

20

25

Another group of preferred drugs for use in this invention are pyrimidine derivatives. These drugs contain a 6-membered ring with nitrogen atoms in positions 1 and 3. These derivatives are usually basic. Preferred pyrimidine derivatives include thiamine, trimethoprim, orotic acid, methylthiouracyl and prothiouracyl.

Still another group of preferred drugs for use herein are purine derivatives, which contain purine, that is, imidazo(4,5-d)pyrimidine, in their structures. These drugs are frequently basic but some of them are acidic. Preferred purine derivatives include caffeine, theophylline, etophylline, proxyphylline and theobromine.

Cyclic drugs having heterocyclic rings characterized as enamines, lactones, lactams, thiolactams, anhydrides, imides, imines, hemiacetals and hemiketals are thus appropriate for use in preferred embodiments of the invention, in which ring opening of the heterocyclic ring takes place.

In various aspects of the present invention, the drug is subjected to chemically reversible ring-opening so that at least a portion thereof is in ring-opened form. The portion in ring-opened form is at least 0.1% by weight, preferably at least 1 or 2% by weight, more preferably at least 5% by weight of said drug. In aqueous formulations, the amount of drug in ring-opened form is frequently from about 5 to about 10% by weight and usually no more than about

-17-

50%. In solid formulations, the portion of drug in ring-opened form can generally be much higher, frequently about 50% or more, and sometimes even about 90 to 95%.

When the method of the invention comprises complexing the drug with cyclodextrin in an aqueous medium under conditions which effect chemically reversible ring-opening of at least a portion (at least 0.1% by weight) of the drug, the complexation is advantageously conducted at a pH level which affords ring-opening of at least 5% by weight of said drug. Preferably the complexation is conducted at a pH level of below about 5.

10

15

20

25

5

In one preferred embodiment, the drug is a basic drug, especially a benzodiazepine, and the complexation is conducted at a pH level of below about 5. It is also preferred that the cyclodextrin is hydroxypropyl-β-cyclodextrin, βcyclodextrin sulfobutyl ether, a branched  $\beta$ -cyclodextrin (especially glucosyl  $\beta$ cyclodextrin or maltosyl-β-cyclodextrin), β-cyclodextrin, hydroxypropyl-γcyclodextrin or  $\gamma$ -cyclodextrin. It is also preferred that the benzodiazepine is alprazolam, brotizolam, chlordiazepoxide, clobazam, clonazepam, clorazepam, demoxazepam, flumazenil, flurazepam, halazepam, midazolam, nordazepam, medazepam, diazepam, nitrazepam, oxazepam, midazepam, lorazepam, prazepam, quazepam, triazolam, temazepam or loprazolam; and that the cyclodextrin-drug complex thus obtained be formulated as a nasal spray, sublingual tablet or parenteral solution, especially when formulated suitable for use in producing a sedative, anti-anxiety, anticonvulsant or muscle relaxant effect, most especially as a pre-anaesthetic medication, or to supplement anaesthesia, to induce and/or maintain anaesthesia or to induce a hypnotic effect. In especially preferred embodiments, the benzodiazepine is midazolam, alprazolam, clonazepam, lorazepam or triazolam; the cyclodextrin is hydroxypropyl-β-cyclodextrin, βcyclodextrin sulfobutyl ether, a branched β-cyclodextrin (especially glucosyl βcyclodextrin or maltosyl β-cyclodextrin), β-cyclodextrin, hydroxypropyl-γ-

-18-

cyclodextrin or  $\gamma$ -cyclodextrin; and the complexation is conducted at a pH level below about 5, preferably between about 3 and about 5.

In another embodiment of the present method utilizing chemically reversible ring-opening described above, the drug is an acidic drug.

5

10

In yet another embodiment of the present method utilizing chemically reversible ring-opening described above, the drug is a barbituric acid derivative, a hydantoin, a pyrazole derivative, an imidazole derivative, a pyrimidine derivative or a purine derivative. When the drug is a barbituric acid derivative, it is preferably barbital, butobarbital, amobarbital, phenobarbital, aprobarbital, secobarbital, crotylbarbital, cyclobarbital, phenobarbital, hexobarbital, methylphenobarbital, thiopental, isopropylbromallylbarbituric acid, or cyclohexenylallylthiobarituric acid, or a salt thereof. When the drug is a hydantoin, it is preferably phenytoin. When the drug is a pyrazole derivative, it is preferably phenazone, propylphenazone, metamidazole, phenylbutazone, oxyphenbutazone or sulfinpyrazone. When the drug is an imidazole derivative, it is preferably histamine, miconazole, pilocarpine, naphazoline or clonidine. When the drug is a pyrimidine derivative, it is preferably thiamine, trimethoprim, orotic acid, methylthiouracyl or prothiouracyl. When the drug is a purine derivative, it

20

25

15

When the present invention comprises complexing the drug with cyclodextrin in an aqueous medium under conditions which effect chemically reversible ring-opening of at least a portion (at least 0.1% by weight) of the drug to enhance the complexation efficacy, followed by administering the cyclodextrin-drug complex thus obtained to said animal under conditions which reduce the complexation efficacy, the complexation is generally conducted at a pH level which affords ring-opening of at least 5% by weight of the drug. Preferably, the complexation is conducted at a pH level of below about 5, especially between about 3 and about 5. The cyclodextrin is preferably hydroxypropyl-β-

is preferably caffeine, theophylline, etophylline, proxyphylline or theobromine.

-19-

cyclodextrin, β-cyclodextrin sulfobutyl ether, a branched β-cyclodextrin (especially glucosyl-β-cyclodextrin or maltosyl-β-cyclodextrin), β-cyclodextrin, hydroxypropyl-γ-cyclodextrin or γ-cyclodextrin. The drug is preferably a benzodiazepine, especially midazolam, alprazolam, clonazepam, lorazepam or triazolam. The cyclodextrin-drug complex is preferably administered in the form of an aqueous solution or a hydrogel, particularly as a nasal spray or nasal drops, or as a parenteral solution. As a nasal spray of a benzodiazepine, the aqueous solution is advantageously brought to a pH level of below about 6, preferably below about 4.7, most especially to a pH between about 3 and about 4.7. When administered as a solid, the cyclodextrin-drug complex is preferably formulated as a tablet for oral, buccal or sublingual administration. The water may be removed from the aqueous complexation medium after formation of the cyclodextrin-drug complex.

5

10

15

20

25

When the present invention comprises subjecting a basic drug to complexation in an aqueous medium at a pH level below the pKa+2 value of said basic drug to enhance the complexation efficiency, followed by administering the cyclodextrin-drug complex thus obtained to an animal under conditions which reduce the complexation efficiency, the basic drug is preferably a benzodiazepine. Benzodiazepines of particular interest are alprazolam, brotizolam, chlordiazepoxide, clobazam, clonazepam, clorazepam, demoxazepam, flumazenil, flurazepam, halazepam, midazolam, nordazepam, medazepam, diazepam, nitrazepam, oxazepam, midazepam, lorazepam, prazepam, quazepam, triazolam, temazepam and loprazolam. Particularly preferred benzodiazepines are alprazolam, midazolam, clonazepam, lorazepam and triazolam. The cyclodextrin-benzodiazepine complex obtained in the complexation step is preferably formulated as a nasal spray, sublingual tablet or parenteral solution, which is preferably administered in an effective sedative, anti-anxiety, anticonvulsant or muscle relaxant amount, particularly as a pre-anaesthetic

-20-

5

10

15

20

25

medication, or to supplement anaesthesia, to induce and/or maintain anaesthesia or to induce a hypnotic effect. In this general aspect of the invention, the pH level of the aqueous complexation medium is advantageously selected so that it also affords ring-opening of at least 5% by weight of the drug. For the benzodiazepines, the complexation is preferably conducted at a pH level of below about 5, most preferably between about 3 and about 5. Also in this general aspect of the invention, in one preferred embodiment, the complexation is carried out in the presence of from about 0.001 to about 5% (weight/volume) of a pharmacologically inactive, pharmaceutically acceptable water-soluble polymer at a temperature of from about 30°C to about 150°C. Preferably, the polymer is a cellulose derivative or a polyvinyl polymer; more preferably, the polymer is methylcellulose, hydroxyethyl cellulose, hydroxypropyl cellulose, hydroxypropyl methylcellulose, hydroxyethyl methylcellulose, hydroxypropyl ethylcellulose, hydroxyethyl ethylcellulose, sodium carboxymethylcellulose or polyvinylpyrrolidone. An especially preferred cellulose derivative is hydroxypropyl methylcellulose. A method for enhancing drug-cyclodextrin complexation utilizing a pharmacologically inactive water-soluble polymer is described in Loftsson United States Patents No. 5,324,718 and No. 5,472,954. In another preferred embodiment of this general aspect of the invention, the complexation is also carried out in the presence of acetic acid and/or one or more pharmaceutically acceptable salts of acetic acid, the acetate-water ratio of the aqueous complexation medium being from about 1:1000 to about 2:1, preferably from about 1:100 to about 1:1, more preferably from about 1:20 to about 1:4. Preferably, the drug is midazolam and the cyclodextrin is hydroxypropyl-βcyclodextrin,  $\beta$ -cyclodextrin sulfobutyl ether, a branched  $\beta$ -cyclodextrin (especially glucosyl-β-cyclodextrin or maltosyl-β-cyclodextrin), β-cyclodextrin, hydroxypropyl- $\gamma$ -cyclodextrin or  $\gamma$ -cyclodextrin.

-21-

When the present invention comprises subjecting an acidic drug to complexation in an aqueous medium at a pH level above the pKa-2 value of said acidic drug to enhance the complexation efficiency, followed by administering the cyclodextrin-drug complex thus obtained to an animal under conditions which reduce the complexation efficiency, preferably the pH level of the aqueous complexation medium is selected such that it also affords ring-opening of at least 5% by weight of said drug.

In order to further illustrate the present invention and the advantages thereof, the following specific examples are given, it being understood that same are intended only as illustrative and in no way limitative of the invention.

## Example 1

5

10

15

20

25

Phenytoin (5,5-diphenylhydantoin) is a water-insoluble weak acid (pKa 8.1) which forms a somewhat water-soluble anion in alkaline solution. Solubility (S) of phenytoin at three different pH levels was determined in aqueous solutions containing various amounts of 2-hydroxypropyl-β-cyclodextrin (HPβCD) of molar substitution (MS) = 0.9, i.e. (a) pH  $2.74\pm0.18$  (SD), (b) pH  $7.55\pm0.12$ , and (c) pH 10.19±0.14. Excess amount of the drug was added to the aqueous HPβCD solution and the suspension formed sonicated for one hour at room temperature (23°C). After equilibration at 25°C in a water-bath for three days, the suspension was filtered through a 0.45  $\mu$ m membrane filter, diluted with aqueous methanolic solution and the amount of dissolved phenytoin determined by a high pressure liquid chromatographic method (HPLC). FIG. 1 illustrates the effect of pH on the phase-solubility of phenytoin (pKa 8.1) in aqueous HPβCD solutions at 25°C. The results set forth in FIG. 1 show significant enhancement in the HPβCD solubilization (i.e. the efficiency of the complexation) of the drug at pH 10.19 (•) where the drug is mainly in the ionized form. Formation of phenytoin-HPβCD complexes at pH 10.19 can result in enhanced bioavailability of phenytoin. For

-22-

example, topical application of such a solution to the skin will result in lowering of pH, which will decrease the efficiency of the complexation, which again will result in enhanced permeability of phenytoin into and through the skin. Also, formation of phenytoin-HP $\beta$ CD complexes at pH of about 10 (e.g. in aqueous ammonia solutions) and lyophilization of the complex will result in phenytoin-HP $\beta$ CD complex powder which can, for example, be formulated into tablets. The bioavailability of phenytoin from such tablets will be enhanced compared to the phenytoin availability from tablets containing phenytoin-HP $\beta$ CD complex prepared at lower pH, e.g. at pH 2.7 ( $\bullet$ ) or 7.6 ( $\blacksquare$ ).

## 10 Example 2

5

15

20

25

Alprazolam is a water-insoluble weak base (pKa 2.41) which forms a somewhat water-soluble cation in acidic solution. Solubility (S) of alprazolam at several different pH levels was determined in aqueous solutions containing 10% (w/v) 2-hydroxypropyl- $\beta$ -cyclodextrin (HP $\beta$ CD) of molar substitution (MS) = 0.3. Excess amount of the drug was added to the aqueous HPBCD solution and the suspension formed heated in a sealed container in an autoclave (120-140°C for 20-40 minutes). After equilibration at room temperature (22-23°C) for seven days, the suspension was filtered through a 0.45 µm membrane filter, diluted with aqueous methanolic solution and the amount of dissolved alprazolam determined by a high pressure liquid chromatographic method (HPLC). FIG. 2 illustrates the effect of pH on the solubility of alprazolam (pKa 2.4) in aqueous 10% (w/v) HP $\beta$ CD solutions at room temperature. The results set forth in FIG. 2 show significant enhancement in the HPBCD solubilization (i.e. the efficiency of the complexation) of the drug at a pH at which the drug is mainly in the ionized form. The sharp increase in the solubility can, however, only partly be explained by the ionization of the alprazolam molecule.

10

15

Several drugs which have a nitrogen-containing heterocycle in their structure are known to undergo reversible ring-opening which frequently is pH dependent. For example, barbituric acids undergo reversible ring cleavage (H.J. Roth, K. Eger and R. Troschütz, *Pharmaceutical Chemistry*. *Volume 2. Drug Analysis*. Ellis Horwood, 1991, pp. 308-309):

HO NH<sub>2</sub> +H<sub>2</sub>O 
$$R_1$$
 NH  $H_2$ O  $H_2$ N OH  $H_$ 

Another example of such reversible ring-opening is the opening of cyclic imines through formation of an aldehyde or ketone and a primary amine:

Another example of such reversible ring-opening is the opening of cyclic imines through formation of an aldehyde or ketone and a primary amine:

An example of such structure is the 1H-1,4-diazepine ring which, for example, is an essential structure of the benzodiazepine derivatives. These structural changes are pH-dependent and reversible, and it is known that the open form frequently coexists with the closed one in several commercial products. One example is the iv solution of midazolam (Dormicum<sup>TM</sup> from F. Hoffmann-LaRoche & Ltd,

-24-

Switzerland) where the drug is partly in the open form (M. Gerecke, "Chemical structure and properties of midazolam compared with other benzodiazepines", *Br. J. Clin. Pharmac.*, 11S-16S (1983)). However, the open form of midazolam is rapidly converted to the closed one upon *iv* administration.

10

15

20

We have determined the effect of pH and cyclodextrins, i.e. HP $\beta$ CD MS 0.3, sulfobutylether  $\beta$ -cyclodextrin (SBE $\beta$ CD) with degree of substitution (DS) = 6.4,  $\alpha$ -cyclodextrin ( $\alpha$ CD) and  $\gamma$ -cyclodextrin ( $\gamma$ CD) on the ring-opening of several benzodiazepines. The cyclodextrin concentration was 10% (w/v) and the benzodiazepine concentration was 1x10<sup>-4</sup> M. The concentration of the closed form was determined immediately after dissolving the benzodiazepine in the aqueous cyclodextrin solution and again 24 hours later (i.e. after equilibration at 23°C). Preliminary experiments had shown that equilibrium between the closed and the open form was attained within 3 hours at 23°C.

It is clear from the results displayed in **Table 3** below that a large fraction of the benzodiazepines (over 50% at pH below 2) are in the open form at low pH and that the fraction of open form frequently increases upon addition of cyclodextrin to the aqueous solution. For example, at pH 3 about 60% of alprazolam in aqueous HP $\beta$ CD solution is in the open form. This will increase the apparent intrinsic solubility (S $_0$ ). This increase in S $_0$  will result in enhanced complexation efficiency. The observed increase in the complexation efficiency will result in enhanced cyclodextrin solubilization of the benzodiazepines in aqueous solutions.

## Example 4

5

10

15

20

25

Midazolam is a water-insoluble weak base (pKa 6.2) which forms a somewhat water-soluble cation in acidic solution. Solubility (S) of midazolam at several different pH levels was determined in: a) pure aqueous buffer solutions (i.e. without HPβCD and HPMC); b) aqueous buffer solutions containing 10% (w/v) 2-hydroxypropyl- $\beta$ -cyclodextrin (HP $\beta$ CD) of molar substitution (MS) = 0.3; and c) aqueous solutions containing 10% (w/v) 2-hydroxypropyl- $\beta$ cyclodextrin (HP $\beta$ CD) of molar substitution (MS) = 0.3 and 0.10% (w/v) hydroxypropyl methylcellulose (HPMC) 4000. Excess amount of the drug was added to the aqueous solution and the suspension formed was heated in a sealed container in an autoclave (120-140°C for 20-40 minutes). After equilibration at room temperature (22-23°C) for seven days, the suspension was filtered through a  $0.45 \mu m$  membrane filter, diluted with aqueous methanolic solution and the amount of dissolved midazolam determined by a high pressure liquid chromatographic method (HPLC). FIG. 3 illustrates the effect of pH (i.e. the ring-opening) on the solubility of midazolam (pKa 6.2) in pure aqueous buffer solutions (●), aqueous buffer solutions containing 10% (w/v) HPBCD (■), and aqueous buffer solutions containing both 10% (w/v) HPβCD and 0.10% (w/v) HPMC (♦) at room temperature. The results set forth in FIG. 3 show significant enhancement in the HPβCD solubilization (i.e. the efficiency of the complexation) of the drug at pH levels where the drug exists partly in the open form. Addition of HPMC significantly improves the efficiency.

## Example 5

Solubility (S) of midazolam at several different pH levels was determined in: a) pure aqueous buffer solutions (i.e. without cyclodextrin, polymer or acetic acid); b) aqueous buffer solutions containing 10% (v/v) acetic acid as a co-solvent; c) aqueous buffer solutions containing 10% (w/v) sulfobutylether β-cyclodextrin

-28-

(SBEβCD) and 10% (v/v) acetic acid as a co-solvent; and d) aqueous buffer solutions containing 10% (w/v) 2-hydroxypropyl-β-cyclodextrin (HPβCD), 0.10% (w/v) hydroxypropyl methylcellulose (HPMC) and 10% (v/v) acetic acid as a cosolvent. Excess amount of the drug was added to the aqueous HPβCD solution and the suspension formed was heated in a sealed container in an autoclave (120-140°C for 20-40 minutes). After equilibration at room temperature (22-23°C) for seven days, the suspension was filtered through a 0.45 µm membrane filter, diluted with aqueous methanolic solution and the amount of dissolved midazolam determined by a high pressure liquid chromatographic method (HPLC). FIG. 4 illustrates the effects of cyclodextrins, pH and 10% (v/v) acetic acid on the solubility of midazolam in aqueous solutions: pure aqueous buffer solution ( $\triangle$ ); aqueous 10% (v/v) acetate solution (•); 10% (w/v) HPβCD solution containing 0.10% (w/v) HPMC in aqueous 10% (v/v) acetic acid solution (■); 10% (w/v) aqueous SBE $\beta$ CD solution in aqueous 10% (v/v) acetate ( $\spadesuit$ ). The results set forth in FIG. 4 show that addition of 10% (v/v) acetic acid significantly improves the complexation. Addition of the acetic acid increases the value of S<sub>0</sub> without having any significant effect on the value of K<sub>C</sub>, which significantly improves the complexation efficiency and, consequently, enhances the cyclodextrin solubilization of the drug. Midazolam carries a positive charge at acidic pH and, thus, the negatively charged SBEβCD forms a more stable complex than the uncharged HPBCD with midazolam at these conditions. Addition of 10% (v/v) acetic acid as a co-solvent resulted in a small decrease in the fraction of the open ring form of the drug.

#### Example 6

20

25

Female hairless mice were sacrificed by cervical dislocation and their full-thickness skins removed. The outer surface of the skin was rinsed with 35% (v/v) methanol in water and subsequently with distilled water to remove any

WO 99/42111

5

10

contamination. The skin was placed in Franz diffusion cells. The receptor phase consisted of phosphate buffer saline pH 7.4. The skin diffusion cells were stirred with a magnetic bar and kept at 37°C by circulating water through an external jacket. The donor phase (2.0 ml) consisted of a solution of the drug in aqueous 7% (w/v) SBE $\beta$ CD solution pH 3.3, or aqueous cyclodextrin solution where the pH had been raised from 3.3 to 4.1 (by addition of NaOH) before it was applied to the skin. The alprazolam concentration in the donor phase was 1.85 mg/ml at pH 3.3. Samples (200  $\mu$ l) of receptor phase were removed from the cells at various time intervals up to 48 hours and replaced with a fresh buffer solution. The samples were kept frozen until analyzed by HPLC. The flux was calculated from the linear part of each permeability profile and the permeability coefficient obtained by dividing the flux with the concentration of dissolved drug in the donor phase. The results set forth in **Table 4** show clearly that raising the pH from 3.3 to 4.1 increases the flux though biological membranes such as hairless mouse skin.

Table 4. The flux of alprazolam through hairless mouse skin. The donor phase consisted of aqueous pH 3.3 buffer solution containing 7% (w/v) SBEβCD saturated with the drug. In one case the pH of the donor phase was kept constant at pH 3.3, but in the other case the pH was raised to 4.1 (by addition of NaOH) before it was applied to the skin. The alprazolam concentration in the donor phase was 1.85 mg/ml at pH 3.3.

Donor phase	Flux (mg/cm <sup>2</sup> /h)	Ratio	
Without increasing the pH	3.91 x 10 <sup>-4</sup>	1.0	
Increasing the pH from 3.3 to 4.1	4.56 x 10 <sup>-4</sup>	1.2

#### Example 7

5

10

15

20

25

The effect of cyclodextrins and organic solvents on the rate of diazepine ring-closure of several selected benzodiazepines was investigated. Stock solutions containing 1.0x10<sup>-3</sup> M of the benzodiazepine in 0.10 M aqueous hydrochloric acid solution (pH approx. 1.1) were prepared and stored at 37.0°C. The benzodiazepines were in the ring-open form in these stock solutions. Aqueous 0.50 M tris buffer (pH 7.50) solution was prepared. The observed first-order rate constant for the closing (i.e. formation) of the benzodiazepine ring was determined in the following reaction media: a) pure aqueous tris buffer solution; b) aqueous tris buffer solution containing 10% (w/v) cyclodextrin; c) tris buffer solution containing 10% (w/v) cyclodextrin and 10% (v/v) ethanol (EtOH); d) tris buffer solution containing 10% (w/v) cyclodextrin and 50% (v/v) EtOH; e) tris buffer solution containing 10% (w/v) cyclodextrin and 10% (v/v) dimethylsulfoxide (DMSO); and f) tris buffer solution containing 10% (w/v) cyclodextrin and 50% (w/v) DMSO. The stock solution (30  $\mu$ l) was added to 1.50 ml of the reaction media which had previously been equilibrated to 37.0°C and the first-order rate constant for the appearance of the closed form determined from the appearance of the closed form as observed on HPLC. Tables 5, 6 and 7 show the effects of cyclodextrins, EtOH and DMSO on the observed first-order rate constant for the regeneration of alprazolam, triazolam and midazolam, respectively. In pure aqueous buffer solutions, addition of EtOH and DMSO decreases somewhat the rate of ring closure, at least in the case of alprazolam and midazolam. Addition of cyclodextrin or the organic solvents have insignificant effect on the pH under these conditions. The dielectric constant of the reaction medium will, however, decrease upon addition of the organic solvents. It is possible that this decrease in the dielectric constant will reduce the ability of the reaction media to stabilize the transition state which could explain the decrease in the observed rate constant. Addition of cyclodextrin decreased significantly, in all cases, the rate of ring

5

10

15

closure. The cyclodextrins formed stable complexes with the ring-open form of the drug and, thus, the rate decreased upon addition of cyclodextrin. Addition of EtOH or DMSO to the cyclodextrin-containing reaction media resulted in increase in the rate, compared to reaction media containing only cyclodextrin, which could be due to decreased complexation of the diazepine ring-open form. EtOH and DMSO will compete with the diazepine ring-open form for a space in the cyclodextrin cavity resulting in decreased complexation.

Table 5. The effect of cyclodextrins, ethanol (EtOH) and dimethylsulfoxide (DMSO) on the first-order rate constant for the formation of the diazepine ring, i.e. regeneration of alprazolam, at pH 7.5 and 37°C.

The bioavailability of midazolam in a nasal spray according to the invention was evaluated. The composition of the midazolam nasal spray was as follows: midazolam 1.70% (w/v), sulfobutylether β-cyclodextrin sodium salt (Captisol®) 14.00% (w/v), benzalkonium chloride 0.02% (w/v), sodium edetate (EDTA tetrasodium) 0.10% (w/v), hydroxypropyl methylcellulose 0.10% (w/v), phosphoric acid 0.50% (v/v), sodium hydroxide quantum satis ad pH 4.35 in purified water. The intravenous (iv) dose was fixed at 2 mg (Dormicum™ 5 mg/ml iv solution from F. Hoffmann-La Roche & Ltd., Switzerland) but the intranasal (in) dose was 0.06 mg/kg or 4.84 mg (285  $\mu$ l nasal spray) on the average. This was a cross-over study where each individual received both the iv and in formulation (via nasal spray) with a one week resting period between administrations. Serum samples were collected at various time points after administration of the drug and the midazolam concentration determined with an HPLC method. Fig. 5 illustrates the concentration profile of midazolam in serum after administration of 2 mg of midazolam intravenously (O) or 4.8 mg of midazolam intranasally ( $\Delta$ ). Each point represents the mean value; error bars represent standard deviation. The bioavailability of midazolam after intranasal

-33-

administration was determined to be 61% and the mean  $C_p^{\ max}$  was determined to be 52 ng/ml at 12 min after intranasal administration of the drug. Sedation was not observed after the iv administration but sedation was observed in all three individuals within 10 min after intranasal administration of the drug. This sedation lasted for about one and one-half hours. Insignificant irritation was observed in the three individuals tested after intranasal administration of the drug.

5

10

While the invention has been described in terms of various preferred embodiments, the person skilled in the art will appreciate that various modifications, substitutions, omissions and changes can be made without departing from the spirit thereof. Accordingly, it is intended that the scope of the present invention be limited solely by the scope of the following claims, including equivalents thereof.

-34-

#### WHAT IS CLAIMED IS:

5

15

- 1. A method for enhancing the complexation efficiency of a drug with cyclodextrin, said drug having a structure comprising at least one heterocyclic ring having a total of from 4 to 7 ring atoms, of which from 1 to 3 are hetero ring atoms, each of said hetero ring atoms being selected from nitrogen, oxygen and sulfur, said ring being a cyclic imine, enamine, lactone, lactam, thiolactam, anhydride, imide, hemiacetal or hemiketal, said method comprising subjecting said drug to chemically reversible ring-opening so that at least 0.1% by weight thereof is in ring-opened form, and complexing said drug with cyclodextrin.
- 10 2. A method according to Claim 1, comprising complexing said drug with cyclodextrin in an aqueous medium under conditions which effect chemically reversible ring-opening of at least 0.1% by weight of said drug.
  - 3. A method for enhancing the availability of a drug following administration of a cyclodextrin-drug complex to a warm-blooded animal in need of same, said drug having a structure comprising at least one heterocyclic ring having a total of from 4 to 7 ring atoms of which from 1 to 3 are hetero ring atoms, each of said hetero ring atoms being selected from nitrogen, oxygen and sulfur, said ring being a cyclic imine, enamine, lactone, lactam, thiolactam, anhydride, imine, hemiacetal or hemiketal, said method comprising complexing said drug with cyclodextrin in an aqueous medium under conditions which effect chemically reversible ring-opening of at least 0.1% by weight of said drug to enhance the complexation efficiency, followed by administering the cyclodextrindrug complex thus obtained to said animal under conditions which reduce the complexation efficiency.

4. A method for enhancing the availability of a basic drug (i.e., a proton acceptor) following administration of a cyclodextrin-drug complex to a warm-blooded animal in need of same, said basic drug having a structure comprising at least one heterocyclic ring having a total of from 4 to 7 ring atoms, of which from 1 to 3 are hetero ring atoms, each of said hetero ring atoms being selected from nitrogen, oxygen and sulfur, said ring being a cyclic imine, enamine, lactone, lactam, thiolactam, anhydride, imide, hemiacetal or hemiketal, said method comprising subjecting said basic drug to complexation in an aqueous medium at a pH level below the pKa+2 value of said basic drug to enhance the complexation efficiency, followed by administering the cyclodextrin-drug complex thus obtained to said animal under conditions which reduce the complexation efficiency.

5

10

15

20

- 5. A method for enhancing the availability of an acidic drug following administration of a cyclodextrin-drug complex to a warm-blooded animal in need of same, said acidic drug having a structure comprising at least one heterocyclic ring having a total of 4 to 7 ring atoms, of which from 1 to 3 are hetero ring atoms, each of said hetero ring atoms being selected from nitrogen, oxygen and sulfur, said ring being a cyclic imine, enamine, lactone, lactam, thiolactam, anhydride, imide, hemiacetal or hemiketal, said method comprising subjecting said acidic drug to complexation in an aqueous medium at a pH level above the pKa-2 value of said acidic drug to enhance the complexation efficiency, followed by administering the cyclodextrin-drug complex thus obtained to said animal under conditions which reduce the complexation efficiency.
- 6. A method according to any one of Claims 2 to 4, wherein the complexation is conducted under conditions which effect chemically reversible ring-opening of at least 1% by weight of said drug, preferably wherein the

-36-

complexation is conducted at a pH level which affords ring-opening of at least 5% by weight of said drug.

7. A method according to Claim 5, wherein the complexation is conducted under conditions which effect chemically reversible ring-opening of at least 1% by weight of said drug, preferably wherein the complexation is conducted at a pH level which affords ring-opening of at least 5% by weight of said drug.

5

15

- 8. A method according to any one of Claims 1-4 and 6, wherein the complexation is conducted at a pH level of below about 5.
- 9. A method according to any one of Claims 1-3, 6 and 8, wherein the drug is a basic drug.
  - 10. A method according to any one of Claims 1-4, 6, 8, and 9, wherein the drug is a benzodiazepine.
  - 11. A method according to Claim 10, wherein the benzodiazepine is alprazolam, brotizolam, chlordiazepoxide, clobazam, clonazepam, clorazepam, demoxazepam, flumazenil, flurazepam, halazepam, midazolam, nordazepam, medazepam, diazepam, nitrazepam, oxazepam, midazepam, lorazepam, prazepam, quazepam, triazolam, temazepam or loprazolam.
  - 12. A method according to any one of Claims 1-4, 6 and 8-11, wherein the cyclodextrin is hydroxypropyl- $\beta$ -cyclodextrin,  $\beta$ -cyclodextrin sulfobutyl ether,  $\beta$ -cyclodextrin,  $\gamma$ -cyclodextrin or hydroxypropyl- $\gamma$ -cyclodextrin.

- 13. A method according to Claim 5 or 7, wherein the cyclodextrin is hydroxypropyl- $\beta$ -cyclodextrin,  $\beta$ -cyclodextrin sulfobutyl ether,  $\beta$ -cyclodextrin,  $\gamma$ -cyclodextrin or hydroxypropyl- $\gamma$ -cyclodextrin.
- 14. A method according to any one of Claims 10-12, followed by
  5 formulating the cyclodextrin-drug complex thus obtained as a nasal spray,
  sublingual tablet or parenteral solution.
  - 15. A method according to Claim 14, wherein the nasal spray, sublingual tablet or parenteral solution is formulated to be suitable for use in producing a sedative, anti-anxiety, anticonvulsant or muscle relaxant effect, preferably for use as a pre-anaesthetic medication, or to supplement anaesthesia, to induce and maintain anaesthesia or to induce a hypnotic effect.

10

- 16. A method according to Claim 15, wherein the benzodiazepine is alprazolam, clonazepam, lorazepam, midazolam or triazolam.
- 17. A method according to any one of Claims 1-4, 6 and 8-12, wherein the complexation is conducted at a pH level between about 3 and about 5.
  - 18. A method according to Claim 1 or 2, wherein the drug is an acidic drug and the complexation is conducted under conditions which effect chemically reversible ring-opening of at least 1% by weight of said drug, preferably wherein the complexation is conducted at a pH level which affords ring-opening of at least 5% by weight of said drug.
  - 19. A method according to Claim 1 or 2, wherein the drug is a barbituric acid derivative, a hydantoin, a pyrazole derivative, an imidazole

-38-

PCT/IS99/00003

derivative, a pyrimidine derivative or a purine derivative, and the complexation is conducted under conditions which effect chemically reversible ring-opening of at least 1% by weight of said drug, preferably wherein the complexation is conducted at a pH level which affords ring-opening of at least 5% by weight of said drug.

5

WO 99/42111

20. A method according to Claim 19, wherein the barbituric acid derivative is barbital, butobarbital, amobarbital, phenobarbital, aprobarbital, secobarbital, crotylbarbital, cyclobarbital, phenobarbital, hexobarbital, methylphenobarbital, thiopental, isopropylbromallylbarbituric acid, or cyclohexenylallylthiobarituric acid, or a salt thereof; or wherein the hydantoin is phenytoin; or wherein the pyrazole derivative is phenazone, propylphenazone, metamidazole, phenylbutazone, oxyphenbutazone or sulfinpyrazone; or wherein the imidazole derivative is histamine, miconazole, pilocarpine, naphazoline or clonidine; or wherein the pyrimidine derivative is thiamine, trimethoprim, orotic acid, methylthiouracyl or prothiouracyl; or wherein the purine derivative is caffeine, theophylline, etophylline, proxyphylline or theobromine.

15

10

- 21. A method according to Claim 3, wherein the cyclodextrin-drug complex is administered in the form of an aqueous solution or a hydrogel.
- 22. A method according to Claim 21, wherein the cyclodextrin-drug complex is administered as a nasal spray or nasal drops.

- 23. A method according to Claim 21, wherein the cyclodextrin-drug complex is administered as a parenteral solution.
- 24. A method according to Claim 21, wherein the aqueous solution is at a pH level of below about 6 and is administered as a nasal spray.

WO 99/42111 PCT/IS99/00003

-39-

- 25. A method according to Claim 24, wherein the pH level of the nasal spray is below about 4.7, preferably wherein the pH level of the nasal spray is between about 3 and about 4.7.
- 26. A method according to Claim 3, wherein the drug is a benzodiazepine, the complexation is conducted at a pH level which affords ring-opening of at least 5% by weight of said drug, said pH level being below about 5, and the cyclodextrin-drug complex is administered as a solid.
- 27. A method according to Claim 26, wherein the solid cyclodextrindrug complex is administered as a tablet formulated for oral, buccal or sublingual administration.
  - 28. A method according to Claim 3, wherein the water is removed from the aqueous complexation medium after formation of the cyclodextrin-drug complex.
- 29. A method according to Claim 4, wherein the drug is a benzodiazepine and the complexation is carried out at a pH level which affords ring-opening of at least 5% by weight of said drug and in the presence of from about 0.001 to about 5% (weight/volume) of a pharmacologically inactive, pharmaceutically acceptable water-soluble polymer at a temperature of from about 30°C to about 150°C.
- 20 30. A method according to Claim 29, wherein the polymer is a cellulose derivative or a polyvinyl polymer.

WO 99/42111

5

PCT/IS99/00003

31. A method according to Claim 30, wherein the polymer is methylcellulose, hydroxyethyl cellulose, hydroxypropyl cellulose, hydroxyethyl methylcellulose, hydroxypropyl ethylcellulose, hydroxyethyl ethylcellulose, sodium carboxymethylcellulose or polyvinylpyrrolidone.

-40-

- 32. A method according to Claims 4 or 29, wherein the drug is a benzodiazepine and the complexation is carried out at a pH level which affords ring-opening of at least 5% by weight of said drug and in the presence of at least one member of the group consisting of acetic acid and its pharmaceutically acceptable salts, the acetate-water ratio of the aqueous complexation medium being from about 1:1000 to about 2:1.
  - 33. A method according to Claim 32, wherein the drug is midazolam and the cyclodextrin is hydroxypropyl- $\beta$ -cyclodextrin,  $\beta$ -cyclodextrin sulfobutyl ether,  $\beta$ -cyclodextrin,  $\gamma$ -cyclodextrin or hydroxypropyl- $\gamma$ -cyclodextrin.

Box I	Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)
This inter	national search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:
1.	Claims Nos.: 3-5,7,13,21-33 because they relate to subject matter not required to be searched by this Authority, namely:  See PCT Rule 39.1(iv): Methods for treatment of the human or animal body by surgery or therapy, as well as diagnostic methods.
2.	Claims Nos.: because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
Box II	Observations where unity of invention is lacking (Continuation of item 2 of first sheet)
i. 🔲	As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2.	As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3.	As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4.	No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:
Remark	on Protest  The additional search fees were accompanied by the applicant's protest.  No protest accompanied the payment of additional search fees.

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

#### New Applications Under 35 U.S.C. 111

If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

#### National Stage of an International Application under 35 U.S.C. 371

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

#### New International Application Filed with the USPTO as a Receiving Office

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

#### **DETAILED ACTION**

This Office Action is responsive to Applicant's Amendment and Remarks, filed 16 Dec 2009.

This application is the national stage entry of PCT/US04/09387, filed 26 Mar 2004; and claims benefit of provisional application 60/458,922, filed 28 Mar 2003; and claims benefit of provisional application 60/484,756, filed 02 July 2003; and claims benefit of provisional application 60/541,247, filed 04 Feb 2004.

The filing date of the instant claims 12, 83, 85 and 89 are deemed to be the filing date of the instant application which is the filing date of PCT/US04/09387, 26 Mar 2004. The filing date of instant claims 1, 2, 8, 9, 11, 56, 57, 63, 64, 82, 84 and 86-98 are deemed to be the filing date of provisional application 60/541,247, filed 04 Feb 2004.

Claims 1, 2, 8, 9, 11-14, 20, 21, 23-28, 32, 33, 35, 56, 57, 63, 64 and 67-98 are pending in the current application. Claims 13, 14, 20, 21, 23-28, 32, 33, 35 and 67-81, drawn to non-elected inventions, are withdrawn. Claims 1, 2, 8, 9, 11, 56, 57, 63, 64 and 82-98 are examined on the merits herein.

#### Rejections Withdrawn

Applicant's Remarks, filed 16 Dec 2009, with respect to claims 1, 2, 8, 9, 11, 56, 57, 63, 64 and 82-98 are rejected under 35 U.S.C. 103(a) as being unpatentable over Schultz et al. (US Patent 6,194,395, published 27 Feb 2001, of record) in view of Wrenn

Jr. (US Patent 6,174,873, issued 16 Jan 2001, cited in PTO-892) and in view of Loftsson et al. (US Patent 6,699,849, filed 16 Feb 1999, cited in PTO-892) has been fully considered and is persuasive, as Applicant is persuasive that one of ordinary skill in the art would not have a reasonable expectation of success in combining the teaching of Wrenn Jr. drawn to a an amorphous formulation using a polymer cross-linked technology with the teaching of Schultz et al. drawn to a solid pharmaceutical oral dosage form of cladribine comprising cladribine and cyclodextrin.

This rejection has been withdrawn.

The following are new grounds of rejection not necessitated by Applicant's Amendment.

#### Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Amended Claims 1, 2, 8, 9, 11, 56, 57, 63, 64 and 82-98 are rejected under 35 U.S.C. 103(a) as being unpatentable over Schultz et al. (US Patent 6,194,395, published 27 Feb 2001, of record) in view of Pitha (US Patent 4,727,064, issued 23 Feb 1988, provided by Applicant in IDS mailed 4 Apr 2008) and in view of Loftsson J Pharm Sci 2002 (Journal of Pharmaceutical Sciences, 2002, 91(11), p2307-2316, cited in PTO-892).

Schultz et al. discloses a solid pharmaceutical oral dosage form of cladribine comprising cladribine and cyclodextrin (column 2, lines 31-39). Schultz et al. teaches βcyclodextrins are known to possess the ability to form inclusion complexes and to have concomitant solubilizing properties (column 2, lines 10-15). Schultz et al. discloses the use of β-cyclodextrins (column 2, lines 56-58) and derivatives wherein one or more cyclodextrin hydroxy groups are replaced with groups such as hydroxypropyl (column 3, lines 26-27). Schultz et al. discloses the solid oral dosage form in the form of a tablet (column 5, lines 37-38) including the excipients sorbitol and magnesium stearate (column 6, lines 2-7). Schultz et al. discloses an oral dosage form comprising up to 15 mg cladribine and cyclodextrin from 100 to 500 mg, which renders obvious to one of skill in the art the sub-range of a cladribine to cyclodextrin ratio ranging from 15 mg:100 mg to 15mg:500 mg, or 1:6.67 to 1:33.3 by weight (column 6, lines 23-31). Schultz et al. implicitly discloses an oral dosage form comprising up to 15 mg cladribine and cyclodextrin from 100 to 500 mg, or a cladribine to cyclodextrin ratio ranging from 1:6.67 to 1:33.3 by weight (column 6, lines 23-31).

Schultz et al. does not specifically disclose the composition comprising no significant amount of free crystalline cladribine therein (instant claims 1). Schultz et al. does not specifically disclose the composition corresponding to a point located on the curve of a phase solubility diagram for saturated complex cladribine-cyclodextrin complexes, said curve defining complex saturated complexes of cladribine in varying concentrations of the cyclodextrin (instant claim 11). Schultz et al. does not specifically disclose the complex consisting of (a) an amorphous inclusion complex of cladribine

with an amorphous cyclodextrin and (b) amorphous free cladribine associated with amorphous cyclodextrin as a non-inclusion complex (instant claim 56). Schultz et al. does not specifically disclose the composition comprising a cladribine to cyclodextrin ratio from about 1:10 to about 1:16 (instant claims 6, 7, 10, 61, 62 and 65), or a ratio of about 1:14 (instant claims 8 and 63) or about 1:11 (instant claims 9 and 64). Schultz et al. does not specifically disclose the complex wherein from about 30 to about 40 percent by weight of the cladribine is in the inclusion complex (a) and from about 70 to about 60 percent by weight of the cladribine is in the non-inclusion complex (b) (instant claims 12 and 66). Schultz et al. does not specifically disclose the product-by-process wherein 12.00 parts by weight of cladribine and 172.50 parts by weight of hydroxypropyl-βcyclodextrin are introduced in step (i) of the process (instant claim 91 and 93), to give a cladribine to cyclodextrin ratio of 1:14.38. Schultz et al. does not specifically disclose the product-by-process wherein 16.35 parts by weight of cladribine and 172.50 parts by weight of the hydroxypropyl-β-cyclodextrin are introduced in step (i) of the process (instant claim 92), to give a cladribine to cyclodextrin ratio of 1:10.55.

Pitha teaches a pharmaceutical combination of drug and amorphous cyclodextrin to give a stable amorphous state that improves dissolution properties of the drug and absorption by the body (column 1, lines 10-15) and that prevents crystallization processes within the pharmaceutical preparation (column 1, lines 20-25). Pitha teaches the embodiment wherein the amorphous cyclodextrin is hydroxypropylbeta-cyclodextrin (table 1 spanning columns 3 and 4). Pitha teaches the product made

by freeze-drying, or lyophilizing, a solution of cyclodextrin and drug (column 7, lines 5-40).

Loftsson J Pharm Sci 2002 teaches drug/cyclodextrin complexes self-associate to form water-soluble aggregates as non-inclusion complexes in addition to formation of the inclusion complex (abstract). Loftsson J Pharm Sci 2002 teaches the formation of only the drug/cyclodextrin inclusion complex is a general assumption (page 2307, section Introduction), and that drug/cyclodextrin complexes self-associate to form water-soluble aggregates as non-inclusion complexes (page 2315, section Conclusions).

It would have been obvious to one of ordinary skill in the art at the time of the invention to combine Schultz et al. in view of Pitha and in view of Loftsson J Pharm Sci 2002. Schultz et al. teaches solid formulations for oral administration of cladribine and cyclodextrin. One of ordinary skill in the art would have been motivated to combine Schultz et al. in view of Pitha because Schultz et al. teaches undesirable recrystallization of cladribine in tissue may occur and damage the surrounding tissue and that complexes with cyclodextrin are known to solubilize the compound and Pitha teaches the pharmaceutical combination of drug and amorphous cyclodextrin to give a stable amorphous state that improves dissolution properties of the drug and absorption by the body. One of ordinary skill in the art would have a reasonable expectation of success in combining Schultz et al. in view of Pitha because Pitha teaches a application of a wide variety of drugs in the complex taught by Pitha and Schultz et al. teaches the formation of the cladribine and cyclodextrin complex in solution. Schultz et al. in view of Pitha and in view of Loftsson J Pharm Sci 2002 does not teach the specific cladribine to

Page 7

cyclodextrin ratios of 1:14.38 or 1:10.55, however these ratios are encompassed by the prior art and Schultz et al. teaches it is within the level of skill in the art to optimize the ratio of cyclodextrin relative to cladribine (column 4, lines 35-45). See also MPEP 2144.05 II.A, "Generally, differences in concentration or temperature will not support the patentability of subject matter encompassed by the prior art unless there is evidence indicating such concentration or temperature is critical." One of ordinary skill in the art would be motivated to optimize the cladribine to cyclodextrin ratio to give the composition comprising no significant amount of free crystalline cladribine therein because Schultz et al. teaches undesirable recrystallization of cladribine in tissue may occur and damage the surrounding tissue (Schultz et al. column 2, lines 1-15).

Loftsson J Pharm Sci 2002 provides evidence that the property of self-association of the drug/cyclodextrin complex is necessarily present in the drug/cyclodextrin composition taught by Schultz et al. in view of Pitha. Therefore there is reasonable evidence to conclude that the process of self-association of the drug/cyclodextrin complex at the ratio taught by Schultz et al. in view of Pitha would necessarily result in both inclusion complexes and non-inclusion complexes and wherein from about 30 to about 40 percent by weight of the cladribine is in the inclusion complex (a) and from about 70 to about 60 percent by weight of the cladribine is in the non-inclusion complex (b). See also MPEP 2112.

Claims 82-90 and 94-98 are drawn to a product-by-process. The disclosed product is substantially identical to the instantly claimed product-by-process, a pharmaceutical solid oral dosage form comprising an amorphous inclusion complex of

Page 8

Art Unit: 1623

cladribine and cyclodextrin and a non-inclusion complex of an amorphous cladribine and an amorphous cyclodextrin as detailed above. "[E]ven though product-by-process claims are limited by and defined by the process, determination of patentability is based on the product itself. The patentability of a product does not depend on its method of production. If the product in the product-by-process claim is the same as or obvious from a product of the prior art, the claim is unpatentable even though the prior product was made by a different process." In re Thorpe, 777 F.2d 695, 698, 227 USPQ 964, 966 (Fed. Cir. 1985) (citations omitted) (Claim was directed to a novolac color developer. The process of making the developer was allowed. The difference between the inventive process and the prior art was the addition of metal oxide and carboxylic acid as separate ingredients instead of adding the more expensive pre-reacted metal carboxylate. The product-by-process claim was rejected because the end product, in both the prior art and the allowed process, ends up containing metal carboxylate. The fact that the metal carboxylate is not directly added, but is instead produced in-situ does not change the end product.). See MPEP 2113.

#### Response to Applicant's Remarks:

Applicant's Remarks, filed 16 Dec 2009, have been fully considered and not found to be persuasive in view of the new grounds of rejection.

Applicant's note that the invention disclosed by Schultz et al. via a melt-extrusion process results in the formation of the mixture and not a complex of cladribine and cyclodextrin in solid form, as provided by evidence in Van Axel Castelli et al. However, MPEP 2121.01 II. provides a non-enabling reference may qualify as prior art for the

purpose of determining obviousness under 35 U.S.C. 103. Schultz et al. discloses the melt-extrusion as one method of preparing solid oral dosage forms (col 5, line 50), thus the teaching of Schultz et al. does not teach away from the combination of Schultz et al. in view of Pitha, teaching a product made by freeze-drying, and in view of Loftsson J Pharm Sci 2002 to support a conclusion of obviousness.

#### Conclusion

No claim is found to be allowable.

This Office Action details new grounds of rejection not necessitated by Applicant's Amendment. Therefore this Office Action is Non-Final.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jonathan S. Lau whose telephone number is 571-270-3531. The examiner can normally be reached on Monday - Thursday, 9 am - 4 pm EST.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Shaojia Anna Jiang can be reached on 571-272-0627. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

MAIL STOP AMENDMENT
Group Art Unit: 1623
Examiner: JONATHAN S LAU
Confirmation No.: 4092

## **REPLY TO OFFICIAL ACTION**

Commissioner for Patents P.O. Box 1450 Alexandria, VA 22313-1450

Sir:

In response to the Office Action dated March 30, 2010, the following remarks are offered:

### **REMARKS**

Applicants request reexamination and reconsideration of the subject application pursuant to and consistent with 37 C.F.R. § 1.112 in light of the following:

### STATUS OF CLAIMS

The status of the claims under examination has been misstated. Claims 1, 2, 8, 9, 11-14, 20, 21, 23-28, 32, 33, 35, 56, 57, 63, 64 and 66-98 remain in this application. Claims 13, 14, 20, 21, 23-28, 32, 33, 35 and 67-81 have been withdrawn from consideration as drawn to non-elected subject matter. Claims 1, 2, 8, 9, 11, 12, 56, 57, 63, 64, 66 and 82-98 are under examination. It is again pointed out that Claims 12 and 66 were not included in the previous rejection and are not included in the current rejection. Clarification is requested.

### INFORMATION DISCLOSURE STATEMENT

Applicants appreciate the Examiner's consideration of the December 16, 2009 Information Disclosure Statement and the return of the initialed Form PTO-1449.

### **REJECTIONS WITHDRAWN**

Applicants appreciate the Examiner's withdrawal of the previous 35 U.S.C. § 103(a) rejection.

### CLAIM REJECTIONS - 35 U.S.C. § 103(a)

Claims 1, 2, 8, 9, 11, 56, 57, 63, 64 and 82-98 have been rejected as being unpatentable over Schultz et al. US 6194395 in view of Pitha US 4727064 and in view of Loftsson et al., <u>J. Pharm. Sci.</u>, 2002, 91(11), pp. 2307-2316. Applicants believe that all of the claims under examination, that is, all of Claims 1, 2, 8, 9, 11, 12, 56, 57, 63, 64, 66 and 82-98 are patentable over this combination of references.

Applicants have previously established that, while Schultz et al. describe inclusion complex formation in solution to form injectable solutions, Schultz et al. describe solid formulations which are mixtures, not complexes, of cladribine and cylodextrin. Applicants have already shown, particularly with reference to the experiments described in the Van Axel Castelli et al. paper previously submitted, that

contrary to Schultz et al., the instantly claimed cladribine/cyclodextrin complex is not a simple mixture of the ingredients and has different properties from a mixture of cladribine and cyclodextrin. Therefore, the ratios of cladribine and cyclodextrin in Schultz et al.'s solid are irrelevant to the ratios of cladribine and cylodextrin in the presently claimed complexes. The fact remains that Schultz et al. only discloses complexes in solutions for injection, not for solid oral dosage forms.

Moreover, in making his rejection, the Examiner has taken a teaching of Schultz et al. completely out of context and from this he has constructed a rejection which is improper. Specifically, the Examiner states that Schultz et al. teach undesirable recrystallization of cladribine in tissue may occur and damage surrounding tissue (col. 2, lines 1-2), and on this teaching he builds his position about solid oral formulations of cladribine/cyclodextrin complexes. However, the passage in Schultz et al. relied upon by the Examiner needs to be read together with the preceding passages in col. 1., which clearly refers only to injectable formulations of high osmolality when injected by the subcutaneous route (sentence bridging columns 1 and 2 of Schultz et al.). The passage quoted has therefore no relation to solid oral dosage forms. After oral absorption, no crystallization in any tissue could or would occur. Thus, it cannot provide any motivation to one of ordinary skill to combine Schultz et al with the other cited references.

Nevertheless, Pitha US 4727064 has been cited in combination with Schultz et al. Indeed, Pitha was prior art cited during the examination of the Schultz et al. patent, as is evident from the fact that it is listed on the face of the Schultz et al. patent. The Pitha patent issued eleven years before the Schultz et al. application was filed and was clearly available to Schultz et al. at the time of the Schultz et al. invention. Nevertheless, Schultz et al. turned to inclusion complex formulation only as a way of providing suitable injectable formulations of cladribine. In contrast, for solid dosage forms they suggested simple mixtures. Moreover, Pitha did not even address cladribine as such, much less the fact that it is acid-labile and unstable in the acidic environment of the gastrointestinal system (Schultz et al., col. 1, lines 47-51). It is not seen how one of ordinary skill would be motivated to try to combine Pitha with Schultz et al. to provide an alternate solution for solid oral use.

Still further, since there is no mention of cladribine as such in Pitha, preparation of inclusion complexes disclosed therein of, for example, sex hormones (Example 4 in column 7) clearly uses conditions different from those used herein for cladribine.

With respect to the Loftsson et al. <u>J. Pharm. Sci.</u> literature article, applicants believe that the conclusions of the article have been taken out of context. Loftsson et al. do indeed describe particular situations in which <u>self-association of cyclodextrin complexes</u> may explain some observed solubilization phenomena. However, Loftsson et al. first studied the solubility of ibuprofen sodium salt, diflumisal sodium salt, alprazolam,  $17\beta$ -estradiol and diethylstilbestrol in HP $\beta$ CD. Then, aqueous HP $\beta$ CD solutions, previously saturated with the sodium salts of either ibuprofen or diflunisal were saturated with a second drug ( $17\beta$ -estradiol, diethylstilbestrol or alprazolam). On page 2313, left column, first full paragraph, Loftsson et al. summarize their conclusions from these experiments:

If the solubilization of a given drug (the first drug) is solely attributable to inclusion complex formation and if the slope of the obtained phase-solubility diagram is greater than unity, then it can be assumed that almost all cyclodextrin molecules in the aqueous complexation medium will be forming inclusion complexes with the drug. In this case, the concentration of free cyclodextrin in a saturated drug solution will be very low and under such conditions there will be very little capacity to solubilize a second water-insoluble drug in the same medium. Introduction of a second drug will then always result in some precipitation of the drug that previously was used to saturate the solution. However, if the first drug is partially solubilized through non-inclusion association, then there could be some capacity in the solution to solubilize the second drug in a similar manner as drugs are solubilized in micelles. In other words, with inclusion complexation, we will expect to see a consistent competitive effect between the first drug and the second drug, but if solubilization through non-inclusion association exists in the solution, we can expect to observe a cooperative effect, especially if the complexation efficacy of the second drug is low.

Attorney Docket No. 0056192-000024 Application No. 10/551,205 Page 5

It is clear from the foregoing that Loftsson et al. were dealing with combinations of two drugs, one of which was negatively charged. Loftsson et al. do not mention cladribine or suggest both inclusion and non-inclusion association for it by itself in solid form. The presently claimed subject matter, a pharmaceutical composition comprising a complex cladribine-cyclodextrin complex consisting of (a) an amorphous inclusion complex of cladribine with hydroxypropyl-β-cyclodextrin and (b) amorphous free cladribine associated with said amorphous cyclodextrin as a non-inclusion complex, formulated into a solid oral dosage form, said composition comprising no significant amount of free crystalline cladribine therein, said composition having a weight ratio of cladribine to said amorphous cyclodextrin of from about 1:10 to about 1:16, is in no way suggested by the combination of references. See especially Claim 1 and Claim 56, drawn to the complex. Again, we emphasize that the ratios disclosed by Schultz et al. are for simple mixtures, not complexes. There is no reasonable evidence that any of the features of applicants' invention not taught by Schultz et al. are taught by the cited combination of references. Withdrawal of the record rejection is earnestly solicited.

In the event that any issues remain, the Examiner is urged to telephone the undersigned so that such issues can be handled promptly. Further, favorable action in the form of a Notice of Allowance is believed to be next in order and is earnestly solicited. If the Examiner has no intention to allow the application, a personal interview with him and his supervisory Examiner is respectfully requested.

Respectfully submitted,

BUCHANAN INGERSOLL & ROONEY PC

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

### New Applications Under 35 U.S.C. 111

If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

### National Stage of an International Application under 35 U.S.C. 371

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

### New International Application Filed with the USPTO as a Receiving Office

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

nonprovisional	NO	\$1510	\$300	\$0	\$1810	01/04/2011

THE APPLICATION IDENTIFIED ABOVE HAS BEEN EXAMINED AND IS ALLOWED FOR ISSUANCE AS A PATENT. PROSECUTION ON THE MERITS IS CLOSED. THIS NOTICE OF ALLOWANCE IS NOT A GRANT OF PATENT RIGHTS. THIS APPLICATION IS SUBJECT TO WITHDRAWAL FROM ISSUE AT THE INITIATIVE OF THE OFFICE OR UPON PETITION BY THE APPLICANT. SEE 37 CFR 1.313 AND MPEP 1308.

THE ISSUE FEE AND PUBLICATION FEE (IF REQUIRED) MUST BE PAID WITHIN THREE MONTHS FROM THE MAILING DATE OF THIS NOTICE OR THIS APPLICATION SHALL BE REGARDED AS ABANDONED. THIS STATUTORY PERIOD CANNOT BE EXTENDED. SEE 35 U.S.C. 151. THE ISSUE FEE DUE INDICATED ABOVE DOES NOT REFLECT A CREDIT FOR ANY PREVIOUSLY PAID ISSUE FEE IN THIS APPLICATION. IF AN ISSUE FEE HAS PREVIOUSLY BEEN PAID IN THIS APPLICATION (AS SHOWN ABOVE), THE RETURN OF PART B OF THIS FORM WILL BE CONSIDERED A REQUEST TO REAPPLY THE PREVIOUSLY PAID ISSUE FEE TOWARD THE ISSUE FEE NOW DUE.

#### HOW TO REPLY TO THIS NOTICE:

I. Review the SMALL ENTITY status shown above.

If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.

B. If the status above is to be removed, check box 5b on Part B - Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and twice the amount of the ISSUE FEE shown above, or

If the SMALL ENTITY is shown as NO:

A. Pay TOTAL FEE(S) DUE shown above, or

B. If applicant claimed SMALL ENTITY status before, or is now claiming SMALL ENTITY status, check box 5a on Part B - Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and 1/2 the ISSUE FEE shown above.

II. PART B - FEE(S) TRANSMITTAL, or its equivalent, must be completed and returned to the United States Patent and Trademark Office (USPTO) with your ISSUE FEE and PUBLICATION FEE (if required). If you are charging the fee(s) to your deposit account, section "4b" of Part B - Fee(s) Transmittal should be completed and an extra copy of the form should be submitted. If an equivalent of Part B is filed, a request to reapply a previously paid issue fee must be clearly made, and delays in processing may occur due to the difficulty in recognizing the paper as an equivalent of Part B.

III. All communications regarding this application must give the application number. Please direct all communications prior to issuance to Mail Stop ISSUE FEE unless advised to the contrary.

IMPORTANT REMINDER: Utility patents issuing on applications filed on or after Dec. 12, 1980 may require payment of maintenance fees. It is patentee's responsibility to ensure timely payment of maintenance fees when due.

### PART B - FEE(S) TRANSMITTAL

## Complete and send this form, together with applicable fee(s), to: Mail Mail Stop ISSUE FEE

Commissioner for Patents P.O. Box 1450 Alexandria, Virginia 22313-1450

# **Determination of Patent Term Adjustment under 35 U.S.C. 154 (b)**

(application filed on or after May 29, 2000)

The Patent Term Adjustment to date is 0 day(s). If the issue fee is paid on the date that is three months after the mailing date of this notice and the patent issues on the Tuesday before the date that is 28 weeks (six and a half months) after the mailing date of this notice, the Patent Term Adjustment will be 0 day(s).

If a Continued Prosecution Application (CPA) was filed in the above-identified application, the filing date that determines Patent Term Adjustment is the filing date of the most recent CPA.

Applicant will be able to obtain more detailed information by accessing the Patent Application Information Retrieval (PAIR) WEB site (http://pair.uspto.gov).

Any questions regarding the Patent Term Extension or Adjustment determination should be directed to the Office of Patent Legal Administration at (571)-272-7702. Questions relating to issue and publication fee payments should be directed to the Customer Service Center of the Office of Patent Publication at 1-(888)-786-0101 (571)-272-4200.

### **EXAMINER'S AMENDMENT**

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Kathy Baumeister on 27 Sep 2010.

The application has been amended as follows:

### Amendment to the Claims

• Claims 25, 27 and 28 are amended as follows:

Claim 25. (Currently Amended) A method for the treatment of symptoms of a cladribine-responsive condition a condition selected from the group consisting of multiple sclerosis, rheumatoid arthtritis and leukemia in a subject suffering from said symptoms condition comprising orally administering to said subject a pharmaceutical composition comprising a complex cladribine-cyclodextrin complex which is an intimate amorphous admixture consisting of (a) an amorphous inclusion complex of cladribine with the amorphous cyclodextrin hydroxypropyl-β-cyclodextrin and (b) amorphous free cladribine associated with said amorphous cyclodextrin as a non-inclusion complex, formulated into a solid oral dosage form, said composition comprising no significant amount of free crystalline cladribine therein, said composition having a weight ratio of cladribine to said amorphous cyclodextrin of from about 1:10 to about 1:16.

Claim 27. (Canceled)

Application/Control Number: 10/551,205 Page 3

Art Unit: 1623

Claim 28. (Currently Amended) The method according to Claim <del>27</del> <u>25</u>, wherein the <del>cladribine-responsive</del> condition is multiple sclerosis.

Application/Control Number: 10/551,205 Page 4

Art Unit: 1623

# **DETAILED ACTION**

This Office Action is responsive to Applicant's Amendment and Remarks, filed 30 Jul 2010.

This application is the national stage entry of PCT/US04/09387, filed 26 Mar 2004; and claims benefit of provisional application 60/458,922, filed 28 Mar 2003; and claims benefit of provisional application 60/484,756, filed 02 July 2003; and claims benefit of provisional application 60/541,247, filed 04 Feb 2004.

The filing date of the instant claims 12, 83, 85 and 89 are deemed to be the filing date of the instant application which is the filing date of PCT/US04/09387, 26 Mar 2004. The filing date of instant claims 1, 2, 8, 9, 11, 56, 57, 63, 64, 82, 84 and 86-98 are deemed to be the filing date of provisional application 60/541,247, filed 04 Feb 2004.

Claims 1, 2, 8, 9, 11-14, 20, 21, 23-28, 32, 33, 35, 56, 57, 63, 64 and 66-98 are pending in the current application. Claims 13, 14, 20, 21, 23-28, 32, 33, 35 and 67-81, drawn to non-elected inventions, are rejoined herein. Claim 27 is canceled by Examiner's Amendment herein. Claims 1, 2, 8, 9, 11-14, 20, 21, 23-26, 28, 32, 33, 35, 56, 57, 63, 64 and 66-98 are allowed herein.

**Reasons for Allowance** 

Rejections Withdrawn

Applicant's Remarks, filed 30 Jul 2010, with respect to claims 1, 2, 8, 9, 11, 56, 57, 63, 64 and 82-98 rejected under 35 U.S.C. 103(a) as being unpatentable over Schultz et al. (US Patent 6,194,395, published 27 Feb 2001, of record) in view of Pitha (US Patent 4,727,064, issued 23 Feb 1988, provided by Applicant in IDS mailed 4 Apr 2008) and in view of Loftsson J Pharm Sci 2002 (Journal of Pharmaceutical Sciences, 2002, 91(11), p2307-2316, cited in PTO-892) has been fully considered and is persuasive, as Applicant's remarks are persuasive that Schultz et al. in view of Pitha and in view of Loftsson J Pharm Sci 2002 does not teach a composition comprising amorphous free cladribine associated with said amorphous cyclodextrin as a non-inclusion complex. Applicant notes that dependent claims 12 and 66 were omitted from the statement of rejection, however this is moot in view of the withdrawal of this rejection in view of Applicant's Remarks.

This rejection has been withdrawn.

The following is an examiner's statement of reasons for allowance:

The closest prior art is Schultz et al. in view of Pitha and in view of Loftsson J Pharm Sci 2002.

Applicant's Remarks, filed 30 Jul 2010, have been fully considered and found to be persuasive that Schultz et al. in view of Pitha and in view of Loftsson J Pharm Sci 2002 does not teach all features of the instant invention as claimed. None of Schultz et al., Pitha or Loftsson J Pharm Sci 2002 teach or fairly suggest the instant composition comprising amorphous free cladribine associated with said amorphous cyclodextrin as a

non-inclusion complex, and no evidence teaches or fairly suggests that this is an inherent property in the composition that is necessarily present. For example, Pitha teaches crystalline drugs and cyclodextrins that have the ability to form inclusion complexes which are intrinsically amorphous (column 1, lines 25-35), however Pitha does not teach or fairly suggest amorphous free cladribine associated with said amorphous cyclodextrin as a non-inclusion complex and neither Schultz et al. nor Loftsson J Pharm Sci 2002 remedy this. For example, Schultz et al. does not teach or fairly suggest that formation of free cladribine associated with said amorphous cyclodextrin as a non-inclusion complex is necessarily amorphous but rather suggests cladribine will crystallize out of solution (column 1, lines 60-65 and column 2, lines 1-15).

Therefore the prior art does not teach or fairly suggest the instant invention as claimed.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

### Conclusion

Claims 1, 2, 8, 9, 11-14, 20, 21, 23-26, 28, 32, 33, 35, 56, 57, 63, 64 and 66-98 are allowed herein.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jonathan S. Lau whose telephone number is 571-270-3531. The examiner can normally be reached on Monday - Thursday, 9 am - 4 pm EST.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Shaojia Anna Jiang can be reached on 571-272-0627. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.

### **AMENDMENTS TO THE SPECIFICATION:**

Please replace the paragraph at page 22, lines 8-16 of the specification with the following amended paragraph:

The compositions of the invention are particularly suitable as modalities for the treatment of any cladribine-responsive disease. Several disease states responsive to cladribine are well-documented in the literature (see *infra*). For any target disease state, an effective amount of the complex cladribine-cyclodextrin complex complex, *i.e.* the amorphous mixture of the optimized amorphous saturated cladribine-amorphous cyclodextrin complex with amorphous free cladribine as described above is used (e.g., an amount affective effective for the treatment of multiple sclerosis, rheumatoid arthritis, or leukemia).

Please replace the paragraph at page 23, lines 7-28, of the specification with the following amended paragraph:

11-10-12 11-10-12

Moreover, the route of administration for which the therapeutically effective dosages are taught in the literature should be taken into consideration. While the instant compositions optimize the bioavailability of cladribine following oral administration, it will be appreciated that even optimal bioavailability from oral dosage forms is not expected to approach bioavailability ebtain obtained after intravenous administration, particularly at early time points. Thus, it is often appropriate to increase a dosage suggested for intravenous administration to arrive at a suitable dosage for incorporation into a solid oral dosage form. At the present time, it is envisioned that, for the treatment of multiple sclerosis, 10 mg of cladribine in the instant complex cladribine-cyclodextrin complex in the instant solid dosage form would be administered once per day for a period of five to seven days in the first month, repeated for another period of five to seven days in the second month, followed by ten months of no treatment. Alternatively the patient would

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

### New Applications Under 35 U.S.C. 111

If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

#### National Stage of an International Application under 35 U.S.C. 371

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

#### New International Application Filed with the USPTO as a Receiving Office

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

### ISSUE NOTIFICATION

The projected patent number and issue date are specified above.

# **Determination of Patent Term Adjustment under 35 U.S.C. 154 (b)**

(application filed on or after May 29, 2000)

The Patent Term Adjustment is 16 day(s). Any patent to issue from the above-identified application will include an indication of the adjustment on the front page.

If a Continued Prosecution Application (CPA) was filed in the above-identified application, the filing date that determines Patent Term Adjustment is the filing date of the most recent CPA.

Applicant will be able to obtain more detailed information by accessing the Patent Application Information Retrieval (PAIR) WEB site (http://pair.uspto.gov).

Any questions regarding the Patent Term Extension or Adjustment determination should be directed to the Office of Patent Legal Administration at (571)-272-7702. Questions relating to issue and publication fee payments should be directed to the Application Assistance Unit (AAU) of the Office of Data Management (ODM) at (571)-272-4200.

APPLICANT(s) (Please see PAIR WEB site http://pair.uspto.gov for additional applicants):

Nicholas S. Bodor, Bal Harbour, FL; Yogesh Dandiker, Toronto, CANADA;

IR103 (Rev. 10/09)

## Privacy Act Statement

The **Privacy Act of 1974 (P.L. 93-579)** requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

- The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether disclosure of these records is required by the Freedom of Information Act.
- A record from this system of records may be disclosed, as a routine use, in the course of
  presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to
  opposing counsel in the course of settlement negotiations.
- A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
- 4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
- 5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
- 6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
- 7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (i.e., GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
- 8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspection or an issued patent.
- A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.
