DME And VEGF Trap-Eye:
INvestigation of Clinical Impact

One Year Data

VEGF Trap-Eye:

Specifically Designed to Block Members of the VEGF Family

- **Fusion protein** of key domains from human VEGF receptors 1 and 2 with human IgG Fc

The diagram illustrates the construction of VEGF Trap-Eye. It shows two VEGF receptors, VEGFR2 and VEGFR1, with their extracellular domains highlighted. These domains are fused to the Fc portion of human IgG. The resulting VEGF Trap-Eye fusion protein is shown as a Y-shaped structure with two VEGF receptor extracellular domains at the tips of the arms and the IgG Fc portion at the base.

VEGFR2 VEGFR1

Fc portion of IgG

VEGF Trap-Eye

IgG=immunoglobulin G; MW=molecular weight

DA VINCI Study Design

Randomized, multicenter, double-masked trial
in patients with clinically significant DME
with central involvement (>250µm in the central subfield)
and ETDRS BCVA 20/40 to 20/320
N=220

Patients randomized
1:1:1:1:1
n=219

Primary endpoint:
Mean change in BCVA

Treatment to Week 24
(primary endpoint)
n=200

Secondary endpoint:
Change in retinal thickness
(OCT)

Continued treatment to 1 year
n=176

*Following 3 monthly loading doses

Confidential

4

DA VINCI Study Schedule

DA VINCI

Key Exclusion Criteria

- History of vitreoretinal surgery in study eye
- Panretinal laser photocoagulation or macular laser photocoagulation in study eye within 3 months of screening
- Previous use of intraocular or periocular corticosteroids in study eye within 3 months of screening
- Previous treatment with anti-angiogenic drugs in either eye within 3 months of screening

Confidential

6

DA VINCI Laser Retreatment/Rescue

- Laser Arm patients could receive laser retreatment beginning at week 16*
- Patients in VTE arms were able to receive laser rescue beginning at week 24*
- Criteria used to determine laser retreatment/rescue (based on ETDRS criteria):
 - Thickening of the retina at or within 500 microns of the center of the macula
 - Hard exudates at or within 500 microns of the center of the macula, if associated with thickening of adjacent retina
 - A zone or zones of retinal thickening 1 disc area or larger, any part of which is within 1 disc diameter of the center of the macula

*Subsequent laser retreatment may not occur more often than once every 16 weeks

Confidential

7

DA VINCI

Retreatment Criteria

for Patients Randomized to VEGF Trap-Eye 2 mg PRN

Following the 3 monthly loading doses, retreatment based on:

- OCT central retinal thickness $\geq 250 \mu\text{m}$
- Increase $> 50 \mu\text{m}$ in OCT central retinal thickness compared to lowest previous measurement
- Increase of ≥ 5 letters in BCVA between current and most recent visit
- Loss of ≥ 5 letters from the previous BCVA measurement w/ any increase in OCT central retinal thickness

*If a patient does not meet criteria, sham injection is given

Summary of 12-Month Results

Efficacy

- Treatment with VEGF Trap-Eye produced statistically significant improvements in BCVA vs. laser at both 6 and 12 months
 - Proportion of patients who gained ≥ 15 letters was statistically better than laser in all VTE groups except 2q8
- Treatment with VEGF Trap-Eye produced statistically significant reductions in CRT compared to laser

Safety

- VEGF Trap-Eye was generally well tolerated
- Most common ocular adverse events were typical of those associated with intravitreal injections
