3 (Pages 6 - 9)

Page 10 Q Are there any changes at all that you would Q Okay. You submitted two declarations in 1 1 2 these two cases? 2 like to make to your declaration in the 326 IPR? A Two cases, two declarations, yes. 3 A Nothing comes to mind right now. MR. TUMINARO: Okay. I'd like to have this Q Okay. Same with respect to Exhibit 2, which 4 5 marked. 5 is your declaration in the 330 IPR. Anything that (Exhibit 1 was marked for identification you would like to add to that declaration? 7 by the court reporter and is attached hereto.) 8 BY MR. TUMINARO: 8 Q Anything that you'd like to delete? Q Sir, you've been handed what's been marked as 9 A No. 10 Exhibit 1 for identification purposes. This is the 10 Q Any changes at all that you'd like to make to declaration that you submitted in the 326 IPR; is 11 that declaration? 12 that right? 12 A Not at this time. A Correct. 13 13 Q Okay. When were you first contacted with 14 Q And if you would turn with me to the last 14 respect to these two IPRs? 15 page before Appendix A. 15 A So this was signed December. I would say --16 A Exhibit 1? 16 I'm guessing early fall. 17 O Exhibit 1. 17 O 2014? 18 A Last page? 18 A Yeah. 19 Q Before Appendix A. 19 Q Okay. And who contacted you? 20 20 A I think it was Mr. Maas and Mr. Zhu and A Yes. 21 others from that team, I think. 21 Q Is that your signature that appears on that 22 last page that's not numbered? 22 Q Okay. 23 23 A Correct. A I'm -- I'm not certain about this, but these 24 Q Okay. And you signed this declaration on are the names that come to mind. 25 December 10th, 2014? 25 Q That's your best recollection? Page 11 Page 13 1 A Correct. 1 A That's right. 2 MR. TUMINARO: Okay. Q Okay. And how were you contacted? By 3 (Exhibit 2 was marked for identification 3 telephone? By e-mail? In what form were you by the court reporter and is attached hereto.) contacted? 5 BY MR. TUMINARO: 5 A First time? Q If you turn with me to Exhibit 2, this is the 6 O Yes. 7 7 declaration that you submitted in 330 IPR; is that A Phone call, I would say, yeah. 8 right? Q Okay. And since the time that you were first 9 A Correct. contacted until you submitted your declaration, how Q Okay. And again, if you would just turn with 10 much time did you spend preparing your declaration? me to the last page before the appendix. Is that A Oh, I'm going to give you a lower bound like 12 your signature? 12 I have done in the past for my depositions. It was 13 A Yes. 13 at least 40 hours. 14 Q Okay. And you signed the declaration in the Q At least 40 hours on each or combined? Each 15 330 IPR on December 9th, 2014; is that right? 15 declaration --

A That is correct. 16

Q Okay. All right. With respect to Exhibit 1, 17

18 is there anything that you would like to add?

19 MR. PLUTA: Object to the form.

20 THE WITNESS: Not that I can think of right

21 now.

22 BY MR. TUMINARO:

Q Is there anything that you would like to 23

24 delete?

25 A Not that I can think of right now.

16 A On each.

17 O On each.

18 So a total of at least 80 hours working on

19 your declaration in the 326 --

20 A And the --

21 Q -- and the 330?

22 A I'm sorry. Because there was some other

23 case, as well, so that's -- there were -- sorry.

24 There were other patents involved, so I would say --

25 I would say 40 hours each of these two, no. I would

4 (Pages 10 - 13)

Page 14 Page 16

- 1 say total, about 40 hours or more.
- 2 Q Okay.
- 3 A Yeah, I think that's correct.
- 4 Q Okay. And what did you do to prepare for
- 5 today's deposition?
- A I reviewed my declaration. I looked at all
- 7 the appendix references. I can -- I looked at the
- patent. I glanced over the patent history. I've
- 9 looked at Lindholm's patent, Rich Kizhepat,
- 10 Kurihara. I looked at certain portions of OpenGL
- 11 that I was interested in, and that's it.
- 12 Q Okay. And did you also -- so with respect --
- 13 strike that.
- 14 You looked at the 871 patent; is that right?
- 15 A Yes.
- Q Did you also look at the 369 patent? 16
- 17 A Yes, I did.
- 18 Q Okay. Did you also look at the prosecution
- 19 history of the 369 patent?
- 20 A Glanced over it, yes.
- Q Okay. And did you look at -- in preparing 21
- 22 for your deposition here today, did you review any
- 23 other exhibits that are not listed in your materials
- 24 considered for your declarations?
- 25 A Not that I recall.

- 1 Exhibit 3 for identification purposes. This is the
- 2 consultant CV that was attached to -- as an exhibit
- 3 to each of your declarations; is that right?
- A That's correct.
- 5 Q All right. Again, anything that you would
- 6 like to add to this CV?
- 7 A No. I mean, I've published additional
- 8 papers, but I -- I think this is fine.
- Q You've published additional papers since you
- 10 submitted this declaration in -- on December 9th or
- 11 December 10th of 2014?
- 12 A Yes. We publish all the time.
- 13 Q Okay. Apart from any other papers, any---
- 14 anything that you'd want to add to this --
- 15 A No.
- Q -- CV? 16
- 17 A No.
- 18 Q Anything that you'd want to delete from the
- 19 CV?
- 20 A Oh, no.
- 21 Q Any changes at all that you would like to
- 22 make?
- 23 A I mean, if there's a typo somewhere here, I
- 24 would like to change it, but I have not seen a typo.
- 25 If there is any misspelling or, you know, some

Page 15

- 1 Q Okay. Did you look at the patent owner's
- 2 response in the 053 case?
- 3 MR. PLUTA: Object to form.
- THE WITNESS: 053 case?
- 5 BY MR. TUMINARO:
- 6 O Yes.
- 7 A In preparation, I only looked at what's
- related to these two patents.
- Q Okay. Have you seen the patent owner's
- 10 response in the 053 case?
- 11 MR. PLUTA: Object to form, object to
- 12 relevance.
- 13 THE WITNESS: I don't understand your
- 14 question, Counsel. You mean since my deposition,
- 15 there was a response; is that what you're saying?
- 16 BY MR. TUMINARO:
- 17 Q Yeah. Since your deposition, there was a
- 18 response in the 053 case. Have you seen that
- 19 response?
- 20 A No.
- 21 MR. TUMINARO: Okay.
- 22 (Exhibit 3 was marked for identification
- 23 by the court reporter and is attached hereto.)
- 24 BY MR. TUMINARO:
- Q Sir, you've been handed what's been marked as

- 1 cosmetic things, you know, I might want to change
- 2 that. But I don't see anything that I can think of
- 3 to be changed here.
- Q Okay. Do you have any other CVs that you use
- 5 in your professional capacity?
- A Yes. 6
- 7 Q Apart from this consultant CV?
- 8 A That's right.
- 9 Q How many other CVs do you use?
- A Different venues; different CVs. I have a CV 10
- 11 for National Science Foundation grants. Those are
- 12 two-page CVs. I have a CV for merit and promotions
- 13 at the University of California. That's over
- 14 70 pages.
- Q Do you have any other CVs besides those two
- 16 that you mentioned?
- 17 A There are other ones for different
- 18 applications. You know, the -- the way they ask
- 19 you, a one-page CV or like an executive summary or
- 20 something like that, yeah.
- Q Do you -- do you talk on a regular basis,
- 22 give -- give presentations on a regular basis?
- A Yes, I do. 23
- 24 Q Do you have a CV that you use to indicate
- 25 your experience with talking engagements?

5 (Pages 14 - 17)

Page 18 Page 20 A No, because they know me so they don't ask THE WITNESS: We did. We did, yeah. 1 1 2 for a CV. 2 BY MR. TUMINARO: 3 Q Okay. 3 Q Did you actually do that work? A That's right. It would be a little weird for 4 A I'm sorry? 5 them to ask for a CV for somebody they're inviting 5 Q Were you the one that did that work? for a talk. 6 A I was the key engineer, yes. 7 Q Okay. 7 Q Okay. Is it -- you've worked on digital 8 A That's usually not done. 8 signal processors? 9 Q Is your NSF CV publicly available? 9 A Sure, yes. A That's a good question. I don't know if it 10 Q DSP for short; is that right? 11 is publicly available. 11 A Yes. Q Do you -- you're a -- you're a professor at 12 12 Q You've worked on system-on-a-chip 13 architectures? 13 the University of California, Irvine; is that right? 14 A I have, and I continue to, yes. 15 15 Q Do you publish your CV on -- on the Q You've continued to work on that? 16 university's webpage? 16 A Uh-huh. Q You've published papers on a system-on-a-chip 17 A No, we don't. We just have a summary on the 17 18 website. If you Google, you'll find out. 18 architecture? 19 Q So based on your CV, you've -- you've never 19 A All the time. 20 worked at a graphics processing company, correct? 20 Q You continue to do research on system-on-a-MR. PLUTA: Object to form. 21 21 chip architecture? 22 THE WITNESS: Well, I worked for our 22 A That's what we do. 23 23 start-up, and one of the application was for Q Okay. And you also work on processor 24 graphics processing. 24 architecture in general? 25 BY MR. TUMINARO: 25 A That's all my life, yes. Page 19 Page 21 Q The start-up being the MorphoSys? 1 Q That's your research? 1 2 A Yes, Morpho Technology. 2 A Yes. 3 Q Morpho Technologies. 3 Q You've written papers on processor 4 architecture? Okay. If we look at Morpho Technologies on 5 A Yes. 5 your CV, it says: "Duties: Cofounder; DSP design 6 Q Okay. All right. Let -- let's -- let's look 6 at your papers, if you would. On page 5 of your CV, 7 7 for communication and multimedia there's a section that reads "Journal" -- well, it 8 systems." 9 starts with "Publications." 9 Is that right? What about that signifies 10 Do you see that? 10 that you worked on graphics? 11 A So we added the functionality of multimedia A Yes. 12 graphics processing, because we were seeking 12 Q And in the "Journals" section, there are 13 customers and clients to adopt a technology. And we listed, starting on page 5 and spanning to page 13, 14 had a -- you know, we had a hammer. We were looking 14 88 journal articles; is that right? 15 A Right. 15 for a nail. Q And then starting on page 13, there's a 16 So basically, we had a parallel processor, an 16 section that reads "Journal" -- "Journals (other)." 17 SIMD, to say it more specifically. We were very 17 18 Do you see that? 18 proud of it because it worked really nicely. And 19 many of these problems are data parallel, so we felt 19 A Yes. 20 Q What does that refer to? 20 very strongly about being able to apply it to the 21 A These are not -- okay. Yeah. When -- when 21 pixel processing and so on. 22 you have a special issue in a journal -- actually, I 22 Q Okay. So you felt strongly that you could

6 (Pages 18 - 21)

24

see a typo here.

When you see a special issue in a journal,

25 then there would be editors that would be writing a

23 apply it to pixel processing. Did you actually

MR. PLUTA: Object to form.

24 apply it to pixel processing?

Page 22 Page 24 1 summary, an overview of what the special is all --1 graphics processing, right? MR. PLUTA: Object to form. 2 special issue is all about. So the "Journal 2 3 THE WITNESS: I don't know. 3 (others)" means that we wrote an opening statement 4 BY MR. TUMINARO: 4 about what this particular special issue is about. 5 Q Well, I counted, and there's only eight of 5 For instance, let's say there was a special issue for configurable computing, like jo3. them. We could go through them if you'd like. If So Fadi Kurdahi and I, plus others, wrote an 7 you look at j54. opening remark. So this is really not A Okay. I appreciate your due diligence on 9 this. I -- I would be glad to verify them. peer-reviewed. That's why it's called "Journals 10 (other)." Q On page 10, j54. 11 Q I see. 11 A Okay. Okay. j54. 12 Can I -- I just want to put a checkmark to --12 A All the other ones are peer-reviewed, and we 13 j54. Okay. 13 really don't count these for promotions. And this 14 is just a service to the society, IEEE society, and 14 Q Is that directed to a graphics paper? 15 A It is. 15 whoever else is in charge. We have to do that. I -- I don't know how it is in other fields, 16 Q Okay. How about j71? Is that a graphics 16 paper on page 11? 17 but it takes time because you have to review those 18 selected papers and make a summary of what -- what's 18 A Yes. 19 coming up, and so it takes time. 19 MR. PLUTA: Object to form. 20 BY MR. TUMINARO: 20 Q Okay. So under "Journals (other)," you have 21 six articles that are listed there; is that right? 21 O It is? 22 A Yes, it is. 22 A Right. 23 23 Q Okay. And after "Journals," starting on Q Okay. How about c47, which appears on 24 page 13 of your CV, there's book chapters; is that 24 page 18 of your declaration -- I mean of your CV. I 25 apologize. 25 right? Page 23 Page 25 1 A That's right. A Yes. 1 2 Q And there's five listed book -- book chapters 2 Q c76 on page 21 of your CV, is that related to graphics? 3 that you've contributed? 3 4 A Correct. 5 Q All right. c81, page 21, is that related to 5 Q Okay. Then on page 14, there's conference papers, I -- I assume; is that right? Is that what 6 graphics? 7 that means? A Yes. 8 A Yes. Q c87 on page 22, is that related to graphics? 9 Q They're refereed? 9 A Yes. 10 10 A That's right. Q c89, is that related to graphics? 11 Q Okay. And starting on page 14 and spanning 11 A Yes. 12 all the way until -- I guess it's page 29, there's 12 Q And c95 on page 23, is that related to 13 13 160 conference papers listed on your CV? graphics? 14 A Yes. 14 A Yes. 15 Q Okay. Then starting on page 29, there's 15 Q Those are eight papers that you say are 16 another section that reads "Technical Reports," related to graphics. 16 17 correct? 17 Are there any others that are listed on your 18 A Correct. 18 CV? 19 Q Okay. And from page 29 to page 30 of your 19 MR. PLUTA: Object to form. 20 CV, there's 13 technical reports that are listed? 20 THE WITNESS: Yes. 21 21 BY MR. TUMINARO: 22 22 O Where? Q So in total, if you add up all those papers 23 on your CV, you have 272 papers listed on your CV? 23 A So let's start. 24 Q If you'd --A Yes. 24 25 Q Okay. And only eight of them are directed to 25 A Yes.

7 (Pages 22 - 25)

Page 26

1 O -- take a look at it and tell me if there's 2 others.

A Sure. So some of these are tangentially

- related. Like j7, "Finding circular shapes in an
- 5 image on a pyramid architecture." Some of these
- techniques could be used to create a primitive, like
- primitives for 3D graphics because you're trying to
- figure out the shape. And primitives could be
- triangles or could be some other exotic shape. So
- 10 that's -- that -- those algorithms are useful, so I
- would consider that as one related to that. 11
- 12 So j12, although it says "image processing,"
- 13 but the concept of a hierarchical pyramid
- 14 architecture, it's very relevant to the graphics
- 15 because of the way -- as -- as you may recall, we do
- 16 the vertex processing, and then it goes down to the
- 17 pixel processing.
- 18 So this hierarchical level works for image
- 19 processing and graphics. And people have looked at
- 20 this hierarchical architecture. And to some extent
- a unified shader probably is trying to do something
- 22 like that. So I would put a little bit of
- 23 checkmark, at least from my point of view.
- 24 So let me finish all of this, and then if you
- 25 have any questions --

Page 27

- 1
- 2 A -- I will answer that. But I'd like to go
- 3 through this.
- O Okav. You want to --
- 5 A It would not take much time.
- 6 Okay. Sure. Go -- go right ahead. Please
- 7 do.
- A So the j14, also circle detection, it goes
- back to primitives and identifying primitive
- objects, although usually people use triangles, but
- that helps consolidate, you know, triangles or
- 12 whatever into circles. So that is -- that could be
- 13 used for graphics, as well.
- 14 Q Well, I'll stop you. In that paper, was it
- 15 actually directed to graphics?
- MR. PLUTA: Object to form. 16
- 17 THE WITNESS: It was for identifying circles.
- 18 BY MR. TUMINARO:
- Q Okay. And you mentioned that circles could
- 20 be used in graphics, but was it actually -- in that
- 21 paper, were you discussing graphics processing?
- 22 MR. PLUTA: Object to form.
- 23 THE WITNESS: Not directly. Indirectly.
- 24 BY MR. TUMINARO:
- 25 Q Okay.

1 A Again, j19 is about pyramid architectures.

- 2 So that's -- let me go through this more here.
- 3 So I'm down to j40, j41.
- 4 So I -- let me -- before forgetting, what we
- 5 did at Morpho, as you can imagine, it was a
- start-up. We had investors, and we had -- it was
- not possible to publish some of that work. So we
- did a lot of work on using SIMD for graphics
- processing, in particular, pixel processing, and
- they were not publishable.
- I just wanted to mention that to you for the
- 12 record, because there is no -- any documentation on
- 13 that. And that's true for many companies, by the
- 14
- 15 Q Okay. And before you go on, I notice that
- 16 some of these papers, you're listed as the first
- named author, and some you're -- you're the second
- or third or fourth or fifth named author.
- 19 A Uh-huh.
- 20 O How is that determined, what order that
- 21 you're an author?
- 22 A So that's a very interesting point of view
- 23 for faculty. All of these are our ideas or, in this
- case, my ideas. It's just when a student is working
- with me, we try to give him more credit. Some

Page 28

- 1 faculty don't follow this strategy. I do and many others do.
- 3 So we put their names first and ours in the
- 4 back, kind of in the middle or at the end. And if
- they help write some of this, they will get some
- credit for that, as well. We do writing, too, but
- it's the style of the faculty. I would say
- 75 percent follow what I do. Some like to see their
- 9 name first.
- 10 O So if you're listed as a first named
- inventor -- I mean, first named author, I apologize,
- that means you did more of the work on that paper?
- 13 MR. PLUTA: Object to form.
- THE WITNESS: Not really, no, no, because the 14
- 15 ideas come from us.
- 16 BY MR. TUMINARO:
- 17 Q Come from us, who's us?
- 18 A The faculty.
- 19 Q Okay.
- 20 A Me in this case. We give the ideas. We
- provide the -- I mean, the whole idea of MorphoSys
- architecture was my idea. But writing the code and
- implementing it, some of the students helped out.
- 24 Q Okay. All right. So then I'll ask, why
- 25 don't you go through your -- your papers, and if you

8 (Pages 26 - 29)

Page 30 Page 32 1 find any additional ones that you think relate to 1 A Yes. 2 graphics --2 Q Okay. So before you got involved in these 3 A Sure. I'm almost done. 3 cases between LG and ATI at the patent office, had Q -- you can let me know. you ever -- well, strike that. A So again, I repeat that what happened in 5 Before you got involved with these cases, LG Morpho was not published related to graphics. versus ATI, you never worked on a graphics case; is c78, it's "Hardware Accelerated Voxel 7 that right? Carving." Voxel is a three-dimensional pixel, so it 8 MR. PLUTA: Object to form. 9 THE WITNESS: No, that's not correct. is definitely graphics. And it's published in BY MR. TUMINARO: graphics -- computer graphics symposium, so Q That's not correct. 11 definitely that should be counted in your list, 11 12 among other things that I've mentioned, c78. 12 Which one of the cases listed on your CV 13 Q j78, you mean? 13 relates to graphics? 14 A c78. 14 A Fish and Richardson, RIM ITC versus GPH. 15 Q c78. 15 There's also one more, but it's just -- the A And you can see that it says "computer 16 Milberg -- 2011, Milberg, Class versus NVIDIA. 16 17 graphics symposium." 17 Q Any others? 18 "Recovering 3D Metric Structure and Motion 18 A I just looked at it quickly. And that's 19 for Multiple Uncalibrated Camera;" that's also 19 about it, I think, for now. Q Okay. When you were at Morpho Technologies, 20 computer graphics, c83. 20 21 I think you said eventually you added more graphics 21 There are a couple of papers here. We tried 22 to improve the SIMD to have branches. And that was capabilities to the MorphoSys? 23 in preparation for applying it for graphics 23 A It -- it had the capability. We just tried computation, because you want to do a conditional different applications on it to just be able to do statement in SIMD, which we did not have before. pixel processing and so on. You kind of -- you can Page 31 1 And that's what c85 with Anido and also with see that a graphics computation is really an array, 2 c81 which you already identified. to the array. And the MorphoSys was perfectly 3 "Persepolis: Recovering History with a 3 designed for that purpose. 4 Handheld Camera," that is definitely graphics you're Q Switching gears, I'd like to look at your 5 declaration, Exhibit 1. 5 trying to identify. 6 "Image Based Mesh Reconstruction and 6 A Okay. Rendering," that's also --7 7 Q Starting on page 11 of that declaration, Q You're saying c90? there is a large heading number III, "Technology 9 A c90, c91, "Camera Calibration Long Image 9 Background." 10 10 Sequences," those are all related to graphics. A Yes. 11 "Automatic creation of three-dimensional 11 Q Okay. In this technology background, it 12 avatars," that's also graphics. 12 spans all the way to page -- the bottom of page 16; 13 is that right? 13 Again, c98, anything with avatars, you're 14 trying to do -- carving these three-dimensional 14 A Yes. Q Oh, actually, there's one word at the top of 15 pixels, some of the details, I mean -- yes, c100, 15 16 c98. 16 page 17, "processing"; is that right? 17 A Yes.

17 So I would say there are at least twice as many as you mentioned that are directly or 18 19 indirectly related. 20 Anyway, so... 21 Q Okay. Let's look at your litigation support

22 experience that starts on page 2 of your --

23 A Yeah, sure.

24 Q -- CV, and that spans to page 5 of your CV; 25 is that right?

citation; is that right? MR. PLUTA: Object to form.

22 THE WITNESS: I can check.

23 I don't see one, yes.

24 BY MR. TUMINARO:

25 Q Where did the information for this section

Q Okay. In this entire section about the

technology background, there's not a single

9 (Pages 30 - 33)

18

20

21

Page 34 Page 36 1 come from? 1 THE WITNESS: I don't have a product. I just 2 A My knowledge of the field. 2 remember that. 3 Q Okay. So as an expert in graphics, you're 3 BY MR. TUMINARO: 4 knowledgeable about graphics technology? 4 Q You just remember that? A Yes. 5 A Right. Q You're knowledgeable about the evolution of 6 MR. TUMINARO: I'll like to have that marked. 7 graphics technology? 7 (Exhibit 4 was marked for identification A Yes. 8 by the court reporter and is attached hereto.) 9 Q If you turn with me to page 27, there is a 9 BY MR. TUMINARO: 10 Figure 1 that is shown in --Q I've handed you what's been marked as 11 A Page 27? 11 Exhibit 4 for identification purposes. This is a 12 Q I'm sorry, I meant paragraph 27. If I said 12 document entitled "How GPUs Work." 13 page 27 --13 Do you see that? 14 A Right. 14 A Yeah. 15 15 Q Paragraph 27, there's a figure shown in Q And if you'll turn with me to page -- the 16 second page of -- of Exhibit --16 paragraph 27. 17 A Correct. 17 A Uh-huh. Q -- 4. 18 Q Where did that figure come from? 18 19 A From one of my sources that I had or what's 19 MR. PLUTA: I'm just going to object to the 20 on the web. introduction of this evidence as irrelevant at this 21 Q Did you generate this figure? point, lack of foundation. 22 A It's from one of my references or from what's 22 MR. TUMINARO: I'm trying to get to the 23 foundation. 23 available on the Internet. It could be from a specific source. I -- I -- I did not exactly draw 24 Q If you look with me to the right of page --25 this. 25 it's listed 127, in the right-hand column there's Page 35 1 Q Okay. So this came from something on the a -- sort of midway through there's a sentence that 2 Internet or some other source? starts with "for example." A Yeah. 3 Do you see that? Q If you look at your materials considered, 4 A Yes. 5 O I'll read it for the record: 5 there's -- that Internet or other source is not 6 listed, is it? 6 "For example, the NVIDIA GeForce A That source? No. 7 3, launched in February 2001, Q Okay. If you turn with me to paragraph 31 of 8 introduced programmable vertex 9 9 your declaration -shaders. These shaders provide 10 A Yes. 10 units that the programmer can use 11 11 for performing matrix-vector Q -- the first sentence of paragraph 31 reads: 12 "The first programable pipeline 12 multiplication, exponentiation, and 13 13 (PP) was introduced in 2001." square root calculations, as well as 14 14 Do you see that? short default program that use these 15 15 A Yes. units to perform vertex Q What's the basis for that statement? 16 transformation and lighting." 16 A Just my knowledge, what I -- what I know from 17 17 Do you see that? 18 what I've read. 18 A Yes. 19 Q What pipeline was it that you were referring 19 Q Is that the product that you were referring 20 to there? 20 to that was a programmable pipeline in 2001? 21 A I'm not sure. I'm not sure if that was the A Used for graphics. 22 Q Well, what was the product? Is there a 22 product or there were other products, but it seems 23 product that's associated with that? to be consistent with what I said. 24 24 A No. Q Okay. So when you wrote this sentence in paragraph 31, you didn't have any specific product 25 MR. PLUTA: Object to form.

10 (Pages 34 - 37)

	Page 20		D 40
1	Page 38 in mind?	1	Page 40 A The
2	A No, no.	2	MR. PLUTA: Object to form.
3	Q Just your general knowledge of the GPU	3	THE WITNESS: The first
4	evolution in technology?	4	MR. PLUTA: Lack of foundation.
5	A Correct.	5	THE WITNESS: I could not tell you, but
6	Q If you turn with me to paragraph 32 of your	6	the DirectX 10 does because it's the latest one or
7	declaration.	7	one of the latest ones that we have. So so I
8	A Yeah.	8	would say I can't tell you if it was the first

Do you see that? A Okay. MR. PLUTA: I'm going to object to the relevance of this exhibit and also lack of foundation. Also, hearsay. THE WITNESS: I'm seeing this for the first time, so I mean, judging from that paragraph, it says what it says. What do you want me to add to that? BY MR. TUMINARO: Q I was going to ask the question. A Right. Q So does this does this jog your memory, as an expert in graphics, that Shader Model 4.0 in

11 (Pages 38 - 41)

Page 42 Page 44

- 1 MR. PLUTA: Object to form.
- 2 THE WITNESS: I could not answer that based
- 3 on this document. I have to do more research on
- 4 that.
- 5 BY MR. TUMINARO:
- Q So you don't know one way or the other; is
- 7 that your testimony?
- A That is not my testimony. I need more work
- on that. I have some ideas, but I'm not going to
- render my ideas based on just one article.
- Q Well, what's your idea, then --11
- 12 (Simultaneous speaking - unreportable.)
- 13 MR. PLUTA: Object to form, calls for
- 14 speculation.
- 15 THE WITNESS: I need more work on that to
- 16 give you an answer.
- 17 BY MR. TUMINARO:
- 18 Q You can't -- do you have an idea of when the
- 19 first unified shader architecture came out?
- 20 A I can't give you for certain what date.
- 21 Q What's your best understanding of what the
- 22 date is?

1

- 23 A I can't guess.
- 24 Q I -- I didn't ask you to guess. I asked,

MR. PLUTA: Object to form.

25 what's your best understanding?

- 1 felt. We just looked at their architecture; we
- 2 still do. We look at their papers. I'm interested
- in architectures. I'm not interested in how they
- 4 view and what they interpret what is possible or
- 5 not.
- 6 BY MR. TUMINARO:
- 7 Q And just to be clear, you didn't consider
- that in forming your declar- -- the opinions
- expressed in your declaration; is that right?
- MR. PLUTA: Object to form.
- THE WITNESS: I did not mention it here. 11
- 12 BY MR. TUMINARO:
- Q So given that now the two major APIs, OpenGL
- 14 and DirectX 10, provide a unified shader model, it
- would be more efficient for graphics hardware to
- implement a unified shader; isn't that right?
- 17 MR. PLUTA: Object to form.
- 18 THE WITNESS: What do you define efficiency?
- 19 BY MR. TUMINARO:
- 20 Q How would you define efficiency?
- A You asked me the question about efficiency.
- What efficiency do you have in mind?
- Q Well, that's what I'm asking you, how do you
- understand the word "efficiency" in the context of
- graphics processing?

Page 43

- 2 THE WITNESS: I'd have to guess, and I'm not
- 3 going to guess.
- 4 BY MR. TUMINARO:
- Q Okay. You are aware, though, now, as of
- 6 today, OpenGL and DirectX provide a unified shader
- architecture?
- 8 MR. PLUTA: Object to form, relevance.
- THE WITNESS: Yes.
- 10 BY MR. TUMINARO:
- 11 Q Okay. And you know that -- you've heard of
- 12 NVIDIA?
- Q And you understand that NVIDIA initially was 14
- 15 skeptical of whether unified architecture would
- 16 work?
- 17 MR. PLUTA: Object to form, relevance.
- THE WITNESS: I have no idea about their 18
- 19 position on that.
- 20 BY MR. TUMINARO:
- 21 Q So based on your general knowledge of shader
- 22 architecture and graphics evolution, you have no --
- 23 no understanding one way or the other?
- 24 MR. PLUTA: Object to form.
- 25 THE WITNESS: I would not guess what NVIDIA

- Page 45 A This is a very broad question. What is --
- 2 what is the application?
- 3 Q Graphics processing.
- A Counsel, there's a graphic processing in your
- 5 smartphone. There's a graphic processing in your
- 6 desktop.
- 7 Q Okay.
- 8 A There's a graphic processing for applications
- in military and civilian applications. Which one do
- you have in mind? You're asking a very broad
- 11 question.
- 12 Q Okay. So I have in mind graphics processing
- 13 in my cell phone or in a desktop.
- A You are asking that?
- 15 Q Yeah, in either one of those, what would it
- 16 mean to be efficient?
- 17 A Okay. Efficiency means computation
- 18 efficiency. Efficiency could be battery power
- efficiency. And between the two applications, I
- would think that you agree with me that the
- smartphone battery power efficiency's a lot more
- 22 important than your computation efficiency.
- Efficiency could mean cost. It's more
- efficient to have -- well, maybe you don't use the
- word "efficiency" for cost, but it means lower cost

12 (Pages 42 - 45)

Page 48

- 1 that gives you the targeted efficiency. So it
- 2 really depends.
- 3 If your -- if your unified shader is going to
- 4 cost you more for grandma's phone, I might opt for
- 5 a -- just a hardwire approach. Just it's cheaper.
- 6 I might just do that. I don't think NVIDIA or
- 7 anybody will -- will dispute that.
- 8 So it really depends on what your target
- 9 application is and what your cost is. If the cost
- 10 of unified -- unified shader comes down to the level
- 11 of that is acceptable to many target applications,
- 12 then that would be the way to go.
- 13 Q You mentioned that if you were going to put
- 14 it in grandma's phone, you might want to just use a
- 15 hardwire approach.
- 16 A Uh-huh.
- 17 Q What's a hardwire approach?
- 18 A It's the FFP, the fixed function pipeline
- 19 basically, or used to be.
- 20 Let's say the unified shader is very exotic.
- 21 It probably is all the latest technologies that you
- 22 have, but I really don't want that. I really don't
- 23 want -- you don't want to have an 8-cylinder car.
- 24 You're just going to the grocery store, and that's
- 25 all you're doing. You're not racing. That would be
 - Page 47
- 1 the grandma's. Then you may want to use -- then you
- 2 may want to use an ASIC approach, basically,
- 3 where -- where you just -- simple and already
- 4 proven, and it's very efficient cost-wise and
- 5 probably power-wise, too.
- 6 So it really depends. And I don't think
- 7 anybody would dispute that.
- 8 Q So are you suggesting that graphics
- 9 processors are now moving toward more of a hardwire
- 10 approach?
- 11 MR. PLUTA: Object to form.
- 12 THE WITNESS: That's not what I said. I said
- 13 it depends on your application. A unified shader
- 14 gives you the capability through software means.
- 15 It's a lot more advanced. It's the way to go. But
- 16 there are applications that you may find out that
- 17 unified shader is too much of a burden in terms --
- 18 in terms of power consumption, cost and so on.
- 19 If the cost and power consumption comes down
- 20 towards the ASIC solutions, then yes, that would be
- 21 the ultimate graphics engine.
- 22 BY MR. TUMINARO:
- 23 O So you're --
- 24 A We're struggling with this right now in
- 25 all -- all the things that we do that are

- 1 programmable.
- 2 Q So you're aware that in graphics processing,
- 3 initially it was fixed pipeline, correct?
- 4 A Yes.

Page 46

- 5 Q Okay. And then it moved to a programmable
- 6 pipeline, correct?
- 7 A That's right.
- 8 Q And unified pipeline is now sort of the --
- 9 A Program.
- 10 Q -- state of the art kind of pipeline?
- 11 MR. PLUTA: Object to form.
 - THE WITNESS: Yeah.
- 13 BY MR. TUMINARO:
 - Q And you said it's the way to go; is that
- 15 right?

12

14

- 16 A How often do you charge your phone? You
- 7 charge it a lot. You've got an 8-core processor on
- 18 your phone, so we are getting to a point of wanting
- 19 to know the efficiency of the execution. A
- 20 programmable solution is good for lots of people.
- 21 I'm not saying we're going back to the ASIC
- 22 solutions. I'm just saying when you talk about
- 23 efficiency, you have to be more accurate in terms of
- 24 what is -- what problem are you trying to solve?
- 4 what is -- what problem are you trying to solve? 5 You have to -- you have to qualify that. What --
 - Page 49
- 1 what do you mean by efficiency. That's -- that's
- 2 what I'm trying to tell you.
- 3 I'm not saying we're dropping off unified
- 4 shader or programmable solutions. I'm not saying
- 5 that at all. If I said that, I maybe mis---
- 6 misspoke.
- 7 Q So you're aware in your understanding of
- 8 graphics processing that the industry has moved away
- 9 from a fixed pipeline, right?
- 10 MR. PLUTA: Object to form, lack of
- 11 foundation.
- 12 THE WITNESS: I said as much in my report,
- 13 but I'm saying if -- if efficiency -- power
- 14 efficiency's important, there might be solutions
- 15 that are not that way. That's what I'm trying to
- 16 tell you.
- 17 BY MR. TUMINARO:
- 18 Q Okay. My question was not about efficiency.
- 19 I'm just saying, are you aware that it moved -- the
- 20 industry has moved away from fixed pipeline and now
- 21 it's toward a programmable pipeline?
- 22 MR. PLUTA: Object to form --
- 23 BY MR. TUMINARO:
- 24 Q You said that in your declaration, correct?
- 25 A Correct. But your original question was

13 (Pages 46 - 49)

Page 50 Page 52 1 about efficiency, if you recall. Are we -- are we 1 programmable unified shader is the way to go because 2 out of that question? 2 people don't want to design new chips every time Q Just to remind you how this works, I ask a 3 there's a bug. So I hope you understand my position question; you answer the question that I ask; is 4 on that. that right? 5 BY MR. TUMINARO: A Yes. Then I'm confused about what question Q Okay. Switching topics, I'd like to talk 7 you're asking. about -- you've heard of what a -- a register? You Q Okay. So now I'm asking the question. know what a register is? 9 You're aware that the industry has moved away A Register in the context of? 10 from a fixed pipeline and has moved toward a 10 Q Computer processing. 11 programmable pipeline, correct? 11 A Yes. MR. PLUTA: Object to form. 12 12 Q What's a register? 13 THE WITNESS: I said as much in my report. 13 A Stores information. 14 BY MR. TUMINARO: 14 Q Okay. A register is typically a multi-ported Q Okay. And the industry -- after the -- the 15 15 storage unit? 16 programmable pipeline is moving toward a unified A Typically. What's your application? 16 17 shader pipeline, is that correct, the graphics 17 Q Graphics processing. 18 processing industry? 18 A I mean, yes and no, depending on what you're 19 MR. PLUTA: Object to form. trying to do. I have to see what the diagram 20 THE WITNESS: That is correct. 20 looks -- schematic looks like to tell you what 21 BY MR. TUMINARO: 21 you're trying to do. 22 Q Okay. And the unified shader architecture, Q Okay. A register is typically the closest 23 it's the thing of the future, correct? piece of memory to an ALU? 24 A What do you --24 MR. PLUTA: Object to form. 25 MR. PLUTA: Object to form. 25 THE WITNESS: Generally, yes. Page 51 Page 53 THE WITNESS: What do you mean by the 1 BY MR. TUMINARO: 1 Q And a memory is typically something different 2 thing --3 BY MR. TUMINARO: 3 than a register, correct? MR. PLUTA: Object to form. Q Well, you said it's the way to go. 5 THE WITNESS: I don't understand why you A If I talk about efficiency -- if your 5 6 power -- if your power consumption is an issue for 6 distinguish between the two. BY MR. TUMINARO: 7 7 you, we may find changes on that model. Q Well, a memory is typically further from an 8 BY MR. TUMINARO: 8 9 ALU compared to a register? Q Okay. How about this. What if your factor 10 MR. PLUTA: Object to form. 10 that you're considering is performance, not -- not 11 THE WITNESS: Proximity to ALU doesn't 11 power consumption, performance? If you want to 12 increase performance, would you move toward a 12 identify the differences. It just stores 13 unified shader architecture? information. Remember what I defined register to

14 be, stores information; so does memory.

15 BY MR. TUMINARO:

Q And a memory is typically a single-ported storage unit as compared to a register, which is

18 typically a multi-ported?

19 A No. You can have dual port memories, too. I

have designed dual port memories.

21 Q Well, let me ask you this. A register is a

22 different thing than a memory, right?

23 A In terms of storing information, no.

24 Q But in terms of difference -- they're

25 different, correct? A register is different than a

14 (Pages 50 - 53)

14

15

17

23

MR. PLUTA: Object to form.

16 this, but an ASIC solution is far more efficient in

18 it's not programmable because it will have problems 19 in case there's a bug or there are fixes to be made.

20 So that's why unified shader is better, because you

21 can change it, you can modify it easy, and you don't

But it is a well-known concept that the

24 hardwired solutions are more power efficient and

25 they're more computation efficient. But a

22 have to retape the device.

THE WITNESS: Okay. You may be shocked by

computation than a programmable unified shader, but

Page 54 Page 56

- 1 memory?
- A In what way? I don't -- I mean, they have
- 3 different names, yes, they are different names. But
- 4 they store information and you retrieve information.
- 5 So from that point of view --
- Q So then why does the industry use a
- 7 different --
- 8 MR. PLUTA: Hold on, Counsel. I don't --
- 9 MR. TUMINARO: I thought he was done.
- 10 MR. PLUTA: I don't think he was done.
- THE WITNESS: I wasn't done, yeah. Sorry. 11
- Let me identify what a block of storage is. 12
- 13 You write to it and you read from it. Both of these
- 14 entities do that. Register and memory are
- 15 indistinguishable in terms of writing to it and
- 16 reading it.
- 17 In terms of volatility, they both could be
- 18 nonvolatile or could be volatile, both of them. So
- I don't see any difference in terms of
- 20 functionality.
- 21 BY MR. TUMINARO:
- 22 Q Well, the industry has come up with two
- 23 different names for these storage units, right? A

Q So are you telling me that it's -- it's 2 typically not the case that a register is

A I don't know if I said that.

Q So is a -- is a register typically

A It depends on your application. I mean, you

Q So in your mind, is a register the same thing

THE WITNESS: The functionality is very

information for a period of time. From that point

A As in -- you asked the question earlier, it's

25 closer to the ALU or the processor, so that's the

8 could have an accumulator, which is a register, and

9 it could be one-ported. It really depends on what

10 application you have. It's really -- you cannot generalize that, application dependent.

MR. PLUTA: Object to form.

16 similar in terms of reading, writing, storing

18 of view, the same. So it stores data.

Q Are there any differences?

22 memory -- actually, a lot faster, yeah.

A So register is a little faster than a

- 24 register and a memory, correct?
- 25 A Correct.

3 multi-ported?

6 multi-ported?

as a memory?

19 BY MR. TUMINARO:

Q Anything else?

1

5

12

13

14

15

20

21

23 24

- 1 case, as well. So those are very important issues.
- Q Those are two differences. Any others
- 3 between a register and a memory?
- A The actual circuit design could be different
- 5 because you're trying to save power, save energy and
- so on. So yeah, if you are asking memory, it would
- 7 be a little different, but the functionality's
- 8 identical.
- 9 Q Okay. Anything -- any other differences that
- 10 you can think of between an AL- -- between a
- 11 register and a memory?
- A It stores data -- no, I think I mentioned all
- 13 the big differences. Performance, proximity to ALU
- and the circuit actually is being different.
- 15 Q Okay. You've heard of the term "ALU"?
- 16 A Yes, I have for a long time, unfortunately.
- 17 O ALU means what?
- 18 A Arithmetic logic unit.
 - Q Okay. You've heard of the term "processor
- 20 unit" -- strike that, "processor"?
- 21
- 22 Q Okay. Is a processor the same thing as an
- 23 ALU?

19

- 24 MR. PLUTA: Object to form.
- 25 THE WITNESS: Okay. Traditionally, if this

Page 55

- 1 is a class, which I will have in two weeks, a
 - 2 processor includes an ALU and register file and any
 - 3 other things that you can think of, a processor, a
 - 4 processor, a microprocessor.
 - 5 BY MR. TUMINARO:
 - Q So -- so you're saying a processor has
 - additional structure that's not in an ALU?
 - A If you define the microprocessor the way we
 - 9 define it in our textbooks, a microprocessor has
 - 10 those components.
 - 11 Q An ALU and register?
 - 12 A Register file and other things, address
 - 13 decoder and so on --
 - Q So --14
 - 15 A -- and program counter and so on. Sorry.
 - Q So an ALU can do functions like add, 16
 - 17 subtract, compare, correct?
 - 18 A Sure, yes.
 - 19 Q Whereas a processor can run instructions,
 - 20 right?
 - 21 A No. Remember when I put the -- the -- the
 - 22 area around the processor, the processor included
 - the ALU and the register file.
 - 24 Q So, what, you're saying a processor doesn't
 - 25 run instructions?

15 (Pages 54 - 57)

Page 58 Page 60 1 A I didn't say that. 1 will say the engine is different from the car. The 2 MR. PLUTA: Object to form. 2 car includes the engine. This is the same 3 BY MR. TUMINARO: 3 relationship. So it's the only way I can answer your question without confusing myself. Q So -- so my question was, a processor can run instructions, right? And you said no. So if the processor is the car, engine is the ALU, is that -- does that help you with -- to A So let me --7 7 Q So let me ask the question again. answer? 8 A Yeah, please. 8 Q That helps. But -- so just in your example, 9 9 a car is not the same thing as an engine, right? Q A processor can run instructions, right? 10 A A processor executes instructions from its 10 A It includes the engine. Q It includes the engine, but they're not the 11 instruction memory. And based on those 11 12 instructions, it will activate the control signals 12 same thing? 13 for all the internal components, which means A Where do you say the car is? I mean, I 14 activates the register file, activates the ALU and a 14 don't -- I don't understand. Would you call the 15 few other blocks. shell of the car to be the car? I don't know. Q Just so I'm clear because I'm not -- that 16 Q Okay. At least I understand your testimony. 16 17 means yes, a processor can run instructions; is that 17 A Okay. Thank you. 18 right? 18 MR. PLUTA: We've been going for about an 19 A I think I just said that, yeah. 19 hour. Is it a good time for a break? 20 20 Q I just wasn't clear. I didn't know if that MR. TUMINARO: Oh, yeah, sure, yeah, yeah. 21 THE VIDEOGRAPHER: We are off the record. 21 was a yes or not. 22 22 A The answer is the processor executes The time is 10:45 a.m. 23 instructions based on a program counter, which is 23 (Recess.) 24 24 basically sequencing through the instruction memory, THE VIDEOGRAPHER: We're back on the record. 25 and activates -- I'm giving you a little bit more 25 The time is 10:59 a.m. Page 59 Page 61 1 Please continue. 1 answer because --2 (Exhibit 6 was marked for identification Q Okay. 3 A -- I think it has to be clear that ALU does by the court reporter and is attached hereto.) 3 4 BY MR. TUMINARO: 4 the function on behest of the instruction decoded. 5 Q Welcome back, Dr. Bagherzadeh. Q Okay. So just to be clear, though, an ALU by 6 itself does not run instructions, right, or cannot 6 A Thank you. 7 Q You have in front of you Exhibit 6, which is 7 run instructions by itself? 8 MR. PLUTA: Object to form. 8 the Rich patent, U.S. patent number 5,808,690. 9 You recognize this document, right? THE WITNESS: Instruction has to be decoded 10 A Yes, I do. 10 to activate the control signals for the ALU. Some 11 people mistakenly call ALU the microprocessor. 11 Q You considered this, the Rich patent, in 12 That's -- that's their definition. But, yes, ALU 12 preparing your declarations --13 13 gets its control signals from the decoded A Yes. 14 Q -- in this case? 14 instructions. 15 (Exhibit 7 was marked for identification 15 BY MR. TUMINARO: by the court reporter and is attached hereto.) 16 Q Okay. So you would say it's a mistake to 16 17 call an ALU a processor? 17 BY MR. TUMINARO: 18 Q Okay. You also have in front of you 18 MR. PLUTA: Object to form. 19 THE WITNESS: The ALU by itself, you may call Exhibit 7, which is U.S. patent number 6,897,871. 20 You -- I'll refer to this as the 871 patent. 20 it the processor, but that's not what textbooks 21 You'll understand what I'm talking about? 21 usually talk about. 22 22 BY MR. TUMINARO: A Yes. 23 Q And you considered the 871 patent in 23 Q So the textbook definition would say that a 24 24 microprocessor is not the same thing as an ALU? preparing your declaration, correct?

16 (Pages 58 - 61)

25

A Yes.

A This is like saying that mechanical textbooks

Page 62 Page 64 Q Okay. And, in fact, just to be clear, it's Q Well, I -- I read your report, and that's 1 2 your opinion that Rich renders claim 15 of the 871 2 what I'm trying to understand is -- well, let me ask 3 patent obvious, correct? 3 you this. 4 Are you saying that general purpose register A Yes. Right. Rich teaches claim 15, correct. 5 Q Okay. Now, if we look at claim 15 of the 871 5 block claim -- in claim 15 of the 871 patent patent, there are sort of three elements recited. corresponds to memory 34 in Figure 2 of Rich? There's a unified shader comprising a general 7 A I was just about to answer that question, if purpose register block, a processor unit and a 8 you allow me. It will take a few minutes. 9 sequencer, right? 9 It does provide the resources to the ALU, and 10 A Yes. 10 you can see it from Figure 12. And that's consistent with providing operands to the ALU from 11 Q Okay. Now, I think I have this right. 11 You're saying that -- well, okay. Strike that. what -- what I --12 12 13 Let's look at Figure 2 of Rich. 13 THE REPORTER: "Providing" what? 14 A Uh-huh, yes. 14 THE WITNESS: Operands, o-p-e-r-a-n-d. 15 15 Q Figure 2 of Rich, it shows an architecture So that combination of memory in ALU that's disclosed, a computer architecture that's 16 satisfies that operands are available, and ALU 16 17 executes them. 17 disclosed in Rich, right? 18 A Correct. 18 BY MR. TUMINARO: 19 Q And there is an ALU 33 and a memory 34 in 19 Q Okay. And then --20 20 A And I will continue to --Figure 2 of Rich? 21 21 A Correct. Q Oh, there's more? Okay. 22 Q And there is a processing element array 22 A And Rich says: 23 23 control 40 in Figure 2 of Rich, correct? "Each processing element 32 24 A Correct. 24 comprises an 8-bit multifunction 25 Q Now, correct --25 arithmetic logic unit 33, directly Page 63 Page 65 1 A Processing element array controller, yes. 1 coupled to its own bank of" --2 Q Okay. Now, correct me if I'm wrong, but I --Too fast? 3 THE REPORTER: Yes. 3 I think this is what you're saying, that in your opinion, memory 34 corresponds to the claimed 4 THE WITNESS: Sorry. 5 general purpose register block; is that right? I repeat: A So let's look at -- let's look at the details 6 "Each processing element 32 7 of this. 7 comprises an 8-bit multifunction Q I'll help you out. You talk about Rich in 8 arithmetic logic unit 33, directly 9 9 claim 15 starting at paragraph 214 of your coupled to its own bank of 128 bytes 10 10 declaration. of memory, 34. Each ALU is capable How -- how about we do this? How about we do 11 11 of simultaneously accessing its own 12 this? 12 memory and can share data with its 13 neighbors via an interconnecting bus 13 A Okay. Yes. 14 14 Q How about what you can do for me is circle in architect structure." 15 Figure 2 of Rich what you say corresponds to the So -- so it does provide that functionality claimed elements in claim 15 of the 871 patent. 16 of a -- of a register in terms of providing 16 17 MR. PLUTA: Object to form. 17 operands. 18 THE WITNESS: I would rather not do that and 18 BY MR. TUMINARO: 19 answer your question, because this is a complicated, Q So when you say "it does," you're saying very high-level block diagram. And I -- I would not memory 34, in your opinion, corresponds to the 20 do service to the inventors and what they meant. general purpose of register block claimed in claim 21 22 22 But let me try to do it differently and just 15 of the 871? 23 MR. PLUTA: Object to form. 23 refer to you -- to -- refer you to my report and see 24 THE WITNESS: It provides the data that it 24 if that's satisfactory to you. 25 BY MR. TUMINARO: 25 needs in combination with other components.

17 (Pages 62 - 65)

Page 66 Page 68 1 BY MR. TUMINARO: 1 A Right. 2 Q You'll agree with me that Rich never Q Okay. What in Rich are you saying 3 corresponds to the claimed processor unit in claim discloses that vertex data is retrieved from memory 4 15 of the 871 patent? 4 34, right? 5 MR. PLUTA: Object to form. 5 MR. PLUTA: Object to form. THE WITNESS: So the processing units are THE WITNESS: It -- it is -- well, I mean, it 6 7 those -- those ALUs. That's what Rich says. 7 does perform the operations for graphics BY MR. TUMINARO: computation. And even if it doesn't say it 9 Q Okay. specifically, it is capable of doing that. 10 A The processing elements 32 operating --10 BY MR. TUMINARO: processing elements 32. It says that here --11 11 Q Okay. Let's --O Okav. 12 A Because -- because it's -- it is a processing 12 13 A -- "processing elements 32 13 element, it has access to the memory. And it is 14 operating normally as a single 14 done for interpolation of the pixels, rasterizations 15 15 and other functions. So, therefore, vertex instruction multiple data configuration." 16 16 processing is part of that, and therefore, it is 17 Q Okay. consistent with my understanding. 17 18 A Each processing element 32. So that -- that 18 Q Okay. Let -- let's look at what you said in 19 box is called a processing element, which includes 19 paragraph 216. The last sentence says: 20 an ALU. 20 "Rich does not explicitly disclose 21 Q Okay. Great. That's it? 21 vertex processing on data retrieved 22 A Yes. 22 from processing memory 34." 23 23 Q Okay. Now, what in Rich are you saying Do you see that? 24 corresponds to the claimed sequencer in claim 15 of 24 A Yes. 25 the 871 patent? 25 Q Do you agree with that statement? Page 67 Page 69 1 A The control unit 40: 1 A I say it. 2 "The processing element, array 2 Q So it's a true statement? 3 3 element control unit 40 is primarily A It's what I've said, yeah. 4 responsible for sequencing 4 O Okav. A But -- but it doesn't do it explicitly, but 5 5 instructions and addresses to the 6 it's implicitly. 6 processing element array 30." 7 7 Q So then you would agree with me that Rich Q Great. 8 does not disclose that vertex data is retrieved from A It's in my chart. 9 Q Excellent. We're on the same page now. 9 memory 34, right? 10 10 Thank you. MR. PLUTA: Object to form. A You are so excited, Counsel. Okay. Okay. 11 THE WITNESS: I think I can read what I have 11 12 Good. 12 here. It doesn't say it explicitly --Q All right. Now, you would agree with me that 13 13 MR. TUMINARO: Okay. 14 Rich never discloses that vertex data is retrieved 14 THE WITNESS: -- but for an engine that is 15 doing graphics computation, it is -- to me, that's 15 from memory 34, correct? MR. PLUTA: Object to form. 16 clear. 16 17 THE WITNESS: Well, this is a graphics 17 BY MR. TUMINARO: 18 processing engine, and clearly talks about Q Okay. But it's your opinion that it would be performing those operations, so it would have been obvious to modify Rich to store both vertex data and 20 very clear to whoever is looking at this technology 20 pixel data in memory 34; is that right? 21 that that's what Rich is talking about, that it can 21 A That is correct. 22 22 access vertex or pixel. Q Okay. But doesn't Rich actually teach away 23 from storing both vertex and pixel data in memory 23 BY MR. TUMINARO: 24 24 34? Q Okay. I'll ask the question again, because I

18 (Pages 66 - 69)

25

MR. PLUTA: Object to form.

25 think I didn't get an answer to my question.

Page 70 Page 72 1 THE WITNESS: Where does it say that? 1 A For what he saw then. But a POSITA looking 2 BY MR. TUMINARO: 2 at that technology will not say that I don't have Q Well, Rich explicitly discloses the vertex 3 enough memory to put the vertexes in there, because data by itself, without even considering the pixel 4 the design is consistent with being able to do 5 data; the vertex data is too big to fit in memory 5 vertex processing. 34. right? Q Well, didn't you opine that a POSITA would 7 A Can you refer me to what section of the Rich 7 actually read Rich to interpret that the vertex data you're talking about? is stored in external memory? Q How about I'll refer you to your own A POSITA was doing that around early 2003. declaration at page -- paragraph 33. 10 That's almost seven years or six years after this 11 A Paragraph 33? 11 came out. I would -- I would submit to you that the 12 Q Paragraph 233. 12 memory technology had improved probably by -- by at 13 A Okay. 13 least 30, 40 percent. So I -- I don't see that as a 14 Q And the second sentence reads -- and I'll 14 problem. 15 read it for the record: 15 Q In paragraph 233 of your declaration, did you "For example, Rich discloses that 16 16 or did you not opine that Rich discloses that vertex 17 the user of" -data is stored in external memory, not processor 18 I think that should be "use," not user; is memory 34? 19 that right? A I'm repeating what Rich says, right? I am 20 A Okay. 20 quoting what Rich says. I did not -- it says 21 Q So I'll read it again --21 basically -- referring to column 16, 52 through 55, 22 A Yes. 22 which is consistent with what Rich disclosed and 23 O -- with the correction: what was the understanding at that time. 24 "For example, Rich discloses that 24 What I'm trying to explain to you is that 25 the use of external memory for the 25 five years later, it would have been definitely Page 71 Page 73 1 storage of data for processing is 1 clear to the designers to not be limited but at 2 necessary because the processing 2 local memory. It would have been -- one of the 3 elements 32 only have a small amount 3 first things that would improve is the size of the 4 of dedicated memory." 4 memory. So I would not find that as a problem. 5 Q All right. That wasn't my question on Do you see that? 6 A Yeah. 6 whether it was a problem. Let's just see if we 7 agree that Rich teaches that vertex data is stored Q And the next sentence reads: 8 in external memory, not in the local memory 34. Do "Further, transformed vertex data 9 we agree on that? is stored in external memory after 10 the geometry function." 10 A That's what he says directly in his -- in 11 Do you see that? 11 his -- in his invention, yes. 12 A Yeah, but it -- but --12 O Okay. 13 13 A But -- but if I could qualify that response O There's --14 A -- I think --14 by saying that it would have been very clear to a 15 Q Okay. 15 designer to not be limited by that, because the A -- adding more memory to the processing 16 design is so versatile. So you could do vertex and 16 element 32, it's a minor change, extremely trivial. 17 pixel at the same time. And the technology slope for that -- when was this 18 Q Okay. And isn't it a fact that the pixel 18 disclosed? 1998. That's not an issue anymore for data is larger than vertex data? 20 us. 20 MR. PLUTA: Object to form. 21 21 Q Okay. But --THE WITNESS: It's -- it's hard to say, 2.2. A This is almost 20 years ago. 22 depending on what format you have in mind. But it Q But it's true that on chip memory, because 23 could be -- because you have more data for the --24 that is so small, Rich teaches that it's necessary for the triangle, there are more pixels than

19 (Pages 70 - 73)

vertices. But then vertices are -- you know,

25 to store the vertex data in memory, external memory? 25

Page 74 Page 76 1 they're described in 32-bit or 64-bit floating point 1 on processing elements 32 themselves." 2 2 descriptions. So it depends; the size of the Do you see that? 3 triangle, how many RGB bits you have for the pixel, 3 A Yeah. It's okay. It's -- it's good. You can keep larger data outside the processor. We do 4 so it depends. 4 5 BY MR. TUMINARO: it all the time. Q Let's look at what you said in paragraph 235 6 Q So --7 of your declaration. 7 A What -- what is the -- what -- the -- the 8 A Right. concern you have is -- I'm a little -- you know, I 9 Q "That is, the data size of pixels mean, I don't know what -- what concerns you, but I 10 after rasterization is more than the 10 answer your question, because that's what I have to 11 data size of transformed vertices 11 do, is that if you have larger sized data, you leave 12 12 it outside the processor and you bring it in. after vertex operations." 13 A Okay. 13 That's how systems work. Whether it's the vertex 14 Q Do you see that? 14 data or it's pixel data, it's really irrelevant. 15 A Yeah. 15 So if he doesn't say it, that's how it would Q So you said that, right? 16 16 be done if the internal memory was large enough to 17 A I said that and I agree with that, but it 17 hold the data. 18 depends on the size of the triangles and the type of 18 So I don't see any inconsistency with what 19 pixels you have. 19 I've said here, what is disclosed here or what an 20 If you use a 2-bit RGB, it will not be the 20 engineer could figure out in 2003. 21 21 Q But just so that we're clear, Rich explicitly 22 Q So now, we agree that Rich discloses that 22 discloses that vertex data is stored in external 23 23 vertex data is stored in external memory, correct? memory, not local memory 34? 24 A Rich does that, yeah. 24 A The pixel data? 25 Q Okay. And we agree that pixel data is bigger 25 Q Vertex data. Page 75 Page 77 1 than vertex data, correct? 1 A Vertex data. Yes, he says that. 2 MR. PLUTA: Object to form. 2 Q And you opine that it would be obvious to 3 THE WITNESS: From what -- what it 3 modify Rich to store pixel data in external memory, 4 could be considered that way, yes. 4 as well, correct? 5 BY MR. TUMINARO: 5 A Correct. 6 Q Okay. So then why would you store both 6 Q Okay. Yet you still think it's obvious to vertex data and pixel data in memory 34 and not in 7 7 store both of those things in memory 34 on chip? A The job of memory 34 chip is to provide external memory? 8 9 A The answer is obvious, because you need the executable data to the ALUs. It doesn't matter what 10 data to be closer to the ALU. 10 it is, it's pixel, vertices, whatever you have, that Q Well, in fact, didn't you actually opine that 11 11 is -- the ALU wants to see things close to the ALU. 12 it would be obvious in view of Rich to store pixel 12 So if you have vertex data in the outside memory, in 13 data in external memory? the larger memory, you have to kind of mosey them 14 A Could you show me where I opine that? down to the -- to the local memory or registers, 15 Q Paragraph 234: 15 what have you. "It would have been obvious to one 16 So that is the standard practice. That is 16 17 of ordinary skill in the art that the standard practice. That's what a POSITA would 18 pixel data can also be stored in 18 know, that a processing element would need its 19 external memory after rasterization operations very close to it, whether it's a vertex 20 and pixel processing" -- "and before 20 or pixel. So that's -- that is inconsistent with

20 (Pages 74 - 77)

the knowledge of a POSITA in 2003 time frame and

22 what has been disclosed and what I am saying in this

Q Let's look at paragraph 41 of your

24

25 declaration.

21 (Pages 78 - 81)

Page 82 Page 84 1 obviousness factors are, and in my analysis, I 1 not put in my report; that's for sure. Q So discussion of objective factors apart from 2 included whatever was relevant. Q Well, apart from what appears in -- in 3 paragraph 19 doesn't appear anywhere in your report, paragraph 19, do you discuss objective factors 4 correct? 5 anywhere else in your declaration? 5 A Yeah. If you find it, let me know. A I can -- I mean, let's go through them one by 6 (Exhibit 8 was marked for identification 7 one. It seems to be that would be easier for me if 7 by the court reporter and is attached hereto.) we break it down into -- than just a general 8 BY MR. TUMINARO: question. The differences between the prior art and 9 Q Sir, you've been handed what's been marked as 10 the claim at issue, sure, I've done that. I've done 10 Exhibit 8 for identification purposes. This is U.S. that in my -- in my analysis. We can go through patent number 7,015,913 to Lindholm. 11 12 Do you see that? 12 that. 13 The knowledge of a person of ordinary skill 13 A Yes. 14 in the pertinent art, we just went through that. So 14 Q You considered -- I'm going to refer to this 15 I don't understand -- you want me to identify every 15 as the Lindholm patent; is that fair? 16 one of these factors? 16 A That is fair. 17 17 Q And you considered the Lindholm patent when Q No, that was not my question. 18 A Then I don't understand your question. 18 forming the opinions expressed in your declarations, 19 Q Okay. You say that there are four factors 19 correct? 20 that must be considered in an obviousness analysis, 20 A Yes. 21 21 correct? That's what you say in paragraph 19. Q Okay. And if you turn to page 32 of your 22 A That's right. declaration, there's a section that reads "Ground 23 23 1." Q Okay. And there's -- A is: 24 "The scope and content of the 24 Do you see that? 25 prior art." 25 A Yeah, yes. Page 83 Page 85 1 Correct? Q So just so we're clear, it's your opinion 2 A Uh-huh. 2 that Lindholm anticipates certain claims of the 871 3 3 patent, correct? Q B is: 4 "The differences between the prior A Correct. 5 art and the claims at issue." 5 Q Okay. 6 Correct? 6 MR. PLUTA: I'm sorry. Which declaration 7 7 A Uh-huh, yes. were you referring to? 8 8 MR. TUMINARO: Oh, I'm sorry. I was Q C is: 9 "The knowledge of a person of referring to the -- what's Exhibit 1 with respect to 10 ordinary skill in the pertinent 10 the 871 patent. art." 11 11 MR. PLUTA: Thank you. 12 Correct? 12 BY MR. TUMINARO: 13 A Correct. 13 Q And if you look at -- starting on page 32 of 14 Q And D lists: 14 your declaration, Exhibit 1, with respect to the 871 "Objective factors indicating patent, there is a section that is -- has a heading 15 obviousness or nonobviousness." 16 labeled "Lindholm Discloses Claim 1." 16 17 17 A Correct. Do you see that? 18 Q Okay. Now, my question is -- I'm not 18 A Yes, I do. 19 concerned about the first three factors. I want to 19 Q And that spans all the way to page 34, where, 20 know about objective factors. 20 then, there's a claim chart --21 A Okay. I get that. 21 A I see that. Q Did you discuss objective factors anywhere in 22 22 Q -- correct? Okay. your declaration apart from paragraph 19? 23 And on page 33 of your declaration, you 24 24 reproduce Figure 4 from Lindholm, correct? A I considered them, but I did not report them. 25 I mean, it was -- it was definitely something I did 25 A Yes, I do, correct.

22 (Pages 82 - 85)

Page 86 Page 88 1 shader of claim 1. Q So if you would go to Figure 4 of Lindholm 2 for me and circle in Lindholm Figure 4 what you say 2 A The shader is the -- the processor that is 3 corresponds to the claimed elements in claim 1 of doing the job in general, right? So that's the -the execution units. 4 the 871 patent. 5 Q Let -- let me ask again. In paragraph 90, 5 MR. PLUTA: Object to form. THE WITNESS: You want in Figure 4 to 6 you say: 7 "Components of Execution Pipeline 7 identify what's mentioned in claim 1, those components; is that what the question is? 8 240 correspond to the 'shader' of 9 BY MR. TUMINARO: 9 claim 1." 10 Correct? 10 Q Claim 1 of the 871 patent, yes. 11 A Right, the components of 240. And it's shown 11 A I would refer you to my chart. I think 12 here, Figure 4, and all the components are there. 12 that's more accurate. If you want, you can go 13 through it one by one. I -- I think it would be 13 Q So now my question is, which components of 14 easier for me to explain. I would rather do that. 14 execution 240 correspond to the shader claimed in 15 claim 1? 15 Q Well, I'm asking you if you can mark up 16 Figure 4 of Lindholm and show me where in Lindholm 16 A The shader in claim 1 is identified as 17 you're saying -- what in Lindholm Figure 4 17 Box 62, correct? And that particular function is 18 corresponds to the elements claimed in claim 1 of 18 handled by the execution units. 19 the 871 patent. 19 Q So is it -- is it your testimony -- I just 20 want to make sure I understand -- that execution 20 A I would rather read it from the report, which 21 I think is very clear, in my opinion. 21 unit 470 corresponds to shader -- the claimed 22 shader? 22 So the Lindholm thread control buffer -- so 23 23 claim 1 of 871 -- so claim 1 of 871 basically says A Including all the components that goes with 24 an arbiter -- it's a graphic processing -- the 24 it in terms of the instruction, the sequencers and 25 so on. 25 Lindholm talks about graphic processing in the Page 87 Page 89 1 abstract. Q So that's -- that's my question. I want to 2 Then the -- the next part or the -- of the know what your opinion is. In -- in your -- in paragraph 90, you say: 3 claim 1 talks about an arbiter circuit for selecting 3 one of plurality of inputs in response to a control 4 "Components of Execution Pipeline 5 signal. And in this case, we have the TCB, which is 240 correspond to the 'shader' of working as an arbiter here, deciding between the 6 claim 1." inputs, 215 and 220. These are corresponding to 7 I want to know what components of execution vertex and pixel input data. pipeline 240 you're talking about. 9 Q All right. Let me try this, sir. If you Can you identify them for me in Lindholm? 10 10 would turn with me to paragraph 90 of your A Sure. I say it in paragraph 95: declaration. 11 11 "The Execution Unit 470 eventually 12 12 A Yes. processes the retrieved samples 13 13 Paragraph 90 reads: along with received instructions 14 14 "Because Lindholm's Execution from Instruction Dispatcher 440 'to 15 15 Pipeline 240 performs both vertex perform operations such as linear operations such as transforming 16 interpolation, derivative 16 17 vertices and pixel operations such 17 calculation, blending... and output 18 as texture mapping and blending, 18 the processed sample to a 19 components of the Pipeline 240 19 destination specified by" -- "by 20 correspond to the 'shader' of claim 20 the instruction." 21 21 So that should give you the answer, 22 22 Do you see that? paragraph 95. 23 23 Q So is the answer to my question, then, that A Yes. 24 24 instruction dispatcher 240 and execution unit 470 Q So what I want to know is what components of 25 execut- -- execution pipeline 240 correspond to the correspond to the claimed shader --

23 (Pages 86 - 89)

Page 90 Page 92 1 MR. PLUTA: Object to form. 1 the shader and perform the operation. So that's --2 BY MR. TUMINARO: 2 to me, that's clear, at least from what I explained. 3 Q -- of --3 Q I guess it's -- it's not clear to me. I 4 don't know -- is it 470 and instruction dispatcher 4 MR. PLUTA: I'm sorry. 5 BY MR. TUMINARO: 5 240 from Lindholm that make up the -- the claimed Q -- the 871 patent? shader, or are there other things that you are 7 MR. PLUTA: Object to form. pointing to in Lindholm that correspond to the 8 THE WITNESS: There are -- there are 8 shader? 9 components that are related to the shader that help 9 A And the define -- the definition of the 10 470 to execute. So I -- I don't know where you want shader is? You -- the definition that is in 871? 11 O The claimed shader in 871. 11 to put the -- the border in terms of where the 12 shader is. 12 A The claimed shader in 871. Well, it shows 13 But the shader, if you want to count it as 13 the unified shader in this figure, right, if you're 14 the execution unit, it would be the 470. The referring to that. Assuming what's put into that 15 instructions are coming from above, as you see in 15 871 -- Figure 5. Hold on a second. 16 Figure 4. 16 Okay. So the -- looking at 871, the unified 17 BY MR. TUMINARO: 17 shader is defined to be including what's in here, 18 Q It's not where I want to put the borders. I 18 Figure 5, correct? 19 want to know where you put the borders. I want to 19 So that means it includes the instruction 20 know what your opinion is. Which components -store. So I would put anything to do with 21 A And I -instructions as part of the shader based on what 22 Q -- are -- are corresponding to the shader? 22 this -- these guys have defined in 871. 23 23 A The shader is --Q Okay. 24 MR. PLUTA: Object to form. 24 A And that is consistent with this 25 THE WITNESS: -- defined as the execution 25 understanding. Page 93 1 unit. I've -- I've said it several times -- I mean, Q So what structures, then, are you talking 1 2 I've repeated my answer several times. The 2 about that correspond to the instructions -- strike 3 that. 3 execution unit 470 processes the received samples 4 along with the received instructions from 4 What structure in Lindholm are you referring 5 to that corresponds to the instruction store? 5 instruction patch -- instruction dispatch 440. So 6 instruction dispatch provides the instructions to 6 A Anywhere you see an instruction, it's 470 to do the computation. referring to this information that is in Figure 5. It says "instruction store." They -- they BY MR. TUMINARO: Q Okay. So it's -- 440 and 470 correspond to identified this figure to be the shader based on their definition of a shader. And that's consistent 10 the unit -- to the shader claimed in claim 1. with this figure. So that includes anything to do 11 Is there anything else that you're pointing 12 to that corresponds to the shader in claim 1? with the instruction, Counsel. 13 Q Sir -- sir, I --13 MR. PLUTA: Object to form. 14 MR. TUMINARO: I'll ask again. 14 A Let me finish my -- you're not -- you're not 15 letting me finish. 15 Q Is there anything else in Lindholm besides 16 instruction dispatcher 440 and execution --Q I didn't say anything. 16 A You started talking, sir. execution unit 470? Is there anything else besides 17 18 those two components that you're saying corresponds 18 But whatever has to do with instruction is to the claimed shader in claim 1 of the 871 patent? part of this shader.

24 (Pages 90 - 93)

Q That's -- that's what I want to know. What

things in -- in Figure 4 or in Lindholm generally are you pointing to that correspond to the claimed

shader? You said the execution unit 470, the

Is there anything else in Lindholm that

instruction dispatcher 440.

20

23

24

25

20

24

23 computation.

A The -- the way that I interpret your question

But there are other components that feed into

21 is that the shader is the execution unit part of the

25 this block. So there are instructions that come to

22 computation, and that's the one 470 in terms of the

Page 96

- 1 you're pointing to that corresponds to the claimed
- 2 shader?
- 3 A So --
- MR. PLUTA: Objection; asked and answered. 4
- 5 THE WITNESS: It -- it includes instructions,
- 6 it includes the register file, it includes anything
- to do with what has been defined in 871 to be the
- shader, consistent with that.
- 9 BY MR. TUMINARO:
- Q So -- just so I understand now, register file 10
- 11 450 in Lindholm you're saying corresponds to the
- 12 claimed shader, as well?
- 13 A Because there are source registers here for
- 14 the CPU based on Figure 5 of -- of the 871, so there
- 15 are registers corresponding to this.
- 16 Q Okay.
- 17 A If -- if you open up execution unit 470, if
- 18 there are registers in there, that will be
- corresponding to the -- to the Figure 5.
- 20 Q Okay. Anything else in -- in Lindholm,
- 21 besides instruction dispatcher 440, execution unit
- 22 470, register file 450, anything else in Lindholm
- 23 that you're saying corresponds to the claimed shader
- 24 in 871?
- 25 MR. PLUTA: Object to form.

- 1 as defined here for the unified shader. I'm
- 2 identifying -- that's what you wanted me to do.
- 3 Q Right.

Page 94

- 4 A I've identified those pieces that match
- 5 Figure 5 here.
- Q Okay. So Figure 5 is defining the invention
- 7 or the -- it's describing what's in the 871 patent,
- right, not what's in Lindholm, right?
- 9 A No. I was using that as a model to explain
- 10 to you what the unified shader defined here
- 11 corresponds to here. That's what you wanted me to 12 do.
- 13 Q Right. And it's your opinion that Lindholm
- 14 discloses what's in the -- claim 1 of the 871
- 15 patent, right?
- A Based on Figure 5, yes. 16
- 17 Q Okay. So what I'm trying to understand is
- 18 the scope of your opinion. I want to know what --
- if there's anything else in Lindholm besides
- instruction dispatcher 440, register file 450,
- execution unit 470, is there anything else that
- you're pointing to in Lindholm that corresponds to
- the claimed shader, in your opinion? I want to know
- 24 what your opinion is.
- 25 MR. PLUTA: Object to form.

Page 95

- THE WITNESS: Whatever 871 -- 871 defines in 1
- 2 Figure 5 to be the unified shader, they have coined
- 3 that for their -- for their understanding of unified
- 4 shader. It may be different from NVIDIA. It might
- 5 be different from somebody else.
- So referring to Figure 5, referring to Figure 6
- 7 5 -- I'm going to repeat what's in Figure 5. There
- 8 are instruction stores. There's a -- there's a
- constant, which are -- these are specialized
- 10 functions. There are source register operands.
- 11 There is a CPU which does the computation, and there
- 12 is block 92. And that's consistent what's in that
- 13 page.
- 14 (Unintelligible reading) to be
- 15 process (unintelligible reading) to the general
- 16 purpose register block 92. So that's -- that's --
- 17 if they define that to be the part of the shader,
- 18 and it's right here, the register file.
- 19 BY MR. TUMINARO:
- 20 Q Okay. Just -- we'll agree that the 871
- 21 Figure 5 is not referring to Lindholm, right?
- 22 A Excuse me?
- 23 Q Figure 5 of the 871 patent is not referring
- 24 to Lindholm, right?
- A I -- no. I'm just trying to explain to you

Page 97

- 1 THE WITNESS: They did not explain the
- details about how they were --
- 3 BY MR. TUMINARO:
- Q Who's they?
- 5 A 871.
- 6 O Okay.
- 7 A There are additional information -- there's
- just one Figure 5 to show the exploded
- description -- they use the word "exploded"
- description of the shader. This is not sufficient
- to explain whether the score boarding algorithms are
- 12 in there, whether the other components are there.
- 13 Because it talks about resources not being
- 14 available.
- 15 If you read 871, which I'm sure you have, it
- 16 says we will switch from vertices to pixels,
- depending on resources being available. There is
- 18 nothing here to tell me how that switching is done.
- 19 But -- but Lindholm has a lot more detail in
- terms of explaining what's going on. So given what's in Figure 5, I have identified what's
- 22 available in Lindholm, but there are other things in
- Lindholm that 871 did not discuss.
- 24 MR. TUMINARO: I'd like to take a break, I
- 25 guess, to -- to change the tape, and we'll come

25 (Pages 94 - 97)

Page 98 Page 100 1 back. 1 Exhibit 2, your declaration, number 330. 2 THE VIDEOGRAPHER: This -- we are off the 2 A Okay. 3 record. The time is 11:46 a.m., and this is the end 3 Q Are you there? 4 A Yes. of the first media. 5 Q All right. I just want to confirm, I 5 (Lunch recess.) THE VIDEOGRAPHER: This is the beginning of 6 misspoke earlier. You did not actually consider Kizhepat in forming the opinions expressed in the 7 the second media. We're back on the record. The 8 time is 12:37 p.m. declaration for the 369 patent, which is Exhibit 2? 9 A Yeah. Please continue. 10 BY MR. TUMINARO: 10 Q Right. Okay. 11 Thank you, Counsel. 11 Q Welcome back, sir. 12 All right. Now -- so we read the field of 12 A Good afternoon. 13 Q During the break, did you talk with your 13 the invention for Kizhepat. 14 counsel about the substance of your testimony? 14 A Kizhepat. 15 Q Yeah, okay. It's a fact, is it not, that the 15 A No. 16 MR. TUMINARO: Okay. 16 acronym GPU appears nowhere in Kizhepat? 17 17 Did you give him the exhibit? A Okay. I have to check. 18 THE REPORTER: Yes. 18 So it's mostly talking about data processing 19 (Exhibit 9 was marked for identification 19 system. By looking at it very quickly, I did not see the word "GPU," but data processing of this type 20 by the court reporter and is attached hereto.) of architecture is consistent with the understanding 21 BY MR. TUMINARO: of doing graphics operations. 22 Q You have in front of you Exhibit 9. It's 23 23 U.S. patent number 7,376,811. This is the Kizhepat Q And the fact is Kizhepat doesn't use the 24 reference. 24 phrase "graphics processor," correct? 25 A It's -- it -- it is data processing, 25 A Kizhepat. Page 99 Page 101 Q Yes? 1 1 and some aspects of graphic processing is data A Yes, I have it. processing. 3 Q And you considered Exhibit 9 in forming the 3 Q Well, answer me this. Is the word -- does 4 opinions expressed in both of your declarations? 4 the word "graphics" appear anywhere in Kizhepat? 5 A I believe so. A I looked at it quickly, and I did not come Q Okay. All right. If we look at the "Field 6 across it, but that doesn't mean I looked at every 6 7 of the Invention," it's in column 1. It reads: 7 single sentence. 8 "The present invention relates to Q Well, look at every single sentence and tell 9 system architectures for data 9 me, does the word "graphics" appears anywhere in 10 10 Kizhepat? processing, and more particularly to 11 an architecture based upon a A Okay. So all the claims refer to data 12 hardware engine which performs 12 processing. I looked at the claims. I think, 13 operations and computations on data 13 judging from 871, which is the preamble of claim 1, 14 as the data traverses paths 14 and I think Lindholm also talks about graphics 15 controlled by software." 15 processing. I just want to make sure that's the 16 16 case. Do you see that? 17 A Column 1, "Field of Invention," right? 17 Yeah, so it's not in the claim description. 18 18 "Traverses paths controlled by software," yes. You Q So we agree that Kizhepat neither uses the acronym "GPU" nor the word "graphics" anywhere --19 read the paragraph correctly, yes. 20 20 Q I apologize. In the -- the declaration that A In the claim disclosures, right. 21 you submitted for the 330 IPR, Exhibit Number 2, you 21 Q In fact, it doesn't appear -- in addition to 22 the claims, it doesn't appear anywhere in the 22 did not consider the Kizhepat reference for that 23 declaration, right? If you look at the 23 patent? 24 24 materials considered -- strike that. MR. PLUTA: Object to form. 25 Just look at the materials considered in 25 THE WITNESS: I would assume that if they had

26 (Pages 98 - 101)

	Page 102		Page 104
1	mentioned it, it would be in the description	1	(Exhibit 10 was marked for identification
	specification, as well, so	2	by the court reporter and is attached hereto.)
3		3	MR. TUMINARO: This is 10, right?
4	, ,	4 THE REPORTER: 10.	
5		5	BY MR. TUMINARO:

18	"A typical and common multiplexing system is described in Kizhepat.	18	decision, we construe the 'means for
19	Kizhepat discloses a hardware engine	19	performing vertex operations and
20	for data processing that includes a	20	pixel operations and performing one
21	plurality of functional units and	21	of the vertex operations or pixel
22	data routing units that interconnect	22	operations based on the selected one
23	the functional units."	23	of the plurality of inputs' to
24	So that's been	24	include a register, an instruction
	BY MR. TUMINARO:	25	sequencer capable of providing
1	Page 103 Q Okay. I appreciate I appreciate the	1	Page 105 instructions for performing vertex
2		2	operations and pixel operations, and
3	My question was, in your declaration, when	3	a processor capable of floating
4	you're talking about Kizhepat, you didn't cite	4	point, arithmetic, and logical
5	anywhere in Kizhepat just that Kizhepat discloses	5	operations on a selected input."
	the word "GPU" or "graphics processor," right?	6	Do you see that?
7	A It's not in my report.	7	A Yes.
8	Q Okay. Switching gears to the materials	8	Q Did I read it correctly?
9		9	A I didn't check.
	decision with respect to the 871 patent?	10	Q Okay. My question is, do you agree with the
11	A I think you asked that this morning, right?	11	board's construction for this means for limitation?
12	Q Well, I asked if you reviewed anything else.	12	A My understanding is that we have to accept
13		13	the board's understanding or construction.
14		14	That's my understanding from legal point of view.
15	A You did ask, and I said no.	15	I don't know if there is and I agree with
16	Q So are you aware of the fact that the board	16	
17		17	"To include the register,
18	A I'm sorry. You asked me about the response	18	instruction sequencer capable of"
19	you gave to I apologize. You asked me about the	19	"we construe the means of performing
20	response you gave for some other case.	20	vertex operations and pixel
21	Did I look at the review did I look at the	21	operations and" (unintelligible
22		22	reading)
23	MR. TUMINARO: Okay. Maybe this will make it	23	THE REPORTER: I'm sorry.
	faster.	24	THE WITNESS: I'm sorry. I'm just I
25	Can you grab that.	25	should read it for myself.

27 (Pages 102 - 105)

Page 106 Page 108 1 It's identifying what they say should be 1 between the inputs. A more sophisticated control 2 included. I would say that plus additional stuff, 2 will be the -- the logic behind that control signal. 3 if you want to get to the details. That's the 3 BY MR. TUMINARO: 4 minimum requirement, I would say. Q In the past, you've opined that an arbiter 5 BY MR. TUMINARO: receives and provides, correct? Q Are you -- are you saying that the board MR. PLUTA: Object to form. Object to 6 7 relevance. 7 missed out some structure and there should be additional stuff in their construction? THE WITNESS: In the past meaning what? What 9 A No, I'm not saying that. I'm saying these do you mean in the past? 10 are the basic components. And depending what else 10 BY MR. TUMINARO: you want to do, you may add additional stuff to it. O In --11 12 It de- -- it depends on the level of -- so I -- it's 12 A In my history of my life? 13 consistent with my understanding. Q -- in another -- in -- in another proceeding 14 O Okay. You've heard of the word "arbiter" 14 you have opined that arbiter means -- refers to 15 before? structure that receives and provides, correct? 16 A In the context of? 16 MR. PLUTA: Object to form. Object to 17 Q Graphics processing. 17 relevance. Counsel, it's a different patent, 18 A Yes. 18 different references, different terms. 19 Q Okay. And an arbiter selects from available 19 THE WITNESS: I just explained to you what a 20 inputs? 20 MUX is. It has two inputs and has outputs in this 21 A Correct. 21 case, so it's a two-to-one selector. 22 Q Okay. If you'd turn with me to the 871 22 BY MR. TUMINARO: 23 patent, it's Exhibit 7. Q Is it or is it not true that in the past, in 24 A 87- -- 871. What page? 24 another proceeding, you opined that arbiter is 25 Q 871 patent, Figure 4A. 25 structure that receives and provides? Page 107 Page 109 1 A 4A. 1 MR. PLUTA: Object to form. Same objection 2 Q Are you there, 4A? as to relevance. 3 3 A Yep, yes. THE WITNESS: I -- I don't know in what Q All right. My question is, you see MUX 66 at context that was, but in general, a MUX has an input 5 the top of Figure 4A? and output. There's no question about it. It's a 6 A I see it. circuit that has an input and output. 7 7 I don't know what -- what -- can you repeat Q Is MUX 66 an arbiter? 8 what you just said about what I --MR. PLUTA: Object to form. 9 THE WITNESS: Does it say it's an arbiter? 9 BY MR. TUMINARO: 10 10 It says it's a MUX. Q Sure. I'll repeat the question again. 11 11 BY MR. TUMINARO: Is it or is it not true that in the past, in 12 Q Well, that's my question. 12 another proceeding, you opined that an arbiter is 13 A Unless it's a typo. 13 structure that receives and provides? 14 Q That's my question. Do you consider, in your 14 MR. PLUTA: Object to form. Object to 15 relevance. 15 opinion, MUX 66 to be an arbiter? MR. PLUTA: Object to form. 16 THE WITNESS: My answer to you is that it 16 17 THE WITNESS: If -- if you want to implement 17 inputs and outputs. Receives an input and generates 18 an arbiter, you need to have a control, and you need 18 an output.

28 (Pages 106 - 109)

20

22.

23

25

21 output?

BY MR. TUMINARO:

A Of course.

24 to what I just said.

Q An arbiter receives an input and generates an

I mean, I -- I don't know what else I can add

Q Going back to your declaration, with respect

to have a way of selecting between inputs. A MUX

does that on its own, and a simple control would

basically let you select between the inputs. You

22 can basically select which one of the inputs would

want, depending on what -- how you control it.

A simple control will be just selecting

23 be the output. You can call that an arbiter if you

TUMINARO: Q Would you turn back to Exhibit 1 for me. A Yeah.
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23	A Right. Q Right. Okay. My question is so you say that corresponds to the claimed arbiter circuit of claim 1? A Yes. Q Is there any other structure in Lindholm that you're relying on to meet the claimed arbiter circuit? A My position is that's the arbiter that I'm using to discuss claim 1 in my charts. I think that's what I've said. I have not Q Okay. A opined on anything else. Q Okay. All right. Earlier I asked you, is it your opinion that execution unit 470, which appears in Figure 4, corresponds to the claimed shader, and you answered: "Including all the components that goes with it in terms of the instruction, the sequencers and so on." A Right. Q So you is it your opinion that anything in	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23	Correct? You said that in paragraph 90? A I said register file, the processing unit, which is the execution unit, and the sequencer, which in this case would be sequencing the execution unit. Q What are you saying is the sequencer in Figure 4 of Lindholm? I don't see those words. A Instruction scheduler, instruction dispatcher. Q Anything else? A That's all I said. MR. TUMINARO: Okay. Could we go off the record. THE VIDEOGRAPHER: We are off the record. The time is 1:04 p.m. (Recess.) THE VIDEOGRAPHER: We're back on the record. The time is 1:27 p.m. Please continue. BY MR. TUMINARO: Q Would you turn back to Exhibit 1 for me. A Yeah. Q And paragraph 22, which is on page 11.
2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24	A Right. Q Right. Okay. My question is so you say that corresponds to the claimed arbiter circuit of claim 1? A Yes. Q Is there any other structure in Lindholm that you're relying on to meet the claimed arbiter circuit? A My position is that's the arbiter that I'm using to discuss claim 1 in my charts. I think that's what I've said. I have not Q Okay. A opined on anything else. Q Okay. All right. Earlier I asked you, is it your opinion that execution unit 470, which appears in Figure 4, corresponds to the claimed shader, and you answered: "Including all the components that goes with it in terms of the instruction, the sequencers and so on." A Right. Q So you is it your opinion that anything in	2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22	Correct? You said that in paragraph 90? A I said register file, the processing unit, which is the execution unit, and the sequencer, which in this case would be sequencing the execution unit. Q What are you saying is the sequencer in Figure 4 of Lindholm? I don't see those words. A Instruction scheduler, instruction dispatcher. Q Anything else? A That's all I said. MR. TUMINARO: Okay. Could we go off the record. THE VIDEOGRAPHER: We are off the record. The time is 1:04 p.m. (Recess.) THE VIDEOGRAPHER: We're back on the record. The time is 1:27 p.m. Please continue. BY MR. TUMINARO: Q Would you turn back to Exhibit 1 for me. A Yeah.

29 (Pages 110 - 113)

Page 114 Page 116 1 "I have been informed that the 1 illustrated in Figure 3." 2 2 Do you see that? application that issued as the 871 3 patent was filed in November 2003. 3 A Yeah. 4 4 Q Okay. And if you turn to Figure 5, the third As a result, I will assume the 5 line -- are you there? I mean column 5, the third 5 relevant time period for determining line. Excuse me. 6 what one of ordinary skill in the 7 art knew is early to mid 2003." 7 A Uh-huh. 8 Do you see that? 8 Q Column 5 --A Yes. 9 A Yes. 9 Q So you didn't consider what a person of 10 Q -- the third line reads: 11 ordinary skill would have known in, for example, 11 "Figure 3 is a flow chart of geometry processing aspects of the 12 2002, right? 12 13 A It would be not from that statement, but it's 13 image generation system of Figure 14 additive. Whatever they knew in 2002, they have 14 1." 15 15 gained some knowledge since then. So I -- I see it A Okay. 16 like an additive. Q So those two sentences in combination, if you Q Okay. Is there anywhere in your dec- -- in read line 1 of column 9 and the fact that Figure 3 17 18 your declaration where you talk about what a person relates to geometry processing, that means the first of ordinary skill in the art would have known in function carried out by the system is geometry 20 2002? processing as illustrated in Figure 3, correct? 21 21 MR. PLUTA: Object to form. MR. PLUTA: Object to form. 22 THE WITNESS: No, but it is consistent with 22 THE WITNESS: It says it's geometry 23 what I understand, they keep adding to their processing, but it doesn't say that it -- it is 24 knowledge to that point, not all happening in that limited to doing that sequentially with respect to 25 time frame. It would be gradual. pixel. I don't get that --Page 115 Page 117 1 BY MR. TUMINARO: 1 MR. TUMINARO: Okay. 2 Q Okay. Switching gears --2 THE WITNESS: -- information out of that. 3 A Okay. 3 BY MR. TUMINARO: Q -- Rich performs vertex operations and pixel Q Okay. Then let's look at line 40 in column 5 operations sequentially, correct? 5 9. It says: MR. PLUTA: Object to form. 6 "After geometry processing, the 7 BY MR. TUMINARO: 7 next function carried out by the 8 Q Let me ask that again. image generation system is 9 The system disclosed in Rich performs vertex rasterization." 10 10 operations and pixel operations sequentially, Do you see that? correct? 11 11 A Yes. 12 A Let me check. Is there a specific section 12 Q And rasterization is a pixel operation? 13 you want me to refer to, or is this a general A Yes, but --14 question? Do you have a reference so I can look at 14 Q So pixel operations occur after geometry 15 it? 15 processing? 16 Q All right. Look at column 9. A You have to have the primitives before you 17 A Okay. I don't see the word "sequentially can do rasterization, but -- it says -- first of 18 executed." all, in one embodiment, I think it said that as 19 Q All right. Let me help you out, then. much. There is no limitation from what I see here 20 A Yeah. 20 whereby the control unit can activate primitives 21 Q Look at the first sentence in column 9. It 21 being executed into the corresponding rasterization 22 reads: 22 while some other primitive's being evaluated, 23 because you have multiple primitives. So it is not "The first function carried out by 24 one particular embodiment of the limiting that because you have multiple processing 25 image generation system is units, and the control unit can control these

30 (Pages 114 - 117)

Page 118 Page 120 1 independent of each other. 1 correct? 2

9

16

Q I'm asking about what's actually disclosed in

3 Rich. And in column 9, it says first you do

geometry operations, and after the geometry

operations, you do pixel operations; is that right?

A In one particular embodiment, but it doesn't

say that's the only way to do it.

Q Point to me an embodiment where it says they're not done sequentially.

A It didn't need to, because it was obvious to

11 somebody who was looking at this -- or it was clear

12 to somebody who was looking at this that I have

13 multiple processing elements. I have a central

14 control unit that I can control these processing

15 elements.

What I want to do is to able to do a linear 16

17 expression evaluation on a subset of these

18 primitives, convert them into pixels while I'm

working on the primitives of some other portions of

20 the graphics image.

21 So I would say it's -- in other embodiments,

22 that could happen. I don't see any limitations here

23 on that.

24 Q Okay. I'm not asking about what could

25 happen, what -- I want to know, is there anything in

MR. PLUTA: Object to form.

3 THE WITNESS: I haven't checked all the

4 designs at that time frame. There are hundreds of

patents and disclosures and so on. I couldn't tell

you that for a fact, but it is possible that they

7 were there.

8 BY MR. TUMINARO:

Q Well, you're aware of the fact that ATI's

10 Xenos processor is recognized as -- in the industry

as the first to provide a graphics processor with a

unified shader, correct?

13 MR. PLUTA: Object to form, lack of

14 foundation --

15 THE WITNESS: I don't have any --

MR. PLUTA: -- relevance.

17 THE WITNESS: -- indication of that. But I

18 can assure you in conferences and journals, which

they do the foundation work that ends up in these

products, there has been reports of unified shaders

prior to that.

22 BY MR. TUMINARO:

23 Q And you didn't cite any of those reports

anywhere in your declaration that talked about a

unified shader before 2003, correct?

Page 119

1 disclo- -- disclosed in Rich --

2 A The block diagram.

3 Q -- that says that you do geometry operations

4 and pixel operations not sequentially?

MR. PLUTA: Object to form. 5

THE WITNESS: I think the block diagram gives

you that -- that information. But if you want to

8 see it written and happening concurrently, it

9 doesn't say anything about sequentiality either. So

10 I don't have any specific sentence to saying it's

11 happening sequentially or otherwise concurrently.

12 But -- but Figure 2 in this case is

13 indication to me that the -- the operation could

happen in a partition way, namely, portions of the

primitives could be handling -- could be working on

16 rasterization while the other parts are doing vertex

operations. So I -- I would say that is quite

18 possible with this design, although it didn't say it

specifically.

20 BY MR. TUMINARO:

21 Q Okay. And given your knowledge of graphics

22 processing generally, you're aware that there were

no graphics processors --23

24 A Uh-huh.

25 Q -- in 2003 or 2002 that had a unified shader,

Page 121 A I didn't need to. I was convinced with what

2 I had.

1

3 Q If you turn back with me to the institution

decision --

5 A Yeah.

6 O -- in the 326 case.

7 A Yes.

Q On page 22, the second paragraph, the third

sentence of the second paragraph, it starts with

"Nevertheless."

Do you see that? 11

12 A Yes.

15

17

13 O I'll read it:

14 "Nevertheless, as discussed above,

both Petitioner and Patent Owner

16 recognize that Rich discloses

performing vertex operations and

18 pixel operations sequentially."

19 Do you see that?

A Yeah. 20

21 Based on what it --

22 MR. PLUTA: There's no question pending.

23 THE WITNESS: Oh, sorry.

24 BY MR. TUMINARO:

25 Q So during vertex operations, the system

31 (Pages 118 - 121)

Page 124 1 disclosed in Rich will be performing operations on 1 ALU and microprocessors? vertex data, correct? 2 3 MR. PLUTA: Object to the form of the 3 Q Is it your testimony that sometimes the question, lacks foundation. I also object to the terminology of microprocessor and ALU is used relevance because, Counsel, you're reading from a interchangeably? ground that was not instituted by the board in this A Sometimes, yeah. 6 7 7 decision. Q Going to the Rich reference, is it your 8 THE WITNESS: Okay. Thank you. opinion that vertex data and pixel data in Rich can 9 You need an answer? be stored on external memory? 10 BY MR. TUMINARO: 10 A It is, yeah. 11 O I do. Q Is it your opinion that vertex data and pixel A I think I gave you my answer regarding what 12 12 data in Rich may also be stored in an internal 13 Rich can do and cannot do. From understanding of 13 memory? 14 the technology, my position is that one could 14 A That's right. 15 implement that in parallel because it has all the 15 MR. Federal Rules of Civil Procedure Rule 30

- (e) Review By the Witness; Changes.
- (1) Review; Statement of Changes. On request by the deponent or a party before the deposition is completed, the deponent must be allowed 30 days after being notified by the officer that the transcript or recording is available in which:
- (A) to review the transcript or recording; and
- (B) if there are changes in form or substance, to sign a statement listing the changes and the reasons for making them.
- (2) Changes Indicated in the Officer's Certificate. The officer must note in the certificate prescribed by Rule 30(f)(1) whether a review was requested and, if so, must attach any changes the deponent makes during the 30-day period.

DISCLAIMER: THE FOREGOING FEDERAL PROCEDURE RULES

ARE PROVIDED FOR INFORMATIONAL PURPOSES ONLY.

THE ABOVE RULES ARE CURRENT AS OF SEPTEMBER 1,

2014. PLEASE REFER TO THE APPLICABLE FEDERAL RULES

OF CIVIL PROCEDURE FOR UP-TO-DATE INFORMATION.

	Page 6		Page 8
1	on behalf of LG Electronics.	1	under oath here this morning?
2	THE VIDEOGRAPHER: Our court reporter,	2	A. Absolutely.
3	JoAnn Losoya, representing Veritext, will now swear	3	Q. And all day today actually.
4	in the witness.	4	A. Absolutely.
5	WHEREUPON:	5	Q. Is there any reason you cannot do that?
6	NADER BAGHERZADEH,	6	A. No, I cannot see a reason why I could not
7	called as a witness herein, having been first duly	7	do that.
8	sworn, was examined and testified as follows:	8	Q. Okay. Do you know why you're here today?
9	EXAMINATION	9	A. Yes.
10	BY MR. TUMINARO:	10	Q. Why?
11	Q. Good morning. Please state your name,	11	A. There's a case pending.
12	sir.	12	Q. And you submitted a declaration in that
13	A. Nader Bagherzadeh.	13	case?
14	Q. And please state your home address?	14	A. Yes. If you have it, I can show it to
15	A. My address is 415 Hilledge in Laguna	15	you.
16	Beach, California.	16	(WHEREUPON, document marked as
17	O. Your work address?	17	Exhibit No. 1.)
18	A. University of California, Irvine, Irvine,	18	BY MR. TUMINARO:
19	California.	19	Q. Sir, you've been handed what has been
20	Q. Sir, I understand that you have been	20	marked as Exhibit 1. This is titled Declaration of
21	deposed several times before; is that right?	21	Dr. Nader Bagherzadeh. Is this your declaration?
22	A. That's correct.	22	A. Yes, sir.
23	Q. Just a couple of ground rules for this	23	Q. If you turn to the last page of the
24	deposition. As you know, we're trying to get a	24	declaration before the appendix, there's a signature
	Page 7		Page 9
1	clear record. So I'll ask that you don't speak over	1	there?
2	me, and I'll try not to speak over you. Is that	2	A. Yes.
3	fair?	3	Q. Is that your signature?
4	A. That is fair.	4	A. Yes.
5	Q. Okay. I'm going to try to ask clear	5	Q. And you signed this declaration on
6	questions; but if at any point you don't understand	6	December 9, 2014?
7	my question, will you let me know?	7	A. Yes.
8	A. Sure. Can I ask you to slow down a	8	Q. Is there anything that you'd like to add
9	little bit?	9	to this declaration?
10	Q. Oh, sure. Sure. Okay.	10	A. No.
11	If you answer one of my questions,	11	MR. PLUTA: Counsel, did you I thought
12	I'm going to assume that you understood it. Is that	12	I heard you refer to this as Exhibit 1. Are you
13	fair?	13	referring to it as a different exhibit number?
14	A. Yes. If I answer, that means I	14	MR. TUMINARO: Just Exhibit 1 to this
15	understood it, correct.	15	deposition.
16	Q. Okay. I'm going to take periodic breaks,	16	MR. PLUTA: Okay. So you are not going
17	but if at any time you need a break, would you let	17	to refer to it as Exhibit 1003.
18	me know?	18	MR. TUMINARO: I may during the course of
19	A. Absolutely.	19	it. I just wanted to mark this so that it is clear
20	Q. Okay. But if there's a pending question,	20	this is Exhibit 1 to Dr. Bagherzadeh's deposition.
21	I'd ask that you answer the question before we take	21	MR. PLUTA: Fair enough.
22	a break. Is that fair?	22	BY MR. TUMINARO:
23	A. Sure.	23	Q. Is there anything that you would like to
24	Q. You understand that you're testifying	24	delete from your declaration?
_ 1	2. Tou understand that you're testifying		detect from your decidration:

Page 10 Page 12 1 A. No, I don't think so. 1 this. 2 2 Q. Are there any changes that you'd like to Q. But, in fact, a figure from one of those 3 make to your declaration at all? 3 lectures is actually in your declaration, right? 4 4 A. It could be. I couldn't say for certain. 5 Q. If you would turn with me to Paragraph 2 5 Q. Let's look at the next page, Page 11. In 6 of your declaration. 6 Paragraph 31, there's also a figure. Where did this 7 7 A. Okay. figure come from? 8 Q. Paragraph 2 reads: "I have been asked to 8 A. From one of my lectures. 9 provide my opinions and views on materials I have 9 Q. Your lectures aren't listed in the 10 10 reviewed in this case related to U.S. Patent materials considered, right? 11 No. 7742053 (the '053 patent)." 11 A. It's from my knowledge that I have. 12 Do you see that? 12 Q. Well, I appreciate the answer, but I 13 13 think it didn't answer my question. This lecture is A. Yes. 14 Q. What materials are you referring to that 14 not listed on your materials considered, right? 15 15 you reviewed? MR. PLUTA: Object to form. 16 A. I think we have a list of that. If I 16 BY THE WITNESS: 17 refer you to Page 87 of Exhibit 1, you can see the 17 A. It's what I know. So the lecture is not 18 18 cited, that's right, but it's what I know. I have a 19 19 Q. That's titled Materials Considered and lot of other knowledge that is not cited here about 20 Exhibit List, correct? 20 computer architecture, the textbooks that I've used 21 A. That is correct. 21 over the years, my papers I've written over the 22 Q. Does this list all the materials that you 22 years. No, they're not cited here, but they're up 23 23 reviewed in preparing your declaration? in my head. 24 24 A. Yes. Page 11 Page 13 1 Q. In fact, there are no other materials BY MR. TUMINARO: 2 that you reviewed in preparation for your 2 Q. Is there anything else that you relied 3 declaration? 3 upon in preparing your declaration that you did not 4 If they were, I would have put them in 4 list in your exhibits considered? A. 5 5 A. I cannot think of anything right now here. 6 Q. Okay. If you would turn with me to 6 unless you point it out. 7 7 Page 10 of your declaration. Q. The figure in Paragraph 31, do you know 8 8 what lecture this refers to? A. Yes. 9 9 Q. At the top of Page 10, there's a figure A. Computer architecture. 10 or a picture. 10 Q. Is that publicly available? 11 11 Do you see that? A. No. 12 12 A. Hm-hmm. MR. TUMINARO: Counsel, I'd guess I'd 13 You didn't generate this picture, did 13 state for the record that we want a copy of that 14 14 you? lecture. It's not listed on the materials 15 15 A. It was probably from one of my lectures. considered, and it appears to be something that was 16 One of the lectures that you prepared? 16 used in generating this declaration. Q. 17 17 MR. PLUTA: Other than the figure and A. Yeah. 18 18 Q. But that's not listed on your materials what he just testified, I don't see how the 19 19 considered, is it? relevance of the lecture in its entirety would be 20 20 A. It's one of my lectures, yeah. relevant to this proceeding. 21 Q. So. One of your lectures is one of the 21 BY MR. TUMINARO: 22 22 things that you considered in preparing your Q. Did you write your declaration? 23 declaration? 23 A. Yes, sir. 24 A. My knowledge is what was considered for 24 Q. How much time did you spend in preparing

Page 14	Page 16
1 your declaration? 1 A. No. We desig	med boards.
	Bell Labs in 1984?
3 Q. Over 40 hours. Was it over 50 hours? 3 A. Yes, sir.	
	t 30 years, you have been
5 Q. When were you first contacted with 5 in academia, right?	•
6 respect to this matter? 6 A. Not accurate.	
	curate about my statement?
8 Q. Who contacted you? 8 A. Because I wer	•
	In 1987, you started in
10 the experts to the lawyers. 10 academia; is that right	?
11 (WHEREUPON, document marked as 11 A. That's right.	
	ou have been in academia,
13 BY MR. TUMINARO: 13 right?	,
	a little period of running
	have seen it in my resume.
	er actually built a computer
17 Ph.D. 17 chip, have you?	, J
Do you see that? 18 A. I did, yes.	
19 A. Yes. 19 MR. PLUTA:	Object to form.
Q. You have seen this document before? 20 BY MR. TUMINARO	· ·
21 A. Yes. 21 Q. You did build	a computer chip.
22 Q. This is your current CV? 22 A. Absolutely.	I I
23 A. Yes. 23 Q. What did you	do then?
24 Q. Just to be clear, is this just your 24 A. I designed it.

21 Q. What did you do? 22 A. Used them. 21 Q. You fabricated 22 the chip?	

	Page 18		Page 20
1	MR. PLUTA: Object to form.	1	BY MR. TUMINARO:
2	BY THE WITNESS:	2	Q. Your knowledge about
3	A. We designed pieces of the GPU for our	3	A. Knowledge, yes.
4	chip.	4	Q. So Exhibit 3 is an example of your
5	BY MR. TUMINARO:	5	knowledge?
6	Q. Which chip are you referring to?	6	A. That's right. That's better. Yes, thank
7	A. Multiple chips.	7	you.
8	Q. Did you build a chip called morphosys?	8	Q. If you will turn with me in Exhibit 3 to
9	MR. PLUTA: Object to form. Object to	9	Page 10-3.
10	relevance.	10	A. Hm-hmm.
11	BY THE WITNESS:	11	Q. And on the left-hand column, about midway
12	A. Yes, I did.	12	through the page, there's a heading four, Morphosys,
13	(WHEREUPON, document marked as	13	System Model.
14	Exhibit No. 3.)	14	Do you see that?
15	BY MR. TUMINARO:	15	A. Yes.
16	Q. Sir, you have been handed what has been	16	Q. And the last sentence, it says: "The
17	marked as Exhibit 3 for identification purposes. Do	17	system model and architecture details for the first
18	you recognize this document?	18	implementation of morphosys (M1 chip) are described
19	A. Yes.	19	hereafter."
20	O. What is it?	20	Do you see that?
21	A. It's a paper I have written with my	21	A. Yes, I see that.
22	colleagues and former students.	22	Q. Was this morphosys actually a chip?
23	MR. PLUTA: I'm going to object to the	23	A. Yes, sir.
24	relevance of this exhibit at this time.	24	O. So the architectural details were
24		24	
	Page 19		Page 21
1	BY MR. TUMINARO:	1	sufficient to be an implementation of a chip?
2	Q. If you turn with me to I guess what is	2	MR. PLUTA: Object to form.
3	labeled as Page 10-3. Well, first of all first	3	BY THE WITNESS:
4	of all, if you will turn to your CV again,	4	A. So your question is by looking at this
5	Exhibit 2, on Page 19 of your CV.	5	paper, do I prove that I fabricated the chip or not?
6	A. Yeah.	6	BY MR. TUMINARO:
7	Q. Are you there, sir, Page 19?	7	Q. That was not my question.
8	A. Yes.	8	A. But I'm getting that from your question.
9	Q. Okay. If you look at C57, there's a	9	I'm repeating it because I didn't understand what
10	paper there that's listed, and the title of the	10	you said.
11	paper is: "Morphosys: An Integrated Reconfigurable	11	Q. Then I'll clarify.
12	Architecture."	12	A. Right. Please.
13	Do you see that?	13	Q. In this sentence in your paper, it says:
14	A. Yes.	14	"The system model and architectural details for the
15	Q. If you look at the title of Exhibit 3,	15	first implementation of the morphosys chip are
16	it's the same, right?	16	described hereafter." Right?
17	A. Yes.	17	A. Right.
18	Q. Exhibit 3 would be an example of some of	18	Q. So, you had an implementation?
19	the stuff that's in your head as you said earlier,	19	A. I had an implementation. That's right.
· ') ()	right?	20	Q. That implementation was based on
20	MR. PLUTA: Object to form.	21	architectural details of the chip?
21			
21 22	BY THE WITNESS:	22	A. That is described in this document, yes.
21		22 23 24	A. That is described in this document, yes. Q. What were the architectural details that you had made at that time?

	Page 22		Page 24
1	MR. PLUTA: Object to form. Object to	1	architectural details are, correct?
2	relevance.	2	A. Hm-hmm.
3	BY THE WITNESS:	3	Q. You said it's described in the paper,
4	A. It's in the paper.	4	right?
5	BY MR. TUMINARO:	5	A. Yes.
6	Q. Let's look at what the paper says.	6	Q. And I went to Page 10 and the
7	A. I'll be glad to go over it with you.	7	architectural details. Now, my question is are the
8	Q. If you will turn with me to Page 10-10.	8	architectural details the VHDL that's described on
9	On the right-hand side, there's a number 7,	9	Page 10 of your paper?
10	Interactive Software Environment.	10	MR. PLUTA: Object to form. Object to
11	Do you see that?	11	relevance.
12	A. 10-10. Which column?	12	BY THE WITNESS:
13	Q. On the right-hand side.	13	A. Sir, if I read that sentence
14	A. Yes.	14	MR. PLUTA: Object to foundation.
15	O. The first sentence after Interactive	15	BY THE WITNESS:
16	Software Environment, it reads: "The morphosys	16	A. If I read that sentence, it should give
17	reconfigurable system has been specified in	17	you the information. I'll read it again. It
18	behavioral VHDL."	18	says let me finish the sentence, please.
19	Do you see that?	19	The morphosys reconfigurable system
20	A. I do.	20	has been specified in behavior VHDL. Which
21	O. What is VHDL?	21	morphosys am I talking about? It's the one that
22	A. It stands for a hardware description	22	that is discussed in this paper. So the relevance
23	language.	23	is obvious. You have to deduce it from this
24	Q. Verilog Hardware Description Language?	24	statement. If you are not getting that information,
2 1			
	Page 23		Page 25
1	A. It says VHDL. It doesn't say verilog.	1	maybe we didn't write it properly.
2	Q. Does VHDL stand for Verilog Hardware	2	BY MR. TUMINARO:
3	Description Language?	3	Q. That's what I'm asking you. I could read
4	A. No, it does not. I don't think it does.	4	the paper. I'm asking you are the architectural
5	Q. What does the V stand for, then?	5	details the VHDL?
6	A. I don't know. It could be.	6	MR. PLUTA: Object to form. Object to
7	Q. Having read that sentence, turning back	7	relevance. Object to foundation.
8	to the sentence on Page 3 that talked about	8	BY THE WITNESS:
9	architectural details, were the architectural	9	A. I repeat my at the beginning, we talk
10	details that are described on Page 3 the VHDL code	10	about architectural details. This is referring to
11	that you were talking about?	11	the morphosys reconfigurable system. Which other
12	MR. PLUTA: Object to form. Object to	12	architecture are we talking about if it's not what I
13	relevance.	13	just said in Page 2 that you had? Can you tell me
14	BY THE WITNESS:	14	that I could be talking about something else? I
15	A. Well, the statement there is accurate.	15	just don't see why it's so puzzling to you.
16	It says the morphosys reconfigurable system has been	16	BY MR. TUMINARO:
17	specified in behavior VHDL.	17	Q. Is the answer to my question, yes, then,
18	BY MR. TUMINARO:	18	that the architectural details are the VHDL?
19	Q. You didn't answer my question. On Page	19	MR. PLUTA: Object to form. Object to
20	3, you said the system the system model and	20	relevance.
21	architectural details for the implementation of	21	BY THE WITNESS:
22	morphosys (M1 chip) are described hereafter, right?	22	A. It says morphosys reconfigurable system
	A Vou road that Voc	23	has been specified in VHDL. It could not be any
23	A. You read that. Yes.Q. I asked you earlier about what	24	other morphosys circuit.

Page 26 Page 28 1 BY MR. TUMINARO: 1 BY THE WITNESS: 2 2 Q. So that means that the VHDL was an A. My resume speaks for itself. I never 3 3 implementation of that morphosys chip? 4 MR. PLUTA: Object to form. Object to 4 BY MR. TUMINARO: 5 5 Q. You never programmed a 3D graphics on a relevance. Asked and answered. 6 6 BY THE WITNESS: GPU, did you? 7 7 A. Yes. That's what it says. Of course. A. I taught a course, and I did some 8 8 programming in open GL for the course to prepare the BY MR. TUMINARO: 9 Q. If you turn back with me to your 9 exams, the homework, and so on. Yeah. 10 10 Q. Have you ever used a -- strike that. You declaration at Paragraph 38, I'll read it for the 11 record. Are you there? 11 mentioned the open GL. Have you heard of DX10, 11? 12 A. Yeah. 12 A. Yes. I have heard of those. 13 13 Q. Paragraph 38 reads: "I believe that a Q. Have you ever used those? 14 14 person of ordinary skill in the art relating to the A. Not specifically, but I have -- I am 15 '053 patent would be someone with a good working 15 supervising projects or supervised projects, we 16 knowledge of computer graphic processing 16 tried to use GPUs for high performance computing and 17 architecture as well as the systems and programs 17 we're still doing that. 18 18 Q. By high performance computing, you don't that support such architecture." 19 19 mean 3D graphics, do you? Do you see that? 20 A. Yes. 20 A. Well, you're using the GPUs, but you are 21 Q. How did you come up with that definition? 21 doing it for number crunching. 22 A. I just wrote it. 22 Q. Right. 23 O. Based on what? 23 A. It's called GPGPUs. 2.4 A. Based on my knowledge. 24 Q. It's general purpose GPU, right? Page 27 Page 29 1 Q. Do you satisfy that definition? 1 A. Yes. But we're using all the resources 2 A. It's in the report. So I'm happy with 2 on the GPU. All the resources. 3 3 it. Q. Okay. My question is you are not using 4 Q. No, no. That wasn't my question. 4 the GPU to do 3D graphics processing, right? 5 5 Are you a person of ordinary skill in A. Not now. 6 the art with respect to your own definition? 6 Q. Have you ever? 7 7 A. Sorry about that. I took it as satisfied A. Before we did, yes. 8 8 differently. Q. If you look back with me, I guess, at 9 9 Paragraph 31, there's that figure that you put in Yes, I am. 10 10 Q. Were you a person of ordinary skill in from your lecture. 11 the art as of the time that the '053 patent was 11 A. Yes. 12 12 filed? Q. That figure is relating to a 13 A. Yes, I was. 13 multi-threaded CPU, right? 14 14 Q. Have you ever designed a GPU? A. It's related to multi-threading in 15 15 A. I designed some of the architectures that general. And you could think about it as a CPU. 16 we have that were used for computer graphics, yes. 16 You could think about it as a GPU. You can think 17 Q. Architectures other than the morphosys? 17 about it as any computation form. It's not target 18 18 A. Yes. I have done several architectures, application specific. 19 19 but morphosys was used for graphics. Q. If you look at the previous page, 20 Q. That had graphics in it? 20 Page 10, that figure is for multi-threading on a 21 A. Yes. 21 CPU, right? 22 22 Q. You never worked in a graphics company, A. It says CPU, right. I couldn't tell you 23 23 did you? that's a GPU. It says CPU. 24 MR. PLUTA: Object to form. 24 Q. The '053 patent is about a GPU, not a

Page 30 Page 32 1 CPU? So I'm going to look for references to see if there 1 2 2 MR. PLUTA: Object to form. are. 3 BY THE WITNESS: 3 Q. Okay. Great. 4 A. '053 is about multi-threading for GPUs. 4 If I'm misunderstanding, please let me A. 5 5 So this is to give you information about the know. 6 background of multi-threading. It's not talking 6 It doesn't seem to be. 7 Q. Where does this material come from then? 7 about -- I'm not trying to address GPUs here. I'm 8 8 A. I think I addressed that earlier. From talking about what is multi-threading for the layman 9 9 my knowledge and lectures, research, all of it done 10 10 BY MR. TUMINARO: over the years. 11 11 Q. So the entirety of the technical Q. Let's go back to your materials 12 considered. 12 background section just comes from stuff that you 13 13 have in your head? A. Yes, sir. 14 Q. Just to be clear, your lectures aren't 14 MR. PLUTA: Object to form. 15 shown in the materials considered, right? 15 BY THE WITNESS: A. Yes. That's why I'm here. 25 years of 16 MR. PLUTA: Object to form. Asked and 16 17 answered. 17 experience in education. If you want me to cite 18 18 BY THE WITNESS: everything I know, then it will be a book. 19 19 A. I think we established that, Counsel. BY MR. TUMINARO: 20 BY MR. TUMINARO: 20 Q. If you'd turn with me to Page 8, I'd like 21 Q. Is the answer yes? 21 to focus on the Bullet No. 2 that says 22 A. It's clear that it's not. 22 rasterization. 23 23 Q. Earlier you mentioned that you had 24 designed GPUs or certain aspects of GPUs for your 24 O. Rasterization, that's about generating Page 31 Page 33 1 chips. Those previous designs aren't listed in your pixels; is that right? 2 previous materials considered? 2 A. Yep. 3 3 MR. PLUTA: Object to form. Q. If you'd turn with me to Page 10, the 4 BY THE WITNESS: 4 last bullet there talks about cache misses. 5 5 There's a penalty for a cache miss, A. No, sir. 6 BY MR. TUMINARO: right? 6 7 7 Q. Let's go back to your technical A. Yes. 8 background which starts on Page 7 of your 8 Q. So if you increase the size of the cache, 9 9 declaration. And the technical background spans that will likely decrease cache misses; right? 10 from Page 7 through to the top of Page 12, correct? 10 A. There is a reason for that, but you 11 11 A. Yes. cannot assume increasing the cache size will always 12 12 Q. And in that entire section, there's not a improve your performance. There is a limit to that. 13 single cite to any external material, correct? 13 This is what is called a bathtub curve. 14 14 A. Let me check. Q. Bathtub curve, you moved your hand --15 15 MR. PLUTA: Object to form. A. Just like a bathtub. You cannot keep 16 BY MR. TUMINARO: 16 increasing the cache size and expect improvements, 17 17 but it gets better. You're right. Q. Let me ask the question again. 18 18 In that entire section, you didn't Q. And by -- and you said increasing the 19 19 cite any extrinsic evidence to support any statement cache size will increase your performance? 20 20 that you made in this section, right? A. Yeah. 21 A. Would you like me to check? I was just 21 Q. By increased performance, you mean 22 22 about to do that for you. decreased cache misses? 23 23 Q. Yeah. I wanted to clarify my question. A. It will give you more room to put stuff 24 A. Yes. I think I understood your question. 24 in there so you can keep track of more instructions

related to general topics. is the cache block. It's all related. Q. Maybe my question is not perfect. So, a cache miss is a penalty, right? A timing penalty? A. Yes. You're right. Q. Yes. You're right. Q. Fly our miss in the cache, you have to go out and get whatever it is you're looking for in memory, right? A. Then it is right, and penalty in prower comments. The memory in the memory, that's right. Q. So it's a penalty in time? Q. Great. So if you decrease the cache size, that will likely increase cache misses; right? MR. PLUTA: Object to form. Page 35 The WITNESS: A. You dian't qualify your question is for what type of application you're talking about. Q. All right. Since this case is about GPUs. let's talk about GPUs. A. You don't qualify your question with that. You asked me a general question. Q. Oxay. How about in GPUs. A. You dan't qualification is still not sufficient for me to answer that. But let me help you out. If you want metals a larger program, yes, you need a bigger cache. BY MR. TUMINARO: Q. Alarger program in a typical type GPU that you would use in a commercial implementation, decreasing the cache size will increase cache misses; make the cache size, will increase cache misses? MR. PLUTA: Object to form. Page 35 Fage 37 Fashibit No. 4.) The WITNESS: A. You dian't qualify your question with that. You asked me a general question. Q. Oxay. How about in GPUs; If you decrease the cache size, will likely increase the likelihood of a cache miss in a GPU, right? MR. PLUTA: Object to form. Page 35 A. You dian't qualify your question with that. You asked me a general question. Q. Oxay. How about in GPUs; If you application is still not sufficient for me to a likely day out question with that. You asked me a general question. Q. Oxay. How about in GPUs; If you decrease the cache size, will likely increase the likelihood of a cache miss in a GPU, right? A. You dian't qualify your question with that. You didn't qualify your question with that you decrease the cache size, wi		Page 34		Page 36
2	1	or data, and then there's something called how big	1	related to general topics.
Q. Maybe my question is not perfect. So, a cache miss is a penalty, right? A triming penalty? 4			2	
cache miss is a penalty, right? A timing penalty? A. Yes. You're right. Q. I'you miss in the cache, you have to go out and get whatever it is you're looking for in memory, right? A. From the slower memory, that's right. Q. So it's a penalty in time? A. That is right, and penalty in power consumption. Q. Great. So if you decrease the cache size, that will likely increase cache misses; right? MR. PLUTA: Object to form. Page 35 That. So you have to qualify your question is for what type of application you're talking about. Q. May. How about in GPUs. If you have that. You asked me a general question. Q. Al right increase the cache size will likely horease the likelihood of a cache miss in a GPU, right? MR. PLUTA: Object to form. Page 35 A. You didn't qualify your question with that. You asked me a general question. Q. Okay. How about in GPUs! If you are decrease the cache size will likely increase the likelihood of a cache miss in a GPU, right? MR. PLUTA: Object to form. A. You can write two lines of GPUs, and it a larger program, yes, you need a bigger cache. MR. PLUTA: Object to form. A. You all right. Since his case is about decrease the cache size will linerease cache. MR. PLUTA: Object to form. A. You can write two lines of GPUs, and it a larger program, yes, you need a bigger cache. MR. PLUTA: Object to form. MR. PLUTA: Object to form. A. You can write two lines of GPUs, and it a larger program, yes, you need a bigger cache. MR. PLUTA: Object to form. MR. PLUTA			3	
A. Yes. You're right. Q. If you miss in the cache, you have to go out and get whatever it is you're looking for in memory, right? A. From the slower memory, that's right. Q. So it's a penalty in time? A. That is right, and penalty in power consumption. Great. So if you decrease the cache size, that will likely increase cache misses; right? A. What application do you have in mind? BY MR. PLUTA: Object to form. BY MR. TUMINARO: It will fit in a small cache. So you don't need Page 35 A. Well, if your application is three lines, it will fit in a small cache. So you don't need Page 37 A. You dan't to qualify your question with that. You asked me a general question. Q. All right. Since this case is about decrease the cache size, it will likely increase the likelihood of a cache miss in a GPU, right? MR. PLUTA: Object to form. BY THE WITNESS: A. You can write two lines of GPUs, and it a larger program, yes, you need a bigger cache. See MR. PLUTA: Object to form. BY MR. TUMINARO: A. Well a going? It is up to you, sir. THE WITNESS: In okay. If I get tired, THE WITNESS: In okay. If I guestion like you said. MR. TUMINARO: (WHEREUPON, document marked as Exhibit No. 4.) BY MR. TUMINARO: L. Was Exhibit 4 for identifications purposes. This is U.S. Patent No. 7233335. Have you seen this document before? A. You. Correct. Q. And this is listed on your materials considered; correct? A. Correct. WHEREUPON, document marked as Page 37 Exhibit No. 5.) BY MR. TUMINARO: Q. Sir, you have been handed what has been marked as Exhibit No. 5.) BY MR. TUMINARO: Q. Sir, you have been handed what has been marked as Exhibit No. 5.) BY MR. TUMINARO: Q. Sir, you have been handed what has been marked as Exhibit No. 5.) BY MR. TUMINARO: A. Correct. Q. If you would turn with me to the last column, column A in claim No. 5. Are you there, sir; A. Yes. Q. And Ill read it for the record. "A Plurality of command processing engines. Do you see that? A. Yes. Pupulative of command processing engines, coupled to the arbit				
G. If you miss in the cache, you have to go out and get whatever it is you're looking for in memory, right? A. From the slower memory, that's right. Q. So it's a penalty in time? 10 Q. Great. So if you decrease the cache 11 A. That is right, and penalty in power 12 consumption. 13 Q. Great. So if you decrease the cache 14 size, that will likely increase cache misses; right? 15 MR. PLUTA: Object to form. 16 BY THE WITNESS: 17 A. What application do you have in mind? 18 BY MR. TUMINARO: 19 Q. I'm asking you in general. If you have a 10 smaller cache or fewer things in there, it is more 11 likely that you are going to have a miss a cache 12 miss, right? 10 A. Well, if your application is three lines, 11 that. So you have to qualify your question is for 12 what type of application you're talking about. 13 Q. All right. Since this case is about 14 GPUs, let's talk about GPUs. 15 A. You didn't qualify your question with 16 that. You asked me a general question. 17 Q. Okay. How about in GPUs? If you 18 decrease the cache size, it will likely increase the 19 delay would use in a GPU, right? 10 MR. PLUTA: Object to form. 11 BY THE WITNESS: 12 A. You can write two lines of GPUs, and it 13 still would be a very good size cache. So your 14 qualification is still not sufficient for me to 15 answer that. But let me help you out. If you want 16 a large program, yes, you need a bigger cache. 17 BY MR. TUMINARO: 18 MR. TUMINARO: 20 All read what has been marked as Exhibit 5 for identification purposes. 21 This is the would use in a commercial implementation, of command processing engines. 22 If you would turn with me to the last column, column A in claim No. 5. Are you there, sir? 23 A. Vesh. 24 Q. The last element in claim No. 5 is a plantation of the arbiter, each operable to receive and process the command processing engines, coupled to the arbiter, each operable to receive and process the command thread." 24 Droy ou see that? 25 Droy ou see that? 26 Droy ou see that? 27 Droy ou see that?				-
out and get whatever it is you're looking for in memory, right? A. From the slower memory, that's right. Q. So it's a penalty in time? A. That is right, and penalty in power consumption. Q. Great. So if you decrease the cache size, that will likely increase cache misses; right? MR. PLUTA: Object to form. Page 35 that. So you have to qualify your question with that. You asked me a general question. A. You cache miss in a GPU, right? MR. TUMINARO: Okay. Great. (WHEREUPON, document marked as Exhibit 5 for identifications purposes. This is us. Page 37 Till let you know if it's not in the middle of a question like you said. MR. TUMINARO: Okay. Great. (WHEREUPON, document marked as Exhibit 15 not. 4.) BY MR. TUMINARO: Q. You have been handed what has been marked as exhibit of infectingation purposes. This is us. Page 37 have you seen this document before? A. Yes. Q. I'm asking you in general. If you have a miss—a cache miss, right? A. Well, if your application is three lines, it is more things, right? A. Well, if your application is three lines, it is more that. So you have to qualify your question is for what type of application you're talking about. Q. All right. Since this case is about GPUs, and it at. You asked me a general question. Q. Okay. How about in GPUs? If you decrease the cache size, it will likely increase the likelihood of a cache miss in a GPU, right? MR. TUMINARO: Q. Is that should be a very good size cache. So your question with that and the proportion is the middle of a qualification is still not sufficient for me to answer that. But let me help you out. If you want a larger program, yes, you need a bigger cache. BY MR. TUMINARO: Q. In this is the Morton patent, correct? A. Correct. Q. I'm sis the Morton patent, correct? A. Correct. BY MR. A. Yes. You asked me questions that are 24 Q. And in the previous element, it cites an	23	DI THE WITNESS.		A. 168.

Page 38 Page 40 1 arbiter. The time is 10:09 a.m. 1 2 2 BY MR. TUMINARO: Do you see that? 3 A. Yes. 3 Q. If you would turn -- Welcome back, 4 Q. I'll read that one. "An arbiter, coupled 4 Dr. Bagherzadeh. Did you talk with counsel about 5 5 to be at least one memory device, operable to select the substance of your testimony during the break? 6 a command thread from either of the plurality of 6 pixel command threads and the plurality of vertex 7 7 Q. If you'd turn with me to Exhibit 1, your 8 command threads." 8 declaration again. In particular, I would like to 9 Do you see that? 9 go to Page 72. I'm sorry. Paragraph 72, this is 10 10 referring to the Lindholm reference, is that right, A. Yes. 11 Q. So looking at the plurality of command 11 starting on Page 20? 12 processing engines, each of those has to be able to 12 A. Correct. 13 process a vertex command thread or a pixel command 13 14 thread, right? 14 (WHEREUPON, document marked as 15 15 MR. PLUTA: Object to form. Exhibit No. 6.) 16 THE WITNESS: You are asking a yes or no 16 BY MR. TUMINARO: 17 question? 17 Q. You have been handed what's been marked 18 18 BY MR. TUMINARO: as Exhibit 6 for identification purposes. This is 19 Q. Yes. 19 U.S. Patent No. 7015913. 20 A. No. 20 A. Yes. 21 It does not? 21 Q. This is the Lindholm patent? Q. 22 No. 22 A. A. Correct. 23 23 When it says in claim 5, "each operable Q. This is listed on your materials 24 to receive and process the command thread," that's 24 considered. Page 39 Page 41 not referring to vertex command threads or pixel 1 1 A. Correct. 2 command threads? 2 Q. Now, Paragraph 72 of your declaration 3 3 A. It doesn't say that. It just says says and I'll read it for the record: "Because 4 receive and process. I don't get the --4 thread control buffer 420 stores information for 5 Q. It doesn't say "the command thread"? 5 both pixel and vertex threads, they are the claimed 6 A. Yeah, but it doesn't say that it should 6 memory device." 7 be able to do both. I don't see that here. 7 Do you see that? 8 Q. What do you understand the command thread 8 A. I see that. 9 9 to be then? Q. So, Paragraph 72 of your declaration is 10 1.0 A. It's -- it doesn't say what you're referring to -- just to be clear, the thread 11 saying. 11 controlled buffer 420, which is illustrated, for Q. You don't understand it to be a pixel 12 12 example, in figure 4 of Lindholm; is that right? 13 command thread or a vertex command thread? 13 A. Yes. 14 14 A. Not to do both. There will be some that Q. If you will look with me back to 15 would do pixel commands. The other ones would be to 15 Exhibit 5. 16 thread commands. 16 A. Yes. 17 Counsel, do you want to take a break? 17 Q. In claim 1, which appears on column 7, 18 MR. TUMINARO: Sure. Now is a good time 18 the memory device that's claimed in claim 1 reads, 19 19 and I'll read it for the record: "At least one to take a break. 20 THE VIDEOGRAPHER: We're going off 20 memory device comprising a first portion operative 21 record. The time is 9:55 a.m. 21 to store a plurality of pixel command threads and a 22 22 (Whereupon, a break in the second portion operative to store a plurality of 23 proceedings was taken.) 23 vertex command threads." 24 THE VIDEOGRAPHER: We're back on record. 24 Do you see that?

Page 42 Page 44 1 A. Yes. BY THE WITNESS: 1 2 2 Claim 1, the thing that's required to be A. It says to store a several pixel command 3 3 stored are the pixel command threads, command threads and several vertex command threads. threads -- strike that. Let me start over. It was 4 BY MR. TUMINARO: 5 5 all mixed up. Q. Okay. Great. We agree that it's pixel 6 In claim 1, the thing that is stored 6 command threads and vertex command threads, right? 7 7 by the memory device are the pixel command threads These are instructions for the threads, 8 and the vertex command threads; is that right? 8 yes. 9 9 MR. PLUTA: Object to form. Q. In Paragraph 72 of your declaration, what 10 BY THE WITNESS: 10 you say that is stored is "information" for both 11 A. You just repeated that claim, right? It 11 pixels and vertex threads; is that right? 12 talks about -- is that what you did? 12 A. You're reading my statement. 13 13 BY MR. TUMINARO: Q. I just want to be clear that you're saying information about the pixels and vertices 14 Q. What I'm trying to get at is the memory 14 15 device stores a plurality of pixel command threads 15 satisfies the claimed vertex command thread and 16 and a plurality of vertex command threads. 16 pixel command thread? 17 MR. PLUTA: Object to form, if that's a 17 A. I'm not saying that. 18 18 question. What are you saying then? 19 BY THE WITNESS: 19 A. It's a combination of TCB plus the 20 A. It says a memory device comprising of a 20 instruction cache that satisfies that particular 21 first portion operative to store a plurality of 21 element of claim 1. 22 pixel command threads and a second portion operative 22 Q. Well, in Paragraph 72 of your 23 to store a plurality of vertex command threads. I 23 declaration, you're saying that the TCB, as you put 2.4 24 agree with what it says. it, stores information, right? Page 43 Page 45 1 BY MR. TUMINARO: 1 A. Yes. 2 Q. I'm not trying to trick you. There are 2 Q. The claim requires command threads, 3 two things that are stored in the memory device, 3 right? 4 right? 4 That's what it says, yes. 5 MR. PLUTA: Object to form. 5 Q. I just want to be clear. So you're 6 BY MR. TUMINARO: 6 saying that the information stored by the TCB 7 7 Q. Let me try again. There are two types satisfies the claimed command threads? 8 that are stored by the memory device in claim 1; is 8 MR. PLUTA: Object to form. 9 9 BY THE WITNESS: that right? 10 10 MR. PLUTA: Object to form. A. I did not say that. 11 11 BY THE WITNESS: BY MR. TUMINARO: 12 12 Q. That's not what you're saying in A. You're saying at most two or at least two 13 or exactly two? 13 Paragraph 72? 14 14 BY MR. TUMINARO: A. All I'm saying is -- I think you're 15 15 mixing information with instructions. Q. At least two. 16 MR. PLUTA: Still objection. 16 Q. That's what I'm trying to understand. 17 BY THE WITNESS: 17 I'm trying to understand exactly what it is that 18 18 A. I would say it says two here right now. you're mapping in Lindholm that corresponds to the 19 I would not know if there was more or less -- I mean 19 claimed vertex command threads and pixel command 20 20 more. 21 BY MR. TUMINARO: 21 A. As I think I just alluded to just a few 22 22 Q. So what is stored, what does the claim minutes ago, it's a combination of TCB plus the 23 23 require that the memory device stores? instruction cache. 24 MR. PLUTA: Object to form. 24 Q. So what is the thing that is stored in

Page 46 Page 48 the TCB and instruction cache that you're saying is 1 Lindholm does not explicitly disclose thread -- a 2 2 the claimed command threads? thread control buffer that has a first portion for 3 3 A. It is the instructions plus information. storing pixel command threads and a second portion 4 Q. Just to be clear -- I guess what I'm not 4 for storing vertex command threads? 5 5 MR. PLUTA: Object to form. clear about is what is the information that you're 6 talking about? 6 BY THE WITNESS: A. Okay. 7 7 A. Explicitly? I say it, but a POSITA would 8 MR. PLUTA: Object to form. 8 have figured it out from the block diagram and the 9 BY MR. TUMINARO: 9 knowledge that it is --10 Q. All right. Let me clarify. No, I 10 BY MR. TUMINARO: 11 appreciate his objection. So let me clarify. 11 Q. Okay --12 In Paragraph 72 of your declaration, 12 A. -- a combination. 13 what information is it that you're talking about? 13 Q. -- I'm not talking about that for a 14 A. Let me refer you to my report. I wish I 14 second. I'll get to that. I'll get to that. I 15 15 could do a search. promise you. Just for now you would agree that 16 16 there is no explicit disclosure in Lindholm about a Referring to my claim chart on 17 Page 25 of my report, it's just an example of this. 17 first portion that stores pixel command threads and 18 18 It says TCB or thread control buffer 420 includes a second portion that stores vertex command threads? 19 19 storage resources to retain thread state data for a A. So taking the first part of that 20 subset of predetermined number of threads and that's 20 sentence, you are repeating it correctly, but there 21 the data. It's the state data because you have to 21 is more to that. 22 track this information while instructions are alive, 22 So you would agree with me -- strike Q. 23 23 and once they retire, you let go of that state. that. 24 Q. Just to be clear, the thread control 24 And that storing of a first portion Page 49 Page 47 buffer 420 stores this state data that you just operative to store a plurality of pixel command 2 referred to? 2 threads and a second portion operative to store a 3 3 A. At least. plurality of vertex command threads, that's a 4 Q. At least the state data. And that state 4 requirement of claim 1 of the '053 patent, right? 5 data corresponds to the information that you refer 5 You could look at the '053 patent if 6 to in Paragraph 72 of your declaration? 6 you need to. 7 7 A. Some of the information is state data. A. You repeated claim 1, the first element 8 right. 8 of that claim 1, right? 9 9 Q. If you turn with me to Paragraph 73 of O. Right. 10 your declaration. 10 A. Your question is that is a requirement? 11 11 A. Okay. Q. Yes. 12 Q. And the first word is "while" in that 12 A. It's a requirement and Lindholm satisfies 13 paragraph, right? 13 it. 14 14 A. Yes. Q. You would agree with me that Lindholm 15 Q. After that, it reads: "The thread 15 doesn't explicitly disclose it, right? 16 control buffer 42 does not explicitly disclose a 16 MR. PLUTA: Object to form. 17 first portion for storing pixel command threads or a 17 BY THE WITNESS: 18 second portion for storing vertex command threads." 18 A. I think it says in my report, but it's my 19 19 Do you see that? opinion that it would have been obvious to one of 20 20 A. I think you read it correctly. the ordinary skill. Because if you take the 21 Q. Is that a true statement? It's an 21 sentence out of the context, just the first part, 22 22 accurate statement? it's not really my position. 23 23 A. Everything I have here is true. BY MR. TUMINARO: 24 Okay. So you would agree with me that 24 Q. I appreciate that. I just want to be

Page 50 Page 52 1 right? clear on what your position is. I'll get to obviousness. I promise. You are not saying that 2 2 A. It's Lindholm in view of AAPA, that's 3 3 Lindholm anticipates claim 1, right? right. 4 4 Q. And the AAPA that you're relying on, you A. I don't think we said that it anticipates 5 5 talk about that in Paragraph 100, right? claim 1. 6 6 A. Correct. Q. Okay. Okay. 7 7 Q. You mention here in Paragraph 100, it A. I don't think we did, but I can check for 8 says, "the '053 patent discloses that buffer 104 8 you. In view of AAPA, so we're not saying 9 anticipates, right. I'm not saying it's 9 stores ALU resource command threads while buffer 106 stores texture fetch resource command threads." 10 10 anticipating that. 11 11 Do you see that? Q. I just want to be clear. You agree 12 Lindholm does not anticipate claim 1? 12 A. Correct. 13 13 Q. Okay. So this background material talks A. On it's own, correct. about ALU threads and texture threads, right? 14 Q. Okay. All right. But you think that 14 15 15 MR. PLUTA: Object to form. it's obvious, right? BY THE WITNESS: 16 16 A. Yes. 17 Q. Okay. I told you I would get to 17 A. It talks about instructions belonging to 18 obviousness. That's what I'm trying to get to. 18 the -- okay. 19 BY MR. TUMINARO: MR. PLUTA: Object to form. 19 20 20 Q. Let me clarify. There's a first buffer, BY MR. TUMINARO: 21 21 buffer 104 for storing ALU threads, resource command Q. And the reason -- if you look at 22 22 threads, and a second buffer, 106, for storing Paragraph 73, it says about -- after that first 23 23 texture fetch resource command threads, right? subordinate clause that I read, it says: "It is my 24 opinion." 24 A. Yes. Page 51 Page 53 1 1 Do you see that in Paragraph 73? Q. Okay. If you go back to claim 1 of the 2 A. Yes. 2 '053 patent, claim 1 is not about -- it doesn't say 3 Q. I'll read it for the record just so it's 3 anything about ALU command threads or texture 4 clear. "It is my opinion that it would have been 4 command threads. It talks about pixel command 5 obvious to one of ordinary skill in the art to 5 threads and vertex command threads, correct? 6 modify Lindholm's multi-threaded system to store 6 A. That's what it says. But I can qualify 7 7 different types of command threads in separate that if you are trying to tie it into this 8 portions of memory because it is well known that 8 paragraph. 9 9 pixel threads and vertex threads are necessarily Q. I guess in paragraph -- okay. In 10 10 different types of data." Paragraph 101, you say: "In graphics processing, it 11 11 Do you see that? is well known that vertex command threads belong in 12 12 A. Yes. the category of ALU resource division because of the 13 Q. You stand by that statement? 13 nature of vertex operations." 14 14 MR. PLUTA: I'm going to object, Counsel. A. Correct. 15 15 This is outside the scope of the instituted grounds. Q. You provide no cite for that, correct? 16 BY MR. TUMINARO: 16 A. It says well known, in my experience, 17 17 teaching, research. Q. If you would turn with me to 18 Paragraph 100 of your declaration. 18 Q. You think it's a true statement? 19 19 A. It is. A. Yep. 20 20 In fact, pixel commands can also be ALU Q. And Paragraph 100, this is related to Q. 21 your position that this paragraph falls within the 21 operations; is that right? 22 22 section related to ground No. 2 where you're saying Sometimes. Predominantly, it is vertex. 23 23 that Lindholm and so-called admitted prior art Q. You didn't qualify it like that in 24 render obvious certain claims of '053; is that 24 Paragraph 101, did you?

Page 54 Page 56 1 A. It's obvious. 1 Multiplication could be one of them, but it is 2 2 Q. But you said -- so you would agree with usually not floating point. It's integer. me then that pixel command threads could also be ALU 3 BY MR. TUMINARO: operations, right? 4 Q. Multiplication is an ALU, not a texture 5 5 MR. PLUTA: Object to form. type of operation, right? 6 BY THE WITNESS: 6 MR. PLUTA: Object to form. 7 A. Predominantly, it's vertex. 7 BY THE WITNESS: 8 BY MR. TUMINARO: 8 A. It is multiplication. It is ALU. 9 Q. I don't think you answered my question. 9 BY MR. TUMINARO: 10 10 You would agree with me that pixel command threads Q. So, in fact, alpha blending is an example 11 can also be ALU operations? 11 of a pixel command that involves ALU operations? 12 MR. PLUTA: Object to form. 12 MR. PLUTA: Object to form. It is also 13 BY THE WITNESS: 13 outside the scope of the report. 14 A. They could, but it's not very common. 14 BY THE WITNESS: 15 BY MR. TUMINARO: 15 A. I think I have answered you to the best of my abilities. I explained to you that 16 Q. Alpha blending would be an example of 16 17 which pixels commands would be associated with an 17 predominantly it is vertex operations. I don't have 18 18 ALU type operation, right? anything more to add to that. 19 MR. PLUTA: Object to form, lack of 19 BY MR. TUMINARO: 20 foundation. 20 Q. In paragraph 101 you say that vertex 21 BY THE WITNESS: 21 command threads belong to the category of ALU 22 A. As an architect, when we evaluate 22 resource division, right? 23 23 systems, we look at dominance of certain functions A. That's what it says. 24 2.4 in terms of performance, power consumption, and so Q. But isn't it a fact that vertex commands Page 55 Page 57 1 on. A POSITA would have looked at this and would can also involve texture operations? 2 have said, yeah, vertex computations are taking a 2 A. Well, again, predominantly they're 3 lot of computations in terms of using the ALUs. So, 3 computation intensive operations. So they belong to 4 yeah. It would be the dominant one, 80, 70 percent, 4 the ALU sections. 5 and that's -- that's what you do, part of the 5 Q. But it is a fact that vertex commands can 6 6 design. involve texture operations, right? 7 7 BY MR. TUMINARO: MR. PLUTA: Object to form. 8 8 BY THE WITNESS: Q. None of that answered my question, 9 9 respectfully. A. It's a small percentage in terms of 10 10 A. I'm so sorry about that. overall computation. So if you want to take a 11 11 Q. Alpha blending would be an example in hundred to be the example, just using as an example, 12 12 which -- well, strike that. a hundred to be the amount of time, 80 percent 13 Alpha blend is a pixel type 13 perhaps would be -- 90 percent would be in the ALU 14 14 operation? portion, there will be a small portion for texture. 15 15 A. It is. But it's not the dominant BY MR. TUMINARO: 16 computation in terms of -- how you design the 16 Q. Just to be clear, the answer to my 17 17 architecture is you want to be able to address the question is yes? 18 18 most computation intensive functions. So, vertex MR. PLUTA: Object to form. 19 19 BY MR. TUMINARO: will dominant here. 20 20 Q. In alpha blending, the pixel command Q. Vertex commands can involve texture 21 involves multiplication, right? 21 operations? 22 22 MR. PLUTA: Object to form. A. I explained to you that it's 23 23 BY THE WITNESS: predominantly a computation of ALU. 24 A. It includes some sort of a computation. 24 Q. But it can be -- vertex commands can be

Page 58 Page 60 1 something, select one of two different things, you texture operations? 1 2 MR. PLUTA: Object to form, asked and 2 have to have the option to select either of those 3 answered. 3 two things, right? 4 BY THE WITNESS: 4 A. You could have a computation that only 5 5 A. I cannot add any more to what I just the vertex is available. I mean, it's not an --6 said. I mean, it is what it is. You can design it 6 it's not against whatever they say here. It could 7 the way you want. But it's predominantly a 7 be just one chute, if I could use the word chute, is 8 8 computation of the ALU. available, and you just pick from that one. 9 9 BY MR. TUMINARO: Q. Well, if I say to you do you want pizza 10 Q. The morphosys chip that you developed --10 or a sub for lunch, you select. You have to have 11 A. We're switching topics back to morphosys? 11 both of those options available at the same time, 12 Is that what you are asking me? 12 right? 13 Q. Yes. Could that system handle alpha 13 A. If the Subway is closed, I'm going to 14 blending? 14 have pizza. So until the subway opens. 15 15 MR. PLUTA: Object to form. Object to Q. In which case you haven't made a 16 16 the relevance. selection, right? 17 BY THE WITNESS: 17 A. Sure. I made a selection, but it was not 18 18 available. A. Yes. 19 BY MR. TUMINARO: 19 Q. Right but you didn't make that the 20 Q. If you will turn with me to the '053 20 selection, right? 21 patent and claim 1. 21 A. No. I had the option to going to the 22 A. Yes, sir. 22 Subway, but it was closed. It was not available. 23 23 Q. And the second element is an arbiter. Q. Is it your position if an option is not 24 And it reads, for the record, "an arbiter, coupled 24 available to you, you're still selecting that Page 59 Page 61 1 to be at least one memory device, operable to select 1 option? 2 a command thread from either of the plurality of 2 A. In what context are we talking about now? 3 3 The Subway or the computer architecture? pixel command threads and the plurality of vertex 4 command threads." I'll stop there. 4 Q. Let's talk about the context of the 5 5 Do you see that? arbiter. If the pixel is not available to the 6 A. I see that. 6 arbiter, would you say the arbiter is selecting a 7 7 Q. So the claimed arbiter has to select from vertex even though a pixel is not available to it? two types of things, right, vertex command threads 8 A. The job of the arbiter -- I have to 9 9 explain to you, Counsel, if you allow me to finish. and pixel command threads? 10 MR. PLUTA: Object to form. 10 If you are not going to allow me to finish, then I 11 11 BY THE WITNESS: won't be able to answer your question. 12 12 Q. Sir, I didn't say anything. A. The arbiter has to select a command 13 thread from either of the plurality of pixel command 13 A. The way you shaked your face, it was like 14 14 threads. Yeah, that's what it says. you were frustrated with me. 15 15 BY MR. TUMINARO: The job of the arbiter is to select 16 Q. In order to select either a pixel or a 16 between the available options. Is that clear what I 17 vertex, those options both must be available to the 17 said? And that's all it does. You gave an example 18 18 arbiter at the same time, right? of two for this particular claim. It could be 19 19 three, it could be four, and depending when it is MR. PLUTA: Object to form. BY THE WITNESS: 20 20 available. So it's very simple. No tricks. 21 A. What do you mean, those options have to 21 Q. In claim 1, the available options are 22 22 be available? I don't understand that. pixel command threads and vertex command threads? 23 23 A. If they're available, yes. BY MR. TUMINARO: 24 Q. Well, if you are going to select 24 Q. In claim 1, they are available, right?

	Page 62		Page 64
1	MR. PLUTA: Object to form.	1	BY MR. TUMINARO:
2	BY THE WITNESS:	2	Q. Well, it has to select?
3	A. Does it say that, that it has to be	3	A. It has to select. I agree with that.
4	available? I don't see that.	4	MR. PLUTA: Object to form.
5	BY MR. TUMINARO:	5	BY MR. TUMINARO:
6	Q. Well, it doesn't say if they are	6	Q. Does a FIFO select? Do you know what a
7	available, does it?	7	FIFO is?
8	A. Yeah. So, to be more general, it doesn't	8	A. First-in first-out.
9	say it's a necessary condition for the arbiter to	9	Q. First-in first-out buffer?
10	work.	10	A. Okay.
11	Q. I apologize.	11	Q. Does a FIFO select?
12	A. If you let me finish the thought, please.	12	A. You could design a FIFO that has a select
13	I'm trying to clarify what's on the claim. As you	13	line.
14	probably know better than I do, these claims	14	Q. But Does a FIFO by itself select?
15	sometimes are not very well written.	15	A. I mean, you're talking about a FIFO
16	But in this case it doesn't say the	16	without giving me any information about what you
17	requirement of having both available. It says it	17	want to do. So it's a very broad question. If I
18	has the option of choosing between the two. I agree	18	give you a FIFO description, and I say I want to
19	with that.	19	have an arbiter in front of it, you can design it.
20	Q. You said the job of the arbiter is to	20	Q. I'll tell you what. What is a FIFO?
21	select between available options?	21	A. First-in first-out.
22	A. Yeah.	22	O. What does it do?
23	Q. Right. You're talking about the claimed	23	A. The first-in first-out, basically that's
24	arbiter.	24	how it operates.
	Page 63		Page 65
1	A. That was a general comment, but it	1	Q. It stores the first thing that it gets
2	applies here.	2	and it outputs the first thing that's input is
3	Q. The claimed arbiter, the options are	3	the first thing that's output, is that what you're
4	pixel command threads and vertex command threads?	4	saying?
5	A. If they're available.	5	A. I think FIFO means that.
6	Q. If they're available is not a limitation	6	Q. So does a FIFO select between available
7	that appears in claim 1, right?	7	options?
8	A. It doesn't say that.	8	A. You can design it to do that.
9	Q. Okay.	9	Q. How would you design it to do that?
10	A. But it could be interpreted by whoever is	10	A. You put an arbiter in it.
11	looking at this.	11	Q. So a FIFO is not an arbiter itself?
12	Q. But it's not a limitation that's in the	12	A. No. It depends on what you want to do.
13	claim?	13	If you want it to have an arbitration, you could. I
14	MR. PLUTA: Object to form.	14	could design a FIFO with an arbiter.
15	BY THE WITNESS:	15	Q. You would have to put an arbiter in front
16	A. Right.	16	of the FIFO for the FIFO arbitrate?
17	BY MR. TUMINARO:	17	A. You have to put the functionality in the
18	Q. So an arbiter, the claimed arbiter, has	18	FIFO. If you need that, you put it in, and you call
19	to decide or resolve something?	19	that a FIFO. That will be my FIFO because I need
20	MR. PLUTA: Object to form.	20	that functionality. There is no set well, you
21	BY THE WITNESS:	21	could look up a dictionary and come up and say FIFO
22	A. I'm not sure if I understand that	22	means this; but if I want to design it, I can add
23	question.	23	anything I want to it and it will be a FIFO. I have
24		24	done that.

	Page 66		Page 68
1	Q. Do you know what a bus is in a computer	1	write information.
2	context?	2	A. In the context of, sorry, computer
3	A. Yes, I do.	3	architecture, yes.
4	Q. A bus provides data?	4	Q. In the context of computer architecture?
5	A. It does.	5	A. In general, yes.
6	Q. It receives data?	6	Q. Would that be true also in a GPU?
7	A. Not only data.	7	MR. PLUTA: Counsel, I'm going to object.
8	Q. What else does it receive?	8	I gave you a little leeway as the witness said. Can
9	A. Other things.	9	you tie this back to the scope of his report and
10	Q. Is a bus an arbiter?	10	particular information in his report? If not, I'm
11	A. It could be.	11	going to object to the relevance at this point.
12	Q. How?	12	MR. TUMINARO: Counsel, I'll draw your
13	A. Put an arbiter in it as part of the bus.	13	attention to the scheduling order, and it reminds
14	Q. So the arbiter is something different	14	everyone about the testimonial guidelines, and the
15	than the bus?	15	testimonial guidelines are explicit that objections
16	A. It could be integrated with the bus.	16	should be limited to a single word or term.
17	Q. What's a register?	17	Examples of objections that would be properly stated
18	A. It's memory.	18	are objection, form; objection, hearsay; objection,
19	Q. Memory. What's a register do?	19	relevance; and objection, foundation.
20	A. Store information.	20	So I'm going to ask you to refrain
21	Q. So it could receive information?	21	from speaking objections from now on.
22	A. It has to if it wants to store	22	
23	information.	23	
24	Q. It could provide information?	24	
	Page 67		Page 69
1	A. It can read it and write it.	1	MR. PLUTA: Then I'll restate my
2	Q. Is a register an arbiter?	2	objection. I object to the relevance of this line
3	A. Tough question.	3	of questioning.
4	Q. You are the expert.	4	BY MR. TUMINARO:
5	A. You are asking a very abstract question.	5	Q. If you would turn with me to in your
6	A register is part of the arbiter.	6	declaration to Page 10. And there's a figure at the
7	Q. It is part of an arbiter?	7	top of Page 10, the figure from your lectures.
8	A. If you design an arbiter without a	8	A. Yes.
9	register, you have a design that may not work.	9	Q. On the right-hand block that says CPU and
10	Q. So it's a portion of an arbiter. What	10	on the left-hand block, there's a block inside with
11	else would you need to add to the register to make	11	what is labeled as CPU and a block is R-E-G-S.
12	it an arbiter?	12	Do you see that?
13	A. Oh, this is a lot of things.	13	A. Yes.
14	Q. Some sort of logic to select, right?	14	Q. That stands for register?
15	A. Yeah. You asked me outside the scope of	15	A. Yes.
16	this case. Are you asking me a general question	16	Q. Is that register that you're showing in
17	about computer architecture? Because I want to know	17	your diagram an arbiter?
18	what the relevance is to what my report is and so	18	A. Not in that case.
19	on. If you could kindly direct me to what I'm	19	Q. Because it doesn't select?
20	prepared to talk to you about here. I mean, I can	20	A. That one is used for holding temporary
21	talk about these things if I have to because that's	21	data for the PC for the CPU. I get confused that
22	my job to answer your questions, but I don't see the	22	PC is program counter.
23	relevance to this.	23	(WHEREUPON, document marked as
24	 Q. Earlier you said a register can read and 	24	Exhibit No. 7.)

I didn't memorize it. Q. You provided an opinion about what Stuttard discloses, right? A. I did. But I don't recall what the phase means here. We can look at it if you want. Q. Sure. The next sentence in column 8, it says since both phases, referring back to the geometry and rasterization phases, are block parallel, there needs to be a mechanism for
3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21	Processing core 10. Where is processing core 10? Q. If you look at figure 2B. I'll try to help you. A. Thank you. Q. Are you there, sir? A. Yes. Q. You see it sort of toward the top left, there's a label 106, and it says eight times fusion blocks. Do you see that? A. Yes. Q. And that 106 is the same number as shown in figure 3, the processing blocks? A. Okay. Q. Right. So in this example, there are eight processing blocks; is that right? A. Eight 106s, that's correct. Q. Now, Stuttard says that the well,	3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21	Q. "The bidding process must maintain primitive order between the geometry and rasterization phases due to the requirement of most host systems." Do you see that? A. Yes. You read it correctly. Q. That means Stuttard discloses a geometry phase as distinct from a rasterization phase, right? A. It says phases. I don't know what these phases mean. Q. You reviewed Stuttard, right? A. I didn't memorize it. Q. You provided an opinion about what Stuttard discloses, right? A. I did. But I don't recall what the phase means here. We can look at it if you want. Q. Sure. The next sentence in column 8, it says since both phases, referring back to the geometry and rasterization phases, are block

Page 74 Page 76 1 Do you see that? 1 Q. Let's look further down at line 29. "A 2 A. Yes. 2 record is kept of how many primitives are written to 3 3 Q. When it says that the phases are block each bin so that regions can be sorted into similar parallel, that means all the processing blocks 106 4 size groups for block parallel rasterization." 5 5 do geometry processing during the geometry phase and Do you see that? 6 6 all the processing blocks 106 do pixel processing A. Yes. 7 7 during the rasterization phase, right? Q. Block parallel rasterization means all 8 MR. PLUTA: Object to form. 8 blocks are doing rasterization, right? 9 9 BY THE WITNESS: MR. PLUTA: Object to form. 10 A. I could not tell you that. 10 BY THE WITNESS: 11 BY MR. TUMINARO: 11 A. Yes. I think you're taking this out of 12 Q. Well, let's go down then to line 18. It 12 the original context. Block parallel doesn't mean 13 says: "This is implemented by creating multiple 13 that there's no other activities going on. That 14 14 bins -- strike that. Let me start again. means there's a data parallelism in the computation 15 "This is implemented by creating 15 meaning that you apply a single instruction to 16 multiple bin lists per region, one for every 16 multiple data to some extent. So I think you're 17 processing block 106 that is processing geometry 17 taking a block parallel out of its original context, 18 18 data. This allows the geometry output phase to which means multiple things could happen at the same 19 19 proceed in block parallel mode." 20 Do you see that? 20 So, I mean, I'll be glad to look at 21 A. You're reading it correctly. 21 the phases and so on, but that's not the way I read 22 22 Q. That means the geometry phase is this. To have more information, I mean I have to 23 performed in block parallel mode, right? 23 look at the phases. 24 2.4 MR. PLUTA: Object to form. I don't want to take too much time to Page 75 Page 77 1 BY THE WITNESS: explain what the block parallel is, but it has to do 2 A. You're reading what it says or you're 2 with data parallelism, and I think that means the 3 3 asserting what it says. processing elements are working, all of them, on one 4 BY MR. TUMINARO: 4 block, like you said, but there are multiple 5 5 processes that could do that. Q. So what that means is that block 6 parallel, during the geometry phase, all processing 6 Q. In fact, in Stuttard, there is one core 7 7 blocks 106 are doing geometry operations; right? processor, that is core processor 10, right? Look 8 8 at figure 2B. MR. PLUTA: Object to form. 9 9 BY THE WITNESS: 2B. Okay. Yes. 10 10 A. I could not tell you that. The phases And that core processor has eight blocks, Q. 11 11 right? could happen at the same time or in different levels 12 12 of -- you know, this is very detailed analysis of A. Yes. 13 what Stuttard does. 13 Q. And column 18 says that geometry output 14 14 BY MR. TUMINARO: phase proceeds in block parallel mode, talking about 15 15 Q. But Stuttard says they occur in block all the blocks 106 on core 10? 16 16 A. Yes. But figure 3 shows you -- you see parallel, right? 17 the dot dots on the processor unit? Inside the MR. PLUTA: Object to form. 17 18 18 BY THE WITNESS: belly of 106, there are whole bunch of processors 19 19 A. That has nothing to do with phases. That inside that. You have got eight times whatever that 20 20 is. I have to read more to figure out how the block means it is data parallel. 21 BY MR. TUMINARO: 21 is done. Is it done across this or inside this? I 22 22 Q. It says there is geometry phases. would be glad to look at all of this if you want. 23 23 No. Block parallel means other things. But I disagree with your statement there. 24 Data parallel is a different business. 24 Q. Let's look at what each processing

Page 80 Page 78 element within a block does. If you'll turn with me the ME for processing in to the pixel data." 1 1 2 2 to column 9. Do you see that? 3 3 A. Sure. A. Can you tell me the column again? 4 4 Q. Column 10, line 30. Q. Line 57. 5 5 A. Okay. Thanks. 6 Q. It says, "the data is loaded into the PEs 6 Do you see that? 7 7 of the graphic system so that each PE contains data A. Yes. 8 for one vertex." Do you see that? 8 Q. The last sentence in that paragraph, line 9 9 A. Which PE are we talking about? 39, it says: "Each PE also includes data about a 10 Q. Those are the PEs that are inside a block 10 respective pixel (ie, data is stored on a pixel per 11 106 if you look at the figure 3. 11 PE basis)." 12 A. Okay. 12 Do you see that? 13 13 Q. There's processing elements 1061. A. You're reading it as it says, yes. 14 A. I understand. 14 Q. In line 45 -- well, I'll read line 42. 15 15 "Once each pixel is determined to be outside or Q. You agree that at column 9, paragraph --16 line 57, Stuttard is saying that each of the 16 inside the triangle (primitive) concern, the 17 processing elements stores vertex data, right? 17 processing for the primitive can be carried out only 18 18 MR. PLUTA: Object to form. on those pixels occurring inside the perimeter." 19 19 BY THE WITNESS: Do you see that? 20 A. Reading that, it says each -- the data is 20 A. You're reading it correctly, yes. 21 loaded into the PEs of the graphic system so that 21 Q. And then it goes on to say that "the 22 each PE contains the data for one vertex. That I 22 remainder of the PEs in the processing block do not 23 23 take any further part in the processing until that understand. 2.4 24 primitive is processed." Page 79 Page 81 1 BY MR. TUMINARO: 1 Do you see that? 2 Q. So each PE has vertex data? 2 A. Yes. 3 3 Q. That means during the pixel operation, A. One of the things it does, it has the 4 vertex data among other things. 4 all the PEs are doing pixel operations or nothing, 5 Q. Each PE in block 106 has vertex data 5 right? 6 according to what Stuttard is saying? 6 MR. PLUTA: Object to form. 7 A. For this example, yes, but it could have 7 BY THE WITNESS: 8 8 A. With the caveat that there are eight other things. 9 9 Q. You. But Stuttard doesn't say that, slices of those, and other slices could be doing 10 right? Stuttard said each PE has vertex data. 10 other things. You just looked at one slice. 11 11 BY MR. TUMINARO: A. In that sentence, it says that. But I 12 12 have to look at the rest to see if it does other Q. Okay. 13 things. 13 A. I agree with what you said about one 14 14 Q. It continues on to say "that each PE then slice. Across -- let me finish, please. 15 15 represents a vertex of a primitive that could be at MR. PLUTA: You guys are talking over 16 an end of a line or part of a two-dimensional shape 16 each other. 17 such as a triangle." 17 THE WITNESS: I'm trying to finish my 18 18 A. For that paragraph, that is correct. explanation if you don't mind. There are eight 19 19 But, again, PEs could be doing other things. slices, and they could be doing other things 20 Q. Then let's look at what Stuttard says 20 including vertex. 21 about pixel processing. Let's look at what it says 21 BY MR. TUMINARO: 22 22 about pixel processing. Q. But each slice, when it's doing pixel 23 23 operations -- the slice you're talking about at At column 10, line 30, "each PE then 24 transfers in its data concerning its primitive to 24 block 106, right? When it's doing pixel operations,

Page 82 Page 84 1 every processing element within block 106 does 1 are doing vertex operations when block 106 is doing 2 2 either a pixel operation or nothing, right? a vertex operation? 3 3 A. Can I -- not having read the whole thing MR. PLUTA: Object to form. 4 again here, by looking at what you showed me that 4 BY THE WITNESS: 5 5 you are correct, but I want to qualify that that I A. Okay. It doesn't say it has the data for 6 need to check the whole document to make sure that 6 one vertex only. It could have data for pixels 7 it doesn't say another embodiment we can do these. 7 already in the register. So I cannot say from this 8 8 I want to be clear on that. statement that it does not have other information. 9 Q. But here, that's what this means? 9 If it said only vertex, you're right. 10 10 A. In this example as you provided -- if BY MR. TUMINARO: 11 it's one embodiment, you're right. But if the other 11 Q. It does say each PE, right? 12 embodiments are there, I'm not agreeing to what you 12 A. No. 13 13 say. Q. I'll read it again. 14 Q. Okay. So that's for pixels. 14 A. I didn't -- if I could qualify what I 15 15 And then for vertices, within a said. 16 16 processing block, each processing element within Q. Let me read it again for the record. 17 that processing block does vertex operations, right? 17 A. 18 18 A. As I tried to explain, it could be that "The data is loaded into the PEs for the 19 19 each slice is doing different things at the same graphic system so that each PE contains data for one 20 time -- at the same time. 20 vertex." 21 Q. I appreciate that. But what I'm trying 21 Did I read that correctly? 22 to get out now is what a particular slice or 22 A. You did. It's not convincing to me that 23 processing block is doing. And if a processing 23 it's the only thing that it has. 24 block is doing pixels, all the processing elements 24 Q. You don't read each PE to mean that every Page 83 Page 85 1 within that processing block do pixels or nothing, 1 single PE in the block has vertex data? 2 2 we established that, right? A. No, Counsel. It should have said that 3 3 A. For this embodiment. only vertex data, then I agree with you. It doesn't 4 Q. Now, I want to talk for vertices. If a 4 say only. Does it say? 5 5 Q. It says each PE -processing block is doing vertices, all the 6 processing elements within that block do vertices, 6 A. Right. 7 7 right? Q. -- has vertex data. So you're saying a 8 8 PE could have other data? A. Can you show me that section because you 9 9 showed me for the pixel, not vertices. A. Absolutely. From previous computations. 10 10 Q. Let's look for the vertices. It actually does something like that because you 11 11 need to keep track of the state of what you did. Column 9, line 57, "the data is 12 12 The registers -- you showed me the register file. loaded into the PEs of the graphic system so that 13 each PE contains data for one vertex." 13 They have registers. They keep track of the state. 14 14 That means every PE has vertex data, MR. TUMINARO: Why don't we take a break. 15 15 THE VIDEOGRAPHER: We're going off the right? 16 MR. PLUTA: Object to form. 16 record. This is the end of Media 2. The time is 17 BY MR. TUMINARO: 17 11:15 a.m. 18 1.8 Q. Did you nod your head? Is that a yes? (Whereupon, a break in the 19 19 A. Sorry. Apologies. I'm reading and proceedings was taken.) THE VIDEOGRAPHER: We're back on record. 20 20 listening to you at the same time. 21 Okay. Yes. You're reading what it 21 This is the beginning of Media 2. The time is 22 22 11:36. says, yes. 23 23 Q. Well, just to be clear, that means that BY MR. TUMINARO: 24 all the processing elements within that block 106 24 Q. Welcome back, sir.

Page 88 Page 86 1 1 But the understanding of unified A. Thank you. 2 2 You have heard of the phrase unified shader in general, it's a programmable system that 3 3 shader? can handle multiple functions as part of shading. 4 4 That's the understanding I have. A. Yes. 5 5 Q. And unified shader refers to an BY MR. TUMINARO: 6 architecture where the same hardware does both 6 Q. Does claim 1 handle vertex operations and 7 7 vertex operations and pixel operations, right? pixel operations? 8 MR. PLUTA: Object to form. 8 MR. PLUTA: Object to form. 9 9 BY THE WITNESS: BY THE WITNESS: 10 10 A. Claim 1 says that an arbiter -- okay. A. That's the general idea. 11 BY MR. TUMINARO: 11 Does it handle vertex operations? It refers to 12 Q. The claims of the '053 patent are 12 vertex data. I agree with that. It says that it 13 directed to a unified shader, right? 13 will select between vertex and pixel data. That, I 14 A. Did they use the word unified shader 14 see and I agree with the statement here. 15 15 anywhere? Can you point me to it? BY MR. TUMINARO: 16 Q. I guess, if you look at claim 1, it is 16 Q. If you would turn with me with 17 talking about a single set of hardware that does 17 Paragraph 19 of your declaration. 18 18 both vertex operations and pixel operations, right? A. Paragraph 19, okay. 19 19 A. Where do you get that information from Q. Page 5 if that helps. It reads, "I also 20 claim 1? 20 understand that the relevance" -- excuse me. I'll 21 Q. Well, the memory stores both vertex 21 start again. 22 commands and pixel demands, right? 22 "I also understand that the relevant 23 23 A. That's the memory. inquiry into obviousness requires consideration of 2.4 24 And the arbiter selects either vertex four factors." Page 87 Page 89 1 commands or pixel commands, right? 1 Do you see that? 2 A. Correct. 2 A. Yes. 3 3 Q. It's a single set of hardware that's O. And one of the factors that's listed as 4 doing --4 (d) is objective factors, right? 5 A. Overall, it's hardware with multiple 5 A. Correct. 6 6 Q. And one of the objective factors is functional units. 7 7 Q. It's doing vertex operations and pixel copying of the invention by others in the field? 8 operations? 8 A. Commercial success, long-felt needs, 9 9 A. It's really a broad definition, unified copying of the invention by others in the field. 10 shader. You could have specialized hardware, but I 10 That's what it says, yes. 11 11 mean, I haven't really opined on that for this case. Q. You would agree with me that copying of 12 12 the invention by others is objective evidence of Q. I guess I'm asking you right now as an 13 expert in this field, would you consider claim 1 to 13 nonobviousness? 14 14 be directed to a unified shader? MR. PLUTA: Object to form. 15 15 MR. PLUTA: Objection, relevance. BY THE WITNESS: 16 Objection, form. 16 A. Okay. You are asking me -- I know it's 17 BY THE WITNESS: 17 in my report, but this is a legal matter. My level 18 A. I haven't formed an idea on this because 18 of understanding, it is exactly what it says here. 19 19 it's really not a matter of just being a I cannot dwell on this more than what it is. You 20 programmable shader. One has to see more details 20 know, I'm not here for legal issues; but you're 21 about it. I couldn't tell you for certain that this 21 right, it is in my report and that's what it is. I 22 22 is a unified shader because there are no more cannot add any more than what you see there 23 23 unfortunately. Sorry. details about what these functional units do. I 24 cannot say from what I have here. 24

Page 90 Page 92 1 BY MR. TUMINARO: 1 BY MR. TUMINARO: 2 2 Q. And computer graphics chips have to be Q. Okay. You're aware, as an expert, that 3 compatible with DX10 if they want to work on that 3 nearly the entire computing industry now uses 4 4 unified shader? platform, right? 5 5 MR. PLUTA: Objection, form. Objection, MR. PLUTA: Object to form. Objection, 6 relevance. 6 relevance. 7 7 BY THE WITNESS: BY THE WITNESS: 8 A. Which computer graphic chips? There are 8 A. Yeah. I could not tell you that. I have 9 9 not opined on that for my report. It requires a whole bunch of computer graphic chips. 10 10 looking at the entire industry. BY MR. TUMINARO: 11 BY MR. TUMINARO: 11 Q. Any graphic chip that's want to be 12 Q. You have heard of the DX10? 12 compatible with DX10 would have to implement what 13 MR. PLUTA: Object to form. Sorry. 13 DX10 talks about, right? 14 Withdraw the objection to form. But objection to 14 MR. PLUTA: Same objection. I'm sorry, 15 15 Counsel. That prior objection also included a relevance. 16 BY THE WITNESS: 16 relevance objection. 17 A. I have heard of it. 17 BY THE WITNESS: 18 18 A. Without having studied it, if I say BY MR. TUMINARO: 19 19 Q. It's an application programming interface something is able to do a particular application or 20 developed by Microsoft? 20 API, then I have to be able to do it. I can answer 21 MR. PLUTA: Objection, relevance. 21 that in a general term. I would not advertise that 22 BY THE WITNESS: 22 I could do graphics for DX10 API and not be able to 23 23 do it. A. You are asking me something outside the 24 24 scope of my report. It is an API, but that's all I Page 91 Page 93 1 can tell you about that. I need to evaluate it BY MR. TUMINARO: 2 more. 2 Q. Let me ask this, I guess. 3 BY MR. TUMINARO: 3 A. Sure. 4 Q. I'll just say for the record your report 4 DX10 includes a unified shader mode, 5 talks about objective indicia and copying is 5 right? 6 relevant inquiry into obviousness. You opined on 6 MR. PLUTA: Objection, form. Objection 7 7 obviousness, right? relevance. 8 MR. PLUTA: Objection, form. 8 BY THE WITNESS: 9 BY THE WITNESS: 9 A. I have not looked at that. 10 10 A. I did opine on obviousness to the level MR. TUMINARO: I'll have this marked. 11 11 (WHEREUPON, document marked as of an expert using it to evaluate the prior art, but 12 secondary indices or whatever you call it, that's 12 Exhibit No. 8.) 13 not my specialty. I will not be able to give you 13 BY MR. TUMINARO: 14 any meaningful example, although I understand some 14 Q. You have been handed what has been marked 15 15 as Exhibit 8. This is the DX10 architecture. of it. 16 BY MR. TUMINARO: 16 Do you see that? 17 Q. As an expert -- you claim to be an expert 17 18 18 MR. PLUTA: I'm going to object to the in computer graphics? 19 19 introduction of this exhibit as irrelevant. Also A. Yes. 20 Q. You have heard of DX10? 20 hearsay. 21 MR. PLUTA: Objection, relevance. 21 BY MR. TUMINARO: 22 22 BY THE WITNESS: Q. If you will turn with me to Page 14. A. Yes. 23 23 Page 14 at the top says DX10 shader model 4.0. 24 24 Do you see that?

Page 94 Page 96 1 A. Yes. 1 then later on. 2 2 After it reads "shader model 4.0 (SM 4.0) Q. You don't know one way or the other 3 is the new instruction set architecture (ISA) for DX 3 whether DX10 or its later version require a unified 10 that looks at the graphics in a unified way." 4 shader? 5 5 Do you see that? MR. PLUTA: Objection, form. Objection 6 A. Yes. 6 relevance. 7 Q. If you look at the second bullet, it 7 BY THE WITNESS: 8 8 says, "flexible load balancing." A. If I read the documents, I can tell you 9 Do you see that? 9 10 10 A. Yes. BY MR. TUMINARO: 11 11 Q. And the third sentence says that "the Q. Why don't you read it. 12 unified shader is made up of shader blocks that 12 A. If I need additional documents, can I get 13 could handle all vertex, pixel, and geometry 13 them if it's not sufficient? 14 instructions." 14 Q. Why don't read the document and we'll go 15 15 Do you see that? from there. 16 16 A. Yes. You're reading the sentence. A. Okay. 17 Q. Okay. So if a GPU wants to be compatible 17 MR. PLUTA: While he's doing that, I'm 18 18 with DX10 shader model 4.0, the GPU has to offer a just going to also lodge an objection to the 19 19 unified shader, right? authenticity of this document. 20 MR. PLUTA: Objection, relevance. 20 In addition to the authenticity, I'm 21 Objection, hearsay. 21 going to object also to the foundation with the 22 BY THE WITNESS: 22 introduction of this exhibit. 23 23 A. I could not tell you that from that THE WITNESS: The question was on 14. 24 2.4 sentence. You picked one sentence out of this Okay, your question is? Page 95 Page 97 1 document. I'm a very precise person. If I have to BY MR. TUMINARO: 2 make a comment on that, I cannot do that with one 2 Q. After reviewing this --3 sentence. You lifted one sentence out of this 3 A. Up to here. I haven't finished. Do you 4 document that I have never seen before. 4 want me to finish? 5 5 Q. Page 14? BY MR. TUMINARO: 6 Q. Have you used DX10 shader model 4.0? 6 A. Yeah. 7 7 MR. PLUTA: Objection, form and Q. You can look at Page 14. 8 8 A. No. I haven't finished the whole relevance. 9 9 BY THE WITNESS: document. I stopped at 14. Do you want me to read 10 10 more? A. No, I have not. 11 11 BY MR. TUMINARO: Q. I guess -- let's see if you can answer my 12 12 question. Q. Have you used any of the later versions 13 of DX, DX11, DX12 offered by Microsoft? 13 After reviewing this, does DX10 14 14 MR. PLUTA: Objection, relevance. shader model 4.0 require a unified shader? 15 15 MR. PLUTA: Objection, form. Objection Objection, form. 16 BY THE WITNESS: 16 relevance. 17 A. I don't know how it's related to my 17 BY THE WITNESS: 18 report. 18 A. Although it is not related to my report 19 19 BY MR. TUMINARO: and I had a quick review of this document, it 20 Q. You are an expert in graphics, right? 20 provides a programmable shader. 21 A. Yes. 21 BY MR. TUMINARO: 22 22 Q. Supposedly. Q. A unified shader? 23 23 I do not appreciate the comment about MR. PLUTA: Objection, form. Objection 24 supposedly. But I have not used this one, no, and 24 relevance.

Page 98 Page 100 1 BY THE WITNESS: BY THE WITNESS: 1 2 2 A. A computing resource that can be A. I could not tell you. That's a legal 3 programmed to do different shading. 3 issue. I cannot opine on that. I'm sorry. I mean 4 BY MR. TUMINARO: 4 I know I have it in my report. It is just to tell 5 5 Q. So before you submitted your declaration, you that I know about this information, but I cannot 6 you didn't know one way or the other whether DX10 6 go beyond what this sentence says. Analyze it or 7 required a unified shader? 7 discuss it in any way. 8 MR. PLUTA: Objection, form. Objection 8 BY MR. TUMINARO: 9 relevance. 9 Q. Okay. In your report, you didn't analyze 10 10 BY THE WITNESS: any secondary factors of nonobviousness, right? 11 A. I'm very familiar with unified shaders. 11 MR. PLUTA: Objection, form. 12 BY MR. TUMINARO: 12 BY THE WITNESS: 13 Q. But my question is did you know that DX10 13 A. I don't recall I did that. If I'm 14 required a unified shader? 14 missing something, please let me know. I don't 15 MR. PLUTA: Same objections. 15 recall doing that. 16 BY THE WITNESS: 16 BY MR. TUMINARO: 17 A. No, I did not. 17 Q. In this case, counsel provided you with 18 18 BY MR. TUMINARO: all the prior art that you considered, right? 19 Q. You have heard of open GL? 19 MR. PLUTA: Objection, form. 20 A. Yes. 20 BY THE WITNESS: 21 Q. Before you submitted your declaration, 21 A. I identified prior art myself. 22 did you know one way or the other whether the 22 BY MR. TUMINARO: 23 current version of open GL required the unified 23 Q. You identified the prior art that you 24 24 shader? applied? Page 99 Page 101 1 MR. PLUTA: Objection, form. Objection 1 A. Right. 2 2 Q. Did Counsel provide you with any evidence relevance. 3 3 of objective indicia of nonobviousness? BY THE WITNESS: 4 A. I actually knew about open GL and unified 4 MR. PLUTA: Objection, form. Objection, 5 shaders. And now I recall that DX. I also knew 5 relevance. 6 about unified shaders for another. 6 BY THE WITNESS: 7 BY MR. TUMINARO: 7 A. Again, I cannot comment on that because 8 Q. So they both required unified shader? 8 I'm not familiar with the exact term in legal. 9 9 At that time I knew, yes. BY MR. TUMINARO: 10 MR. PLUTA: Objection, form. Objection 10 Q. Did you go out and try to see if anyone 11 11 was copying the claimed invention? relevance. 12 12 BY MR. TUMINARO: MR. PLUTA: Objection, form. Objection, 13 Q. In Paragraph 19 you mentioned -- of your 13 relevance. 14 14 declaration. BY THE WITNESS: 15 15 A. Going out means what? Going visiting A. Okay. 16 Q. You mentioned objective factors are one 16 companies and looking at chips? 17 of the things that must be required for an 17 BY MR. TUMINARO: 18 18 obviousness analysis. Q. Did you do any researching, any analysis, 19 19 any inquiry to see if there was copying of the A. Okay. I say that. And the question is? 20 Q. Well, that's true, right? Objective 20 claimed invention? 21 indicia is one of the things that must be analyzed 21 MR. PLUTA: Same objections. 22 22 in an obviousness consideration? BY THE WITNESS: 23 MR. PLUTA: Objection, form. 23 Copying of the claimed inventions. 24 24 Outside what I have in this report, I have nothing

Page 102 Page 104 1 MR. PLUTA: Objection, form, objection 1 else to add. BY MR. TUMINARO: 2 2 relevance. 3 3 Q. So the answer is you didn't do that? BY THE WITNESS: 4 A. To see if anybody has copied the claims 4 A. I can't comment on that, had to. There 5 5 for the product? might be other options. 6 6 MR. PLUTA: Objection, form. BY MR. TUMINARO: 7 7 BY THE WITNESS: Q. If they want to be compatible with those 8 8 A. No. What is in this report is what I APIs, they would have to include it, right? 9 9 have done. MR. PLUTA: Same objections. 10 BY MR. TUMINARO: 10 BY THE WITNESS: 11 Q. You didn't do any analysis about 11 A. It requires a thorough assessment. I 12 long-felt need for the claimed invention? 12 cannot comment on that. 13 A. It's not in this report, correct? 13 BY MR. TUMINARO: 14 Q. That's correct. 14 Q. What assessment would you have to do to 15 15 A. Whatever is in this report I have done. determine what --16 Q. You didn't do any analysis of failed 16 MR. PLUTA: Objection, form. Objection 17 attempts by others to create the claimed invention? 17 relevance. 18 18 A. Again, I don't recall; but if it's here, BY THE WITNESS: 19 19 it's in the report. A. Not during a deposition. I have to spend 20 Q. The fact is you didn't consider any 20 time to look into it, the details and so on. I will 21 objective indicia of nonobviousness in forming your 21 not be able to opine on that right here based on 22 opinion about obviousness; is that right? 22 what you showed me. 23 23 MR. PLUTA: Objection, form. BY MR. TUMINARO: 24 24 Q. And you didn't consider that -- any of Page 103 Page 105 that in forming your opinions on obviousness? 1 BY THE WITNESS: 2 A. That's a, again, legal matter. I will 2 MR. PLUTA: Objection, form. 3 not want to opine on something I'm not very familiar BY THE WITNESS: 3 4 with, but I mean, it says what it says. 4 A. Whatever I opined on is right here. 5 5 BY MR. TUMINARO: MR. TUMINARO: Let's break for lunch. 6 Q. You considered only prior art in forming 6 MR. PLUTA: Sure. 7 7 your opinions on obviousness? THE VIDEOGRAPHER: We're going off 8 MR. PLUTA: Objection, form. 8 record. The time is 12:06. 9 9 BY THE WITNESS: (Whereupon, a short break in the 10 10 A. I considered what's in the exhibits, proceedings was taken.) 11 11 THE VIDEOGRAPHER: We're back on record. whatever you see here. Prosecution history, patents 12 The time is 12:50. and so on. These are the items I considered. I 12 13 think we went through that with you. If I had done 13 BY MR. TUMINARO: 14 14 something, it would be here. Q. Welcome back, sir. You testified earlier 15 15 I believe that you designed GPU? BY MR. TUMINARO: 16 Q. So now you remember now that DX10 and 16 A. I designed a processor that had GPU 17 open GL require a unified shader? 17 capabilities. 18 18 Q. What's the first step that you took in MR. PLUTA: Objection, relevance. 19 BY THE WITNESS: 19 designing that processor that had GPU capabilities? 20 20 MR. PLUTA: Objection, form. Objection A. Yes, I looked at that before, yeah. 21 BY MR. TUMINARO: 2.1 relevance. 22 22 Q. So if a graphics processing architecture BY THE WITNESS: 23 23 A. You are asking me a general question, not wants to be compatible with either of those APIs, 24 the GPU would have to have a unified shader, right? 24 related to this case, right? Because I haven't

Page 106 Page 108 1 opined about that particular question in this 1 of an C code or something? 2 2 MR. PLUTA: Objection, form. Objection, document. 3 BY MR. TUMINARO: 3 relevance. 4 4 BY THE WITNESS: Q. What was the process -- what was the 5 5 first step that you took --A. Yeah. Right. 6 MR. PLUTA: Same objections. Sorry. 6 BY MR. TUMINARO: 7 BY MR. TUMINARO: 7 Q. After you did the simulations of the C 8 8 Q. -- in developing the chip that had a GPU code, that's when you went to the VHDL? 9 capability? 9 MR. PLUTA: Same objections. 10 10 BY THE WITNESS: A. Coming up with a new idea. Epiphany. 11 You take the idea to the process of simulating it, 11 A. Yes. That's what we do. That's what we 12 you simulate using some sort of a cycle accurate 12 do. That's what we did then, and we continue to do 13 simulator. 13 the same thing. 14 Q. You said? 14 BY MR. TUMINARO: 15 A. Cycle accurate simulator. 15 Q. Is that what is done in the industry? 16 Q. Cycle accurate, is that what you said? 16 A. It is. 17 A. Yes. And then once you're happy with the 17 MR. PLUTA: Objection, form. Objection, 18 18 results, you move onto the level of, like we talked relevance. 19 19 about, writing the VHDL code. BY MR. TUMINARO: 20 Q. You simulate it. What are you simulating 20 Q. Is that what you teach your students? 21 then at that point? 21 MR. PLUTA: Objection, relevance. 22 MR. PLUTA: Objection, form. Objection 22 BY THE WITNESS: 23 23 A. Yeah. That's what we do. We not only we relevance. 2.4 24 teach our students, we also -- we continue our Page 109 Page 107 1 BY THE WITNESS: 1 research in that direction. It would be unwise to 2 A. The ideas. The architectural ideas. 2 go and design the hardware without having it 3 BY MR. TUMINARO: 3 modeled. And that's true for every field I would 4 Q. I guess what I'm confused about, what I 4 say, not just us. And I think -- I would hope not 5 don't understand is what form are the architectural 5 thinking that it is my personal style. It's the 6 ideas in? Are they on paper? Are they in your 6 style of all the designers do -- go for it. I mean, 7 head? 7 they basically model simulate. Then they go to the 8 MR. PLUTA: Objection, form. Objection, 8 hardware. 9 9 relevance. BY MR. TUMINARO: 10 10 BY THE WITNESS: Q. What does the model tell you? 11 A. Well, I mean, they go from your head to 11 MR. PLUTA: Objection, form. Objection, 12 the piece of paper, and then finally you write the 12 relevance. 13 software to represent the architecture. 13 BY THE WITNESS: 14 14 Let's use the morphosys as an example A. If you recall, I said cycle accurate. So 15 15 since you had done your due diligence and looked at it gives you the number of cycles it will take to do 16 that paper. We had to simulate it before we go into 16 a computation. 17 fabricating it. We had funding from the government 17 So, the morphosys project, we had a 18 18 agencies. It's unusual for a university to actually cycle accurate or close to cycle accurate model of 19 19 fabricate a chip as you probably were alluding to. the system. We massaged certain things. 20 But we had funding. We went simulations -- we did 20 BY MR. TUMINARO: 21 simulations and then ultimately we went to the VHDL 21 Q. What does that mean? 22 22 model and did the layout. MR. PLUTA: Objection, form. 23 BY MR. TUMINARO: 23 BY THE WITNESS: 24 Q. Oh, okay. You simulated, what, some kind 24 A. Meaning that we had -- I don't know your

Page 110 Page 112 1 background but engineering is all about tradeoffs 1 combination thereof such that it receives the 2 2 command thread and thereupon provides the command and, you know, we're coming up with new things 3 3 instead of finding out what is already there. Like, thread to a command processing engine." 4 what physicists and chemists will do, they find 4 So that's my definition. 5 5 things that are already there. We're trying to come BY MR. TUMINARO: 6 6 up with new things. There's a lot of trial and Q. What part of that definition describes 7 7 error. So that's why when you model and simulate that the arbiter selects from available inputs? 8 8 A. It basically describes how the arbiter is based on the application, that application presents 9 9 itself, it says this particular piece of implemented, and arbiter as we described is the one 10 10 architecture is not the right choice for me. We go that selects between inputs. 11 and massage it and go change it. I don't know when 11 Q. Just to be clear, your interpretation of 12 I start whether I have the optimal solution or not. 12 arbiter is in Paragraph 52 of your declaration, 13 13 It is a very trial and error basis. 14 14 Q. By massage, you're saying it helps you A. Yes. That's the implementation of it. 15 determine what the appropriate architecture should 15 This is the definition of it, right. 51 is the --16 be? 16 how you implement it and 52 explains what it does. 17 A. Adjusted. Yeah. Think of it as dials. 17 Q. So where in your definition in 18 18 You used the word cache as an example. So let's use Paragraph 52 does it explain that the arbiter is 19 19 that as an example. You find out the size of the selecting from available inputs? 20 cache is not appropriate, then you change the cache. 20 A. It says it receives and provides a 21 Q. And you could tell that kind of stuff 21 thread. 22 22 from your model of the chip? Q. You're reading receives and provides to 23 MR. PLUTA: Objection, form. Objection, 23 mean selects from available inputs? 24 2.4 relevance. A. Yes. Page 111 Page 113 1 BY THE WITNESS: 1 Q. If you turn with me to the Lindholm 2 A. Yeah. I mean, that's basically what it 2 reference. 3 3 is. A. Okay. 4 BY MR. TUMINARO: 4 At figure 4 in Lindholm, there's the 5 5 Q. Switching topics. I think earlier you thread control buffer 420? 6 6 mentioned that an arbiter selects from available A. Yes. 7 7 options, right? Q. I just want to make sure I understand 8 8 your position. Is it your position that the thread MR. PLUTA: Objection, form. 9 9 control buffer 420 in Lindholm is the claimed memory BY THE WITNESS: 10 10 A. Arbiter is -- the job of arbiter is to device in claim 1 of the '053 patent? 11 11 MR. PLUTA: Object to form. selecting available inputs. 12 12 BY THE WITNESS: BY MR. TUMINARO: 13 O. So, is an accurate definition of a 13 A. In combination with instruction cache. 14 14 MR. TUMINARO: Let's have this marked, arbiter any computer hardware, software, or 15 15 combination thereof that receives and provides a please. 16 command thread? 16 (WHEREUPON, document marked as 17 MR. PLUTA: Objection, form. 17 Exhibit No. 9.) 18 18 BY MR. TUMINARO: BY THE WITNESS: 19 19 Q. Okay. You have been handed what's been A. I think that's the claim construction 20 that I offered, I think. Let me check that, please, 20 marked as Exhibit 9. This is the petition for inter 21 just to make sure that you got it right. 21 partes review of U.S. Patent 00742053. You have 22 22 Reading for the record Paragraph 51, seen this document before? 23 23 A. I have seen it. It's not on my list of "the '053 patent discloses that an arbiter may be an 24 implementation of hardware, software, or a materials considered, but I've seen it, yes.

Page 114 Page 116 1 Q. If you will turn with me to paragraph --1 report. I agree with what's in there. 2 I mean Page 13? 2 Q. You didn't consider any other time frame 3 3 A. Page 13. All right. besides mid-to-late 2003? 4 Q. And the first full paragraph, there's in 4 MR. PLUTA: Object to form. 5 5 the first sentence, after the comma, it reads: BY THE WITNESS: 6 "Lindholm's thread control buffer." Do you see 6 A. What do you mean by that? 7 7 that? BY MR. TUMINARO: 8 8 Q. Well, you considered the relevant time A. Yeah. 9 9 Q. I'll read it for the record. "Lindholm's period for determining what a person of ordinary 10 skill in the art to be -- to have known would be thread control buffer 420 corresponds to the claimed 10 11 memory device." 11 mid-to-late 2003? 12 Do you see that? 12 A. That's what it says. 13 13 Q. That's the time frame you're considering. Yes. 14 Q. You disagree with the petitioner that the 14 My question is: You didn't consider any other time 15 thread control buffer is the memory device? 15 period, right? 16 MR. PLUTA: Object to form. 16 MR. PLUTA: Object to form. 17 BY THE WITNESS: 17 BY THE WITNESS: 18 18 A. It's part of the memory device. It A. Any other time meaning before that time. 19 19 completes the memory device. It is an important It could not be after that time, right? 20 part of the memory device. 20 BY MR. TUMINARO: 21 BY MR. TUMINARO: 21 Q. It could be before. It could be after. 22 Q. So you have a different position than the 22 You didn't consider any other times when determining 23 23 what a person of ordinary skill in the art would petitioner? 2.4 24 have known? MR. PLUTA: Object to form. Page 115 Page 117 1 BY THE WITNESS: 1 MR. PLUTA: Same objection. 2 A. It is consistent with the petitioner in 2 BY THE WITNESS: 3 3 A. Well, if this was filed September, 2003, my opinion. 4 BY MR. TUMINARO: 4 it would be very illogical for me to assume anybody 5 Q. But you will agree that on Page 13 of the 5 after the filing date or after the application 6 petition, it doesn't say anything about the memory 6 filing date, right? So your question is probably 7 device -- the claimed memory device also including 7 before that. It cannot be after that. 8 8 BY MR. TUMINARO: the instruction cache, right? 9 9 MR. PLUTA: Object to form. Q. So you didn't consider after because you 10 10 BY THE WITNESS: think it is illogical? 11 A. It also does not exclude it and it 11 A. I mean, I'm not a lawyer, but I'm 12 12 doesn't say it's the only thing so.... assuming that would not work very well. 13 BY MR. TUMINARO: 13 Q. How about before? Did you consider 14 14 Q. Let's go back to your declaration. And before mid-to-late 2003? 15 15 I'd like to go to Paragraph 22. It's on Page 7. A. Well, the person of ordinary skill in the 16 A. 22. Yes. 16 art should have all those prior art references 17 Q. And the second sentence of that paragraph 17 available to them, and if they were available, it 18 18 reads: "As a result, I will assume the relevant would be sufficient, whatever that time frame is. 19 19 time period for determining what one of ordinary They're taking the knowledge that they have, and 20 skill in the art knew is mid-to-late 2003." 20 they're combining those references. So that's all I 21 Do you see that? 21 can tell you about that. It should be inclusive of 22 22 A. Yes. all those references. 23 23 That's an accurate statement? Q. If you could go with me to Paragraph 116 24 That's what it says. I mean, this is my 24 of your declaration. It's on Page 40. Further, I

Page 118 Page 120 1 guess at the top of Page 40, you have a figure 4 1 primitive can be carried out only those pixels 2 2 from the Stuttard reference, right? occurred inside the primitive. The remainder of the 3 3 A. That is correct. PEs in the processing block do not take any further 4 Q. And if you look at Paragraph 116, the 4 part in the processing until that primitive is 5 5 last sentence says "because cache unit 1024 includes processed." 6 both vertex and pixel command threads, it is the 6 A. I remember that discussion. 7 7 Q. We agreed that that embodiment discloses claimed memory device." 8 8 Do you see that? that in a given processing block all the PEs do 9 9 either pixel operations or nothing, right? 10 10 Q. What's your basis for saying that the MR. PLUTA: Object to form. 11 cache unit 1024 in Stuttard includes both vertex and 11 BY THE WITNESS: 12 pixel command threads? 12 A. I don't believe I agreed with that. 13 13 A. Because it feeds the instructions for the BY MR. TUMINARO: 14 graphics processing all the instructions. 14 Q. You didn't agree to that earlier? 15 Q. What feeds that? 15 A. You can read what's on the record. I 16 16 agreed with that's what you read which was the PEs A. The cache. 17 Q. So how do you know it has both pixel 17 were doing the same thing, and I also interjected 18 18 command threads and vertex command threads? that they could have state from other computations 19 19 that are going on. And I also interjected that A. It's identified as one cache and that's 20 what it does. If there were more than one, it would 20 those slices could be doing different things. 21 have shown it, and also I can check to see what I 21 Q. I guess my question is in this embodiment 22 have in my claim chart. Let me see if I can find 22 that is disclosed at column 10, line 45, the 23 23 you the text. sentence reads that "the remainder of the PEs in the 24 24 I mean, there's just the first part. processing block do not take any further part in the Page 119 Page 121 1 It says the thread manager 102 is shown in more processing until the primitive is processed." So those PEs in the processing block 2 detail in figure 4, and comprises a cache memory 2 3 3 unit 1024 for storing instructions fetch for each do nothing, right? 4 thread. And Stuttard does vertex and pixel so it is 4 A. That's what he's saying for that block. 5 5 Q. And the other PEs in that block in the 6 sentence before that, he says those other PEs are Later on, if you look at Page 43, the 6 top of it, it says, for example, thread zero may be 7 7 doing pixel operations, right? 8 assigned for general system control, thread one A. It says they're doing pixel, yeah. Yes. 9 9 assigned to execute 2D, two-dimensional activities, Q. In column 10 in that paragraph that we're 10 10 and threads 2 through 7 assigned to executing 3D talking about, it starts at line 43 and goes to line 11 11 activities, such as calculating vertices, 47, the first sentence says that the PEs in the 12 12 primitives, or rastering. processing block are doing pixel operations and the 13 The citation is column 5, lines 56 13 second sentence in that paragraph says that pixel --14 14 through 64. the PEs are not doing anything, right? 15 15 MR. PLUTA: Object to form. Q. If you'd turn with me in Stuttard, 16 Exhibit 7. 16 BY THE WITNESS: 17 17 A. The remainder of the PEs. Not the PEs A. Okay. 18 18 Q. We talked about column 10, lines 42 are not doing anything. It just -- that means if 19 19 there are eight of them, maybe four are doing PE and through 47. Do you recall that? 20 20 A. Where -- when did I talk about that? four are not doing anything, although they may have 21 Q. Earlier today, I read this into the 21 residual computation from previous operations 22 22 record. Starting at line 43, "once each pixel is because they may hand it over to the next step. 23 23 determined to be outside or inside the triangle BY MR. TUMINARO:

24

24

(primitive) concerned, the processing for the

31 (Pages 118 to 121)

Q. Okay. Just to be clear, I just want to

Page 122 Page 124 1 make it clear. This paragraph says that within a 1 my pen back. 2 2 processing block, the PEs will either do -- if that A. I will give you your pen back. 3 processing block is doing pixels, the PEs in that 3 MR. PLUTA: Is there a question pending processing block will either do pixel operations or 4 just to refresh? 5 5 nothing. Is that what this paragraph says? MR. TUMINARO: I'll ask the question 6 Counsel, let's identify the processing 6 again. Thank you. 7 blocks so there's no misunderstanding between you 7 BY MR. TUMINARO: 8 and me and the records. So I want it to be clear 8 Q. Okay. Sir, you mentioned that the other 9 what I'm saying. So let's understand for the record 9 blocks 106 could potentially be doing vertex 10 10 that the eight fusion blocks, I'm saying that those operations when a single block is doing a pixel 11 could be doing different things. What you're saying 11 operation, is that right? 12 what's happening inside the fusion block --12 A. Yes, I am reconfirmed my position on that 13 13 by reading the text. O. That's right. 14 A. -- which is, for the record, it's figure 14 Q. Tell me where. 15 15 A. I'll tell you the text and then we can 3, identified as 106 processors. Okay. 16 So, if that is referring to that --16 see if it is convincing for you. So if you go to 17 no, I'm sorry, what you just read refers to 17 column 2, line -- I'm going to give you a whole 18 18 106 blocks, yes, that's what he says he's doing. bunch of excerpts from this to see how things are 19 19 Although we don't know anything about what residual with this with respect if it is satisfactory. It 20 state is in there and how the other blocks perform 20 says --21 the vertex processes simultaneously. 21 Q. What line? 22 Q. I want to make sure we agree on what the 22 A. I was just going to get to that. Let's 23 23 paragraph says at column 10 starting at line 43 and read that top paragraph, "according to another 24 24 going to line 47. That paragraph is referring to aspect of the present invention, there is provided a Page 125 Page 123 processing going on within one processing block 106, 1 1 data -- there is provided a data processing 2 right? 2 apparatus comprising an array of processing elements 3 3 A. One slice of 106, yes. which are operable to process respective data items 4 Q. And that paragraph is saying that the 4 in accordance with a common received instruction. 5 processing elements within one processing block will 5 When the processing elements are operably divided 6 be doing either pixel operations or nothing. Do we 6 into plurality of processing blocks having at least 7 7 agree? one processing element and the processing blocks 8 A. Yes, that's what it says. But I 8 being operable to process respective group of data 9 9 qualified my response -- my response to you that items, this data items refers to a general group of 10 those other blocks, fusion blocks, are doing other 10 data that is related to graphic processing including 11 11 things including vertex operations. vertices and pixels." 12 12 So let's continue with that. Same Q. Okay. Where does it say that? 13 A. We are going to find out. 13 column. 14 14 Q. Look at it. Let me give you all of the evidence 15 15 Can I have a pen or something to mark the that I found and then you can go and attack it if 16 areas that I want to refer to later on? Can I mark 16 you wish. But let me finish the thought up to that 17 the exhibit? 17 point. Is that okay? 18 18 Q. Yes, please do. Q. Hm-hmm. 19 19 A. Okay. I didn't know what the rules were. A. Column 2, line 52 or 51, "however, this 20 Let me give you some explanations. If you are not 20 embodiment is purely exemplary. This goes to the 21 happy, then I'll continue reading. How's that? We 21 embodiment issue that we have talked about before. 22 22 call that prefetching. And it will be readily apparent that techniques and 23 23 Okay. So are you ready? architecture described here for processing graphical 24 Q. I am. At some point I am going to want 24 data are equally applicable to other data types such

Page 126 Page 128 1 as video data and so on." 1 things because they're different data types, it's a 2 2 If it covers video data, it for sure multi-threaded, and it has the capability to launch 3 3 covers vertex and pixel because it is inherent in these instructions to each slice of the PEs. 4 the discussion of graphics processing. So I would 4 So, with that respect and the fact 5 5 say this guy basically went beyond graphics. that he talks about embodiments that could do more, 6 6 So let's go to column 4, line 25. I consider that his invention or their invention is 7 "As will be explained in greater detail below the 7 consistent with the fact that they can do PE and -processing core 10 includes a number of control 8 8 they could do pixel and vertices simultaneously. 9 units, thread manager 102, a rate controller 104, 9 Q. When you say they could do pixel and 10 and channel controller 108 and bidding unit 1069 per 10 vertices simultaneously, you mean the processing block, and micro code store 105. These control 11 11 blocks, one processing block could do vertex and one 12 units control the operation of a number of 12 processing block could do pixel, that's your processing blocks which perform the graphic 13 13 position? 14 processing itself." 14 A. That's right. 15 15 Q. The section that you didn't cite is Again, vertex and pixel are a 16 divisible part of the graphic processing. So it is 16 column 18. 17 also there for somebody who is reading this as an 17 A. I didn't get to it. I thought people 18 18 expert or a person with ordinary skill in the art. were getting impatient. 19 19 Q. In column 18 as we talked about earlier Again, the same column, it says the 20 array of --20 says at line 19 -- I guess, starting at line 17, 21 Q. What line? 21 "this is implemented by creating multiple bin lists 22 A. Sorry. Line 58, "the array 1061 of 22 per region, one for every processing block 106 that 23 23 processing elements provide a single instruction is processing geometry data. This allows the 24 multiple data processing structure." That's a data 24 geometry output phase to proceed in block parallel Page 127 Page 129 1 block parallel that I mentioned to you before. It 1 mode." 2 is SIMD. 2 A. Hm-hmm. 3 3 Q. The block parallel mode means that all "Each PE in the array 1061 is 4 supplied with the same instruction, which is used to 4 the blocks 106 are doing geometry operations, right? 5 process data specific to the PE concerned." So 5 MR. PLUTA: Object to form. 6 basically they have all the instructions they need 6 BY THE WITNESS: 7 7 to perform the different data types that we just A. It's an SIMD, yes. I think if you 8 talked or I just talked about earlier. 8 recall, I read that these blocks operate in SIMD. 9 9 Now, notice that there is the thread BY MR. TUMINARO: 10 10 controller at the top of that page, right, if you Q. If the block parallel mode is referring 11 11 could look at it. It says a thread controller, and to blocks 106, right? 12 the job of that thread controller is basically to 12 A. Yes. Each slice can do an SIMD 13 dole out --13 operation. 14 14 Q. What page? Q. And in line 30 of that same column 18, it 15 15 A. Thread manager. Thread manager is 102, says, "a record is kept of how many primitives are 16 figure 3 at the very top. Okay. 16 written to each bin so that regions can be sorted 17 So the thread manager for a 17 into similar size groups for block parallel 18 18 rasterization." multi-threaded processor, which is responsible for 19 19 different data types, is equally responsible for Do you see that? So block parallel 20 launching vertices. And the way it's shown in its 20 rasterization means that all the blocks 106 are 21 design, it could easily provide that to these PEs 21 doing rasterization, right? 22 22 simultaneously. But not to one group of PEs because A. One slice.

23

24

23

24

they would be doing SIMD for pixels, as you said,

and I also agree. But they could be doing different

Q. Block parallel means only one slice?

A. Again, if you go back to -- so this

Page 130 Page 132

- is parallelism -- the only way I can explain it to
- 2 you is -- why don't we just use books as these
- 3 fusion blocks. I have ten books on a book shelf.
- 4 One book is doing rasterization. The other book is
- 5 doing vertex operations. The other book may be
- 6 doing something else. The design is not preventing
- 7 you from designing it that way and the inventors
- 8 talk about it, the flexibility of the design.

So I agree with you that one slice or one book of that bookshelf is doing what you said but the other books are doing different things and they can do different things because the thread is distributing information to different blocks.

Q. What's your interpretation of Stuttard's disclosure of block parallel rasterization? Doesn't that mean that all the processing blocks 106 are doing rasterization, they're doing that in parallel?

MR. PLUTA: Object to form.

Q. So it's your interpretation that when he says block parallel, the block that he's talking about there is not processing block 106; is that your --

MR. PLUTA: Object to form. BY THE WITNESS:

15 A. No. It is processing block 106. Let 16 help refer you to the figure if you don't mind. For 17 the record, we're looking at figure 3.

18 BY MR. TUMINARO:

Q. Mark it up.

A. Okay. I'm going to letter name them. So it will be A, B, and C. So I have shown you -- of course, there's a dot dot, here, right? It could be like E, G, F. So that is one slice. Okay.

A. That's right because you got the PEs.

They can work in SIMD fashion. There is another

A. That's right. It could do the SIMD, and

work on different data types. The slice D and so

on. So it gives you the capability to function

Q. Okay. Referring to figure 3 -- thank

you. Referring to figure 3, block 106 on the top,

which you labeled as A, is shown as being parallel

A. Yeah. I see where you're -- Sorry, you

about parallel there. We're talking about parallel

might be misunderstanding here. We're not talking

multiple SIMDs at the same time.

it could be doing something else. He says that. We

Page 133

Q. A is one slice?

slice right behind it.

Q. Slice B?

to block B, correct?

Page 131

1 A. SIMD, single instruction multiple data.

3 Morphosys is an SIMD. If you read the paper, you

4

5

Q. You don't interpret block parallel to mean that all the blocks are doing the same parallel

A. That's what SIMD is, single instruction multiple data, but you have multiple slices. Think of it as a stack of these guys. Each slice -- so, if I wanted to do the morpho this way, I would have had two layers of morpho. One would be doing one type and the other another type. That is consistent with what he says.

Q. Maybe we're talking past each other. The slices that you're talking about in Stuttard -strike that.

19 The slices that you're talking about 20 Stuttard calls processing block 106, right?

21 A. Yes.

22 Q. So, when he says block parallel, doesn't 23 he mean that the processing blocks 106 are doing 24 parallel operations?

2 The best way to explain SIMD -- morpho was an SIMD.

saw I mentioned that it was SIMD. SIMD is single

instruction multiple data.

type of operation?

19 A. I understand what -- I see what your 20 confusion may be.

here.

21 22 23

24

Q. Your interpreting block parallel -- when Stuttard is talking about block parallel in column

Q. So -- but just to be clear --

18, he's not referring to processing block 106? A. No, no. Not by any stretch. If he's

34 (Pages 130 to 133)

Page 134 Page 136 1 inventing his own definition, that's a different about SIMD, yeah. 1 2 ball game. Somebody who is working in the field, a 2 BY MR. TUMINARO: POSITA, would understand a block parallel, it means 3 Q. Column 18 in the lines that we read that PEs here are working in parallel. They're 4 doesn't say SIMD? 5 5 doing an SIMD function. So just think of it as 106 A. It is implied. 6 slice A is a morpho. 6 Q. Doesn't say it, right? 7 Q. How would a person of ordinary skill in 7 A. A POSITA would know. 8 the art know that when Studdard talks about block 8 Q. Just SIMD does not appear in column 18? 9 parallel mode in column 18 -- let me start over. 9 MR. PLUTA: Objection, form. 10 How would a person of ordinary skill 10 BY THE WITNESS: 11 in the art know in 2003, reading Stuttard, that 11 A. Out of 33 pages, you are referring to a 12 Stuttard meant block parallel mode in column 18 to 12 paragraph that doesn't have SIMD, but he talks about 13 refer to an SIMD device? 13 SIMD. It is clear to a POSITA that it is SIMD. So 14 A. Did we not say what degree the person 14 you can take whatever you want from that paragraph. 15 should have as a POSITA? I think we did opine that 15 I disagree with that. 16 he has to have a degree in electrical engineering or 16 BY MR. TUMINARO: 17 computer science, and that topic is covered. And 17 Q. Switching gears --18 18 somebody working in the field with a background, A. My resume. 19 somebody taking course in engineering, especially 19 Q. Earlier we talked about DX10 and open GL or the current version of DX and the current version 20 computer engineering and computer science would know 20 21 that what SIMD is. We cover it. Our degree is a 21 of open GL and we agreed that they require a unified 22 very typical ABET accredited. I think that's true 22 shader? 23 23 for everybody. MR. PLUTA: Objection, form. Objection, 2.4 Q. SIMD was well known in 2003? 24 relevance. Page 137 Page 135 1 BY THE WITNESS: A. Morpho was an SIMD, so ... 2 Q. In fact, at other times when Stuttard 2 A. From the document, you provided and I 3 meant SIMD, he explicitly said SIMD, right? 3 read, that's what it says. 4 A. That's right. 4 BY MR. TUMINARO: 5 5 Q. For example, in column 1, line 21, it Q. And do you also remember that now? 6 says, "the present invention relates to parallel 6 MR. PLUTA: Objection, form. Objection, 7 7 data processing apparatus, in particular to SIMD, relevance. 8 (single instruction multiple data) processing 8 BY THE WITNESS: 9 9 apparatus." Right? I believe that at the time we were 10 10 A. Yes. looking at the DX and open GL, they were referring, 11 11 MR. PLUTA: Objection, form. but I don't know the exact year of the open GL we 12 12 looked at. They transitioned to this as you can BY MR. TUMINARO: 13 O. So when Stuttard meant SIMD, he said 13 see. So I cannot say for certain that when I looked 14 14 SIMD, right? at open GL for another thing. 15 15 MR. PLUTA: Object to form. BY MR. TUMINARO: 16 BY THE WITNESS: 16 Q. Okay. So a GPU today, as of today, to be 17 A. When he said SIMD, he meant SIMD. I 17 fully compatible with the current version of DX and 18 18 the current version of open GL, that GPU would have don't know. I mean, that's probably what he meant. 19 BY MR. TUMINARO: 19 to provide a unified shader, right? 20 20 MR. PLUTA: Objection, form. Objection, Q. So when he wanted to refer to a single 21 instruction multiple data, he said SIMD, right? 21 relevance. 22 22 MR. PLUTA: Objection, form. BY THE WITNESS: 23 23 A. I could not tell you that for sure. Can BY THE WITNESS: 24 A. He says a previously proposed -- he talks 24 there be a design around where you do it without a

Page 138 Page 140 1 unified shader? Anything is possible. that. I cannot answer. Sorry. 1 2 2 BY MR. TUMINARO: Q. Well, I'm asking to be fully compliant 3 3 Q. You don't know one way or the other if with those APIs, the GPU would have to provide a 4 unified shader, to be fully compliant? 4 you provided an opinion on objective indicia of 5 5 MR. PLUTA: Objection, form. nonobviousness? 6 6 MR. TUMINARO: Not a design around. MR. PLUTA: Objection, form. 7 MR. PLUTA: Objection. Objection, form. 7 BY THE WITNESS: 8 8 A. I would be glad to look at my report. I Objection, relevance. 9 9 BY THE WITNESS: have prior art. I have other items that I've 10 10 A. It's hard to say, Counsel. It's hard to discussed. 11 11 BY MR. TUMINARO: sav. 12 BY MR. TUMINARO: 12 Q. Take a look at your report. Tell me. 13 O. Why is it hard to say? 13 Did you provide an opinion on objective indicia of 14 14 A. Because you could design it that it is nonobviousness? 15 interacting with the APIs the DX10 and 11 and open 15 A. I don't believe I have. 16 GL and still not completely a unified shader. It's 16 MR. PLUTA: We've been going about an 17 hard to say. You have to design it. I cannot 17 hour and a half. Is this a good breaking point? 18 18 MR. TUMINARO: Sure. We can take a answer that the way you are asking me. 19 19 Q. What do you mean by completely a unified break. 20 shader? What is the qualifier "completely" mean? 20 THE VIDEOGRAPHER: We're going off 21 MR. PLUTA: Objection, form. Objection, 21 record. The time is 1:49 p.m. 22 relevance. 22 (Whereupon, a short break in the 23 23 BY THE WITNESS: proceedings was taken.) THE VIDEOGRAPHER: We're back on record. 2.4 A. A unified shader has to be a fully 2.4 Page 139 Page 141 programmable solution. There might be ways of doing 1 This is the beginning of Media 3. The time is 2 this without adhering to that objective. Yeah. 2 2:12 p.m. 3 3 That's basically what I have to say. I cannot BY MR. TUMINARO: 4 answer the question without more analysis. 4 Q. Would you turn with me to Lindholm 5 BY MR. TUMINARO: 5 reference. I forget what exhibit number it is. 6 Q. I guess what I'm hung up about, if the 6 MR. PLUTA: 6. 7 7 GPU has to satisfy everything that's in those APIs, MR. TUMINARO: Thank you. 8 and one of things that's in the API is a unified 8 BY MR. TUMINARO: 9 shader, how is it that the GPU could not provide a 9 Q. Would you circle what you're calling the 10 10 unified shader? arbiter? What in Lindholm corresponds to the 11 MR. PLUTA: Object, form. Objection, 11 arbiter? 12 12 relevance. A. Which figure? 13 BY THE WITNESS: 13 Q. Whatever figure you think best depicts 14 14 A. This is outside the scope of what I the arbiter. 15 15 MR. PLUTA: Object to the form. worked on. So I will not be able to give you a very 16 accurate and professional answer. It requires more 16 BY MR. TUMINARO: 17 work. I would be glad to work on that and get back 17 Q. Would you write arbiter next to it? 18 18 to you. A. (Witness marking document.) 19 BY MR. TUMINARO: 19 Q. Would you circle for me what you're 20 Q. Because you didn't provide any opinion on 20 saying corresponds to the claim claimed plurality of 21 objective indicia of nonobviousness? 21 command processing engines from the '053 patent --22 22 MR. PLUTA: Objection, form. that was a terrible question. Let me start again. 23 BY THE WITNESS: 23 Would you please look at the Lindholm 24 A. Now you're wrapping a legal issue on 24 reference and circle in Lindholm what you say

	Page 142		Page 144
1	corresponds to the claimed plurality of command	1	reserved and managed according to an alternative
2	processing engines?	2	memory space reservations process. Figure 5 is
3	A. (Witness marking document.)	3	described in relation to figures 1 and 2. Memory
4	Q. Just to be clear, what figure are you	4	resource 200 of figure 5 contains each element shown
5	marking up?	5	in figure 2. Memory resource also contains a second
6	A. Figure 4.	6	memory section 520 having at least two memory spaces
7	Q. Figure 4 of Lindholm?	7	505 for use by threads of second set of threads
8	A. Yes. I think so, yes.	8	executing on graphics processor 125. All threads of
9	Q. Okay. Would you turn with me to the	9	the first set of threads are of the first thread
10	Morton reference, which is Exhibit 4?	10	type and are each reserved in memory space 205.
11	A. Are we done with this?	11	So basically memory space 205 is used
12	Q. You can put it aside.	12	for the first set of threads and then on memory
13	A. Yes.	13	space 505 is for the other type. So, this is
14	Q. Sorry. I didn't realize you were there.	14	referring to this passage. Memory space 505 having
15	I apologize.	15	a second memory space second thread type being
16	Would you circle for me in Morton	16	different than the first thread type.
17	what corresponds to the claimed plurality of command	17	BY MR. TUMINARO:
18	processing engines?	18	Q. Is memory space 505 on figure 5?
19	MR. PLUTA: Objection, form.	19	A. That's what it's referring to in this
20	BY THE WITNESS:	20	section of the document.
21	A. He talks about this being one slice or	21	O. Is that one of the is that the first
22	multiple slices, but at least figure 1 shows one	22	portion or the second portion?
23	slice. I'm going to make the assumption that so	23	A. Second memory thread type.
24	as I pointed out, it's 140 through 170. These are	24	Q. Would you circle that then?
	Page 143		Page 145
1	the graphics processors.		A. It's done.
2	BY MR. TUMINARO:	2	Q. Would you label it?
3	Q. Would you write next to that command	3	A. (Witness marking document.)
4	processing engines.	4	Q. Thank you.
5	A. (Witness marking document.)	5	It was figure 5 that you marked up,
6	Q. Just so we're clear, you're marking	6	just so the record is clear?
7	figure 1 of Morton?	7	A. Yeah.
8	A. Yeah.	8	Q. Would you turn with me to Paragraph 131
9	Q. Claim 1 of the '053 patent recites a	9	of your declaration. I'll read for the record with
10	first portion and a second portion for the memory	10	respect to claim 7. "Because Stuttard also
11	device.	11	discloses that the processing elements 1061 perform
12	A. Yes.	12	'lighting and shading' functions, the processing
13	Q. Would you circle the first portion and	13	elements 1061 must necessarily include a texture
14	the second portion that you say strike that.	14	processing engine."
15	Would you circle in Morton what you	15	Do you see that?
16	say corresponds to the claimed first portion and	16	A. Yes.
17	second portion from the '053 patent?	17	Q. Is it your position that lighting
18	MR. PLUTA: Objection, form.	18	functions necessarily require texture processing?
19	BY THE WITNESS:	19	MR. PLUTA: Objection, form.
20	A. So referring to column 15, 48 through 67.	20	BY THE WITNESS:
21	Also referring to the claim construction page	21	A. It speaks for itself. Lighting and
22	chart sorry my claim construction chart,	22	shading functions must necessarily include the
23	figure 5 shows a conceptual diagram of a memory	23	texture processing engine. I cannot add anything
د ک	resource 200 containing memory spaces that are	24	more than what is in here.
24			

Page 146 Page 148 1 BY MR. TUMINARO: BY MR. TUMINARO: 1 2 2 Q. Isn't it true, though, that a shading Q. Can you answer my question? 3 3 MR. PLUTA: Objection, form. Objection, function can be performed without texture 4 4 relevance. Asked and answered. processing? 5 5 A. In my opinion, predominantly, this is how BY THE WITNESS: 6 it is done. 6 A. I did the best I could. 7 7 (WHEREUPON, document marked as Q. Predominantly, but it is possible that a 8 shading function can be performed without texture 8 Exhibit No. 10.) 9 9 processing, right? MR. PLUTA: I'm going to object to the 10 10 relevance of this, the introduction of this exhibit A. No. In my opinion, that's the way it's 11 done. 11 into evidence. 12 Q. So shading functions have to include 12 BY MR. TUMINARO: 13 texture processing? 13 Q. This is Exhibit 10. You have been handed 14 MR. PLUTA: Objection, form. 14 what has been marked as Exhibit 10 for 15 15 identification purposes. This paper is titled BY THE WITNESS: 16 A. It says, must necessarily include the 16 Design and Implementation of a Rendering Algorithm 17 texture processing engine. So that's clear what it 17 in a SIMD Reconfigurable Architecture (Morphosys). 18 18 says: Must necessarily. Do you see that? 19 19 BY MR. TUMINARO: A. Yes. 20 Q. Is it possible that a shading function 20 Q. In the listing of inventors there is one 21 can be performed, and in doing that shading 21 Nader Bagherzadeh. Do you see that? 22 function, there's no texture processing? Is that 22 MR. PLUTA: Objection, form. 23 23 BY THE WITNESS: possible? 24 2.4 A. Not correct. We're -- this is an MR. PLUTA: Objection, form. Page 147 Page 149 1 BY THE WITNESS: article. It's not a patent. So it's not an 2 A. It is my opinion that a texture 2 invention. 3 processing engine must include lighting and shading. 3 BY MR. TUMINARO: 4 BY MR. TUMINARO: 4 Q. Sorry. I said inventors? Sorry. 5 Q. I can read your declaration. My question 5 A. We don't consider ourselves inventors. Q. One of the authors listed on Exhibit 10 6 is a little bit different. Is it possible that a 6 7 shading function can be performed; and in doing that 7 is an individual named Nader Bagherzadeh? 8 shading function, there's no texture processing? 8 A. Yes. 9 MR. PLUTA: Objection, form. Objection, 9 Is that you? O. 10 10 relevance. A. Yes. 11 BY THE WITNESS: 11 Q. You're one of the authors on this paper? 12 12 A. I mean, somebody could design something, A. Yes. 13 but it is my opinion that that should include 13 O. If you would turn with me to the third 14 14 lighting and shading. page. It is not numbered. The third page of text. 15 BY MR. TUMINARO: 15 On the right-hand side of the page, 16 Q. Is it possible that a lighting function 16 right hand column, there's a formula, which is the 17 can be performed that does not involve any texture 17 first line on the right-hand column. It says Id 18 18 processing? equals I and it goes on. Do you see that? 19 19 MR. PLUTA: Objection, form. Objection, A. Yes. 20 20 Q. If you look to the left-hand column in relevance. 21 BY THE WITNESS: 21 the last full paragraph, it starts with "in order to 22 22 A. It is my opinion that lighting and obtain." 23 23 shading should be part of the texture processing. Do you see that? 24 24 A. Yes.

Page 150 Page 152 1 Q. I'll read it. "In order to obtain an 1 mapping, right? 2 2 image with enough realism, we apply to each pixel a MR. PLUTA: Objection, form. Objection, 3 Gouraud shading algorithm." Did I say that 3 relevance. 4 4 BY THE WITNESS: 5 5 A. Gouraud shading. A. The function that is responsible for 6 Q. Can you explain what Gouraud shading is? 6 lighting and shading would be called texture 7 MR. PLUTA: Objection, form. Objection, 7 processing engine, and this would be part of that. 8 8 relevance. But we did not call it that much because this was a 9 BY THE WITNESS: 9 limited time. But an expanded version of this 10 10 A. It is says we calculate the light should have a texture processing engine named and 11 intensity for each triangle, basically like 11 included this function. 12 perpendicular to the surface of a vertex to that 12 BY MR. TUMINARO: 13 other primitive. 13 Q. Okay. There might be an expanded 14 BY MR. TUMINARO: 14 version, but yes or no, this shading function that's 15 Q. A Gouraud shading, does that include 15 disclosed in your own paper is an example of a 16 16 shading function that does not include texture texture mapping? 17 MR. PLUTA: Objection, form. Objection, 17 mapping? 18 18 MR. PLUTA: Objection, form and relevance. 19 19 BY THE WITNESS: relevance. 20 A. It could. But in this case, we didn't 20 BY THE WITNESS: 21 talk about it. 21 A. This function is part of a texture 22 BY MR. TUMINARO: 22 processing engine, the box responsible for that. 23 23 Q. In this case, does it include texture BY MR. TUMINARO: 24 mapping? 24 Q. Is it your testimony that this Gouraud Page 151 Page 153 1 MR. PLUTA: Objection, form. Objection, 1 shading that's described in your paper necessarily 2 2 occurs in a texture processing engine? relevance. 3 3 BY THE WITNESS: MR. PLUTA: Objection, form. Objection, 4 A. Yeah, in this case, we did not talk about 4 relevance. 5 5 texture mapping, but we could have. It was just not BY THE WITNESS: 6 part of the design. It would have been appropriate 6 A. It belongs necessarily to a texture 7 7 to add that as well. processing engine, yes. 8 BY MR. TUMINARO: 8 BY MR. TUMINARO: 9 9 Q. But it is a fact that in this shading Q. Is that how it was implemented in the 10 10 algorithm there is no texting mapping? example that you described in your paper? 11 MR. PLUTA: Objection, form. Objection, 11 MR. PLUTA: Same objections. 12 12 BY THE WITNESS: relevance. 13 BY THE WITNESS: 13 A. I think we basically simulated a lot of 14 14 A. What it is is that it gives you an stuff here. We did not implement this as far as I 15 15 opportunity to find Gouraud shading, but a box that remember. This was just a paper analysis. 16 does texture -- what did we call it? A texture 16 BY MR. TUMINARO: 17 processing engine would include this particular 17 Q. Did this paper analysis include the 18 18 simulation of a texture processing engine? function as well. So -- so, this is part of the 19 19 MR. PLUTA: Objection, form. Objection, texture mapping engine. 20 20 BY MR. TUMINARO: relevance. 21 Q. This is your paper and you talk about 21 BY THE WITNESS: 22 22 Gouraud shading, right? And this Gouraud shading A. It is assumed that that is part of the 23 23 texture processing engine, yes. that you talk about in your paper, it is an example MR. TUMINARO: We have no more questions 24 where a shading function does not include texture 24

Page 154 Page 156 at this time. 1 1 A. Instruction cache, which is Box 410. 2 2 MR. PLUTA: Let's go off the record. Q. Let's look at another document, the 3 THE VIDEOGRAPHER: Going off record. The 3 petition, which is Exhibit 9. Do you recall Counsel 4 took you to Page 13 I believe of the --5 5 (Whereupon, a short break in the A. Okay. 6 proceedings was taken.) 6 Q. -- petition? Do you recall that counsel 7 THE VIDEOGRAPHER: We're back on record. 7 asked you about Page 13 and regarding the thread 8 The time is 3:06 p.m. 8 control buffer 420? 9 EXAMINATION 9 A. Correct. 10 10 Q. And you recall counsel asked you whether BY MR. PLUTA: 11 Q. Welcome back. I just have a couple of 11 you agree with petitioner's statement and you 12 questions for you. 12 said -- and I'm paraphrasing here -- you agree with 13 Do you recall the discussion about 13 it because it includes the thread control buffer 14 VHDL and in specifically in relation to Exhibit 3 --14 420, right? 15 15 A. Yes. MR. TUMINARO: Objection, leading. 16 Q. -- your paper? 16 BY MR. PLUTA: 17 A. Yes. 17 Q. Do you recall your testimony regarding 18 18 Q. Now, putting aside my objections to the Page 13 of the petition? 19 paper, I have a couple of questions for you on that 19 A. Yes. 20 topic. You recall the questions counsel asked you 20 Q. And counsel asked you about the position 21 about building a chip, correct? 21 with respect to I believe it's the first paragraph 22 A. Yes. 22 of Page 13? 23 Q. You also mentioned, I'm paraphrasing your 23 A. Okay. 24 testimony here, that to you building a chip means 2.4 And you agreed that the memory device Page 157 Page 155 1 fabrication of a chip, correct? includes the thread control buffer, correct? 2 A. Right. 2 A. Correct. Q. And you just testified that you also 3 Q. You also mentioned a process of massaging 3 4 during the process of designing a computer chip in 4 believed that it also includes the instruction 5 particular after simulation of it? 5 cache, correct? 6 A. Yes. 6 A. Correct. Q. I'd like to turn to Page 22 of the 7 Q. And is it true that you testified that 7 there's a lot of trial and error involved in the petition and direct your attention to the second 9 9 design of a computer chip? full paragraph on that page. Could you read that 10 10 A. Yes. second full paragraph, please, for the record? 11 11 A. "As discussed above, Lindholm discloses Q. I also like to direct you now to 12 12 Lindholm, which is Exhibit 6, just for reference, instruction cache 410 and thread control buffer 420 13 and then I'm also going to take you to Paragraph 72 13 which corresponds to the claim at least one memory 14 14 of your declaration. device." 15 15 A. Yep. Q. Now, after reading that, is it your 16 Q. Do you recall questions about the thread 16 position that the thread control buffer in 17 control buffer 420? 17 combination with the instruction cache corresponds 18 18 A. Yes. to the claimed memory device consistent with the 19 19 Q. Is your opinion that the thread control petitioner's petition here in this case? 20 buffer is the only element that corresponds to the 20 A. Yep. This is exactly what I had in mind. 21 claimed memory device? 21 Q. Let's switch one more topic. 22 22 No. A. Okay. A. 23 23 Q. What else are you pointing to as Q. Do you recall the questioning regarding 24 corresponding to the claimed memory device? 24 the ALU resource and texture fetch resource

FOR THE NORTHERN DISTRICT OF CALIFORNIA

IN THE UNITED STATES DISTRICT COURT

UNIRAM TECHNOLOGY, INC,

No C 04-1268 VRW

Plaintiff,

FINDINGS OF FACT AND CONCLUSIONS OF LAW

TAIWAN SEMICONDUCTOR MANUFACTURING COMPANY, LTD and TSMC NORTH AMERICA,

Defendants.

This is a patent dispute between UniRAM Technology, Inc ("UniRAM") and Taiwan Semiconductor Manufacturing Company Ltd and TSMC North America (collectively "TSMC"). UniRAM sued TSMC for patent infringement and misappropriation of trade secrets, among other claims. TSMC counterclaimed that one of UniRAM's patents was unenforceable due to inequitable conduct in front of the Patent and Trademark Office.

On January 14 and 15, 2008, the court heard testimony concerning TSMC's allegation that UniRAM committed inequitable conduct in the prosecution of US Patent No 6,108,229 ("the '229 patent"). The court heard live testimony from Bo-In Lin, Jeng-Jye

> ATI 2075 LG v. ATI IPR2015-00326

Shau, David Taylor, and Carl Sechen, and deposition testimony from Richard Killworth and Peter Gillingham. That testimony supplemented testimony heard by the court from September 9 to 21, 2007, at the jury trial of UniRAM's trade secret misappropriation (and related) claims.

5109).

FINDINGS OF FACT

- 1. United States Patent 6,108,229 ("the '229 Patent," Ex. 353) issued on August 22, 2000, from United States Application Serial No 09/114,538 ("the '538 Application," Ex. 5133), which was filed on July 13, 1998. The '538 Application was filed as a continuation-in-part ("CIP") both of United States Application Serial No 08/805,290 (the "'290 Application," Ex 5132) and United States Application Serial No 08/653,620 (the "'620 Application," Ex
- 2. The `620 Application was filed on May 24, 1996, and issued as United States Patent No 5,748,547 ("the `547 Patent") on May 5, 1998. Ex 7.
- 3. The '290 Application was filed on February 25, 1997, as a continuation-in-part of the '620 Application, and issued as United States Patent No. 5,825,704 ("the '704 Patent") on October 20, 1998. Ex 9.
- 4. All three patents name Dr Jeng-Jye Shau as the sole inventor. Exs 7, 9 & 353.
- 5. Dr Shau's native language is Mandarin Chinese. Although he can communicate in English, Shau's English is imperfect. Doc #621 85:15 to 86:10. TSMC's expert stated that Shau's "patent

obviously is written by someone who doesn't have a great command of English." Doc #621 154:24 to 155:15.

- 6. Shau is an integrated circuit designer. Jury Trial 146:23-24.
- 7. The person of ordinary skill for purposes of Shau's patents is an integrated-circuit designer, and not an integrated-circuit manufacturer. Doc #621 134:4-9; 175:2 to 176:11. TSMC's own expert, Mr Taylor, defined a person of ordinary skill as having "a Bachelor's degree in electrical engineering and three to five years of experience in the design of semiconductor memory products, preferably DRAM products." Doc #621 134:7-9 (emphasis added). TSMC's expert therefore defined a person of ordinary skill with respect to experience and training in circuit design.
- 8. The work of an integrated-circuit designer is performed almost entirely on a computer. Circuit designers make extensive use of software-based circuit simulation, verification and layout tools. Doc #621 96:13 to 97:7; 101:9-12; 166:10-12; 177:9-22; 180:19 to 181:2.
- 9. The entire integrated-circuit design industry relies heavily on software simulation tools to predict accurately how a circuit will perform once manufactured. Doc #621 177:23 to 178:4; 188:5-18.
- 10. As a general practice, circuit designers simulate their designs extensively before having their circuit designs fabricated into a physical integrated-circuit, commonly called a "chip." Doc #621 188:9-16.
 - 11. A circuit designer's product is his design, and his or

her final product is an electronic design file known as a "tape out" file. Doc #621 181:16-20; 190:3-17. Even TSMC sometimes refers to design files as products. Doc #621 191:4-24. The tape out file serves as a blueprint from which the entirety of a design's details may be discerned and from which a circuit manufacturer can fabricate a chip. Jury Trial 177:8-12.

- 12. Once the design stages are completed including simulations, verifications, and the creation of a tape out file the design in the form of a tape out file is generally submitted to a circuit fabrication facility, commonly termed a "fab." Doc #621 181:12-15.
- 13. Whereas the final product of a circuit designer is a tape out and a circuit design, the final product of a fab, or foundry, is a physical chip.
- 14. Although circuit design and circuit manufacturing are part of the overall integrated-circuit production process, they are typically separate and distinct activities. Generally, circuit designers do not fabricate chips, and generally foundries do not design tape out files. Doc #621 181:16-24. Circuit designers and manufacturers by and large employ distinct vocabularies. Doc #621 177:1-5.
- 15. Integrated circuits from the point of view of a circuit-designer are under production when the circuit designer begins computer layout work on his or her design. This includes computer-simulations of the anticipated performance of the design, verification on a computer of the design's compliance with foundry-specific "design rules," creation of a tape-out file on a computer and continues until the tape out file is submitted to the

fab and sometimes continues therein and thereafter during an iterative refinement process. Doc #621 177:6 to 182:3.

- 16. UniRAM presented Dr Carl Sechen as an expert on how a circuit-designer with an appropriate background would interpret certain of Shau's patent statements that TSMC has challenged in the instant case. Dr Sechen holds a PhD from the University of California at Berkeley, is a fellow in the IEEE, has authored 150 publications in the field of integrated circuit design and has taught at Yale University, the University of Washington and the University of Texas at Dallas (where he is currently a full professor). Doc #621 170:13 to 172:21.
- 17. TSMC's expert on how one of ordinary skill would interpret certain of Shau's patent statements, Mr David Taylor, is less qualified than Dr Sechen. Mr Taylor lacks a PhD, is not a fellow in the IEEE and lacks the teaching and research experience of Dr Sechen. Ex 5291.
- 18. Mr Taylor, unlike Dr Sechen, cited no documents in either his expert report or his trial testimony to corroborate his opinions. Doc #621 152:3-20.
- 19. Dr Sechen consistently offered opinions that were more specific and complete than the answers given by Mr Taylor. Dr Sechen's opinions were supported by reference to objective standards in the industry, such as terms of art. Mr Taylor, by contrast, relied more often on his view of common sense and his personal interpretations of disputed phrases. Dr Sechen explained his interpretations of disputed terms in greater detail, usually by a more thorough consideration of the context in which the term appears.

2.7

20).	In May	1996,	Shau be	gan deve	eloping	an inte	egrated-cir	cuit
design	tha	t incl	uded a	dynamic	random	access	memory	("DRAM")	
archite	ectu	re. D	oc #62	1 88:22	to 89:2	•			

- 21. In May 1996, Shau began layout work on a tape out file using a software program named MAGIC and completed simulations using software programs named SPICE and RSIM. Doc #621 89:20 to 90:1; 90:10 to 91:3; Jury Trial 161:1 to 162:2.
- 22. The simulations reflected that the "access time" for Shau's DRAM architecture using 0.6 micron ("µm") technology design rules was 4 nanoseconds ("ns"). Doc #621 55:11-13; 72:17-24.
- 23. After confirming the viability of his DRAM architecture by simulation, and while he continued work on the tape out, Shau began drafting the '620 Application. Doc #621 91:11-19.
- 24. Shau is not a lawyer, and he drafted the '620 Application by himself, without assistance from counsel. Doc #621 88:11-21;
 Jury Trial 156:19-24.
- 25. The '620 Application as drafted included the following passage:

Our results show that a memory of the present invention is faster than an SRAM of the same memory capacity.

Ex. 5109, at 5109-014. The court finds this statement was not false or misleading.

26. At the time Shau made this statement, no physical "chip" had yet been fabricated. The '620 Application would not, however, suggest to a person of ordinary skill in the art that any physical semiconductor chips had been fabricated. Instead, this statement about "results" refers to simulations conducted on Shau's design.

Doc #621 202:11-18.

23

24

25

26

27

27. Circuit designers simulate their designs regularly. Doc #621 94:5-10. UniRAM's expert stated that "[t]he whole [integrated circuit] industry relies extensively on simulation results to accurately predict the performance of the design." Doc #621 188:12-14. TSMC's expert stated that simulations provide "realistic predictions of just what the performance will be" once the design is fabricated. Doc #621 138:14-19.

- 28. From the perspective of a circuit designer, the term "results" in this sentence refers to simulation results that pertain to a design file, not results from testing a physical chip. Doc #621 93:20 to 94:10; 186:18 to 187:11.
- The challenged statement refers to "results" only, not "measured results." The choice of the word "results" is important because the phrase "measured results" is a term of art in the semiconductor industry. Doc #621 187:2-4. When persons of ordinary skill in the art discuss test results on a physical, fabricated chip as opposed to test results on a design, they often use the phrase "measured results." Doc #621 187:2-11. Creators of integrated circuits "get a lot of accolades for actually producing a part and having measured results." Doc #621 187:6-8. modifier "measured" in the phrase "measured results" is a very "prestigious and important qualifier" on the word "results." Doc #622 231:7-10. Accordingly, if and only if a circuit designer has a physical chip, he will use the term of art "measured results" to describe his test results. The absence of that term of art suggests strongly that the designer does not have a physical chip. Doc #621 187:9-11. Because Shau never in May 1996 made any

reference to "measured results," a person of ordinary skill would not read his statements to suggest the existence of a physical chip. Doc #621 186:18 to 187:11.

- 30. The Figures included in the `547 patent prove to one skilled in the art that the application discussed simulations and not actual chips. Figures 7a, 7b, and 7c in the `547 patent include artificial curves, input labels such as "BLKSEL" or "KWL" and output labels such as "BL" or "BL#" that a circuit designer would understand come from the SPICE simulation program and not a physical chip. Doc #621 91:9 to 93:19.
- 31. Circuit designers would also understand Figure 7a necessarily to relate to simulation results and not physical chip measurements. Figure 7a includes data on bitline outputs. It is not possible, however, to measure the bitline output of a physical chip. Accordingly, a circuit designer reviewing Figure 7a would know that the author of the patent had to have been reporting simulation results. Doc #621 98:15 to 99:4.
- 32. Similarly, the absence in the patent of any "chip photomicrographs" suggests that a person of ordinary skill in the art would infer that no physical chips had been produced. Doc #621 187:12 to 188:4. A chip photomicrograph is essentially a photograph that shows the details of the actual fabricated silicon chip. 187:16-22. Without such evidence, "no one would believe you have actually produced an actual chip." 187:23-24. Shau's patent did not include any reference to a chip photomicrograph. 187:25 to 188:4.
 - 33. The '620 Application includes the following passage:

Although the bit line structure in FIG. 3b is the actual bit line structure used in our product, for simplicity, we will use the simpler two-dimensional bit line structure in FIG. 3a as example in the following discussions.

Ex. 5109, at 5109-020. The court finds this statement was not false or misleading.

- 34. At the time Shau made this statement, no physical "chip" had yet been fabricated. A person of ordinary skill in the art, however, would also not interpret this statement to suggest that a physical "chip" had been manufactured. TSMC does not offer credible evidence to the contrary.
- 35. The audience of the patent is a circuit designer, and the subject matter of the patent is a circuit design. For circuit designers, the final product is a circuit design and a tape out file. As UniRAM's expert stated, because the person of ordinary skill in the art for the '620 Application is a circuit designer, the term "product" logically can mean a circuit design or a tape out file. Doc #621 190:3-17.
- 36. TSMC's expert stated that to a person of ordinary skill in the art, "product" refers to a chip that is "well beyond a test chip" and is "working to meet all specifications and is something that is available to be commercialized and sold." That testimony is less credible than the testimony of UniRAM's expert because the context and subject matter of the patent is not a physical chip that has been tested, but rather a design that has undergone simulations as described above.
- 37. There is no credible evidence that the statement "Although the bit line structure in FIG 3b is the actual bit line

2.7

structure used in our product, for simplicity, we will use the simpler two-dimensional bit line structure in FIG 3a as example in the following discussions" was false or misleading.

38. The '620 Application includes the following passage:

A memory device of the present invention is under production. Using 0.6 micron technology to build a memory array containing one million memory cells, we are able to achieve 4 ns access time, which is more than 10 times faster then existing memories devices of the same storage capacity.

Ex. 5109, at 5109-026. The court finds this statement was not false or misleading.

- 39. TSMC offers no credible evidence that the term "memory device" refers necessarily to physical fabricated chips. To the contrary, TSMC's expert stated that there is no "'nice, clear-cut totally clear definition of what a memory device is.'" Doc #621 154:6-23.
- 40. UniRAM's expert testified that in the context of the '229 patent, "memory device" refers to an integrated circuit which can exist as a design on a computer and is completely different from a "physical integrated circuit" or a "physical chip." #621 222:7-23.
- 41. UniRAM's expert stated that a memory device can exist "way before fabrication," including "in the design stage on a computer." #621 225:12-14. He specifically rejected the idea that a memory device refers to a physical chip. #621 222:16-23 and 220:10-11. In the context of the patent at issue, which discussed circuit design, it was "inconceivable" that the author was referring to a physical chip. Doc #622 226:4-10.

- 42. UniRAM's expert also testified that the phrase "device has been fabricated" is a term of art. Doc #621 183:16-20. Without that term of art, a person of ordinary skill in the art would be "convinced beyond any doubt that nothing has been actually fabricated." Doc #621 184:1-3. That term of art does not appear in the patent. Doc #621 183:16 to 184:3.
- 43. TSMC's only evidence that "memory device" refers necessarily to physical fabricated chips is its expert's statement that "I think in my view, it's pretty clear that when it says a device, it means something physical." Doc #621 152:24-25. He did not connect his interpretation to any terms of art or industry standards.
- 44. TSMC offers no credible evidence that the term "under production" means necessarily that physical chips are being fabricated for sale.
- 45. Unlike "under production," the phrase "in production" is a term of art in the semiconductor industry that "means that products intended for sale are actually being fabricated and produced." Doc #621 192:5-15; 182:22 to 183:4. UniRAM's expert compared having chips "in production" to producing automobiles on an assembly line in Detroit. Doc #622 215:6-24.
- 46. By contrast, the phrase "under production" does not have any widely understood specific meaning. Doc #621 183:1-4. In fact, because the phrase "in production" is a term of art referring specifically to mass production of chips, the use of the phrase "under production" suggests that physical chips are not being fabricated. Doc #622 215:6-24.

- 47. Because the meaning of "under production" is open-ended, the phrase should be interpreted in context. Doc #622 212:3-7. The context of the statement in the patent is circuit design, and thus the phrase "under production" refers to "the steps of the design process, including design, simulation, verification and on to the tapeout." Doc #621 183:5-12.
- 48. In addition, other assorted terms of art in the industry that also refer to the physical production of chips, such as "fabricated" or "manufactured," do not appear in the patent. Doc #621 183:16 to 184:3. The absence of any terms of art referring to physical production of chips suggests strongly that a person of ordinary skill in the art would not interpret "under production" as referring to the physical production of chips.
- 49. TSMC's expert testified that "under production" refers to the process of producing thousands of copies of a chip to test its viability before moving on to high-volume mass production, which runs in the millions of copies. Doc #621 139:25 to 141:16. His description of this pre-production process may be an accurate statement of production practices in the industry, but he offers no testimony that the specific term "under production" refers necessarily to the specific pre-production process he describes. He did not state that "under production" is a term of art, and he did not discuss whether his interpretation of "under production" is the same for the purposes of manufacturing processes and for the purposes of disclosures in a circuit design patent.
- 50. In the specific context of design disclosures in a circuit design patent, the use of the phrase "under production" to mean fabrication would be "highly unlikely." Doc #622 217:9-16.

This is because the usual practice for designers is to obtain a valid patent on a design <u>before</u> proceeding to manufacture and sale of the invention. Doc #622 215:19 to 216:15.

51. Because a circuit designer's final product is a circuit design and tape out, the statement in the '620 Application that a "memory device" was "under production" is consistent with a circuit design being in progress and the tape out being under production. Shau's design was "under production" as long as he was working on the layout of the chip design, including simulations. Doc #621 182:9 to 184:3; Jury Trial 269:1-19; 270:12-15. At the time the '620 Application was filed on May 24, 1996, most if not all of Shau's simulation work was finished and his layout work had begun. Doc #621 89:20 to 90:1. When he filed the '620 Application, Shau had completed the entire layout for the memory device that was claimed (but had not completed the external logic circuitry design). Doc #621 44:6-22. Shau's tape out, which is a circuit designer's product, was thus "under production" as of May 24, 1996.

- 52. The passage in the '620 Application "[u]sing 0.6 micron technology to build a memory array containing one million memory cells" referred to Shau's process of designing an array of a million memory cells and implementing the design with 0.6 micron technology design rules, not to a physical chip. Doc #621 95:9 to 96:8.
- 53. The reference to a "memory array" further shows that Shau was referring to a design and not a physical chip because an "array" is not a physical chip from a circuit designer's point of view. Doc #621 95:9 to 96:1; Jury Trial 271:8-15. Shau demonstrated a "memory array" for the jury on his computer -

navigating a software file, not a physical chip - while explaining his USRAM tape out. Jury Trial 188:20 to 189:3.

54. The reference to "build[ing]" an array also does not suggest necessarily a physical chip, because circuit designers - those of ordinary skill in the art - use the infinitive "to build" to discuss their work on design files, performed on a computer. Doc #621 96:13 to 97:10; 184:15 to 185:1; Jury Trial 271:19 to 272:8. The word "build" is not a term of art among circuit designers. Doc #621 184:21-22. Even if "build" refers commonly to physical structures, TSMC offers no evidence that "build" cannot be used as a metaphor for other purposes. According to Webster's Third International Dictionary, for instance, one can "build" an argument, a work of art or a piece of literature. Webster's Third New International Dictionary 291-92 (1981).

- 55. Shau's simulation results at the time of the '620 Application reflected a 4 ns access time, which was at relevant times more than ten times faster than traditional DRAM memories of the same size. Doc #621 94:2-17; 55:24 to 56:3; 97:18 to 98:3.
- 56. The reference to "4 ns" access time also would indicate to a person or ordinary skill in the art that Shau was referring to a design and not a physical chip because circuit designers use more than one digit of precision when referring to a physical, tested chip (for example, 4.x nanosecond access time) rather than a design (for example, 4 ns access time). Doc #621 185:25 to 186:17. Accordingly, Shau was not claiming to achieve a specific result, as he would if he were referring to a physical chip. TSMC's expert did not address Shau's use of one rather than two significant figures in his patent.

26 27

art. Doc #621 55:24 to 56:2; 39:16 to 44:5. The reference to "one million memory cells" further indicates that a person of ordinary skill in the art would not read this patent language to suggest the presence of a physical chip. In the industry, memory cells in finished chips are always counted

Shau was not referring to Sunaga prior art when he

claimed that his invention was ten times faster than existing prior

Accordingly, a person of ordinary skill in the art would interpret Shau's imprecise description as suggesting that a design is being discussed. Doc #621 185:2-24.

as a power of two, and one million is not a power of two.

- 59. In the summer of 1996, Shau completed his first tape out and submitted it to MOSIS. Doc #621 102:10-15.
- MOSIS (not to be confused with MoSys, a former defendant in this case) is a relatively low-cost semiconductor manufacturing service often used for academic or research purposes. Doc #621 102:2-9.
- Shau realized that MOSIS could support only small test chips, so his original million memory cell array was reduced in size for the MOSIS tape out. Doc #621 107:23 to 108:14. Ex. 1378.
- 62. The MOSIS design was a test chip with a simple interface for testing purposes only. It was not configured as a commercial product. Doc #621 103:24 to 104:15.
- MOSIS sent Shau manufactured and packaged chips in late 1996. Doc #621 102:10-24.
- 64. Shau's initial tape out to MOSIS had bugs, but the bugs related to the logic portions of the tape out. The bugs did not relate to Shau's DRAM architecture, the subject of the claimed

inventions of Shau's patents. Shau was able to bypass the bugs to determine that the architecture of his design worked. Doc #621 102:10-21. The MOSIS tape out was successful. Doc #621 102:10-17.

- 65. Shau's success in verifying his memory architecture using the MOSIS prototype is reflected by his contemporaneous statement to TSMC in December 1996 that the "USRAM architecture has been verified on silicon by a 8K x 9 device." Ex 443 at 0041660.
- 66. Shau wished to verify his DRAM architecture on a full-size chip. Shau decided to approach TSMC, the world's largest independent commercial foundry, to begin commercial fabrication activities on his DRAM architecture designs. Doc #621 102:22 to 103:9.
- 67. In the latter part of 1996, pursuant to a nondisclosure agreement, Shau disclosed his DRAM architecture to TSMC and secured permission from TSMC to submit a tape out as a paying customer. Doc #621 103:10-17; Jury Trial 162:20 to 164:7.
- 68. In late 1996, Shau sent TSMC a tape out file. Shau's tape out to TSMC employed the same general DRAM architecture as the MOSIS tape out but was modified significantly. Doc #621 103:24 to 104:7. For example, the chip that Shau taped out to TSMC was much larger and had a more complex interface. Doc #621 104:2-7; 108:3-14.
- 69. Unlike his earlier MOSIS tape out, the design embodied in Shau's first tape out to TSMC was a test chip fully compatible with a popular commercial chip at the time, called CacheRAM. Doc #621 104:13-15; 106:16 to 107:8.

7	0.	TSN	IC suc	ccessi	Eully	CC	omple	eted	the	physi	cal	fabri	LCa	ation (of
Shau's	fi	rst	TSMC	tape	out	in	Janu	ıary	1997	and	sent	him	a	small	
number	of	tes	st chi	ips.	Jury	Tı	rial	211:	6 to	211:	24.				

- 71. Shau's initial TSMC tape out had bugs. However, the bugs were outside the portion of the tape out corresponding to Shau's DRAM architecture that is the subject of the claimed inventions of Shau's patents. Doc #621 109:17-25. Shau was able to bypass those errors for purposes of establishing that he could read and write data to the memory cells in the memory array. This meant that his memory array design was working properly. Doc #621 109:2 to 111:16; Jury Trial 211:25 to 213:1-18; 469:3-6; 214:17-22.
- 72. On February 25, 1997, Shau filed the '290 Application.

 The '290 Application included the following additional text in its specification:

Using this memory cell 1400 and a memory architecture disclosed in this invention and in our previous patent application, commercial memory products were manufactured successfully. The major advantage of the logic memory cell 1400 is that it can be manufactured using standard logic technology. The resulting memory product achieved unprecedented high performance.

Ex. 5132, at 5132-035.

- 73. As of the time of the filing of the `290 Application, physical chips corresponding to Shau's design had been fabricated successfully by TSMC. Doc #621 111:9-16; 116:21 to 117:2.
- 74. Because a physical semiconductor chip had been fabricated by February 1997, Shau included text in the '290 Application to reflect that a product had been "manufactured," whereas the term "manufactured" had not previously been employed in the '620

Application. Compare Ex 5109, with Ex 5132; see also Doc #621 183:23 to 184:9.

75. Because he had actually achieved (past tense) measured results from a manufactured chip, Shau used the term "achieved" in the '290 Application - rather than the present tense term "we are able to achieve" as was used in the '620 Application in reference to simulation results. Compare Ex 5109, at 5109-026, with Ex 5132, at 5132-035. The statement that the chip achieved unprecedented high performance was accurate. Doc #621 72:7; 72:22-24; 114:11-14.

76. The initial TSMC test chip was a "commercial" chip in the sense that it was configured as a commercial CacheRAM chip and was manufactured by a commercial foundry (TSMC) rather than an academic foundry (MOSIS). Doc #621 104:13-15; 106:16 to 107:8; 112:22-25. It was also a "commercial" chip in the sense that Shau intended it as a profit-making vehicle. Doc #621 49:19 to 50:15.

77. Most importantly, a person of ordinary skill in the art would consider a design to be a "commercial product" so long as it is intended and designed for eventual commercial sale - and not, for example, for experimental or academic purposes. Doc #621 194:18 to 195:3.

78. Based upon Shau's experience at Intel Corporation, he considered a product to be "commercial" if it was designed to be sold. Doc #621 112:24 to 113:5. Indeed, even the personnel at TSMC referred to Shau's USRAM product as a commercial product. Doc #621 113:6-8.

79. The phrase "manufactured successfully" is not a term of art, and its meaning is ambiguous rather than clear and unequivocal. Doc #621 195:4-10. Interpreted literally, the term

"manufactured successfully" in the '290 Application would indicate to a person of ordinary skill at a bare minimum that the circuit manufacturer had fabricated a chip successfully, the chip achieved a degree of functionality and the chip might lead to a successful commercial product. Doc #621 195:11 to 196:5.

- 80. The term "manufactured successfully" does not mean that the design is free of errors or bugs as long as the design is likely to lead to commercial success. Doc #621 195:16-21.
- 81. The first TSMC test chip had completed the manufacturing process, and, despite the presence of bugs in the extraneous logic portions of the chip, the memory portion of the chip (which contained the inventions claimed by the '290 Application) functioned successfully. Doc #621 109:2-25. Accordingly, the test chip was "manufactured successfully." Doc #621 114:2-5.
- **Manufactured successfully" in the '290 Application to reflect
 "full" or perfect functionality. The phrase "fully functional" is
 a term of art in the industry for perfect functionality, including
 functionality in areas of the chip that may have absolutely nothing
 to do with the claimed invention. Nor would a person of ordinary
 skill interpret "manufactured successfully" to suggest that the
 design was ready for mass production. Doc #621 195:4 to 196:22.
 Shau's statements to TSMC that his design was not worthy for mass
 production and not fully functional are consistent with his
 statement to the PTO that his claimed invention was successful; the
 claimed invention in his patent application related to the memory
 array (which worked perfectly), while the errors precluding mass
 production referred to the external logic circuitry.

8.	3.	In	the	lat	ter	half	of	1997,	Shau	ı beç	jan	design	ing	his	DRAI
archit	ectu	re	usir	ıg I	SMC	's 0.	35µ	n tech	nolog	gy•	Tha	t same	yea	ar,	Shau
submit	ted	to	TSMC	: a	tape	e out	de	signed	for	TSMO	C's	0.35µm	ı gei	neri	С
logic p	proc	ess		Jury	r Tri	ial 2	17:1	10-23.							

- 84. After revision of his 0.35µm TSMC tape out, Shau received fabricated chips from TSMC that were fully functional. Based on these fully functional chips, Shau filed the '538 Application, which ultimately issued as the '229 Patent. Jury Trial 217:10 to 218:20. Thus, a fully functional chip existed at the time the application for the '229 Patent was filed.
- 85. TSMC filed its motion for summary judgment on its inequitable conduct counterclaim on the eve of a mediation with UniRAM, suggesting that its pursuit of this claim was intended as settlement leverage against UniRAM. Doc #621 116:14-20.
- 86. In 2006, UniRAM reached a settlement with MoSys, a former defendant in this case. Doc #293.
- 87. To provide MoSys with complete relief, UniRAM had to include a patent release in the MoSys settlement that covered TSMC. Doc #287 at 3.
- 88. After executing the MoSys settlement, UniRAM pursued only trade-secret, and not patent, claims against TSMC. In November of 2006, UniRAM and TSMC filed jointly with the court a case management statement in which UniRAM stated that it was no longer seeking to enforce the '229 patent against TSMC. Doc #287 at 3.
- 89. Despite no longer needing to pursue its inequitable conduct theory as a defense against UniRAM's patent claims because UniRAM relinquished those claims TSMC did not drop its inequitable conduct counterclaim.

90. At the hearing on TSMC's motion for summary judgment,
counsel for TSMC informed the court that a motivation behind filing
the motion was to deny UniRAM's and UniRAM's counsel access to the
MoSys settlement funds: "UniRAM's a corporate entity and they could
pay [the settlement money] out to their shareholders. Whether
that's appropriate or not is a different question. There's
probably preexisting payments to law firms that need to be made.
They don't have a lot of money." Doc #381 (1/11/07 Inequitable
Conduct Summary Judgment Hearing Tr) at 3.

- 91. Relatedly, if TSMC had only been interested in protecting the settlement funds, it could have chosen a less drastic measure, such as an injunction, rather than seeking a judgment on its counterclaim. Doc #381 at 3-13. This suggests that TSMC's continued pursuit of its counterclaim was pretextual and was not in good faith.
- 92. In February 2007, the court denied TSMC's motion for summary judgment on inequitable conduct. Doc #349.
- 93. In the court's order denying TSMC's motion for summary judgment, the court indicated that TSMC had failed to identify any bases by which a PTO examiner could have made an obviousness or enablement rejection of the UniRAM patents. The court also labeled TSMC's interpretation of its evidence of Shau's intent to deceive the PTO as "odd." Doc #349 at 16.
- 94. Despite the summary judgment order that called into question the fundamental merits of TSMC's inequitable conduct counterclaim, TSMC continued to pursue that counterclaim after issuance of the order.

- 95. In continuing to pursue its inequitable conduct counterclaim after the summary judgment order, TSMC did not act to rectify the deficiencies in its position identified in that order. Doc #601 at 3-4.
- 96. UniRAM's trade secret claims proceeded to trial in September 2007.
- 97. During the trade secret trial, TSMC cross-examined Shau about most of the same supposed misstatements in his patent applications that form the basis of its inequitable conduct counterclaim. Jury Trial 265:25 to 287:5.
- 98. During the trade secret trial, TSMC's counsel argued to the jury in closing arguments that these supposed misstatements meant that Shau lacked credibility. Jury Trial 1841:15 to 1847:18.
- 99. Despite TSMC's arguments about the supposed misstatements in UniRAM's patents, the jury found in favor of Shau and UniRAM.

 Doc #544.
- 100. Even though TSMC's use of its supposed inequitable conduct evidence had not persuaded the jury to find against UniRAM, TSMC continued to pursue its inequitable conduct counterclaim against UniRAM following the jury verdict.

CONCLUSIONS OF LAW

A breach of the duties of candor, good faith, and honesty when prosecuting patent applications constitutes inequitable conduct. Molins PLC v Textron, Inc, 48 F3d 1172, 1178 (Fed Cir 1995). The proponent of an inequitable conduct defense has a "heavy burden to meet." UniRAM Tech, Inc v Taiwan Semiconductor

- 5. Where the proponent of the inequitable conduct defense seeks to have a later patent declared unenforceable based upon alleged inequitable conduct in related patents, the proponent "must prove an 'immediate and necessary relation' between the inequitable conduct in the earlier patents and the enforcement of the descendent patent." <u>UniRAM</u>, 2007 WL 596397, at *2; see <u>Hoffman-La Roche</u>, Inc v Promega Corp, 319 F Supp 2d 1011 (N D Cal 2004).
- The fact that an applicant uses an imprecise term in a patent application does not provide "clear and convincing" evidence of a misstatement. Kothmann Enterprises, Inc v Trinity Indus, Inc, 455 F Supp 2d 608, 618-24 (S D Tex 2006), citing Hoffmann-La Roche, Inc v Promega Corp, 323 F3d 1354, 1363 (Fed Cir 2003), Purdue Pharma LP v Endo Pharms, Inc, 410 F3d 690 (Fed Cir 2005) and Frazier v Roessel Cine Photo Tech, Inc, 417 F3d 1230 (Fed Cir Although courts have found inequitable conduct based on "applicants' representations that they had performed experimental testing when they had not done so and that they had achieved test results that simply did not exist" (see Kothmann, 455 F Supp 2d at 623), here the evidence shows that Shau did perform tests. language Shau used to describe his claimed invention may at points have been imprecise. Shau's testimony describing the testing he did and the language he chose to use in his patent applications makes clear that the statements TSMC challenges were not misrepresentations. See Kothmann, 455 F Supp 2d at 623-24.
- 7. If the PTO needs more information in interpreting a patent application, the PTO examiner is authorized to seek clarification or additional information. Star Fruits SNC v United States, 393 F3d 1277, 1283 (Fed Cir 2005) ("The Office is clearly

entitled to use section 1.105 to seek information that may support a rejection. Just as the applicant produces information it deems pertinent to patentability under section 1.56, the examiner is free to request information under section 1.105 that the examiner deems pertinent to the issue of patentability.").

- 8. The PTO has adequate resources to investigate the representations made by applicants, if necessary. The PTO has the benefit of "hundreds of experts in the relevant arts to make independent inquiries." Aptix Corp v Quickturn Design Systems, Inc, 269 F3d 1369, 1379 (Fed Cir 2001) ("The courts have no greater resources to uncover fraud than the PTO. Although patent prosecutions are ex parte and judicial proceedings are adversarial, the PTO has the benefit of hundreds of experts in the relevant arts to make independent inquiries.") (Mayer dissenting in part).
- 9. Attorney fees may be awarded in an exceptional case. 35 USC § 285.
- 10. A finding that a case is exceptional imposes a more stringent requirement than the standard for proof of inequitable conduct, and in turn, an award of attorney fees imposes a more stringent requirement than the "exceptional case" standard. Argus Chemical Corp v Fibre Glass-Evercoat Co, 812 F2d 1381, 1387 (Fed Cir 1987) (Nies concurring).
- 11. Whether a case is "exceptional" is a question of fact.

 Brasseler, USA I, LP v Stryker Sales Corp, 267 F3d 1370, 1378 (Fed Cir 2001); Graco, Inc v Binks Mfg Co, 60 F3d 785, 794-95 (Fed Cir 1995) ("A finding by a court that a case is exceptional is a factual determination whereas the decision to award fees is discretionary.") (internal citations omitted). Direct or

circumstantial evidence that is clear and convincing is needed to establish an "exceptional case." <u>Brasseler</u>, 267 F3d at 1378-79.

- 12. Over-assertion of the defense of inequitable conduct has become an "absolute plague." <u>Burlington Indus, Inc v Dayco Corp</u>, 849 F2d 1418, 1422 (Fed Cir 1988).
- 13. Often litigants improperly assert the defense as a delay tactic, a tactic to obfuscate the issues before the court or to drive up the patentee's litigation costs. Chiron Corp v Abbott Labs, 156 FRD 219, 221 (N D Cal 1994).
- 14. "A patent litigant should be made to feel * * * that an unsupported charge of inequitable conduct in the Patent Office is a negative contribution to the rightful administration of justice."

 Burlington Indus, 849 F2d at 1422; see Fiskars, Inc v Hunt Mfg Co,

 221 F3d 1318, 1328 (Fed Cir 2000) (affirming an award of attorney fees for an inequitable conduct defense "so lacking in substance as to constitute a waste of the time and resources of all the participants").
- 15. Under 28 USC § 1927, courts have statutory authority to sanction attorneys for improper litigation conduct: "Any attorney * * * who so multiplies the proceedings in any case unreasonably and vexatiously may be required by the court to satisfy personally the excess costs, expenses, and attorneys' fees reasonably incurred because of such conduct."
- 16. Having reviewed the evidence and considered the testimony at trial, the court considers the testimony of UniRAM's witnesses to be more credible as to the existence or nonexistence of alleged misstatements in the patents and patent applications at issue in this proceeding than the evidence and testimony presented by TSMC.

- 17. The testimony of TSMC's primary witness as to falsity rested primarily upon his experience alone and was uncorroborated by any documents or other witnesses. Accordingly, it fails to provide clear and convincing evidence of falsity.
- 18. The basis of TSMC's claim is that some of Shau's statements can be possibly read in a context that would make the statements misleading. TSMC does not come close to proving that the alleged misstatements were false or misleading.
- 19. To the extent that the words used in the patents and patent applications at issue were imprecise, this imprecision does not give rise to clear and convincing evidence of falsity.
- 20. The court concludes that TSMC failed to prove by a preponderance of the evidence, much less clear and convincing evidence, that Shau made any misstatements in the patents and patent applications at issue.
- 21. Because TSMC has failed to establish by clear and convincing evidence the existence of any misstatements, the court concludes that there was no inequitable conduct in the prosecution of any of the patents at issue. The issues of materiality and intent are moot.
- 22. In light of the circumstances, the court finds that this is an exceptional case because TSMC pursued its counterclaim long after UniRAM dropped its patent infringement case. Moreover, circumstantial evidence suggests that TSMC brought this counterclaim not because it believed that Shau lied to the patent office but because it wanted to intimidate UniRAM. Most importantly, TSMC's evidence of falsity was barren. TSMC's pursuit of its inequitable conduct contention is highly questionable.

Nonetheless, the court declines to order TSMC to pay the attorney fees UniRAM incurred in defending the defense and counterclaim.

Awarding fees is an extraordinary sanction, and the Federal Circuit has not developed detailed criteria for such awards in the context of inequitable conduct claims.

ATI 2076 LG v. ATI IPR2015-00326 A GRAPHICS PROCESSING ARCHITECTURE EMPLOYING A UNIFIED SHADER

FIELD OF THE INVENTION

[0001] The present invention generally relates to graphics processors and, more

particularly, to a graphics processor architecture employing a single shader.

BACKGROUND OF THE INVENTION

[0002] In computer graphics applications, complex shapes and structures are formed

through the sampling, interconnection and rendering of more simple objects, referred to

as primitives. An example of such a primitive is a triangle, or other suitable polygon.

These primitives, in turn, are formed by the interconnection of individual pixels. Color

and texture are then applied to the individual pixels that comprise the shape based on

their location within the primitive and the primitives orientation with respect to the

generated shape; thereby generating the object that is rendered to a corresponding display

for subsequent viewing.

[0003] The interconnection of primitives and the application of color and textures to

generated shapes are generally performed by a graphics processor. Conventional

graphics processors include a series of shaders that specify how and with what

corresponding attributes, a final image is drawn on a screen, or suitable display device.

As illustrated in FIG. 1, a conventional shader 10 can be represented as a processing

block 12 that accepts a plurality of bits of input data, such as, for example, object shape

data (14) in object space (x,y,z); material properties of the object, such as color (16);

texture information (18); luminance information (20); and viewing angle information (22)

1

and provides output data (28) representing the object with texture and other appearance

properties applied thereto (x', y', z').

[0004] In exemplary fashion, as illustrated in FIGS. 2A-2B, the shader accepts the vertex

coordinate data representing cube 30 (FIG. 2A) as inputs and provides data representing,

for example, a perspectively corrected view of the cube 30' (FIG. 2B) as an output. The

corrected view may be provided, for example, by applying an appropriate transformation

matrix to the data representing the initial cube 30. More specifically, the representation

illustrated in FIG. 2B is provided by a vertex shader that accepts as inputs the data

representing, for example, vertices V_X, V_Y and V_Z, among others of cube 30 and

providing angularly oriented vertices $V_{X'}, V_{Y'}$ and $V_{Z'}$, including any appearance

attributes of corresponding cube 30'.

[0005] In addition to the vertex shader discussed above, a shader processing block that

operates on the pixel level, referred to as a pixel shader is also used when generating an

object for display. Generally, the pixel shader provides the color value associated with

each pixel of a rendered object. Conventionally, both the vertex shader and pixel shader

are separate components that are configured to perform only a single transformation or

operation. Thus, in order to perform a position and a texture transformation of an input,

at least two shading operations and hence, at least two shaders, need to be employed.

Conventional graphics processors require the use of both a vertex shader and a pixel

shader in order to generate an object. Because both types of shaders are required, known

graphics processors are relatively large in size, with most of the real estate being taken up

by the vertex and pixel shaders.

2

[0006] In addition to the real estate penalty associated with conventional graphics processors, there is also a corresponding performance penalty associated therewith. In conventional graphics processors, the vertex shader and the pixel shader are juxtaposed in a sequential, pipelined fashion, with the vertex shader being positioned before and operating on vertex data before the pixel shader can operate on individual pixel data.

[0007] Thus, there is a need for an improved graphics processor employing a shader that is both space efficient and computationally effective.

BRIEF DESCRIPTION OF THE DRAWINGS

[0008] The present invention and the associated advantages and features thereof, will become better understood and appreciated upon review of the following detailed description of the invention, taken in conjunction with the following drawings, where like numerals represent like elements, in which:

[0009] FIG. 1 is a schematic block diagram of a conventional shader;

[00010] FIGS. 2A-2B are graphical representations of the operations performed by the shader illustrated in FIG. 1;

[00011] FIG. 3 is a schematic block diagram of a conventional graphics processor architecture;

[00012] FIG. 4A is a schematic block diagram of a graphics processor architecture according to the present invention;

[00013] FIG. 4B is a schematic block diagram of an optional input component to the graphics processor according to an alternate embodiment of the present invention; and

[00014] FIG. 5 is an exploded schematic block diagram of the unified shader employed in the graphics processor illustrated in FIG. 4A.

DETAILED DESCRIPTION OF THE INVENTION

[00015] Briefly stated, the present invention is directed to a graphics processor that employs a unified shader that is capable of performing both the vertex operations and the pixel operations in a space saving and computationally efficient manner. In an exemplary embodiment, a graphics processor according to the present invention includes an arbiter circuit for selecting one of a plurality of inputs for processing in response to a control signal; and a shader, coupled to the arbiter, operative to process the selected one of the plurality of inputs, the shader including means for performing vertex operations and pixel operations, and wherein the shader performs one of the vertex operations or pixel operations based on the selected one of the plurality of inputs.

[00016] The shader includes a general purpose register block for storing at least the plurality of selected inputs, a sequencer for storing logical and arithmetic instructions that are used to perform vertex and pixel manipulation operations and a processor capable of executing both floating point arithmetic and logical operations on the selected inputs according to the instructions maintained in the sequencer. The shader of the present invention is referred to as a "unified" shader because it is configured to perform both vertex and pixel operations. By employing the unified shader of the present invention,

the associated graphics processor is more space efficient than conventional graphics processors because the unified shader takes up less real estate than the conventional multi-shader processor architecture.

[00017] In addition, according to the present invention, the unified shader is more computationally efficient because it allows the shader to be flexibly allocated to pixels or vertices based on workload.

[00018] Referring now to FIG. 3, illustrated therein is a graphics processor incorporating a conventional pipeline architecture. As shown, the graphics processor 40 includes a vertex fetch block 42 which receives vertex information relating to a primitive to be rendered from an off-chip memory 55 on line 41. The fetched vertex data is then transmitted to a vertex cache 44 for storage on line 43. Upon request, the vertex data maintained in the vertex cache 44 is transmitted to a vertex shader 46 on line 45. As discussed above, an example of the information that is requested by and transmitted to the vertex shader 46 includes the object shape, material properties (e.g. color), texture information, and viewing angle. Generally, the vertex shader 46 is a programmable mechanism which applies a transformation position matrix to the input position information (obtained from the vertex cache 44), thereby providing data representing a perspectively corrected image of the object to be rendered, along with any texture or color coordinates thereof.

[00019] After performing the transformation operation, the data representing the transformed vertices are then provided to a vertex store 48 on line 47. The vertex store 48 then transmits the modified vertex information contained therein to a primitive

assembly block 50 on line 49. The primitive assembly block 50 assembles, or converts, the input vertex information into a plurality of primitives to be subsequently processed. Suitable methods of assembling the input vertex information into primitives is known in the art and will not be discussed in greater detail here. The assembled primitives are then transmitted to a rasterization engine 52, which converts the previously assembled primitives into pixel data through a process referred to as walking. The resulting pixel data is then transmitted to a pixel shader 54 on line 53.

The pixel shader 54 generates the color and additional appearance attributes that are to be applied to a given pixel, and applies the appearance attributes to the respective pixels. In addition, the pixel shader 54 is capable of fetching texture data from a texture map 57 as indexed by the pixel data from the rasterization engine 52 by transmitting such information on line 55 to the texture map. The requested texture data is then transmitted back from the texture map 57 on line 57' and stored in a texture cache 56 before being routed to the pixel shader on line 58. Once the texture data has been received, the pixel shader 54 then performs specified logical or arithmetic operations on the received texture data to generate the pixel color or other appearance attribute of interest. The generated pixel appearance attribute is then combined with a base color, as provided by the rasterization engine on line 53, to thereby provide a pixel color to the pixel corresponding at the position of interest. The pixel appearance attribute present on line 59 is then transmitted to post raster processing blocks (not shown).

[00021] As described above, the conventional graphics processor 40 requires the use of two separate shaders: a vertex shader 46 and a pixel shader 54. A drawback associated with such an architecture is that the overall footprint of the graphics processor

is relatively large as the two shaders take up a large amount of real estate. Another drawback associated with conventional graphics processor architectures is that can exhibit poor computational efficiency.

Referring now to FIG. 4A, in an exemplary embodiment, the graphics processor 60 of the present invention includes a multiplexer 66 having vertex (e.g. indices) data provided at a first input thereto and interpolated pixel parameter (e.g. position) data and attribute data from a rasterization engine 74 provided at a second input. A control signal generated by an arbiter 64 is transmitted to the multiplexer 66 on line 63. The arbiter 64 determines which of the two inputs to the multiplexer 66 is transmitted to a unified shader 62 for further processing. The arbitration scheme employed by the arbiter 64 is as follows: the vertex data on the first input of the multiplexer 66 is transmitted to the unified shader 62 on line 65 if there is enough resources available in the unified shader to operate on the vertex data; otherwise, the interpolated pixel parameter data present on the second input will be passed to the unified shader 62 for further processing.

[00023] Referring briefly to FIG. 5, the unified shader 62 will now be described. As illustrated, the unified shader 62 includes a general purpose register block 92, a plurality of source registers: including source register A 93, source register B 95, and source register C 97, a processor (e.g. CPU) 96 and a sequencer 99. The general purpose register block 92 includes sixty four registers, or available entries, for storing the information transmitted from the multiplexer 66 on line 65 or any other information to be maintained within the unified shader. The data present in the general purpose register block 92 is transmitted to the plurality of source registers via line 109.

[00024] The processor 96 may be comprised of a dedicated piece of hardware or can be configured as part of a general purpose computing device (i.e. personal computer). In an exemplary embodiment, the processor 96 is adapted to perform 32-bit floating point arithmetic operations as well as a complete series of logical operations on corresponding operands. As shown, the processor is logically partitioned into two sections. Section 96 is configured to execute, for example, the 32-bit floating point arithmetic operations of the unified shader. The second section, 96A, is configured to perform scaler operations (e.g. log, exponent, reciprocal square root) of the unified shader.

The sequencer 99 includes constants block 91 and an instruction store 98. [00025] The constants block 91 contains, for example, the several transformation matrices used in connection with vertex manipulation operations. The instruction store 98 contains the necessary instructions that are executed by the processor 96 in order to perform the respective arithmetic and logic operations on the data maintained in the general purpose register block 92 as provided by the source registers 93-95. The instruction store 98 further includes memory fetch instructions that, when executed, causes the unified shader 62 to fetch texture and other types of data, from memory 82 (FIG. 4A). In operation, the sequencer 99 determines whether the next instruction to be executed (from the instruction store 98) is an arithmetic or logical instruction or a memory (e.g. texture fetch) instruction. If the next instruction is a memory instruction or request, the sequencer 99 sends the request to a fetch block (not shown) which retrieves the required information from memory 82 (FIG. 4A). The retrieved information is then transmitted to the sequencer 99, through the vertex texture cache 68 (FIG. 4A) as described in greater detail below.

[00026] If the next instruction to be executed is an arithmetic or logical instruction, the sequencer 99 causes the appropriate operands to be transferred from the general purpose register block 92 into the appropriate source registers (93, 95, 97) for execution, and an appropriate signal is sent to the processor 96 on line 101 indicating what operation or series of operations are to be executed on the several operands present in the source registers. At this point, the processor 96 executes the instructions on the operands present in the source registers and provides the result on line 85. The information present on line 85 may be transmitted back to the general purpose register block 92 for storage, or transmitted to succeeding components of the graphics processor 60.

[00027] As discussed above, the instruction store 98 maintains both vertex manipulation instructions and pixel manipulation instructions. Therefore, the unified shader 99 of the present invention is able to perform both vertex and pixel operations, as well as execute memory fetch operations. As such, the unified shader 62 of the present invention is able to perform both the vertex shading and pixel shading operations on data in the context of a graphics controller based on information passed from the multiplexer. By being adapted to perform memory fetches, the unified shader of the present invention is able to perform additional processes that conventional vertex shaders cannot perform; while at the same time, perform pixel operations.

[00028] The unified shader 62 has ability to simultaneously perform vertex manipulation operations and pixel manipulation operations at various degrees of completion by being able to freely switch between such programs or instructions, maintained in the instruction store 98, very quickly. In application, vertex data to be processed is transmitted into the general purpose register block 92 from multiplexer 66.

The instruction store 98 then passes the corresponding control signals to the processor 96 on line 101 to perform such vertex operations. However, if the general purpose register block 92 does not have enough available space therein to store the incoming vertex data, such information will not be transmitted as the arbitration scheme of the arbiter 64 is not satisfied. In this manner, any pixel calculation operations that are to be, or are currently being, performed by the processor 96 are continued, based on the instructions maintained in the instruction store 98, until enough registers within the general purpose register block 92 become available. Thus, through the sharing of resources within the unified shader 62, processing of image data is enhanced as there is no down time associated with the processor 96.

[00029] Referring back to FIG. 4A, the graphics processor 60 further includes a cache block 70, including a parameter cache 70A and a position cache 70B which accepts the pixel based output of the unified shader 62 on line 85 and stores the respective pixel parameter and position information in the corresponding cache. The pixel information present in the cache block 70 is then transmitted to the primitive assembly block 72 on line 71. The primitive assembly block 72 is responsible for assembling the information transmitted thereto from the cache block 70 into a series of triangles, or other suitable primitives, for further processing. The assembled primitives are then transmitted on line 73 to rasterization engine block 74, where the transmitted primitives are then converted into individual pixel data information through a walking process, or any other suitable pixel generation process. The resulting pixel data from the rasterization engine block 74 is the interpolated pixel parameter data that is transmitted to the second input of the multiplexer 66 on line 75.

[00030] In those situations when vertex data is transmitted to the unified shader 62 through the multiplexer 66, the resulting vertex data generated by the processor 96, is transmitted to a render back end block 76 which converts the resulting vertex data into at least one of several formats suitable for later display on display device 84. For example, if a stained glass appearance effect is to be applied to an image, the information corresponding to such appearance effect is associated with the appropriate position data by the render back end 76. The information from the render back end 76 is then transmitted to memory 82 and a display controller line 80 via memory controller 78. Such appropriately formatted information is then transmitted on line 83 for presentation on display device 84.

[00031] Referring now to FIG. 4B, shown therein is a vertex block 61 which is used to provide the vertex information at the first input of the multiplexer 66 according to an alternate embodiment of the present invention. The vertex block 61 includes a vertex fetch block 61A which is responsible for retrieving vertex information from memory 82, if requested, and transmitting that vertex information into the vertex cache 61B. The information stored in the vertex cache 61B comprises the vertex information that is coupled to the first input of multiplexer 66.

[00032] As discussed above, the graphics processor 60 of the present invention incorporates a unified shader 62 which is capable of performing both vertex manipulation operations and pixel manipulation operations based on the instructions stored in the instruction store 98. In this fashion, the graphics processor 60 of the present invention takes up less real estate than conventional graphics processors as separate vertex shaders and pixel shaders are no longer required. In addition, as the unified shader 62 is capable

of alternating between performing vertex manipulation operations and pixel manipulation operations, graphics processing efficiency is enhanced as one type of data operations is not dependent upon another type of data operations. Therefore, any performance penalties experienced as a result of dependent operations in conventional graphics processors are overcome.

[00033] The above detailed description of the present invention and the examples described therein have been presented for the purposes of illustration and description. It is therefore contemplated that the present invention cover any and all modifications, variations and equivalents that fall within the spirit and scope of the basic underlying principles disclosed and claimed herein.

CLAIMS

What is claimed is:

1. A graphics processor, comprising:

an arbiter circuit for selecting one of a plurality of inputs in response to a control signal; and

a shader, coupled to the arbiter circuit, operative to process the selected one of the plurality of inputs, the shader including means for performing vertex operations and pixel operations, and performing one of the vertex operations or pixel operations based on the selected one of the plurality of inputs, wherein the shader provides a appearance attribute.

- 2. The graphics processor of claim 1, further including a vertex storage block for maintaining vertex information.
- 3. The graphics processor of claim 2, wherein the vertex storage block further includes a parameter cache operative to maintain appearance attribute data for a corresponding vertex and a position cache operative to maintain position data for a corresponding vertex.
- 4. The graphics processor of claim 1, wherein the appearance attribute is color, and the color is associated with a corresponding pixel when the selected one of the plurality inputs is pixel data.

- 5. The graphics processor of claim 1, wherein the appearance attribute is position, and the position attribute is associated with a corresponding vertex when the selected one of the plurality of inputs is vertex data.
- 6. The graphics processor of claim 5, wherein the appearance attribute is color, and the color attribute is associated with a corresponding pixel when the selected one of the plurality of inputs is pixel data.
- 7. The graphics processor of claim 5, wherein the appearance attribute is one of the following: color, lighting, texture, normal and position data.
 - 8. The graphics processor of claim 1, wherein the appearance value is depth.
- 9. The graphics processor of claim 1, wherein the selection circuit is a multiplexer, and the control signal is provided by an arbiter, wherein the arbiter is coupled to the multiplexer.
- 10. The graphics processor of claim 1, wherein the shader provides vertex position data and further including a primitive assembly block, coupled to the shader, operative to generate primitives in response to the vertex position data.

11. The graphics processor of claim 10, further including a raster engine, coupled to the primitive assembly block, operative to generate pixel parameter data in response to the assembled vertex data.

12. The graphics processor of claim 1, wherein the shader generates pixel color information in response to the selected one of the plurality of inputs.

13. The graphics processor of claim 1, wherein the shader includes a register block for maintaining the selected one of the plurality of inputs, a computation element operative to perform arithmetic and logical operations on the data maintained in the register block, and a sequencer for maintaining the instructions that are executed by the computation element.

14. The graphics processor of claim 1, wherein the shader further includes circuitry operative to access a memory.

- 15. A unified shader, comprising:
 - a general purpose register block for maintaining data;
 - a processor unit; and
- a sequencer, coupled to the general purpose register block and the processor unit, the sequencer maintaining instructions operative to cause the processor unit to execute vertex calculation and pixel calculation operations on selected data maintained in the general purpose register block.
- 16. The shader of claim 15, wherein the sequencer further includes circuitry operative to fetch data from a memory.
- 17. The shader of claim 15, further including a selection circuit operative to provide information to the general purpose block in response to a control signal.
- 18. The shader of claim 15, wherein the processor unit executes instructions that generate a pixel color in response to the selected one of the plurality of inputs.
- 19. The shader of claim 15, wherein the processor unit executes vertex calculations while the pixel calculations are still in progress.
- 20. The shader of claim 15, wherein the processor unit generates vertex position and appearance data in response to a selected one of the plurality of inputs.

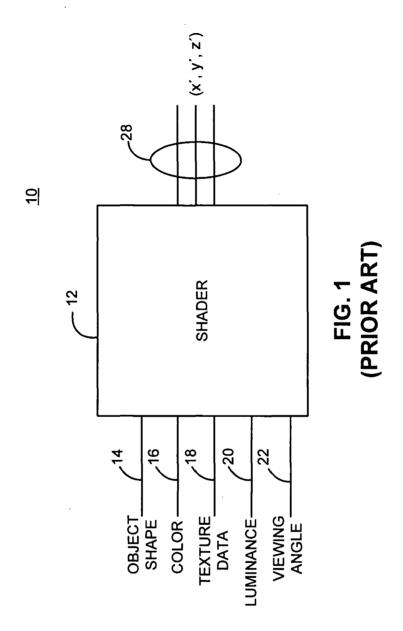

21. The shader of claim 17, wherein the selection circuit is a multiplexer and the control signal is provided by an arbiter.

A GRAPHICS PROCESSING ARCHITECTURE EMPLOYING A UNIFIED SHADER

ABSTRACT

A graphics processing architecture employing a single shader is disclosed. The architecture includes a circuit operative to select one of a plurality of inputs in response to a control signal; and a shader, coupled to the arbiter, operative to process the selected one of the plurality of inputs, the shader including means for performing vertex operations and pixel operations, and wherein the shader performs one of the vertex operations or pixel operations based on the selected one of the plurality of inputs. The shader includes a register block which is used to store the plurality of selected inputs, a sequencer which maintains vertex manipulation and pixel manipulations instructions and a processor capable of executing both floating point arithmetic and logical operations on the selected inputs in response to the instructions maintained in the sequencer.

History of the Modern Graphics Processor, Part 3

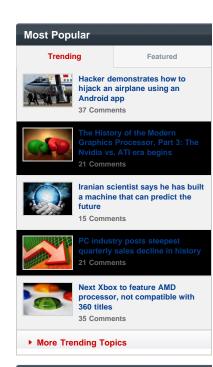

With the turn of the century the graphics industry bore witness to further consolidation.

The pro market saw iXMICRO leave graphics entirely, while NEC and Hewlett-Packard both produced their last products, the TE5 and VISUALIZE FX10 series respectively. Evans & Sutherland also parted ways with the sale of its RealVision line to focus on the planetaria and fulldome projection systems.

In the consumer graphics market, ATI announced the acquisition of ArtX Inc. in February 2000, for around \$400 million in stock. ArtX was developing the GPU codenamed Project Dolphin (eventually named "Flipper") for the Nintendo GameCube, which added significantly to ATI's bottom line.

Also in February, 3dfx announced a 20% workforce cut, then promptly moved to acquire Gigapixel for \$186

ATI 2077 LG v. ATI IPR2015-00326 million and gained the company's tile-based rendering IP

Meanwhile, S3 and Nvidia settled their outstanding patent suits and signed a seven-year cross-license agreement.

ATI GameCube GPU

VIA assumed control of S3 around April-May which itself

was just finishing a restructuring process from the acquisition of Number Nine. As part of S3's restructuring, the company merged with Diamond Multimedia in a stock swap valued at \$165 million. Diamond's high-end professional graphics division, FireGL, was spun off as SONICblue and later sold to ATI in March 2001 for \$10 million.

3DLabs acquired Intergraph's Intense3D in April, while the final acts of 3dfx played out towards the end of the year, despite 2000 kicking off with the promise of a better future as the long-awaited Voodoo 5 5500 neared its debut in July. The latter ended up trading blows with the GeForce 256 DDR and won the high-resolution battle.

Where 3dfx was once a byword for raw performance, its strengths around this time laid in its full screen antialiasing image quality.

But where 3dfx was once a byword for raw performance, its strengths around this time laid in its full screen antialiasing image quality. The Voodoo 5 introduced T-buffer technology as an alternative to transformation and lighting, by basically taking a few rendered frames and aggregating them into one image. This produced a slightly blurred picture that, when run in frame sequence, smoothed out the motion of the animation.

3dfx's technology became the forerunner of many image quality enhancements seen today, like soft

shadows and reflections, motion blur, as well as depth of field blurring.

3dfx's swan song, the Voodoo 4 4500, arrived October 19 after several delays – unlike the 4200 and 4800 that were never released. The card was originally scheduled for spring as a competitor to Nvidia's TNT2, but ended up going against the company's iconic GeForce 256 DDR instead, as well as the much better performing GeForce 2 GTS and ATI Radeon DDR.

On November 14, 3dfx announced they were belatedly ceasing production and sale of their own-branded graphics cards, something that had been rumoured for some time but largely discounted. Adding fuel to the fire, news got out that upcoming Pentium 4 motherboards would not support the 3.3V AGP signalling required Voodoo 5 series.

Voodoo5 5500 AGP box art

The death knell sounded a month later for 3dfx when Nvidia purchased its IP portfolio for \$70 million plus one million shares of common stock. A few internet wits later noted that the 3dfx design team which had moved to Nvidia eventually got both their revenge and lived up to their potential, by delivering the underperforming NV30 graphics chip powering the FX 5700 and FX 5800 cards behind schedule.

The Nvidia vs. ATI Era Begins

Prior to the Voodoo 5's arrival, ATI had announced the Radeon DDR as "the most powerful graphics processor ever designed for desktop PCs." Previews of the card had already gone public on April 25, and only twenty-four hours later Nvidia countered with the announcement of the GeForce 2 GTS (GigaTexel Shader). The latter included Nvidia's version of ATI's Pixel Tapestry Architecture, named Nvidia Shading Rasterizer, allowing for effects such as specular shading, volumetric explosion, refraction, waves, vertex blending, shadow volumes, bump mapping and elevation mapping to be applied on a per-pixel basis via hardware.

The feature was believed to have made it to the previous NV10 (GeForce 256) chip but it remained disabled due to a hardware fault. The GTS also followed ATI's Charisma Engine in allowing for all transform, clipping and lighting calculations to be supported by the GPU. That said, ATI went a step further with vertex skinning for a more fluid movement of polygons, and keyframe interpolation, where developers designed a starting and finishing mesh for an animation and the Charisma core calculated the intervening meshes.

ATI Radeon DDR

The ATI Radeon DDR eventually launched for retail in August 2000. Backed by a superior T&L implementation and support for several of the upcoming DirectX 8 features, the Radeon DDR alongside the GeForce 2 GTS ushered in the use of DVI outputs by integrating support for the interface into the chip itself. The DVI output was more often found on OEM cards, however, as the retail variety usually sported VIVO plugs.

One downside to the Radeon DDR is that boards shipped with their core and memory downclocked from the promised 200MHz and 183MHz, respectively. In addition, drivers were once again less than optimal at launch. There were issues with 16-bit color and compatibility problems with VIA chipsets, but this did not stop the card from dominating the competition at resolutions higher than 1024x768x32. A price of \$399 for the 64MB version stacked up well versus \$349-399 for the 64MB GeForce 2 GTS, which it beat by a margin of 10-20% in benchmarks, and helped ATI maintain its number one position in graphics market share over Nvidia.

Nvidia wasn't doing all that bad for themselves either. The company reported net income of \$98.5 million for the fiscal year on record revenue of \$735.3 million, driven in large part by its market segmentation strategy, releasing a watered-down MX version of the card in June and a higher clocked Ultra model in August. The latter dethroned the Radeon in terms of performance but it also cost \$499. A Pro model arrived in December.

Besides releasing a GeForce 2 card at every price point, from the budget MX to the professional Quadro 2 range, Nvidia also released its first mobile chip in the form of the GeForce2 Go.

As 3dfx was undergoing its death throes in November, Imagination Tech (ex-VideoLogic) and ST Micro attempted to address the high volume budget market with the PowerVR series 3 KYRO. Typically ranging in price from \$80 to \$110 depending on the memory framebuffer, the card represented good value for the money in gaming at resolutions of 1024x768 or lower. It would have become more popular, had the GeForce2 MX

By the time 2001 dawned, the PC graphics market consisted of a discrete card duopoly, with both

arrived later, or not so aggressively priced at ~\$110.

The KYRO II arrived in April 2001 with a bump in clock speeds compared to the original and manufactured on a smaller 180nm process by ST Micro. But once again the card faced stiff

of them in addition to Intel supplying the vast majority of integrated graphics chipsets.

competition from the GeForce 2 MX. Nvidia rebadged the card as the MX200 and lopped 40% off its price, while adding a higher clocked MX400 card at the same price as the Kyro II.

When PowerVR failed to secure game development impetus for tile based rendering, and ST Micro closed down its graphics business in early 2002, Imagination Technologies moved from desktop graphics to mobile and leveraged that expertise into system on chip graphics. They licenced the Series 5/5XT/6 for use with ARM-based processors in the ultra portable and smartphone markets.

By the time 2001 dawned, the PC graphics market consisted of a discrete card duopoly, with both of them in addition to Intel supplying the vast majority of integrated graphics chipsets.

Meanwhile, Matrox and S3/VIA clung to the margins of traditional markets.

Building on the strides made with the GeForce 2 series, Nvidia unveiled the GeForce 3 on February 27, 2001 priced between \$339 and \$449. The card became the new king of the hill, but it really only came into its own at the (then) extreme resolution of 1600x1200, preferably with full screen antialiasing applied.

Nvidia's stock GeForce 3 card

Initial drivers were buggy, especially in some OpenGL titles. What the new GeForce did bring to the table was DirectX 8, multisampling AA, quincunx AA (basically 2xMSAA + post process blur), 8x anisotrophic filtering as well as the unrivalled ability to handle 8xAF + trilinear filtering, and a programmable vertex shader which allowed for closer control of polygon mesh motion and a more fluid animation sequence.

There was also LMA (Lightspeed Memory Architecture) support -- basically Nvidia's version of HyperZ -- for culling pixels that would end up hidden behind others on screen (Z occlusion culling) as well as compressing and decompressing data to optimize use of bandwidth (Z compression).

Lastly, Nvidia implemented load-balancing algorithms as part of what they called the Crossbar Memory Controller, which consisted of four independent memory sub-controllers as opposed to the industry standard single controller, allowing incoming memory requests to be routed more effectively.

Nvidia NV2A inside Microsoft's Xbox

Nvidia's product line later added the NV2A, a derivative of the GeForce 3 with GeForce4 attributes that was used in Microsoft's Xbox game console.

At this point, Nvidia controlled 31% of the graphics market to Intel's 26% and ATI's 17%.

As Nvidia complemented the GF3 lineup with underclocked Ti 200 and overclocked Ti 500 models, ATI hurried to ramp up deliveries of the Radeon 8500. The card was built around the R200 GPU using TSMC's 150nm process (the same used by GeForce 3's NV20). The chip had been

announced in August and was eagerly awaited since John Carmack of id software talked it up saying it would run the new Doom 3 "twice as well" as the GeForce 3.

ATI's official R8500 announcement was no less enthusiastic. But reality kicked in once the card launched in October and was found to perform at the level of the underclocked GF3 Ti 200 in games. Unfinished drivers and a lack of workable Smoothvision antialiasing weighted heavily against the R8500 in its initial round of reviews. By the time the holiday season arrived, a second round of reviews showed that the drivers had matured to a degree and raised the R8500's performance in-between the Ti 200 and the standard GF3.

Spec comparison snapshot

	Core clock (MHz)	Pixel pipelines	Fill rate (Mpixels/s	Texture units per pixel pipeline	Fill rate (Mtexels/s)	Memory clock (MHz)	Memory bus width (bits)	Memory bandwidth (GB/s)
GeForce3 Ti 200	175	4	700	2	1400	400	128	6.4
GeForce3	200	4	800	2	1600	460	128	7.4
GeForce3 Ti 500	240	4	960	2	1920	500	128	8.0
Radeon 64MB DDR	183	2	366	3	1100	366	128	5.9
Radeon 8500	275	4	1100	2	2200	550	128	8.8

Very competitive pricing and a better all around feature set (2D image quality, video playback, performance under antialiasing) made the card a worthy competitor to the GF3 and Ti 500 nonetheless.

ATI's sales for the year dropped to \$1.04 billion as the company recorded a net loss of \$54.2 million. The company began granting licenses to board partners to build and market graphics boards, while refocusing their resources on design and chip making.

ATI also debuted the Set-Top-Wonder Xilleon, a development platform based on the Xilleon 220 SoC which provided a full processor, graphics, I/O, video and audio for set-top boxes integrated into digital TV designs.

To complement Xilleon, ATI acquired NxtWave

ATI Xilleon board

Communications for \$20 million in June 2002. The company specialized in digital signal processing and applications for set-top boxes and terrestrial

digital solutions.

Keeping up with their product launch cycle, Nvidia released the GeForce 4 in February 2002. Three MX parts, three mobile parts based on the MX models, and two performance Titanium models (Ti 4400 and Ti 4600) made up the initial line up -- built on TSMC's 150nm process. The GeForce 4 was effectively ready for release two months earlier but the launch was delayed to avoid eating into GeForce 3 sales over the holiday season.

The MX series cards were intended for the budget segment but they were still largely uninspiring as they were based on the old GeForce 2 architecture. MPEG2 decode added but the cards reverted to DirectX 7.0/7.1 support as the earlier GF2 MX line. Pricing at \$99-179 reflected the reduced feature set.

The Titanium models on the other hand were excellent performers and in some instances managed a 50+% increase in performance over the GeForce3 Ti 500. The Ti 4600 became the performance champ overnight, easily disposing of the Radeon 8500, while the Ti 4200 at \$199 represented the best value for money card.

But then came the Radeon 9700 Pro and promptly consigned every other card to also-ran status.

ATI Radeon 9700 Pro (FIC A97P)

Developed by a team that had originally formed the core of ArtX, the ATI R300 GPU delivered spectacularly and arrived very promptly. It was the first to bring DirectX 9.0 support, and by extension, the first architecture to support shader model 2.0, vertex shader 2.0, and pixel shader

2.0. Other notable achievements: it was the second GPU series to support AGP 8x -- SiS's Xabre 80/200/400 line was first -- and implementing the first flip-chip GPU package.

ATI complemented the line-up in October by adding a non-Pro 9700 at \$299 for those unable to part with \$399 for the top model. Meanwhile, the cut down 9500 Pro (\$199) and 9500 (\$179) reached down through mainstream market segments, and the FireGL Z1/X1 filled in the \$550-950 bracket for professional graphics. The All-In-Wonder 9700 Pro (\$449) was also added in December.

ATI's sales are likely to have taken a hit when it was found that many cards could be modded to their more expensive counterparts. Examples of this included the ability to turn a 9500 card into a 9700 using its reference board (with the full complement of memory traces), or a

About flip-chip GPU packages: Previous generations of graphics chips and other ICs used wire-bonding mounting. With this method, the chip sits on the board with the logic blocks sitting under the metal layers whose pads would be connected by thin wires arranged around the edges of the chip down to solder balls or pins on the underside. Flip-chip does away with the wire component through contact points (usually soldered in a ball grid array) directly on the "top" of the chip, which is then inverted, or "flipped" so that the solder points directly contact the substrate or circuit board. The chip then undergoes localised heating (reflow) to melt the solder that then forms the connection with the underlying contact points of the board.

9800 Pro to its XT counterpart. For the latter, a driver patch was made available to check if it would accept the mod, which consisted of soldering in a resistor or using a pencil to tweak the GPU and memory voltage control chip. Hard mods also included upgrading various 9800 models into a FireGL X2, while a patched/Omega driver had the ability to turn a \$250 9800 SE 256MB into a \$499 9800 Pro 256MB.

In addition to discrete graphics, ATI also introduced desktop integrated graphics and chipsets. These included the A3/ IGP 320 meant to be paired with AMD CPUs, RS200/IGP 330 & 340 for Intel chips, as well as the mobile series U1/IGP 320M for AMD platforms and RS200M for Pentium 4-M. All of them were complemented with ATI southbridges, specifically the IXP200/250.

SiS unveiled the Xabre line between the launch of the GeForce4 and the R300. The cards were consistently slower than Nvidia and ATI's offerings at the same price points, and were handicapped by the lack of vertex shader pipelines. This translated into a heavy reliance upon drivers and game developers to get the most out of software emulation, thus keeping SiS in the margins of desktop discrete 3D graphics.

The Xabre line also implemented "Turbo Texturing", where framerates were increased by drastically reducing texture quality, and lacked anisotrophic filtering. All this did little to endear reviewers to the cards.

The Xabre line was the last under the SiS banner, as the company spun off its graphics division (renamed XGI) and merged with Trident Graphics a couple of months later in June.

The first of Nvidia's FX series arrived on January 27, 2003 with the infamous "Dustbuster" FX 5800 and the slightly faster (read: less slow) FX 5800 Ultra. When compared to the reigning champ, the ATI Radeon 9700 Pro (and non-Pro), the FX was much louder, it delivered inferior anisotrophic filtering (AF) quality and antialiasing (AA) performance, and was overall much slower. ATI was so far ahead that a second-tier Radeon 9700 card launched five months earlier comfortably outperformed the Ultra, and it was \$100 cheaper (\$299 vs \$399).

The 3dfx design team which had moved to Nvidia got both their revenge and lived up to their potential, by delivering the underperforming NV30 graphics chip

behind schedule.

The NV30 chip was supposed to debut in August, around the same time as the Radeon 9700, but ramping problems and high defect rates on TSMC's Low-K 130nm process held Nvidia back. Some circles also argued that the company was strapped for engineering resources, with more than a few tied up with the NV2A Xbox console chip, the SoundStorm APU, as well as the motherboard chipsets.

Looking to move things forward Nvidia undertook a project to have several FX series chips fabricated on IBM's more conventional Fluorosilicate glass (FSG) low-K 130nm process.

ATI refreshed its line of cards in March, starting with the 9800 Pro, featuring a R350 GPU that was basically an R300 with some enhancements to the Hyper-Z caching and compression instruction.

The RV350 and RV280 followed in April. The first of these, found inside the Radeon 9600, was built using the same TSMC 130nm low-K process that Nvidia had adopted, Meanwhile, the RV280 powering the Radeon 9200 was little more than a rebadged RV250 of the Radeon 9000 with AGP 8x support.

The same month saw ATI and Nintendo sign a technology agreement that would eventually lead to the Hollywood GPU for the Nintendo Wii console. ATI added a second console coup in August, when Microsoft awarded the Xbox 360 GPU contract to them.

A scant three and a half months after the inglorious debut of the FX 5800, Nvidia took another shot with the NV35 (FX 5900 and FX 5900 Ultra). The new Detonator FX driver greatly improved AA and AF, almost matching ATI's solution in terms of quality. However the 5900 achieved what the 5800 could not. It knocked ATI's Radeon 9800 Pro from its spot as the fastest card around, although at \$499 apiece, few would actually take advantage of this.

Xbox 360 GPU (ATI C1 / Xenos)

As expected, ATI regained bragging rights in September with the release of the 9800 XT. Superior driver support – mainly with some DX9 games – also made the XT a better overall card than Nvidia's counterpart, ensuring that ATI ended the year with the performance crown. The 9700 Pro remained the standout mainstream board, while the FX 5700 Ultra at \$199 won the sub-\$200 price segment.

ATI bounced back with a \$35.2 million profit in 2003 after posting a \$47.5 million loss in 2002. A good chunk of this came from higher selling prices for the dominant 9800 and 9600 cards. Meanwhile, Nvidia retained 75% of the DirectX 9 value segment market, thanks to the popularity of the FX 5200.

0009

Source DirectX 9.0 Effects Trailer, shown during ATI's presentation of the Radeon 9800 XT and 9600 XT

The newly formed XGI launched the Xabre successor in a staggered release between September and November. Renamed Volari, the card line-up ranged from the \$49 V3 to the dual GPU Duo V8 Ultra. The V3 was virtually a rebrand of Trident's Blade XP4 and a DX 8.1 part, while the rest of the series (V5 and V8) was developed from the previous SiS Xabre and featured DX9.0 support.

For the most part, all of the models underdelivered, with the exception of the entry-level V3 which offered performance equal to the GeForce FX 5200 Ultra and Radeon 9200. The Duo V8 Ultra was priced ~20% higher than the Radeon 9800 Pro 128MB, yet delivered performance on par or lower than the 9600XT.

Another company making a comeback into desktop graphics was S3. Unfortunately, the buying public now generally saw desktop graphics as a two horse race – and S3 wasn't one of the two.

XGI's Volari line lingered on with the 8300 in late 2005, which was more or less on par with the Radeon X300SE/GeForce 6200 at \$49, as well as the Z9/Z11 and XP10. The company was reabsorbed back into SiS in October 2010.

Another company making a comeback into desktop graphics was S3. After the graphics division was sold to VIA for \$208 million plus the company's \$60 million debt, the restructured venture concentrated primarily on chipset projects.

DeltaChrome desktop cards were announced in January, but in time-honoured S3 fashion, the first S4 and S8 models didn't start appearing in the retail channel until December. The new cards featured most of the new must-haves of 2003;

DirectX 9 support, 16x AF, HD 1080p support, and portrait-mode display support.

Unfortunately, the buying public now generally saw desktop graphics as a two horse race – and S3 wasn't one of the two. While S3 was looking to keep competitive, ATI and Nvidia were driving each other to achieve ever-increasing levels of performance and image quality.

The DeltaChrome was succeeded by the GammaChrome in 2005.

Nvidia and ATI continued in 2005 their staggered launches. The former launched its first GDDR3 card in March as the FX 5700 Ultra, followed by the GeForce 6 series with the high-end 6800 range. The initial line up comprised the 6800 (\$299), GT (\$399), the Ultra (\$499), and an overclocked variant known as the Ultra Extreme (\$549) to counter ATI's X800 XT Platinum Edition. The latter was sold by a select band of add-in board partners.

The 6800 Ultra 512MB was added on March 14 2005 and sold for the unbelievable price of \$899 -- BFG added an overclocked version for \$999. The midrange was well catered for with the 6600 series in September.

Nvidia's feature set for the 6000 series included DirectX 9.0c support, shader model 3.0 (although the cards were never able to fully exploit this), Nvidia's PureVideo decode and playback engine,

and SLI support -- the multi-GPU performance multiplier IP that was acquired from 3dfx.

Reintroducing an old feature: SLI

Where the 3dfx implementation resulted in each processing unit being responsible for alternate line scans, Nvidia handled things in a few different ways. The company implemented split frame rendering (SFR), in which each GPU rendered the top or bottom half of the frame, alternate frame rendering (AFR) so GPUs rendered frames in turn, and in some cases the driver just disabled SLI depending on whether the game supported the feature. This last feature was a hit-or-miss early in driver development.

While the technology was announced in June, it required a motherboard with an nForce4 chipset to enable multi-GPU setups, and these didn't start reaching the retail channel in numbers until late November. Adding fuel to the fire, initial driver releases where sporadic (at best) until into the following year.

Reviews at the time generally mirrored current performance, showing that two lower tier cards (like the 6600 GT SLI which could be had for \$398) generally equalled one enthusiast card at lower resolutions and image quality. At highest resolutions and with antialiasing applied, however, single card setups still gained the upper hand. SLI and ATI's CrossFire performance was as erratic then as it sometimes is now, running the full gamut from perfect scaling to not working at all.

Nvidia's board partners immediately saw marketing opportunities with the re-invented tech, with Gigabyte offering a dual 6600 GT SLI card (the 3D1), followed by a dual 6600 (3D1-XL), and

While Nvidia's SLI was announced in June 2004, the required nForce4 motherboards didn't hit the retail channel in numbers until November, and initial driver releases where sporadic until

into the following year.

the 6800 GT (3D1-68GT). These cards not only required an nF4 chipset but also a Gigabyte branded motherboard as well.

Of the high-end single GPU cards, the 6800 Ultra and X800 XT/XT PE were fairly evenly matched, both in price and performance. But they weren't without their issues. The latter arrived in May and suffered supply constraints throughout its entire production life, while Nvidia's flagship 6800 Ultra was extremely late arriving in August and suffered supply constraints too depending on distribution area, since the card was only made available by a percentage of board partners.

The 6800 GT generally bested the X800 Pro at \$399, while the 6600 GT cleaned up in the \$199 bracket.

Intense competition with Nvidia that year didn't have an adverse effect on ATI's bottom line, as profit peaked at \$204.8 million for the year from nearly \$2 billion in revenue.

One quirk associated with the well-received 6600 GT was that it initially launched as a PCI Express card, at a time when PCI-E was an Intel-only feature for motherboards designed for Pentium 4 processors. These chips generally lagged in gaming performance behind AMD's offerings, which of course used the AGP data bus.

Nvidia's 7000 series started rolling off the assembly lines well before the 6000 series had completed its model line-up. The 7800 GTX arrived a full five months before the reduced bill of materials (BoM) 6800 GS saw the light of day. The first iteration of the 7800 series was based around the G70 GPU on TSMC's 110nm process, but quickly gave way to the G71-based 7900 series, made on TSMC's 90nm process.

While the naming convention changed from "NV" to "G", the latter were architecturally related to the NV40 series of the GeForce 6000. And while only fractionally larger than the NV40-45 at 334mm², the G70 packed in an extra eighty million transistors (for a total of 302 million), adding a third more vertex pipelines and 50% more pixel pipelines. In most cases, the G70 was superseded within nine months, and in the case of the GS and GTX 512MB, the figure was 3 and 4 months respectively.

At the entry level, the 7100 GS continued the use of TurboCache (the ability for the board to use some system memory), which was introduced with the previous generation GeForce 6200 TC.

Nvidia GeForce 7800 GTX

At the other end of the spectrum, the 7800 GTX 256MB hit retail on June 22 with an MSRP of \$599, though its actual street price was higher in many instances. ATI wrested the single-GPU crown back with the X1800 XT, but Nvidia countered with a 512MB version of the 7800 GTX thirty-five days later and promptly regained the title.

Two months later, ATI launched the X1900 XTX, which traded blows with Nvidia's flagship. This particular graphics horsepower race resulted in both cards being priced at \$650. One spinoff of the cards moving to a 512MB frame buffer was that gaming at 2560x1600 with 32-bit color and a high level of image quality enabled was now possible via dual link DVI.

ATI announced their multi-card Crossfire technology in May 2005 and made it available in September with the launch of the Xpress 200 Crossfire Edition chipset, and X850 XT Crossfire Master board. Due to a single-link TMDS, resolution and refresh rates were initially limited to 1600x1200 @60Hz, but a dual-link TMDS for 2560x1600 would soon replace it.

Unlike Nvidia's solution of two identical cards communicating via a bridge connector, ATI implemented a master card with TMDS receiver, which

ATI's original CrossFire design required using an external Y cable

accepted input from a slave card via external dongle and a Xilinx compositing chip.

Like Nvidia's SLI, CrossFire offered alternative frame rendering (AFR) and split frame rendering (SFR), but also a rendering technique called SuperTiling. The latter offered a performance increase in certain applications, but it did not work with OpenGL or support accelerated geometry processing. Also like SLI, Crossfire faced its share of driver-related troubles.

ATI intended to have their R520 based cards – their first to incorporate Shader Model 3.0 – ready by the June-July timeframe, but the late discovery of a bug in the cell library forced a 4 month delay.

Initial launches comprised the X1800 XL/XT using the R520 core, the X1300 budget cards using the RV515 with essentially one quarter of the graphics pipelines of the R520, and the X1600 Pro/XT based on the RV530, which was similar to the RV515 but with a higher shader and vertex pipeline-to-TMU and ROP ratio.

Due to the initial delay with the R520, the GPU and its derivations were being replaced a scant three and a half months later by the R580-based X1900 series which used TSMC's new 80nm process. Continuing with the roll out, half the graphics pipeline resources went into the RV570 (X1650 GT/XT and X1950 GT/Pro), while a shrunk RV530 became the RV535 powering the X1650 Pro as well as the X1300 XT.

ATI's revenue rose to a record \$2.2 billion for the year, the highest in the company's history, aided by shipments of Xenos GPUs for the Xbox 360. Net profit, however, slumped to \$16.9 million.

ATI's revenue rose to a record \$2.2 billion in 2005, the highest in the company's history, aided by shipments of Xenos GPUs for the Xbox 360. Net profit, however, slumped to \$16.9 million.

By this stage, any graphics card launch not based on an Nvidia or ATI GPU was received with a certain amount of curiosity, if not enthusiasm. Such was the scene when S3's overhauled graphics line-up debuted in November.

The Chrome S25 and S27 promised good gaming performance based on their high clocks, but delivered a mostly sub-par product. Initial pricing at \$99 (S25) and \$115 (S27) put the cards in competition against Nvidia's 6600/6600GT and ATI's X1300Pro/X1600Pro, but neither S3 card stood up to the competition in any meaningful way, aside from power consumption. That slight advantage evaporated as ATI/AMD and Nvidia

addressed the HTPC and entry-level market

segment, effectively killing S3's subsequent Chrome 400 and 500 series.

An added issue for S3 was that the cost of building the cards resulted in razor thin profits. The company needed high volume sales in a market dominated by two vendors. HTC were to acquire S3 in July 2012 for \$300 million, a move originally seen as leverage in HTC's and S3's separate legal disputes with Apple.

Nvidia and ATI continued to hog the press coverage in 2006.

ATI acquired Macrosynergy, a Shanghai based design and engineering centre with personnel working in California and previously part of the XGI group. Then in May the company bought BitBoys in a \$44 million deal.

Meanwhile, Nvidia's first foray into dual-GPU single board products came in March, following in the footsteps of ATI, 3dfx, and XGI. The 7900 GX2 would sandwich two custom boards essentially carrying a couple of downclocked 7900 GTXs. But Asustek didn't wait around for Nvidia's dual-GPU solution, however, and released its own take as the Extreme N7800GT Dual (\$900, 2000 units built), which paired two 7800 GT GPUs instead.

This card started Asus interest in limited edition dual-GPU boards, and possibly hardened Nvidia's attitude towards board partners', as Asustek products took the spotlight from their reference models at launch.

In the higher volume mainstream market, the 7600 GT and GS both provided solid performance and remarkable longevity, while ATI's X1950 XTX and Crossfire ruled the top end enthusiast benchmarks for single GPU cards. The X1900 XT and GeForce 7900 GT were fairly evenly matched in the upper mainstream bracket.

ATI's David Orton and AMD's Hector Ruiz officially announce the historic merger

After twenty-one years as an independent company, ATI was bought out by AMD on October 25 2006 for a total price of \$5.4 billion – split between \$1.7 billion from AMD, \$2.5 billion borrowed from lending institutions, 57 million AMD shares and 11 million options/restricted stock units valued at \$1.2 billion. At the time of the buy out, around 60-70% of ATI's chipset/IGP revenues were accrued from a partnership with Intel based motherboards.

Two weeks after the ATI buy-out, Nvidia ushered in

the age of unified shader architectures for PC graphics.

With a large part of Intel's IGP chipset market moving to Nvidia, market share dropped dramatically. The logic behind the buy was a seemingly quick path to GPU technology, rather than use the \$5.4 billion to develop AMD's own IP and add licenced technology where needed. At the time, AMD was aiming at the quick introduction of Torrenza and the associated Fusion projects.

Two weeks after the ATI buy-out, Nvidia ushered in the age of unified shader architectures for PC graphics. ATI's Xenos GPU for the Xbox 360 had already introduced the unified architecture to consoles.

This article is the third installment on a series of four. Next week we'll wrap things up, following the development of Radeon products under AMD's wing, the continued rivalry between GeForce and Radeon CPUs, the transition toward stream processing, and what the present a near future holds for graphics processors.

Part 1: (1976 - 1995) The Early Days of 3D Consumer Graphics

Part 2: (1995 - 1999) 3Dfx Voodoo: The Game-changer

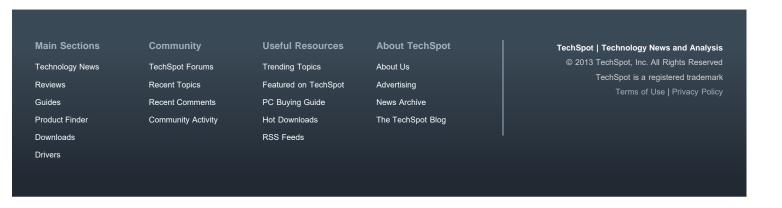

Part 3: (2000 - 2006) The Nvidia vs. ATI Era Begins

Part 4: (2006 - Present) The Modern GPU: Stream processing units a.k.a.

How GPUs Work

David Luebke, NVIDIA Research **Greg Humphreys**, University of Virginia

n the early 1990s, ubiquitous interactive 3D graphics was still the stuff of science fiction. By the end of the decade, nearly every new computer contained a graphics processing unit (GPU) dedicated to providing a high-performance, visually rich, interactive 3D experience.

This dramatic shift was the inevitable consequence of consumer demand for videogames, advances in manufacturing technology, and the exploitation of the inherent parallelism in the feed-forward graphics pipeline. Today, the raw computational power of a GPU dwarfs that of the most powerful CPU, and the gap is steadily widening.

Furthermore, GPUs have moved away from the traditional fixed-function 3D graphics pipeline toward a flexible general-purpose computational engine. Today, GPUs can implement many parallel algorithms directly using graphics hardware. Well-suited algorithms that leverage all the underlying computational horsepower often achieve tremendous speedups. Truly, the GPU is the first widely deployed commodity desktop parallel computer.

THE GRAPHICS PIPELINE

The task of any 3D graphics system is to synthesize an image from a description of a scene—60 times per second for real-time graphics such as videogames. This scene contains the geometric primitives to be viewed as well as descriptions of the lights illuminating the scene, the way that each object reflects light, and the viewer's position and orientation.

GPU designers traditionally have expressed this image-synthesis process as a hardware pipeline of specialized stages. Here, we provide a high-level overview of the classic graphics pipeline; our goal is to highlight those aspects of the real-time rendering calculation that allow graphics application developers to exploit modern GPUs as general-purpose parallel computation engines.

Pipeline input

Most real-time graphics systems assume that everything is made of triangles, and they first carve up any more complex shapes, such as quadrilaterals or curved surface patches, into triangles. The developer uses a computer graphics library (such as OpenGL or

Direct3D) to provide each triangle to the graphics pipeline one vertex at a time; the GPU assembles vertices into triangles as needed.

Model transformations

A GPU can specify each logical object in a scene in its own locally defined coordinate system, which is convenient for objects that are naturally defined hierarchically. This convenience comes at a price: before rendering, the GPU must first transform all objects into a common coordinate system. To ensure that triangles aren't warped or twisted into curved shapes, this transformation is limited to simple affine operations such as rotations, translations, scalings, and the like.

As the "Homogeneous Coordinates" sidebar explains, by representing each vertex in homogeneous coordinates, the graphics system can perform the entire hierarchy of transformations simultaneously with a single matrix-vector multiply. The need for efficient hardware to perform floating-point vector arithmetic for millions of vertices each second has helped drive the GPU parallel-computing revolution.

The output of this stage of the pipeline is a stream of triangles, all expressed in a common 3D coordinate system in which the viewer is located at the origin, and the direction of view is aligned with the *z*-axis.

Lighting

Once each triangle is in a global coordinate system, the GPU can compute its color based on the lights in the scene. As an example, we describe the calculations for a single-point light source (imagine a very small lightbulb). The GPU handles multiple lights by summing the contributions of each individual light. The traditional graphics pipeline supports the Phong lighting equation (B-T. Phong, "Illumination for Computer-Generated Images,' Comm. ACM, June 1975, pp. 311-317), a phenomenological appearance model that approximates the look of plastic. These materials combine a dull diffuse base with a shiny specular high-

96 Computer

ATI 2078 LG v. ATI IPR2015-00326 light. The Phong lighting equation gives the output color $C = K_d L_i(N \cdot L) + K_s L_i(R \cdot V)^s$.

Table 1 defines each term in the equation. The mathematics here isn't as important as the computation's structure; to evaluate this equation efficiently, GPUs must again operate directly on vectors. In this case, we repeatedly evaluate the dot product of two vectors, performing a four-component multiply-and-add operation.

Camera simulation

The graphics pipeline next projects each colored 3D triangle onto the virtual camera's film plane. Like the model transformations, the GPU does this using matrix-vector multiplication, again leveraging efficient vector operations in hardware. This stage's output is a stream of triangles in screen coordinates, ready to be turned into pixels.

Rasterization

Each visible screen-space triangle overlaps some pixels on the display; determining these pixels is called rasterization. GPU designers have incorporated many rasterizatiom algorithms over the years, which all exploit one crucial observation: Each pixel can be treated independently from all other pixels. Therefore, the machine can handle all pixels in parallel—indeed, some exotic machines have had a processor for each pixel. This inherent independence has led GPU designers to build increasingly parallel sets of pipelines.

Texturing

The actual color of each pixel can be taken directly from the lighting calculations, but for added realism, images called textures are often draped over the geometry to give the illusion of detail. GPUs store these textures in high-speed memory, which each pixel calculation must access to determine or modify that pixel's color.

In practice, the GPU might require multiple texture accesses per pixel to mitigate visual artifacts that can result when textures appear either smaller or larger on screen than their native

Homogeneous Coordinates

Points in three dimensions are typically represented as a triple (x,y,z). In computer graphics, however, it's frequently useful to add a fourth coordinate, w, to the point representation. To convert a point to this new representation, we set w = 1. To recover the original point, we apply the transformation $(x,y,z,w) \longrightarrow (x/w, y/w, z/w)$.

Although at first glance this might seem like needless complexity, it has several significant advantages. As a simple example, we can use the otherwise undefined point (x,y,z,0) to represent the direction vector (x,y,z). With this unified representation for points and vectors in place, we can also perform several useful transformations such as simple matrix-vector multiplies that would otherwise be impossible. For example, the multiplication

$$\begin{bmatrix} 1 & 0 & 0 & \Delta x \\ 0 & 1 & 0 & \Delta y \\ 0 & 0 & 1 & \Delta z \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ w \end{bmatrix}$$

can accomplish translation by an amount Dx, Dy, Dz.

Furthermore, these matrices can encode useful nonlinear transformations such as perspective foreshortening.

resolution. Because the access pattern to texture memory is typically very regular (nearby pixels tend to access nearby texture image locations), specialized cache designs help hide the latency of memory accesses.

Hidden surfaces

In most scenes, some objects obscure other objects. If each pixel were simply written to display memory, the most recently submitted triangle would appear to be in front. Thus, correct hidden surface removal would require sorting all triangles from back to front for each view, an expensive operation that isn't even always possible for all scenes.

All modern GPUs provide a depth buffer, a region of memory that stores the distance from each pixel to the viewer. Before writing to the display, the GPU compares a pixel's distance to the distance of the pixel that's already present, and it updates the display memory only if the new pixel is closer.

THE GRAPHICS PIPELINE, EVOLVED

GPUs have evolved from a hardwired implementation of the graphics pipeline

to a programmable computational substrate that can support it. Fixed-function units for transforming vertices and texturing pixels have been subsumed by a unified grid of processors, or shaders, that can perform these tasks and much more. This evolution has taken place over several generations by gradually replacing individual pipeline stages with increasingly programmable units. For example, the NVIDIA GeForce 3, launched in February 2001, introduced programmable vertex shaders. These shaders provide units that the programmer can use for performing matrix-vector multiplication, exponentiation, and square root calculations, as

Table 1. Phong lighting equation terms.				
Term	Meaning			
K_d	Diffuse color			
$\overline{L_i}$	Light color			
N	Surface normal			
L	Vector to light

HOW THINGS WORK

Figure 1. Programmable shading. The introduction of programmable shading in 2001 led to several visual effects not previously possible, such as this simulation of refractive chromatic dispersion for a "soap bubble" effect.

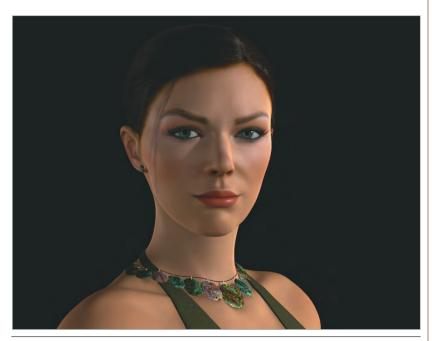

Figure 2. Unprecedented visual realism. Modern GPUs can use programmable shading to achieve near-cinematic realism, as this interactive demonstration shows, featuring actress Adrianne Curry on an NVIDIA GeForce 8800 GTX.

well as a short default program that uses these units to perform vertex transformation and lighting.

GeForce 3 also introduced limited reconfigurability into pixel processing,

exposing the texturing hardware's functionality as a set of *register combiners* that could achieve novel visual effects such as the "soap-bubble" look demonstrated in Figure 1. Subsequent

GPUs introduced increased flexibility, adding support for longer programs, more registers, and control-flow primitives such as branches, loops, and subroutines.

The ATI Radeon 9700 (July 2002) and NVIDIA GeForce FX (January 2003) replaced the often awkward register combiners with fully programmable pixel shaders. NVIDIA's latest chip, the GeForce 8800 (November 2006), adds programmability to the primitive assembly stage, allowing developers to control how they construct triangles from transformed vertices. As Figure 2 shows, modern GPUs achieve stunning visual realism.

Increases in precision have accompanied increases in programmability. The traditional graphics pipeline provided only 8-bit integers per color channel, allowing values ranging from 0 to 255. The ATI Radeon 9700 increased the representable range of color to 24-bit floating point, and NVIDIA's GeForce FX followed with both 16-bit and 32-bit floating point. Both vendors have announced plans to support 64-bit double-precision floating point in upcoming chips.

To keep up with the relentless demand for graphics performance, GPUs have aggressively embraced parallel design. GPUs have long used four-wide vector registers much like Intel's Streaming SIMD Extensions (SSE) instruction sets now provide on Intel CPUs. The number of such fourwide processors executing in parallel has increased as well, from only four on GeForce FX to 16 on GeForce 6800 (April 2004) to 24 on GeForce 7800 (May 2005). The GeForce 8800 actually includes 128 scalar shader processors that also run on a special shader clock at 2.5 times the clock rate (relative to pixel output) of former chips, so the computational performance might be considered equivalent to $128 \times 2.5/4 = 80$ four-wide pixel shaders.

UNIFIED SHADERS

The latest step in the evolution from hardwired pipeline to flexible computational fabric is the introduction of unified shaders. Unified shaders were first realized in the ATI Xenos chip for the Xbox 360 game console, and NVIDIA introduced them to PCs with the GeForce 8800 chip.

Instead of separate custom processors for vertex shaders, geometry shaders, and pixel shaders, a unified shader architecture provides one large grid of data-parallel floating-point processors general enough to run all these shader workloads. As Figure 3 shows, vertices, triangles, and pixels recirculate through the grid rather than flowing through a pipeline with stages of fixed width.

This configuration leads to better overall utilization because demand for the various shaders varies greatly between applications, and indeed even within a single frame of one application. For example, a videogame might begin an image by using large triangles to draw the sky and distant terrain. This quickly saturates the pixel shaders in a traditional pipeline, while leaving the vertex shaders mostly idle. One millisecond later, the game might use highly detailed geometry to draw intricate characters and objects. This behavior will swamp the vertex shaders and leave the pixel shaders mostly idle.

These dramatic oscillations in resource demands in a single image present a load-balancing nightmare for the game designer and can also vary unpredictably as the players' viewpoint and actions change. A unified shader architecture, on the other hand, can allocate a varying percentage of its pool of processors to each shader type.

For this example, a GeForce 8800 might use 90 percent of its 128 processors as pixel shaders and 10 percent as vertex shaders while drawing the sky, then reverse that ratio when drawing a distant character's geometry. The net result is a flexible parallel architecture that improves GPU utilization and provides much greater flexibility for game designers.

GPGPU

The highly parallel workload of real-time computer graphics demands

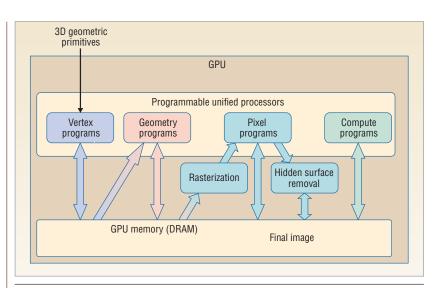

Figure 3. Graphics pipeline evolution. The NVIDIA GeForce 8800 GPU replaces the traditional graphics pipeline with a unified shader architecture in which vertices, triangles, and pixels recirculate through a set of programmable processors. The flexibility and computational power of these processors invites their use for general-purpose computing tasks.

extremely high arithmetic throughput and streaming memory bandwidth but tolerates considerable latency in an individual computation since final images are only displayed every 16 milliseconds. These workload characteristics have shaped the underlying GPU architecture: Whereas CPUs are optimized for low latency, GPUs are optimized for high throughput.

The raw computational horsepower of GPUs is staggering: A single GeForce 8800 chip achieves a sustained 330 billion floating-point operations per second (Gflops) on simple benchmarks (http://graphics.stanford.edu/projects/gpubench). The ever-increasing power, programmability, and precision of GPUs have motivated a great deal of research on general-purpose computation on graphics hardware—GPGPU for short. GPGPU researchers and developers use the GPU as a computational coprocessor rather than as an image-synthesis device.

The GPU's specialized architecture isn't well suited to every algorithm. Many applications are inherently serial and are characterized by incoherent and unpredictable memory access. Nonetheless, many important problems require significant computational

resources, mapping well to the GPU's many-core arithmetic intensity, or they require streaming through large quantities of data, mapping well to the GPU's streaming memory subsystem.

Porting a judiciously chosen algorithm to the GPU often produces speedups of five to 20 times over mature, optimized CPU codes running on state-of-the-art CPUs, and speedups of more than 100 times have been reported for some algorithms that map especially well.

Notable GPGPU success stories include Stanford University's Folding@ home project, which uses spare cycles that users around the world donate to study protein folding (http://folding.stanford.edu). A new GPU-accelerated Folding@home client contributed 28,000 Gflops in the month after its October 2006 release—more than 18 percent of the total Gflops that CPU clients contributed running on Microsoft Windows since October 2000.

In another GPGPU success story, researchers at the University of North Carolina and Microsoft used GPU-based code to win the 2006 Indy PennySort category of the TeraSort competition, a sorting benchmark testing price/performance for database

HOW THINGS WORK

operations (http://gamma.cs.unc.edu/ GPUTERASORT). Closer to home for the GPU business, the HavokFX product uses GPGPU techniques to accelerate tenfold the physics calculations used to add realistic behavior to objects in computer games (www. havok.com).

odern GPUs could be seen as the first generation of commodity data-parallel processors. Their tremendous computational capacity and rapid growth curve, far outstripping traditional CPUs, highlight the advantages of domain-specialized data-parallel computing.

We can expect increased programmability and generality from future

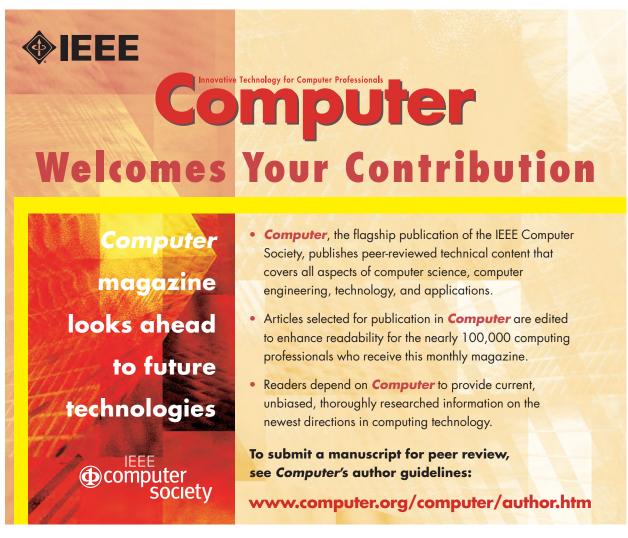

GPU architectures, but not without limit; neither vendors nor users want to sacrifice the specialized architecture that made GPUs successful in the first place. Today, GPU developers need new high-level programming models for massively multithreaded parallel computation, a problem soon to impact multicore CPU vendors as well.

Can GPU vendors, graphics developers, and the GPGPU research community build on their success with commodity parallel computing to transcend their computer graphics roots and develop the computational idioms, techniques, and frameworks for the desktop parallel computing environment of the future?

Microsoft and ATI Technologies Announce Technology Development Agreement

REDMOND, Wash., Aug. 14, 2003 — Microsoft Corp. (Nasdaq

"MSFT") today announced it has entered into a technology development agreement with ATI Technologies Inc. (TSX: ATY, NASDAQ: ATYT). Under the agreement, ATI is developing custom, leading-edge graphics technologies for use in future Xbox® products and services.

"We're combining Microsoft's vision, software experience and R & D resources with ATI's pioneering leadership in graphics technologies to create innovative future Xbox products and services that meet the lifestyle needs of consumers in the Digital Decade."

said Robbie Bach, senior vice president of the Home and Entertainment Division at Microsoft.

"We selected ATI after reviewing the top graphics technologies in development and determining that ATI's technical vision fits perfectly with the future direction of Xbox."

"Microsoft shares our passion for cutting-edge innovation,"

said K. Y. Ho, chairman and chief executive officer, ATI Technologies Inc.

"Our success working with Microsoft in the past gives us great confidence as we move forward, and our broad experience and wealth of engineering resources will ensure that we deliver. This agreement cements ATI's position as the prime graphics supplier for the future of the games industry."

About ATI Technologies Inc.

ATI Technologies Inc. is a world leader in the design and manufacture of innovative 3-D graphics and digital media silicon solutions. An industry pioneer since 1985, ATI is the world's foremost visual processor unit (VPU) provider and is dedicated to delivering leading-edge performance solutions for the full range of PC and Mac desktop and notebook platforms, workstation, set-top and digital television, game console, and handheld markets. With 2002 revenues in excess of U.S. \$1 billion, ATI has more than 2,000 employees in the Americas, Europe and Asia. ATI common shares trade on Nasdaq (ATYT) and the Toronto Stock Exchange (ATY).

About Xbox

Xbox (http://www.xbox.com/) is Microsoft's future-generation video game system that delivers the most powerful games experiences ever. Xbox empowers game artists by giving them the technology to fulfill their creative visions as never before, creating games that blur the lines between fantasy and reality. Xbox is now available in the continents of North America, Europe, Asia and Australia.

About Microsoft

Founded in 1975, Microsoft (Nasdag

"MSFT"

) is the worldwide leader in software, services and Internet technologies for personal and business computing. The company offers a wide range of products and services designed to empower people through great software — any time, any place and on any device.

Microsoft and Xbox are either registered trademarks or trademarks of Microsoft Corp. in the United States and/or other countries.

The names of actual companies and products mentioned herein may be the trademarks of their respective owners.

ATI and NVIDIA Proclaim Different Graphics Processors Architecture Goals

ATI Says Unified Rendering Engine – the Way to Go, NVIDIA Disagrees

Video News Archive

by <u>Anton Shilov</u> 12/23/2004 | 07:55 AM

While particular approaches in graphics processing units design have been pretty different for leading computer visual companies ATI Technologies and NVIDIA Corp., in future the architecture of GPUs from the firms may be fundamentally different, as executives from both companies proclaim different approaches for chip internal architectures.

NVIDIA Disagrees with ATI Technologies

ATI Technologies' developer relations manager Richard Huddy said last month during a conference in London, UK, that the company's future visual processing units will feature unified pixel and shader processing. While he declined to elaborate on the timeframes for such chips, he said unified pixel and vertex data processing is a required capability for Windows Graphics Foundation 2.0 that comes out together with Microsoft's next-generation operating system called Windows Longhorn. On of the benefits the unified approach brings is ability to dynamically allocate chip resources depending on the demand for pixel and vertex processing, Mr. Huddy said. Another one is simplified software development.

NVIDIA Corp.'s chief architect David Kirk called the unified graphics engines as an implementation detail, not a feature, but admitted the unified architecture would be nice for programmers, who would have one instruction set for vertex and pixel shaders.

"It's not clear to me that an architecture for a good, efficient, and fast vertex shader is the same as the architecture for a good and fast pixel shader. A pixel shader would need far, far more texture math performance and read bandwidth than an optimized vertex shader. So, if you used that pixel shader to do vertex shading, most of the hardware would be idle, most of the time. Which is better – a lean and mean optimized vertex shader and a lean and mean optimized pixel shader or two less-efficient hybrid shaders? There is an old saying: 'Jack of all trades, master of none'," Mr. Kirk said in an interview with ExtremeTech web-site.

ATI: Bridging Today and Tomorrow

Not much is known about the architecture and capabilities of the codenamed R520 product scheduled for release in Q2 2005 that was initially referred as the R500. What is clear now is that the new graphics chip will

ATI 2080 LG v. ATI IPR2015-00326 sport Shader Model 3.0 – pixel shaders 3.0 and vertex shaders 3.0 – bringing additional programming capabilities to ATI's future graphics processors as well as some other innovations.

ATI's R5xx architecture will not resemble that of the previous generation products and NVIDIA's GeForce 6 architecture known as NV4x, particularly ATI will implement efficient flow-control, a crucial feature for pixel shaders 3.0, that will not bring speed penalty it does on existing SM3.0 hardware, according to sources. The future of the graphics hardware lies in higher number of ALUs ops per texture ops, unified pixel and vertex shaders as well as some other requirements of Microsoft Windows Longhorn operating system, such as virtualisation and context switches. While ATI agrees on the long-term goals for its roadmap, it does not name feature-set of actual products and says all the architectural changes will be implemented gradually, not at once.

Some sources claim that the R500 is a code-name of ATI's graphics processor that will be submitted for Microsoft's next Xbox console. The shader core of the R500 was reported to have 48 Arithmetic Logic Units (ALUs) that can execute 64 simultaneous threads on groups of 64 vertices or pixels. ALUs are automatically and dynamically assigned to either pixel or vertex processing depending on load. The ALUs can each perform one vector and one scalar operation per clock cycle, for a total of 96 shader operations per clock cycle. Texture loads can be done in parallel to ALU operations. At peak performance, the GPU can issue 48 billion shader operations per second, it was said.

The R520 is also expected to feature advanced memory interface, presumably supporting <u>GDDR4 memory</u>.

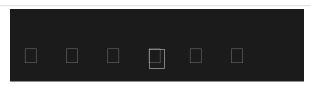

NVIDIA: Plans Unclear

While NVIDIA remains extremely tight-lipped over its future products, it is known that the company is readying its code-named NV47 visual processing unit, a massively revamped GeForce 6 architecture with 24 pixel pipelines. The NV47 is expected to be released sometime in Spring, 2005, but it is unknown whether NVIDIA is ahead, or behind ATI's R520 product. NVIDIA also reportedly plans to release a chip called NV48 in O2 2005.

The status of NVIDIA's future architecture code-named NV50 is also uncertain: some reported recently that the chip had been cancelled, but officials decline to confirm or deny the information.

5.2.3 Mobile Unified Shader

As shaders have developed, vertex shaders and pixel shaders have similar instruction set architecture and register files, except for some unique instructions such as texture sampling. Therefore a unified shader architecture, which can compute vertex shading and pixel shading with the same hardware, has been developed to reduce

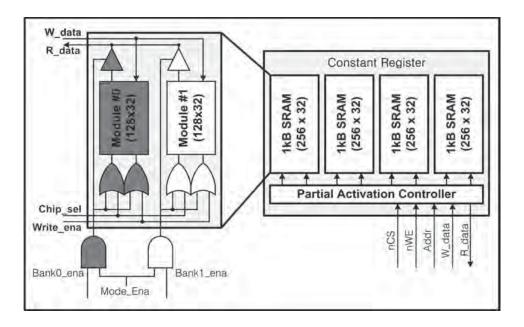

Figure 5.16 Partial activation

^a AC current is measured at 25% read, 25% write, 50% idle state.

design complexity and turnaround time. The first unified shader was implemented in Xenos by ATI for X-Box 360 [26]. In PC and console devices, a few tens of unified shaders are integrated and controlled with multi-thread control. Therefore, programmable graphics operations can be mapped to those unified shaders dynamically in real time, and the 3D graphics processor with unified shader can utilize the hardware resources more efficiently than conventional architecture with vertex shader and pixel shader.

In the mobile environment, a fully programmable 3D graphics pipeline is required. Owing to the need for low power consumption and small area, the conventional architecture with separate vertex shader and pixel shader is hard to implement. Since a unified shader can compute vertex shading and pixel shading in a single hardware, it is a good solution for programmable 3D graphics [21]. Figure 5.17a shows the block diagram of the 3D graphics processor, in which the unified shader performs vertex and pixel shading and other blocks perform other operations of the 3D graphics pipeline such as clipping, rasterization, and blending.

The unified shader is a 4-way SIMD processor. It consists of $128 \, \text{b}$, 4×32 -bit SIMD datapath, a special functional unit, a texture engine, a low-power lighting engine, register files, and control logic, as shown in Figure 5.17b. The SIMD datapath is responsible for vector and matrix arithmetic operations such as addition (ADD), multiplication (MUL), and inner product (DOT), and the special functional unit is dedicated to special functional scalar operations such as logarithm (LOG), exponent

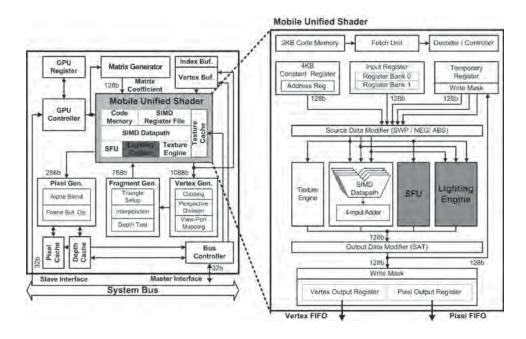

Figure 5.17 Mobile unified shader: (a) 3D graphics processor, and (b) mobile unified shader

(EXP), reciprocal (RCP), and reciprocal square-root (RSQ). The texture engine performs texture address generation, texture fetching, and texture filtering.

Since the single shader performs both vertex shading and pixel shading, task scheduling is crucial. Figure 5.18a shows a data flow diagram of the programmable 3D graphics pipeline. In conventional architecture, the primitive vertices are computed in the vertex shader for per-vertex operations such as transformation and lighting. After per-vertex operations, vertex generator and fragment generator perform clipping and

```
const D3DXCOLOR YELLOW( D3DCOLOR_XRGB(255, 255, 0) );
const D3DXCOLOR CYAN( D3DCOLOR_XRGB(0, 255, 255) );
const D3DXCOLOR MAGENTA( D3DCOLOR_XRGB(255, 0, 255) );
```

4.2 Vertex Colors

The color of a primitive is determined by the color of the vertices that make it up. Therefore, we must add a color member to our vertex data structure. Note that a D3DCOLORVALUE type cannot be used here because Direct3D expects a 32-bit value to describe the color of a vertex. (Acually, by using a vertex shader we could use 4D color vectors for the vertex color, and thereby gain 128-bit color, but that is getting ahead of ourselves for now. Vertex shaders are covered in Chapter 17.)

```
struct ColorVertex
{
    float _x, _y, _z;
    D3DCOLOR _color;
    static const DWORD FVF;
}
const DWORD ColorVertex::FVF = D3DFVF_XYZ | D3DFVF_DIFFUSE;
```

4.3 Shading

Shading occurs during rasterization and specifies how the vertex colors are used to compute the pixel colors that make up the primitive. There are two shading modes that are presently used: flat shading and Gouraud shading.

With flat shading, the pixels of a primitive are uniformly colored by the color specified in the *first* vertex of the primitive. So the triangle formed by the following three vertices would be red, since the first vertex color is red. The colors of the second and third vertices are ignored with flat shading.

```
ColorVertex t[3];
t[0]._color = D3DCOLOR_XRGB(255, 0, 0);
t[1]._color = D3DCOLOR_XRGB(0, 255, 0);
t[2]._color = D3DCOLOR_XRGB(0, 0, 255);
```

Flat shading tends to make objects appear blocky because there is no smooth transition from one color to the next. A much better form of shading is called Gouraud shading (also called smooth shading). With Gouraud shading, the colors at each vertex are interpolated linearly across the face of the primitive. Figure 4.2 shows a red flat shaded triangle and a triangle colored using Gouraud shading.

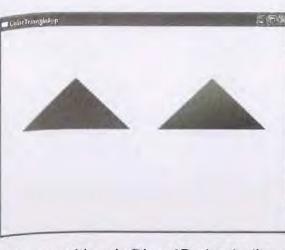

Figure 4.2: On the left is a triangle colored red with flat shading. On the right is a triangle with vertex colors red, green, and blue; notice that with Gouraud shading, the vertex colors are interpolated across the triangle.

Like many things in Direct3D, the shading mode is controlled through the Direct3D state machine.

```
// set flat shading
Device->SetRenderState(D3DRS_SHADEMODE, D3DSHADE_FLAT);

// set Gouraud shading
Device->SetRenderState(D3DRS_SHADEMODE, D3DSHADE GOURAUD);
```

4.4 Sample Application: Colored Triangle

The sample program for this chapter demonstrates a triangle colored using flat shading and a triangle colored using Gouraud shading. It renders the image shown in Figure 4.2. First we add the following global variables:

```
DJDXMATRIX World;
|Direct3DVertexBuffer9* Triangle = 0;
```

We include a D3DXMATRIX that is used to store the world transformation of the triangles that we are going to draw. The Triangle variable is the vertex buffer that stores the vertex data of a triangle. Notice that we only have to store the geometry of one triangle because we can draw it multiple times at different positions in the world using the world matrix

The Setup method creates the vertex buffer and fills it with the data of a triangle with colored vertices. The first vertex in the triangle is full-intensity red (255), the second is full-intensity green (255), and the third is full-intensity blue (255). Finally, we disable lighting for this sample. Notice that this sample uses the new ColorVertex structure, as explained in section 4.2.

```
bool Setup()
      // create vertex buffer
      Device->CreateVertexBuffer(
           3 * sizeof(ColorVertex),
           D3DUSAGE WRITEONLY,
           ColorVertex::FVF,
           D3DPOOL MANAGED,
           &Triangle,
           0);
      // fill the buffers with the triangle data
     ColorVertex* v;
     Triangle->Lock(0, 0, (void**)&v, 0);
     v[0] = ColorVertex(-1.0f, 0.0f, 2.0f, D3DCOLOR_XRGB(255, 0, 0));
     v[1] = ColorVertex( 0.0f, 1.0f, 2.0f, D3DCOLOR_XRGB(0, 255, 0));
v[2] = ColorVertex( 1.0f, 0.0f, 2.0f, D3DCOLOR_XRGB(0, 0, 255));
     Triangle->Unlock();
     // set projection matrix
     D3DXMATRIX proj;
     D3DXMatrixPerspectiveFovLH(
           &proj,
           D3DX PI * 0.5f, // 90 - degree
           (float) Width / (float) Height,
           1.0f,
           1000.0f);
     Device->SetTransform(D3DTS PROJECTION, &proj);
     // set the render states
     Device->SetRenderState(D3DRS_LIGHTING, false);
     return true;
```

Then, the Display function draws Triangle twice in two different positions and with different shade modes. The position of each triangle is controlled with the world matrix—World.

```
Part II
```

```
Device->SetRenderState(D3DRS_SHADEMODE, D3DSHADE_FLAT);
    Device->DrawPrimitive(D3DPT_TRIANGLELIST, 0, 1);

// draw the triangle to the right with gourand shading
    D3DXMatrixTranslation(&World, 1.25f, 0.0f, 0.0f);
    Device->SetTransform(D3DTS_WORLD, &World);

Device->SetRenderState(D3DRS_SHADEMODE, D3DSHADE_GOURAUD);
    Device->DrawPrimitive(D3DPT_TRIANGLELIST, 0, 1);

Device->EndScene();
    Device->Present(0, 0, 0, 0);
}
return true;
```

// draw the triangle to the left with flat shading
p3DXMatrixTranslation(&World, -1.25f, 0.0f, 0.0f);

Device->SetTransform(D3DTS WORLD, &World);

4.5 Summary

- Colors are described by specifying an intensity of red, green, and blue. The additive mixing of these three colors at different intensities allows us to describe millions of colors. In Direct3D, we can use the D3DCOLOR, the D3DCOLORVALUE, or the D3DXCOLOR type to describe a color in code.
- We sometimes treat a color as a 4D vector (r, g, b, a). Color vectors are added, subtracted, and scaled just like regular vectors. On the other hand, dot and cross products do *not* make sense for color vectors, but component-wise multiplication does make sense for colors. The symbol \otimes denotes component-wise multiplication, and it is defined as: $(c_1, c_2, c_3, c_4) \otimes (k_1, k_2, k_3, k_4) = (c_1k_1, c_2k_2, c_3k_3, c_4k_4)$.
- We specify the color of each vertex, and then Direct3D uses the current shade mode to determine how these vertex colors are used to compute the pixel colors of the triangle during rasterization.
- With flat shading, the pixels of a primitive are uniformly colored by the color specified in the *first* vertex of the primitive. With Gouraud shading, the colors at each vertex are interpolated linearly across the face of the primitive.

Example:

Device->SetTexture (0, stonewall);

Note: In Direct3D, you can set up to eight textures that can be combined to create a more detailed image. This is called multitexturing. We do not use multitexturing in this book until Part IV; therefore we always set the texture's stage to 0, for now.

To disable a texture at a particular texturing stage, set pTexture to 0. For instance, if we don't want to render an object with a texture, we would write:

```
Device->SetTexture(0, 0);
renderObjectWithoutTexture();
```

If our scene has triangles that use different textures, we would have t_0 do something similar to the following code:

```
Device->SetTexture(0, _tex0);
drawTrisUsingTex0();
Device->SetTexture(0, _tex1);
drawTrisUsingTex1();
```

6.3 Filters

As mentioned previously, textures are mapped to triangles in screen space. Usually, the texture triangle is not the same size as the screen triangle. When the texture triangle is smaller than the screen triangle, the texture triangle is *magnified* to fit. When the texture triangle is larger than the screen triangle, the texture triangle is *minified* to fit. In both cases, distortion will occur. *Filtering* is a technique Direct3D uses to help smooth out these distortions.

Direct3D provides three different types of filters; each one provides a different level of quality. The better the quality, the slower it is, so you must make the trade-off between quality and speed. Texture filters are set with the IDirect3DDevice9::SetSamplerState method.

Nearest point sampling—This is the default filtering method and produces the worst-looking results, but it is also the fastest to compute. The following code sets nearest point sampling as the minification and magnification filter:

```
Device->SetSamplerState(0, D3DSAMP MAGFILTER, D3DTEXF POINT);
Device->SetSamplerState(0, D3DSAMP MINFILTER, D3DTEXF POINT);
```

■ Linear filtering —This type of filtering produces fairly good results and can be done very fast on today's hardware. It is

Once a light is registered, we can turn it on and off using what this next example illustrates:

```
Device->LightEnable(
        // the element in the light list to enable/disable
   true); // true = enable, false = disable
```

5.5 Sample Application: Lighting

The sample for this chapter creates the scene shown in Figure 5.7. It demonstrates how to specify vertex normals, how to create a material, and how to create and activate a directional light. Note that in this sample program we do not make use of the d3dUtility.h/cpp material and light functionality code because we want to show how it is done manually first. However, the rest of the samples in this book do use the material and light utility code.

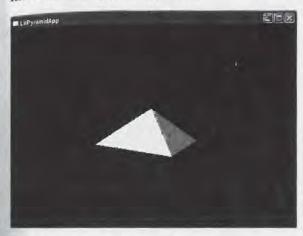

Figure 5.7: Screen shot from the LitPyramid sample

The steps for adding light to a scene are:

- 1. Enable lighting.
- 2. Create a material for each object and set the material before rendering the corresponding object.
- Create one or more light sources, set the light sources, and enable them.
- 4. Enable any additional lighting states, such as specular highlights.

First we instantiate a global vertex buffer that stores the pyramid's vertices:

IDirect3DVertexBuffer9* Pyramid = 0;

The Setup function contains all the code relevant to this chapter, so we omit the other functions to save space. It implements the previously discussed steps to add lighting to a scene. The Setup method starts by enabling lighting, which isn't necessary because it's enabled by default (but it doesn't hurt either).

```
bool Setup()
{
    Device->SetRenderState(D3DRS_LIGHTING, true);
```

Next, we create the vertex buffer, lock it, and specify the vertices that form triangles of the pyramid. The vertex normals were precomputed using the algorithm covered in section 5.3. Notice that while the triangles share vertices, they do not share normals; thus it is not very advantageous to use an index list for this object. For example, all the triangles share the peak point (0, 1, 0); however, for each triangle, the peak vertex normal points in a different direction.

```
Device->CreateVertexBuffer(
          12 * sizeof (Vertex),
          D3DUSAGE WRITEONLY,
          Vertex::FVF,
          D3DPOOL MANAGED,
          &Pyramid,
     // fill the vertex buffer with pyramid data
     Vertex* v;
     Pyramid->Lock(0, 0, (void**)&v, 0);
     // front face
     v[0] = Vertex(-1.0f, 0.0f, -1.0f, 0.0f, 0.707f, -0.707f);
     v[1] = Vertex( 0.0f, 1.0f, 0.0f, 0.0f, 0.707f, -0.707f);
     v[2] = Vertex(1.0f, 0.0f, -1.0f, 0.0f, 0.707f, -0.707f);
     // left face
     v[3] = Vertex(-1.0f, 0.0f, 1.0f, -0.707f, 0.707f, 0.0f);
     v[4] = Vertex(0.0f, 1.0f, 0.0f, -0.707f, 0.707f, 0.0f);
     v[5] = Vertex(-1.0f, 0.0f, -1.0f, -0.707f, 0.707f, 0.0f);
     // right face
     v[6] = Vertex(1.0f, 0.0f, -1.0f, 0.707f, 0.707f, 0.0f);
     v[7] = Vertex( 0.0f, 1.0f, 0.0f, 0.707f, 0.707f, 0.0f);
     v[8] = Vertex( 1.0f, 0.0f, 1.0f, 0.707f, 0.707f, 0.0f);
     // back face
     v[9] = Vertex( 1.0f, 0.0f, 1.0f, 0.0f, 0.707f, 0.707f);
     v[10] = Vertex( 0.0f, 1.0f, 0.0f, 0.0f, 0.707f, 0.707f);
     v[11] = Vertex(-1.0f, 0.0f, 1.0f, 0.0f, 0.707f, 0.707f);
     Pyramid->Unlock();
```

After we have generated the vertex data of our object, we describe how the object interacts with light by describing its materials. In this sample, the pyramid reflects white lights, emits no light, and produces some highlights.

```
D3DMATERIAL9 mtrl;
mtrl.Ambient = d3d::WHITE;
mtrl.Diffuse = d3d::WHITE;
mtrl.Specular = d3d::WHITE;
mtrl.Emissive = d3d::BLACK;
mtrl.Power = 5.0f;
Device->SetMaterial(&mtrl);
```

Second to last, we create and enable a directional light. The directional light rays run parallel to the x-axis in the positive direction. The light emits strong white diffuse light (dir.Diffuse = WHITE), weak white specular light (dir.Specular = WHITE * 0.3f), and a medium amount of white ambient light (dir.Ambient = WHITE * 0.6f).

```
p3pLIGHT9 dir;
::ZeroMemory(&dir, sizeof(dir));
dir.Type = D3pLIGHT_DIRECTIONAL;
dir.Diffuse = d3d::WHITE;
dir.Specular = d3d::WHITE * 0.3f;
dir.Ambient = d3d::WHITE * 0.6f;
dir.Direction = D3pXVECTOR3(1.0f, 0.0f, 0.0f);

Device->SetLight(0, &dir);
Device->LightEnable(0, true);
```

Finally, we set the state to renormalize normals and enable specular highlights.

```
Device->SetRenderState(D3DRS_NORMALIZENORMALS, true);
Device->SetRenderState(D3DRS_SPECULARENABLE, true);

// ... code to set up the view matrix and projection matrix
// omitted
return true;
```

5.6 Additional Samples

Three additional samples are included for this chapter in the companion files. They use the D3DXCreate* functions to create the 3D objects that compose the scene. The D3DXCreate* functions create vertex data with the format D3DFVF_XYZ | D3DFVF_NORMAL. In addition, these functions compute the vertex normals of each mesh for us. The additional samples demonstrate how to use directional lights, point lights, and spotlights. Figure 5.8 shows a screen shot from the directional light sample.

OpenGL - Lighting, Material, Shading and Texture Mapping

 $\begin{array}{c} \textbf{CS475 - Computer Graphics} \\ \textbf{Sumair Ahmed} \\ \textbf{IIT Bombay} \end{array}$

August 28, 2009

ATI 2084 LG v. ATI IPR2015-00326 This document briefs about the ways to deal with the prominent features existing in OpenGL. Here we discuss the Lighting, Shading, Material and Texture Mapping in programming perspective of OpenGL.

Lighting

Light makes the scene look real. Effectively, in a real world, light is present everywhere. Objects also have their own reaction in presence of a light. OpenGL supports a number of lighting effects - Directional, Spot, Ambient lights and attenuation. The Lighting and the Shading models define the light in OpenGL. But before setting these up, lighting mode has to be enabled. Lighting support needs the depth buffer to be enabled.

```
glEnable (GL\_DEPTH\_TEST);

glEnable (GL\_LIGHTING);
```

The above function glEnable can enable many features of OpenGL; the feature you want to enable is provided as an input parameter. The above code enables the lighting, however we need lights as well. OpenGL has direct support for about 8 lights . To enable a light, call:

```
glEnable(GL\_LIGHT0);
```

Likewise, LIGHT1 or 2..8 shall be enabled when you want to handle multiple lights. Similar to glEnable function, OpenGL also has glDisable function that disables the features set before by glEnable. These functions turn a particular feature ON or OFF. OpenGL also provides a set of specific global properties to specify the visual behavior of the lighting model. This is done in two ways:

```
glLightModelf(GLenum\ pname, GLfloat\ param); // scalar params glLightModelfv(GLenum\ pname, const\ GLfloat\ params); // vector params
```

For Instance, suppose you want to have a *GLOBAL* Ambient light that casts on all the rendered objects. The following code sets the *global_ambient* colour on all the objects.

```
Glfloat \ global\_ambient[] = \{0.5f, 0.5f, 0.5f, 1.0f\} \ // R,G,B,Alpha \ glLightModel fv (GL\_LIGHT\_MODEL\_AMBIENT, global\_ambient);
```

Similarly, we have GL_LIGHT_MODEL_TWO_SIDE and GL_LIGHT_MODEL_LOCAL_VIEWER parameters. The first parameter defines if the light is to be applied on two sides of an object or one side. Second defines how specular component is calculated. The specular highlight depends on the direction from the vertex to the viewpoint and also the direction from the vertex to the light source. So, the highlight depends on the eye position. With a default infinite viewpoint, the direction from the vertex to the viewpoint remains the same for all vertices. 0 is considered as infinite viewpoint, while 1 is local view point.

```
glLightModelf (GL_LIGHT_MODEL_LOCAL_VIEWER, GL_TRUE);
```

There are two types of light properties you should consider while programming the lighting model in OpenGL. The first type describes a light source and the second type describes the light reflected by the material of an object's surface. These four independent models define the light - $GL_AMBIENT$, $GL_DIFFUSE$, $GL_SPECULAR$ and $GL_EMISSIVE$

For every type of light source you need to call the glLightfv function with parameters. For example, To add a component of specular light to a light source, you would make the following function call:

```
GLfloat\ specular[] = \{1.0f, 1.0f, 1.0f, 1.0f, 1.0f\};

glLightfv\ (GL\_LIGHT0, GL\_SPECULAR, specular);
```

1

0002

The first three parameters of *specular* variable are the RGB values which can range between 0.0f and 1.0f. 0 being no colour, and 1 being full colour. The final parameter, Alpha, is used to define the translucency factor of an object and is used to simulate materials made out of translucent matter such as glass. The colour format here is often referred as RGBA format.

OpenGL also provides the light attenuation feature, that reduces the light intensity with the distance. Light Intensity should decrease with the distance to mimic the real world. It shall be inversely related to the distance. The Intensity attenuation formula would be :

```
Attenuated Intensity = Intensity of light Source * \frac{1}{C+L*d+Q*d^2} = Intensity of light Source * Attenuation Factor
```

where

```
d = distance between light source and the vertex C = GL\_Constant\_Attenuation (default is 1) L = GL\_Linear\_Attenuation (default is 0) Q = GL\_Quadratic\_Attenuation (default is 0)
```

are the three attenuation provided by OpenGL. In order to have an attenuation with the distance, you should set to a value different to 0 the linear or quadratic. It calculates an attenuation factor (between 0 and 1) which is multiplied to the ambient, diffuse and specular colours. By default, attenuation factor is 1, it means there is no attenuation w.r.t the distance.

```
glLightf(GL\_LIGHT0, GL\_LINEAR\_ATTENUATION, 0.2f);
```

But assigning ambient, diffuse and specular types of light to a light source is not usually enough. You also have to specify the position of the light source. You can have Directional light source instead of the below Positional light source.

```
\begin{aligned} &Glfloat\ position1[] = \{-1.5f, 1.0f, -4.0f, 1.0f\};\ //x,y,z,w\\ &Glfloat\ position2[] = \{-1.05f, 1.0f, -1.0f, 0.0f\};\ //x,y,z,w\\ &glLightfv\left(GL\_LIGHT0, GL\_POSITION, position1\right);\\ &glLightfv\left(GL\_LIGHT0, GL\_POSITION, position2\right); \end{aligned}
```

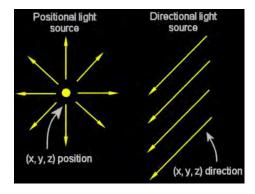

Figure 1: Positional and Directional light source

The light source can be a positional (w > 0) or directional (w = 0) light source depending on the w value. A positional light source is positioned at the location (x, y, z) as shown above. The source emits light from that particular location towards all directions. for example: lamp, bulb.

A directional one does not have any location. The source emits light from an infinite location, the rays are all parallel and have the direction (x, y, z). A directional light is not subject to attenuation since it is at an infinite distance. for example: Sun.

Shading

The Shading model is set up with a call to glShadeModel and can be either set to SMOOTH or FLAT model. The SMOOTH shading model specifies the use of Gouraud-shaded polygons to describe light while the FLAT shading model specifies the use of single-colored polygons.

```
glShadeModel(GL\_SMOOTH);
```

When SMOOTH model is selected, Lighting is evaluated at each vertex, and pixel colours are linearly interpolated across polygons. However, in FLAT model, Lighting is evaluated once for a polygon, and the resulting colour value is used for the complete object.

Material

This defines the reaction of an object when its surface is hit with the light. For example, some objects absorb a particular colour or reflects light. Usually when the lighting is enabled it is equally likely to assign material properties with the glMaterialf command as shown in the following code sample:

```
Glfloat\ mcolor[] = \{1.0f, 0.0f, 0.0f, 1.0f\};

glMaterialfv\ (GL\_FRONT, GL\_AMBIENT\_AND\_DIFFUSE, mcolor);
```

The material property of an object (defined by RGB colour format), is usually the colour reflected by that object. The first parameter of the glMaterialfv command indicates which face of the polygon should reflect the light specified by mcolor. Apparently, there are two sides to a polygon - front and back. OpenGl provides two ways to specify a polygon in 3D space in order to decide the front face. The clockwise or counterclockwise direction describes which side is the front and which is the back. OpenGL lets you specify these rules with the glFrontFace command. The Following code denotes that counter clockwise direction direction of the polygons is considered to be Front Face.

```
glFrontFace(GL\_CCW);
```

glMaterial command should be called prior to defining the polygon's vertices to apply these material properties to the surface.

A convenient alternative to glmaterial is color tracking. Material properties are specified by merely calling the glColor command prior to each object or polygon. Also it has to be enabled.

```
\begin{split} glEnable\left(GL\_COLOR\_MATERIAL\right);\\ glColorMaterial\left(GL\_FRONT,GL\_AMBIENT\_AND\_DIFFUSE\right);\\ glColor3f(0.0f,0.0f,1.0f);//\text{ blue reflective properties} \end{split}
```

Example: This code would typically be placed with the OpenGL initialization code

```
//set the global lighting / shading glShadeModel\left(GL\_SMOOTH\right); // or GL\_FLAT glEnable\left(GL\_NORMALIZE\right); glEnable\left(GL\_LIGHTING\right); 
//set the global ambient light GLfloat\ ambient = \{.2, .2, .2, 1\}; glLightModelfv\left(GL\_LIGHT\_MODEL\_AMBIENT, globalAmb\right); 
//set up a light and enable it GLfloat\ diffuse[] = \{1, 0, 0, 1\}; GLfloat\ ambient[] = \{.5, 0, 0, 1\}; GLfloat\ specular[] = \{1, 1, 1, 1\};
```

```
\begin{split} &glLightfv\left(GL\_LIGHT0,GL\_DIFFUSE,diffuse\right);\\ &glLightfv\left(GL\_LIGHT0,GL\_AMBIENT,ambient\right);\\ &glLightfv\left(GL\_LIGHT0,GL\_SPECULAR,specular\right);\\ &glEnable\left(GL\_LIGHT0\right);\ //enable\ the\ light\\ &\ //set\ light\ position\\ &\ //set\ last\ term\ to\ 0\ for\ a\ spotlight\\ &Glfloat\ lightpos[] = \{1,1,1,1\};\\ &glLightfv\left(GL\_LIGHT0,GL\_POSITION,lightpos\right);\\ &\ //This\ code\ sets\ a\ simple\ material\ property\\ &GLfloat\ ambient[] = \{.5,0,0,1\};\\ &GLfloat\ specular[] = \{1,1,1,1\};\\ &\ //set\ params\ for\ front\ and\ back\ separately\ (GL\_BACK,GL\_FRONT\_AND\_BACK)\\ &glMaterialfv\left(GL\_FRONT,GL\_AMBIENT\_AND\_DIFFUSE,ambient\right);\\ &glMaterialfv\left(GL\_FRONT,GL\_SPECULAR,ambient\right); \end{split}
```

Example2: A Cube in an environment with two diffuse lights and an ambient light. Two Diffuse lights are of different colours (blue & green) whereas the ambient light is red colour.

```
\begin{split} GLfloatDiffuseLight1[] &= \{0,0,1\};\\ GLfloatDiffuseLight2[] &= \{0,1,0\};\\ GLfloatAmbientLight[] &= \{1,0,0\};\\ gLightfv\left(GL\_LIGHT0,GL\_DIFFUSE,DiffuseLight1\right);\\ glLightfv\left(GL\_LIGHT1,GL\_AMBIENT,AmbientLight\right);\\ glLightfv\left(GL\_LIGHT2,GL\_DIFFUSE,DiffuseLight2\right);\\ GLfloatLightPosition1[] &= \{0,0,3,0\};\\ GLfloatLightPosition2[] &= \{3,0,0,0\};\\ glLightfv\left(GL\_LIGHT0,GL\_POSITION,LightPosition1\right);\\ glLightfv\left(GL\_LIGHT2,GL\_POSITION,LightPosition2\right);\\ glLlookAt\left(3.0,-2.0,4.0,0.0,0.0,0.0,1.0,0.0\right); \end{split}
```

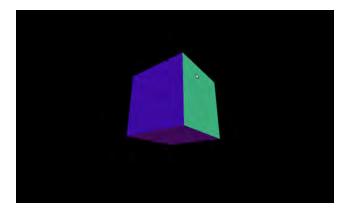

Figure 2: Output of Example2

You can see three colours on three sides of a cube. There is one diffuse light at position (3,0,0) and the other at (0,0,3). There is also an Ambient light of red colour. The eye position is at (3,-2,4) and is looking at (0,0,0) i.e., the center of cube.

Texture Mapping

Another feature in OpenGL is Texture Mapping feature where you can apply the textures to your geometry. Once a texture is uploaded to the video memory it can be used throughout the program. There are certain steps to be followed before a texture is readily available to the program. We first need a texture name. This is essentially a number that OpenGL uses to index all the different textures.

```
GLuint texture; // allocate a texture name qlGenTextures (1, &texture); //get a free texture id
```

Now that we have our texture name, it has to be bound before doing anything to it. Note that there are two forms of textures in OpenGL, 1D and 2D. You can load different textures, however only one is selected at a time.

```
// select our current texture glBindTexture (GL_TEXTURE_2D, texture);
```

Now we need to set some texture parameters and load the texture data on the current texture. OpenGL has four texture parameters to setup. Here, it defines several effects like bilinear, trilinear texture filtering, and mipmapping. We also can define whether the texture wraps over at the edges or is clamped at the ends.

```
// the texture wraps over at the edges (repeat)
glTexParameteri (GL_TEXTURE_2D, GL_TEXTURE_WRAP_S, GL_REPEAT);
glTexParameteri (GL_TEXTURE_2D, GL_TEXTURE_WRAP_T, GL_REPEAT);

// when texture area is large, bilinear filter the original
glTexParameteri (GL_TEXTURE_2D, GL_TEXTURE_MAG_FILTER, GL_LINEAR);
glTexParameteri (GL_TEXTURE_2D, GL_TEXTURE_MIN_FILTER, GL_LINEAR);
```

The default state of MIN_FILTER is $GL_LINEAR_MIPMAP_NEAREST$, if it is not defined. In such a case, the texture is considered incomplete and it renders a white texture on the object.

Also we need to set environment variables for the current texture. This tells the OpenGL how the texture should act when it is rendered into a scene.

```
glTexEnvf(GL\_TEXTURE\_ENV,GL\_TEXTURE\_ENV\_MODE,GL\_MODULATE);
```

Here it sets the active texture to $GL_MODULATE$. This attribute allows to apply effects such as lighting and colouring to your texture. If you would like to display the texture unchanged then replace it with GL_DECAL .

After all these parameters are set, OpenGL calls glTexImage2D that will upload the texture to the video memory and will be ready for us to use in our programs.

 $glTexImage2D(GL.TEXTURE_2D, level, internalFormat, width, height, border, format, type, ptexels);$

- internalFormat This tells OpenGL how many colour components are needed to represent internally from the texture that is uploaded.ex: GL_RGB
- format Format of the pixel data that will be uploaded. ex: GL_RGB
- $\bullet~type$ Type of data that will be uploaded. ex: $GL_UNSIGNED_BYTE$
- ptexels Pointer to the image data.

Note that after your call to glTexImage2D you can free this memory with free function since the texture is already uploaded into video memory. A good alternative to glTexImage2D is to build your texture mipmaps. This can be done by:

$gluBuild2DMipmaps(GL_TEXTURE_2D, 3, width, height, GL_RGB, \\ GL_UNSIGNED_BYTE, data);$

Now the texture is ready to be applied to your geometry, with all the above parameters set. Remember Texturing has to be enabled.

Example: Texture Quad

```
// enable texturing glEnable\ (GL\_TEXTURE\_2D); glBegin\ (GL\_QUADS); glTexCoord2d\ (0.0,0.0); glVertex2d\ (0.0,0.0); glVertex2d\ (1.0,0.0); glVertex2d\ (1.0,0.0); glTexCoord2d\ (1.0,1.0); glVertex2d\ (1.0,1.0); glTexCoord2d\ (0.0,1.0); glVertex2d\ (0.0,1.0); glVertex2d\ (0.0,1.0); glEnd\ ();
```

application processor *n*. A processor dedicated to a single application.

application program n. See application.

application program Interface. *n. See* application programming interface.

application programming Interface *n*. A set of routines used by an application program to direct the performance of procedures by the computer's operating system. *Acronym:* API. *Also called:* application program interface.

application server *n*. **1.** A server program on a computer in a distributed network that handles the business logic between users and backend business applications or databases. Application servers also can provide transaction management, failover, and load balancing. An application server is often viewed as part of a three-tier application consisting of a front-end GUI server such as an HTTP server (first tier), an application server (middle tier), and a backend database and transaction server (third tier). *Also called:* appserver. *Compare* HTTP server (definition 1). **2.** Any machine on which an application-server program is running. *Also called:* appserver.

application service provider *n*. A third-party company or organization that hosts applications or services for individuals or business customers. The customer connects to a data center maintained by the application service provider (ASP) through Internet or private lines to access applications that would otherwise need to be housed on the customer's local servers or individual PCs. This arrangement allows the customer to free up disk space that would otherwise be taken by applications, as well as to access the most recent software updates. ASPs deliver solutions ranging from high-end applications to services for small and medium-sized businesses. *Acronym:* ASP.

application shortcut key *n*. A key or combination of keys that when pressed will quickly perform an action within an application that would normally require several user actions, such as menu selections. *Also called:* keyboard shortcut.

application software n. See application.

application-specific integrated circuit n_e See gate array. application suite n_e See suite (definition 1).

appserver n. See application server.

Aqua n. The graphical user interface (GUI) of Macintosh OS X. Aqua was designed to maintain familiarity and a comfort level for users of the earlier Macintosh system while allowing access to newer Macintosh OS X capabilities. The Aqua GUI features updated versions of Macintosh staples such as the Finder alongside new features like the Dock, a new type of organizational tool. See also Dock, Macintosh OS X.

arbitration *n*. A set of rules for resolving competing demands for a machine resource by multiple users or processes, *See also* contention.

.arc n. The file extension that identifies compressed archive files encoded using the Advanced RISC Computing Specification (ARC) format. See also compressed file.

arcade game *n*. **1.** A coin-operated computer game for one or more players that features high-quality screen graphics, sound, and rapid action. **2.** Any computer game designed to mimic the style of a coin-operated arcade game, such as games marketed for the home computer. *See also* computer game.

Archle *n*. An Internet utility for finding files in public archives obtainable by anonymous FTP. The master Archie server at McGill University in Montreal downloads FTP indexes from participating FTP servers, merges them into a master list, and sends updated copies of the master list to other Archie servers each day. Archie is a shortened form of *archive*. *See also* anonymous FTP, FTP¹ (definition 1). *Compare* Jughead, Veronica.

Archie client n. See Archie.

Archie server n. On the Internet, a server that contains Archie indexes to the names and addresses of files in public FTP archives. *See also* Archie, FTP¹ (definition 1), server (definition 2).

architecture *n*. **1.** The physical construction or design of a computer system and its components. *See also* cache, CISC, closed architecture, network architecture, open architecture, pipelining, RISC. **2.** The data-handling capacity of a microprocessor. **3.** The design of application software incorporating protocols and the means for expansion and interfacing with other programs.

archive¹ n. 1. A tape or disk containing files copied from another storage device and used as backup storage. 2. A compressed file. 3. A file directory on the Internet that is

CD. A permutation is a grouping of elements taken from a larger set with regard to the order of the elements. For example, in making permutations of two objects from the same set of four objects, there would be four candidates to choose from for the first selection (A), and three left over to choose from for the second selection (B), or 12 permutations in all: AB, AC, AD, BA, BC, BD, CA, CB, CD, DA, DB, DC. *See also* combinatorial explosion.

COM callable wrapper *n*. A proxy object generated by the runtime so that existing COM applications can use managed classes, including .NET Framework classes, transparently. *Acronym:* CCW.

COMDEX *n*. Any of a series of annual computer trade shows operated by Softbank COMDEX, Inc. One of these shows takes place in Las Vegas each November and is the largest computer trade show in the United States.

Comité Consultatif International Télégraphique et Téléphonique n. See CCITT.

comma-delimited file *n*. A data file consisting of fields and records, stored as text, in which the fields are separated from each other by commas. Use of comma-delimited files allows communication between database systems that use different formats. If the data in a field contains a comma, the field is further surrounded with quotation marks.

command *n*. An instruction to a computer program that, when issued by the user, causes an action to be carried out. Commands are usually either typed at the keyboard or chosen from a menu.

command buffer *n*. An area in memory in which commands entered by the user are kept. A command buffer can enable the user to repeat commands without retyping them completely, edit past commands to change some argument or correct a mistake, undo commands, or obtain a list of past commands. *See also* history, template (definition 4).

command button *n*. A control shaped like a pushbutton in a dialog box in a graphical user interface. By clicking a command button, the user causes the computer to perform some action, such as opening a file that has just been selected using the other controls in the dialog box.

COMMAND.COM *n*. The command interpreter for MS-DOS. *See also* command interpreter.

command-driven *adj.* Accepting commands in the form of code words or letters, which the user must learn. *Compare* menu-driven.

command-driven system *n*. A system in which the user initiates operations by a command entered from the console. *Compare* graphical user interface.

command Interpreter *n*. A program, usually part of the operating system, that accepts typed commands from the keyboard and performs tasks as directed. The command interpreter is responsible for loading applications and directing the flow of information between applications. In OS/2 and MS-DOS, the command interpreter also handles simple functions, such as moving and copying files and displaying disk directory information. *See also* shell¹.

Command key *n*. On the original Macintosh keyboard, a key labeled with the special symbol, sometimes called the propeller or puppy foot. This key is found on one or both sides of the Spacebar, depending on the version of the Apple keyboard. The key serves some of the same functions as the Control key on IBM keyboards. *See also* Control key.

command language *n*. The set of keywords and expressions that are accepted as valid by the command interpreter. *See also* command interpreter.

command line *n*. A string of text written in the command language and passed to the command interpreter for execution, *See also* command language,

command-line Interface *n*. A form of interface between the operating system and the user in which the user types commands, using a special command language. Although systems with command-line interfaces are usually considered more difficult to learn and use than those with graphical interfaces, command-based systems are usually programmable; this gives them flexibility unavailable in graphics-based systems that do not have a programming interface. *Compare* graphical user interface.

command mode *n*. A mode of operation in which a program waits for a command to be issued, *Compare* edit mode, insert mode.

command processing *n. See* command-driven system. **command processor** *n. See* command interpreter.

command prompt window *n*. A window displayed on the desktop used to interface with the MS-DOS operating

C

insider attack instruction set

Insider attack *n*. An attack on a network or system carried out by an individual associated with the hacked system. Insider attacks are typically the work of current or former employees of a company or organization who have knowledge of passwords and network vulnerabilities. *Compare* intruder attack.

Ins key n. See Insert key.

Install *vb.* To set in place and prepare for operation. Operating systems and application programs commonly include a disk-based installation, or setup, program that does most of the work of preparing the program to work with the computer, printer, and other devices. Often such a program can check for devices attached to the system, request the user to choose from sets of options, create a place for the program on the hard disk, and modify system startup files as necessary.

Installable device driver *n*. A device driver that can be embedded within an operating system, usually in order to override an existing, less-functional service.

Installable File System Manager *n*. In Windows 9x and Windows 2000, the part of the file system architecture responsible for arbitrating access to the different file system components. *Acronym:* IFS.

Installation program *n*. A program whose function is to install another program, either on a storage medium or in memory. An installation program, also called a setup program, might be used to guide a user through the often complex process of setting up an application for a particular combination of machine, printer, and monitor.

Installer n. A program, provided with the Apple Macintosh operating system, that allows the user to install system upgrades and make bootable (system) disks.

Instance *n*. An object, in object-oriented programming, in relation to the class to which it belongs. For example, an object *myList* that belongs to a class *List* is an instance of the class *List*. *See also* class, instance variable, instantiate, object (definition 2).

Instance variable *n*. A variable associated with an instance of a class (an object). If a class defines a certain variable, each instance of the class has its own copy of that variable. *See also* class, instance, object (definition 2), object-oriented programming.

Instantlate *vb.* To create an instance of a class. *See also* class, instance, object (definition 2).

Instant messaging *n*. A service that alerts users when friends or colleagues are on line and allows them to communicate with each other in real time through private online chat areas. With instant messaging, a user creates a list of other users with whom he or she wishes to communicate; when a user from his or her list is on line, the service alerts the user and enables immediate contact with the other user. While instant messaging has primarily been a proprietary service offered by Internet service providers such as AOL and MSN, businesses are starting to employ instant messaging to increase employee efficiency and make expertise more readily available to employees.

Institute of Electrical and Electronics Engineers n. See IEEE.

Instruction n. An action statement in any computer language, most often in machine or assembly language. Most programs consist of two types of statements: declarations and instructions. *See also* declaration, statement.

Instruction code n. See operation code.

Instruction counter n. See instruction register.

Instruction cycle *n*. The cycle in which a processor retrieves an instruction from memory, decodes it, and carries it out. The time required for an instruction cycle is the sum of the instruction (fetch) time and the execution (translate and execute) time and is measured by the number of clock ticks (pulses of a processor's internal timer) consumed.

Instruction mix *n*. The assortment of types of instructions contained in a program, such as assignment instructions, mathematical instructions (floating-point or integer), control instructions, and indexing instructions. Knowledge of instruction mixes is important to designers of CPUs because it tells them which instructions should be shortened to yield the greatest speed, and to designers of benchmarks because it enables them to make the benchmarks relevant to real tasks.

Instruction pointer n. See program counter.

Instruction register *n*. A register in a central processing unit that holds the address of the next instruction to be executed.

Instruction set n. The set of machine instructions that a processor recognizes and can execute. *See also* assembler, microcode.

frequently requested data) on computers running at bus speeds of 75 MHz or higher. Acronym. PB SRAM, See also burst (definition 2), L2 cache, pipelining, static RAM. Compare asynchronous static RAM, dynamic RAM, synchronous burst static RAM.

pipeline processing n. A method of processing on a computer that allows fast parallel processing of data. This is accomplished by overlapping operations using a pipe, or a portion of memory that passes information from one process to another. See also parallel processing, pipe (definition 1), pipelining (definition 3).

pipelining n. 1. A method of fetching and decoding instructions (preprocessing) in which, at any given time, several program instructions are in various stages of being fetched or decoded. Ideally, pipelining speeds execution time by ensuring that the microprocessor does not have to wait for instructions; when it completes execution of one instruction, the next is ready and waiting. See also superpipelining. 2. In parallel processing, a method in which instructions are passed from one processing unit to another, as on an assembly line, and each unit is specialized for performing a particular type of operation. 3. The use of pipes in passing the output of one task as input to another until a desired sequence of tasks has been carried out. See also pipe (definition 1), pour.

piracy n. 1. The theft of a computer design or program. 2. Unauthorized distribution and use of a computer program.

.pit n. A file extension for an archive file compressed with PackIT. See also PackIT.

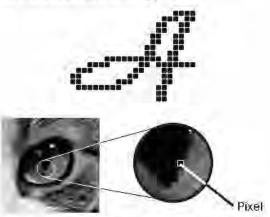

pitch n A measure, generally used with monospace fonts, that describes the number of characters that fit in a horizontal inch. See also characters per inch, screen pitch. Compare point¹ (definition 1).

PivotChart adj. A graphical tool in Microsoft Excel or Access that can be used to display data from a list or database in chart form. Based on user-selected information incorporated in an Excel PivotTable report or list, a PivotChart report provides the ability to chart the data interactively—for example, to "pivot" the chart's point of view from product sales by category to product sales by region or by salesperson. See also PivotTable.

PivotTable adj. An interactive table in Microsoft Excel or Access that can show the same data from a list or a database in more than one arrangement. A user can manipulate the rows and columns in a PivotTable to view or summarize the information in different ways for purposes of analysis. In Excel, a PivotTable report is the basis for creating a PivotChart report that displays the same data in chart form. See also PivotChart.

pivot year n. In Year 2000 windowing, a date in a 100-year period that serves as the point from which correct dates can be calculated in systems or software that can store only 2-digit years. For example, a pivot year of 1970 means that the numbers 70 through 99 are interpreted as the years 1970 to 1999, and the numbers 00 through 69 as the years 2000 through 2069. See also windowing.

pixel n. Short for picture (**pix**) element. One spot in a rectilinear grid of thousands of such spots that are individually "painted" to form an image produced on the screen by a computer or on paper by a printer. A pixel is the smallest element that display or print hardware and software can manipulate in creating letters, numbers, or graphics. See the illustration. Also called pel.

Pixel. The letter A is actually made up of a pattern of pixels in a grid, as is the cat's eye.

pixel image n The representation of a color graphic in a computer's memory. A pixel image is similar to a bit image, which also describes a screen graphic, but a pixel image has an added dimension, sometimes called depth, that describes the number of bits in memory assigned to each on-screen pixel.

406

point of sale Pong

point of sale n. See POS.

point-to-point configuration n. A communications link in which dedicated links exist between individual origins and destinations, as opposed to a point-to-multipoint configuration, in which the same signal goes to many destinations (such as a cable TV system), or a switched configuration, in which the signal moves from the origin to a switch that routes the signal to one of several possible destinations. Also called: point-to-point connection.

point-to-point connection n. See point-to-point configuration

point-to-point message system *n*. In Sun Microsystems's J2EE network platform, a messaging system that uses message queues to store asynchronous, formatted data for coordinating enterprise applications. Each message is addressed to a specific queue, and client applications retrieve messages from the queues. *See also* asynchronous, J2EE.

Point-to-Point Protocol n. See PPP.

point-to-point tunneling n. A means of setting up secure communications over an open, public network such as the Internet. *See also* PPTP.

Point-to-Point Tunneling Protocol n. See PPTP.

Polsson distribution *n*. A mathematical curve often used in statistics and simulation to represent the likelihood of some event occurring, such as the arrival of a customer in a queue, when the average likelihood is known. This distribution, named after the French mathematician S. D. Poisson, is simpler to calculate than the normal and binomial distributions. *See also* binomial distribution, normal distribution.

poke *vb.* To store a byte into an absolute memory location. PEEK (read a byte from memory) and POKE commands are often found in programming languages, such as Basic, that do not normally allow access to specific memory locations.

polar coordinates n. Coordinates of the form (r, q) used to locate a point in two dimensions (on a plane). The polar coordinate r is the length of the line that starts at the origin and ends at the point, and q (Greek theta) is the angle between that line and the positive x-axis. Compare Cartesian coordinates.

polarity *n*. The sign of the potential (voltage) difference between two points in a circuit. When a potential difference exists between two points, one point has a positive polarity and the other a negative polarity. Electrons flow from negative to positive; by convention, however, current is considered to flow from positive to negative.

polarized component *n*. A circuit component that must be installed with its leads in a particular orientation with respect to the polarity of the circuit. Diodes, rectifiers, and some capacitors are examples of polarized components.

polarizing filter *n*. A transparent piece of glass or plastic that polarizes the light passing through it; that is, it allows only waves vibrating in a certain direction to pass through. Polarizing filters are often used to reduce glare on monitor screens. *See also* glare filter.

Pollsh notation *n. See* prefix notation.

polling n. See autopolling.

polling cycle *n*. The time and sequence required for a program to poll each of its devices or network nodes. *See also* autopolling.

polygon *n*. Any two-dimensional closed shape composed of three or more line segments, such as a hexagon, an octagon, or a triangle. Computer users encounter polygons in graphics programs.

polyline *n*. An open shape consisting of multiple connected segments. Polylines are used in CAD and other graphics programs. *See also* CAD.

polymorphism *n*. In an object-oriented programming language, the ability to redefine a routine in a derived class (a class that inherited its data structures and routines from another class). Polymorphism allows the programmer to define a base class that includes routines that perform standard operations on groups of related objects, without regard to the exact type of each object. The programmer then redefines the routines in the derived class for each type, taking into account the characteristics of the object. *See also* class, derived class, object (definition 2), object-oriented programming.

Pong *n*. The first commercial video game, a table tennis simulation, created by Nolan Bushnell of Atari in 1972.

preventive maintenance printed circuit board.

preventive maintenance n. Routine servicing of hardware intended to keep equipment in good operating condition and to find and correct problems before they develop into severe malfunctions.

preview *n*. In word processors and other applications, the feature that formats a document for printing but displays it on the video monitor rather than sending it directly to the printer.

PRI *n*. Acronym for Primary Rate Interface. One of two ISDN transmission rate services (the other is the basic rate interface, BRI). PRI has two variations. The first, which operates at 1.536 Mbps, transmits data over 23 B channels and sends signaling information at 64 Kbps over one D channel in the United States, Canada, and Japan. The second, which operates at 1.984 Mbps, transmits data over 30 B channels and sends signaling information at 64 Kbps over one D channel in Europe and Australia. *See also* BRI, ISDN.

primary channel n. The data-transmission channel in a communications device, such as a modem. *Compare* secondary channel.

Primary Domain Controller n. 1. In Windows NT, a database providing a centralized administration site for resources and user accounts. The database allows users to log onto the domain, rather than onto a specific host machine. A separate account database keeps track of the machines in the domain and allocates the domain's resources to users. 2. In any local area network, the server that maintains the master copy of the domain's user accounts database and that validates logon requests, Acronym: PDC.

primary key n. In databases, the key field that serves as the unique identifier of a specific tuple (row) in a relation (database table). *Also called:* major key. *See also* alternate key (definition 1), candidate key. *Compare* secondary key.

Primary Rate Interface n. See PRI.

primary storage *n*. Random access memory (RAM); the main general-purpose storage region to which the microprocessor has direct access. A computer's other storage options, such as disks and tape, are called *secondary storage* or (sometimes) *backing storage*.

primitive *n*. **1.** In computer graphics, a shape, such as a line, circle, curve, or polygon, that can be drawn, stored, and manipulated as a discrete entity by a graphics program. A primitive is one of the elements from which a large graphic design is created. **2.** In programming, a fundamen-

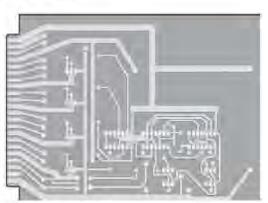

tal element in a language that can be used to create larger procedures that do the work a programmer wants to do.

print *vb*. In computing, to send information to a printer. The word is also sometimes used in the sense of "show me" or "copy this." For example, the PRINT statement in Basic causes output to be displayed (printed) on the screen. Similarly, an application program that can be told to print a file to disk interprets the command as an instruction to route output to a disk file instead of to a printer.

print buffer *n*. A section of memory to which print output can be sent for temporary storage until the printer is ready to handle it. A print buffer can exist in a computer's random access memory (RAM), in the printer, in a separate unit between the computer and the printer, or on disk. Regardless of its location, the function of a print buffer is to free the computer for other tasks by taking print output at high speed from the computer and passing it along at the much slower rate required by the printer. Print buffers vary in sophistication: some simply hold the next few characters to be printed, and others can queue, reprint, or delete documents sent for printing.

printed circuit board n. A flat board made of nonconducting material, such as plastic or fiberglass, on which chips and other electronic components are mounted, usually in predrilled holes designed to hold them. The component holes are connected electrically by predefined conductive metal pathways that are printed on the surface of the board. The metal leads protruding from the electronic components are soldered to the conductive metal pathways to form a connection. A printed circuit board should be held by the edges and protected from dirt and static electricity to avoid damage. See the illustration. Acronym: PCB.

Printed circuit board.

privileged mode Prodigy

privileged mode *n*. A mode of execution, supported by the protected mode of the Intel 80286 and higher microprocessors, in which software can carry out restricted operations that manipulate critical components of the system, such as memory and input/output ports (channels). Application programs cannot be executed in privileged mode; the heart (kernel) of the OS/2 operating system can be, as can the programs (device drivers) that control devices attached to the system.

privileges n. See access privileges.

PRN *n*. The logical device name for *printer*. A name reserved by the MS-DOS operating system for the standard print device. PRN usually refers to a system's first parallel port, also known as LPT1.

.pro *n*. One of seven new top-level domain names approved in 2000 by the Internet Corporation for Assigned Names and Numbers (ICANN), pro is meant for use in Web sites relating to professions such as physicians, accountants, and lawyers. Six of the new domains became available for use in the spring of 2001; negotiations are still underway for the final registry agreement for the pro domain.

probability n. The likelihood that an event will happen, which can often be estimated mathematically. In mathematics, statistics and probability theory are related fields. In computing, probability is used to determine the likelihood of failure or error in a system or device.

problem solving *n*. **1.** The process of devising and implementing a strategy for finding a solution or for transforming a less desirable condition into a more desirable one. **2.** An aspect of artificial intelligence wherein the task of problem solving is performed solely by a program. *See also* artificial intelligence.

procedural language *n*. A programming language in which the basic programming element is the procedure (a named sequence of statements, such as a routine, subroutine, or function). The most widely used high-level languages (C, Pascal, Basic, FORTRAN, COBOL, Ada) are all procedural languages. *See also* procedure. *Compare* nonprocedural language.

procedural rendering *n*. The rendering of a two-dimensional image from three-dimensional coordinates with texturing according to user-specified conditions, such as direction and degree of lighting.

procedure *n*. In a program, a named sequence of statements, often with associated constants, data types, and variables, that usually performs a single task. A procedure can usually be called (executed) by other procedures, as well as by the main body of the program. Some languages distinguish between a procedure and a function, with the latter (the function) returning a value. *See also* function, parameter, procedural language, routine, subroutine.

procedure call *n*. In programming, an instruction that causes a procedure to be executed. A procedure call can be located in another procedure or in the main body of the program. *See also* procedure.

process¹ n. A program or part of a program; a coherent sequence of steps undertaken by a program.

process² vb. To manipulate data with a program.

process-bound *adj*. Limited in performance by processing requirements. *See also* computation-bound.

process color n. A method of handling color in a document in which each block of color is separated into its subtractive primary color components for printing: cyan, magenta, and yellow (as well as black). All other colors are created by blending layers of various sizes of halftone spots printed in cyan, magenta, and yellow to create the image, See also color model, color separation (definition 1). Compare spot color.

processing *n*. The manipulation of data within a computer system. Processing is the vital step between receiving data (input) and producing results (output)—the task for which computers are designed.

processor n. See central processing unit, microprocessor.

Processor Direct Slot n. See PDS (definition 1).

Processor Input/Output n. See PIO.

Procmall *n*. An open-source e-mail-processing utility for Linux and other UNIX-based computers and networks. Procmail can be used to create mail servers and mailing lists, filter mail, sort incoming mail, preprocess mail, and perform other mail-related functions.

Prodlgy *n*. An Internet service provider (ISP) that offers Internet access and a wide range of related services. Prodigy was founded by IBM and Sears as a proprietary online service, was acquired by International Wireless in 1996, and in 1999 entered into a partnership with SBC Commu-

nications. The addition of SBC's Internet customer base made Prodigy the third largest ISP in the United States.

Prodlgy Information Service *n*. An online information service founded by IBM and Sears. Like its competitors America Online and CompuServe, Prodigy offers access to databases and file libraries, online chat, special interest groups, e-mail, and Internet connectivity. *Also called:* Prodigy.

product *n*. 1. An operator in the relational algebra used in database management that, when applied to two existing relations (tables), results in the creation of a new table containing all possible ordered concatenations (combinations) of tuples (rows) from the first relation with tuples from the second. The number of rows in the resulting relation is the product of the number of rows in the two source relations. *Also called:* Cartesian product. *Compare* inner join. 2. In mathematics, the result of multiplying two or more numbers. 3. In the most general sense, an entity conceived and developed for the purpose of competing in a commercial market. Although computers are products, the term is more commonly applied to software, peripherals, and accessories in the computing arena.

production system *n*. In expert systems, an approach to problem solving based on an "IF this, THEN that" approach that uses a set of rules, a database of information, and a "rule interpreter" to match premises with facts and form a conclusion. Production systems are also known as rule-based systems or inference systems. *See also* expert system.

Professional Graphics Adapter *n.* A video adapter introduced by IBM, primarily for CAD applications. The Professional Graphics Adapter is capable of displaying 256 colors, with a horizontal resolution of 640 pixels and a vertical resolution of 480 pixels. *Acronym:* PGA.

Professional Graphics Display *n*. An analog display introduced by IBM, intended for use with their Professional Graphics Adapter. *See also* Professional Graphics Adapter.

profile¹ n. See user profile.

profile² vb. To analyze a program to determine how much time is spent in different parts of the program during execution.

profiler *n*. A diagnostic tool for analyzing the run-time behavior of programs.

Profiles for Open Systems Internetworking Technology n. See POSIT.

program¹ n. A sequence of instructions that can be executed by a computer. The term can refer to the original source code or to the executable (machine language) version. Also called: software. See also program creation, routine, statement.

program² vb. To create a computer program, a set of instructions that a computer or other device executes to perform a series of actions or a particular type of work.

program button *n*. On a handheld device, a navigation control that is pressed to launch an application, *Also called*: application button.

program card n. See PC Card, ROM card.

program cartridge n. See ROM cartridge.

program comprehension tool *n*. A software engineering tool that facilitates the process of understanding the structure and/or functionality of computer applications. *Acronym:* PCT. *Also called:* software exploration tool.

program counter n. A register (small, high-speed memory circuit within a microprocessor) that contains the address (location) of the instruction to be executed next in the program sequence.

program creation n. The process of producing an executable file. Traditionally, program creation comprises three steps: (1) compiling the high-level source code into assembly language source code; (2) assembling the assembly language source code into machine-code object files; and (3) linking the machine-code object files with various data files, run-time files, and library files into an executable file. Some compilers go directly from high-level source to machine-code object, and some integrated development environments compress all three steps into a single command. See also assembler, compiler (definition 2), linker, program.

program encapsulation *n*. A method of dealing with programs with Year 2000 problems that entailed modifying the data with which a program worked. The input data is modified to reflect a parallel date in the past that the program can handle. When output is generated, that data is changed again, to reflect the correct date. The program itself remains unchanged.

program file n. A disk file that contains the executable portions of a computer program. Depending on its size and

remote monitoring replace

net, remote login is done primarily by rlogin and telnet. See also rlogin¹ (definition 1), telnet¹.

remote monitoring n. See RMON.

remote network monitoring n. See RMON.

Remote PC n. See remote system.

remote procedure call *n*. In programming, a call by one program to a second program on a remote system. The second program generally performs a task and returns the results of that task to the first program. *Acronym:* RPC.

remote system *n*. The computer or network that a remote user is accessing via a modem. *See also* remote access. *Compare* remote terminal.

remote terminal *n*. A terminal that is located at a site removed from the computer to which it is attached. Remote terminals rely on modems and telephone lines to communicate with the host computer. *See also* remote access. *Compare* remote system.

removable disk *n*. A disk that can be removed from a disk drive. Floppy disks are removable; hard disks usually are not. *Also called:* exchangeable disk.

REM statement *n*. Short for remark statement. A statement in the Basic programming language and the MS-DOS and OS/2 batch file languages that is used to add comments to a program or batch file. Any statement beginning with the word *REM* is ignored by the interpreter or compiler or the command processor. *See also* comment.

rename *n*. A command in most file transfer protocol (FTP) clients and in many other systems that allows the user to assign a new name to a file or files.

render *vb*. To produce a graphic image from a data file on an output device such as a video display or printer.

rendering *n*. The creation of an image containing geometric models, using color and shading to give the image a realistic look. Usually part of a geometric modeling package such as a CAD program, rendering uses mathematics to describe the location of a light source in relation to the object and to calculate the way in which the light would create highlights, shading, and variations in color. The degree of realism can range from opaque, shaded polygons to images approximating photographs in their complexity. *See also* ray tracing.

RenderMan Shading Language n. A C-like graphics and rendering language developed by Pixar.

repaginate vb. To recalculate the page breaks in a document.

Repeat *n*. A command in Microsoft Word that causes all information contained in either the last command dialog box or the last uninterrupted editing session to be repeated.

repeat counter *n*. A loop counter; typically, a register that holds a number representing how many times a repetitive process has been or is to be executed.

Repeat delay n. A delay for the amount of time that elapses before a character begins repeating when you hold down a key.

repeater *n*. A device used on communications circuits that decreases distortion by amplifying or regenerating a signal so that it can be transmitted onward in its original strength and form. On a network, a repeater connects two networks or two network segments at the physical layer of the ISO/OSI reference model and regenerates the signal.

repeating Ethernet n. See repeater.

repeat key *n*. On some keyboards, a key that must be held down at the same time as a character key to cause the character key's key code to be sent repeatedly. On most computer keyboards, however, a repeat key is not needed because a key automatically repeats if held down for longer than a brief delay. *Compare* typematic.

RepeatKeys *n*. A feature of Windows 9x and Windows NT that allows a user to adjust or disable the typematic keyboard feature so as to accommodate users with restricted mobility, who may activate typematic by accident because they have trouble lifting their fingers from the keys. *See also* typematic. *Compare* BounceKeys, FilterKeys, MouseKeys, ShowSounds, SoundSentry, StickyKeys, ToggleKeys.

repetitive strain injury n. An occupational disorder of the tendons, ligaments, and nerves caused by the cumulative effects of prolonged repetitious movements. Repetitive strain injuries are appearing with increasing frequency among office workers who spend long hours typing at computerized workstations that are not equipped with safeguards such as wrist supports. Acronym: RSI. See also carpal tunnel syndrome, ergonomic keyboard, wrist support.

replace *vb.* To put new data in the place of other data, usually after conducting a search for the data to be replaced. Text-based applications such as word processors typically include search-and-replace commands. In such

R

Xerox PARC XML-RPC

Xerox PARC n. Short for **Xerox** Palo Alto Research Center. Xerox's research and development facility in Palo Alto, California. Xerox PARC is the birthplace of such innovations as the local area network (LAN), the laser printer, and the graphical user interface (GUI).

XFCN *n*. Short for external function. An external code resource that returns a value after it has completed executing. XFCNs are used in HyperCard, a hypermedia program developed for the Macintosh. *See also* HyperCard, XCMD.

XFDL *n*. Short for Extensible Forms Description Language, a document description language introduced and submitted to the World Wide Web Committee in 1998 by the Canadian Internet forms company UWI.Com. XFDL is an XML-based language for describing complex forms, such as legal and government documents. It is designed to allow for interactivity yet remain consistent with Internet standards.

XGA n. See Extended Graphics Array.

x-height *n*. In typography, the height of the lowercase letter x in a particular font. The x-height thus represents the height of the body only of a lowercase letter, excluding ascenders (such as the top of the letter b) and descenders (such as the tail on the letter g). *See also* ascender, descender.

XHTML *n*. Short for Extensible Hypertext Markup Language. A markup language incorporating elements of HTML and XML. Web sites designed using XHTML can be more readily displayed on handheld computers and digital phones equipped with microbrowsers. XHTML was released for comments by the World Wide Web Consortium (W3C) in September 1999. *See also* HTML, microbrowser, XML.

XIP *n*. See execute in place.

XLANG n. A derivative XML language that describes the logical sequencing of business processes, as well as the implementation of the business process by using various application services.

XLink *n*. An XML language that provides a set of attributes that are used to create links between resources. XLink provides complex extended linking, link behavior, and management capabilities. XLink is able to describe links that connect sets of resources, point to multiple targets, or serve multiple roles within an XML document.

XLL *n*. Acronym for eXtensible Linking Language. Broad term intended to denote the family of XML linking/pointing/addressing languages, which include XLink, XPointer, and XPath.

XMI n. 1. Acronym for **XML** Metadata Interchange Format. An object-based model for exchanging program data across the Internet. XMI is sponsored by IBM, Unisys, and others and was submitted as a proposed standard to the Object Management Group (OMG); it is now one of OMG's recommended technologies. XMI is designed to allow for storing and sharing programming information and exchanging data among tools, applications, and storage locations through a network or the Internet so that software developers can collaborate on applications, even if they are not all using the same development tools. 2. As XMI bus, a 64-bit parallel bus supported on certain DEC and Alpha-Server processors. An XMI bus is capable of transferring data, exclusive of addressing overhead, at 100 Mbps.

XML *n*. Acronym for eXtensible Markup Language, a condensed form of SGML (Standard Generalized Markup Language), XML lets Web developers and designers create customized tags that offer greater flexibility in organizing and presenting information than is possible with the older HTML document coding system. XML is defined as a language standard published by the W3C and supported by the industry. *See also* SGML.

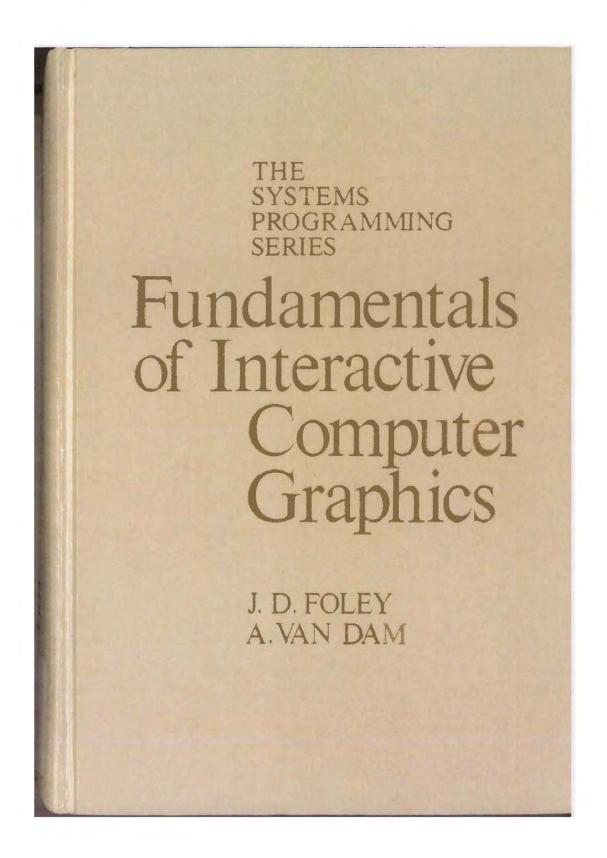

XML attribute *n*. Information added to a tag to provide more information about the tag, such as <ingredient quantity="2"units="cups">flour</ingredient>.

XML element *n*. Information delimited by a start tag and an end tag in an eXtensible Markup Language (XML) document. An example would be <Lastname> Davalio</LastName>.

XML entities *n*. Combinations of characters and symbols that replace other characters when an XML document is parsed, usually those that have other meanings in XML. For example, & t; represents the & lt; symbol, which is also the opening bracket for a tag.

XML Metadata Interchange Format n. See XMI (definition 1).

XML-RPC *n.* Acronym for eXtensible Markup Language-Remote Procedure Call. A set of XML-based implementations that allows cross-platform and cross-programming language procedure calls over the Internet. XML-RPC

(a) Phong model

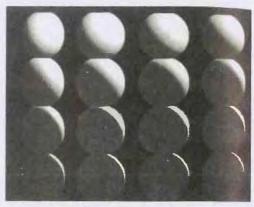

(b) Torrance-Sparrow model

Fig. 16.5 Comparison of Phong and Torrance-Sparrow models for a 70° angle of incident light (by J. Blinn [BLIN77a], courtesy University of Utah).

(a) Phong model

(b) Torrance-Sparrow model

Fig. 16.6 Comparison of the Phong and Torrance-Sparrow models for a metallic sphere illuminated by a light source from different directions. Differences are most apparent for back-lit cases (bottom rows) (by J. Blinn [BLIN77a], courtesy University of Utah).

16.4 POLYGON MESH SHADING

There are three basic ways to shade objects defined by polygon meshes. In order of increasing complexity, they are: constant shading, intensity interpolation shading, and normal-vector interpolation shading. In each case, any of the shading models from the previous two sections can be used. Recall that color shading just involves three equations rather than one.

Constant shading calculates a single intensity value for shading an entire polygon. Several assumptions are made:

- 1. The light source is at infinity, so $\vec{N} \cdot \vec{L}$ is constant across the polygonal face;
- 2. The viewer is at infinity, so $\overline{N} \cdot \overline{V}$ is constant across the polygon face;
- 3. The polygon represents the actual surface being modeled, and is not an approximation to a curved surface.

If either of the first two assumptions is unacceptable, then an average \overline{L} and \overline{V} might be used, perhaps calculated at the center of the polygon.

The final assumption is most often the one which is incorrect and has a much more substantial effect on the resulting image than the other two. The effect is that each visible polygonal facet of the approximated surface is distinguishable, because each is a slightly different intensity than its neighbors. The difference in shading on adjacent facets is accentuated by the Mach band effect, which was discovered in 1865 by E. Mach and is described in detail in [RATL65]. The effect is one of exaggeration of intensity change at any edge where there is a discontinuity in magnitude or slope of intensity. Figure 16.7 shows, for two separate cases, the actual and perceived changes in intensity along a surface. The effect is caused by lateral inhibition of the receptors in the eye, whose response to light is influenced by adjacent receptors in inverse relation to the distance to the adjacent receptor. Receptors immediately to the brighter side of an intensity change have more response than those further from the edge, because they receive less inhibition from their neighbors on the darker side. Similarly, receptors immediately to the darker side of an intensity change will have less response than those further into the darker area, because they receive more inhibition from their neighbors on the brighter side.

Figure 16.8(b) shows a car with constant shading. The Mach band effect is quite evident. Even though the polygonal patches are quite noticeable, the image is much more realistic than that in Fig. 16.8(a), which shows only the polygon edges.

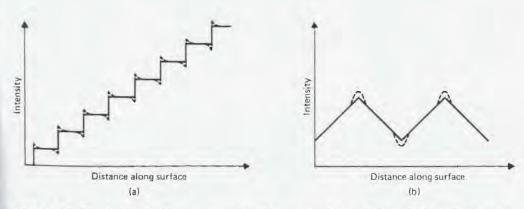

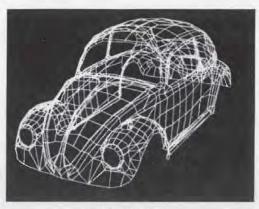

Fig. 16.7 Mach band effect—actual and perceived intensities: dashed lines—perceived intensity; solid lines—actual intensity.

(a) Polygon outlines

(b) Constant shading

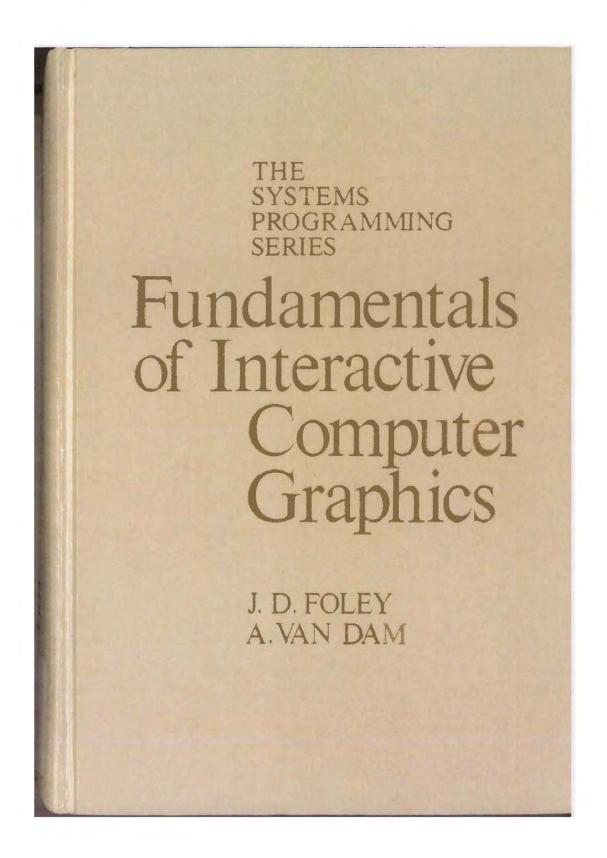

(c) Gouraud shading

Fig. 16.8 Car body displayed three ways (courtesy University of Utah).

Intensity interpolation shading, usually known from the name of its developer as Gouraud shading [GOUR71], eliminates intensity discontinuities. Figure 16.8(c) shows a Gouraud-shaded car. The intensity ridge running down the hood on the right side of the picture, close to the fender, is a Mach band caused by a rapid change in the slope of the intensity curve: Gouraud shading does not completely eliminate such intensity changes.

The Gouraud shading process consists of four steps. First, surface normals are calculated. Second, *vertex normals* are calculated by averaging the surface normals of all polygonal facets that share the vertex (Fig. 16.9). If an edge is meant to be visible (such as at the joint between a planes' wing and body), then two vertex normals, one for each side of the edge, are found by separately averaging the normals of polygons on each side of the edge. Third, *vertex intensities* are found by using the vertex normals with any desired shading model. Finally, each polygon is shaded by linear interpolation of vertex intensities along each edge and then between edges along each scan line (Fig. 16.10).

16.4 POLYGON MESH SHADING

There are three basic ways to shade objects defined by polygon meshes. In order of increasing complexity, they are: constant shading, intensity interpolation shading, and normal-vector interpolation shading. In each case, any of the shading models from the previous two sections can be used. Recall that color shading just involves three equations rather than one.

Constant shading calculates a single intensity value for shading an entire polygon. Several assumptions are made:

- 1. The light source is at infinity, so $\vec{N} \cdot \vec{L}$ is constant across the polygonal face;
- 2. The viewer is at infinity, so $\overline{N} \cdot \overline{V}$ is constant across the polygon face;
- 3. The polygon represents the actual surface being modeled, and is not an approximation to a curved surface.

If either of the first two assumptions is unacceptable, then an average \overline{L} and \overline{V} might be used, perhaps calculated at the center of the polygon.

The final assumption is most often the one which is incorrect and has a much more substantial effect on the resulting image than the other two. The effect is that each visible polygonal facet of the approximated surface is distinguishable, because each is a slightly different intensity than its neighbors. The difference in shading on adjacent facets is accentuated by the Mach band effect, which was discovered in 1865 by E. Mach and is described in detail in [RATL65]. The effect is one of exaggeration of intensity change at any edge where there is a discontinuity in magnitude or slope of intensity. Figure 16.7 shows, for two separate cases, the actual and perceived changes in intensity along a surface. The effect is caused by lateral inhibition of the receptors in the eye, whose response to light is influenced by adjacent receptors in inverse relation to the distance to the adjacent receptor. Receptors immediately to the brighter side of an intensity change have more response than those further from the edge, because they receive less inhibition from their neighbors on the darker side. Similarly, receptors immediately to the darker side of an intensity change will have less response than those further into the darker area, because they receive more inhibition from their neighbors on the brighter side.

Figure 16.8(b) shows a car with constant shading. The Mach band effect is quite evident. Even though the polygonal patches are quite noticeable, the image is much more realistic than that in Fig. 16.8(a), which shows only the polygon edges.

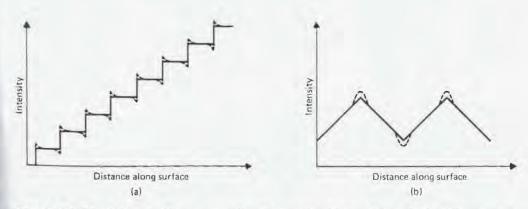

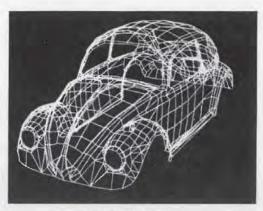

Fig. 16.7 Mach band effect—actual and perceived intensities: dashed lines—perceived intensity; solid lines—actual intensity.

(a) Polygon outlines

(b) Constant shading

(c) Gouraud shading

Fig. 16.8 Car body displayed three ways (courtesy University of Utah).

Intensity interpolation shading, usually known from the name of its developer as Gouraud shading [GOUR71], eliminates intensity discontinuities. Figure 16.8(c) shows a Gouraud-shaded car. The intensity ridge running down the hood on the right side of the picture, close to the fender, is a Mach band caused by a rapid change in the slope of the intensity curve: Gouraud shading does not completely eliminate such intensity changes.

The Gouraud shading process consists of four steps. First, surface normals are calculated. Second, *vertex normals* are calculated by averaging the surface normals of all polygonal facets that share the vertex (Fig. 16.9). If an edge is meant to be visible (such as at the joint between a planes' wing and body), then two vertex normals, one for each side of the edge, are found by separately averaging the normals of polygons on each side of the edge. Third, *vertex intensities* are found by using the vertex normals with any desired shading model. Finally, each polygon is shaded by linear interpolation of vertex intensities along each edge and then between edges along each scan line (Fig. 16.10).

Introduction

This White Paper provides an overview of Microsoft's DirectX 10 architecture. DirectX 10 compatible features provide an important component of the enhanced experience available to users of systems featuring S3 Graphics Chrome 400 Series graphics processors. These processors are designed especially for Microsoft DirectX 10 and Windows Vista.

DirectX 3D is the standard API (application programming interface) that allows graphics hardware to render and support graphics on Microsoft Windows platforms. This API is a common interface or middleware that provides a hardware abstraction layer which allows developers of an application, such as a 3D game or CAD program, to access the graphics hardware via programming calls to the operating system (OS). When the application makes a request to draw an image on the screen, the API calls the OS, which in turn will invoke the graphics processor (GPU) driver to communicate with the graphics hardware to draw the corresponding image and output the result to the display. By using the standard DirectX interface, application developers need only need be concerned about their specific application, without needing to be concerned about details of the underlying hardware implementation. This allows developers to quickly create many visually stunning images and realistic detail, by providing fast access to the advanced hardware capabilities of today's leading edge GPUs.

Previous generations of Microsoft's DirectX (DX) 3D, had significant changes. Fixed function hardware units were used in DirectX generations up to DX7. Then programmable hardware shader units with new user-defined programming capabilities appeared for DX8. DX9 featured added hardware functionality and programmability. The latest release from Microsoft is DX10, which introduces a new architecture that is the subject of this white paper. S3 Graphics continues to work closely with Microsoft's DirectX team to extend its leadership in graphics technology with high performance parts, including the Chrome S20 Series processors based on DX9.0c, and the Chrome 400 Series graphics processor line with advanced DX10 support.

Microsoft's latest DirectX release, DX10, extends the API beyond the limitations of previous generations. The DX10 API is the first redesign to the underlying architecture of DirectX 3D. New are optimized run-time features, CPU off-loading during state changes, a hardware geometry shader, texture arrays, and other graphics rendering enhancements that allow cinematic-like image quality. S3 Graphics Chrome 400 Series product line fully supports these new capabilities of DX10.

DirectX 9 Hardware Pipeline

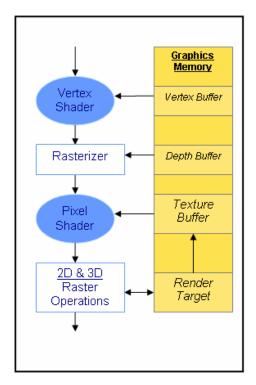

Figure 1. DirectX 8/9 Graphics Pipeline

The DirectX 8/9 pipeline is diagrammed in the above figure, which shows the basic features of a DX8/9 GPU. With the introduction of DX8/9 GPUs such as S3 Graphics' Chrome 20 Series, the transition from a fixed to a programmable pipeline changed the graphics landscape. Fixed function pipelines meant the hardware blocks were hard-coded with specific graphics algorithms. Application developers had to limit their development to what the hardware supported. DirectX 8 introduced and DirectX 9 expanded programmable pipelines which provided an additional programmable API layer closer to the graphics hardware. Developers can take advantage of this layer by using shader assembly language to creatively write specific code to control the different shaders and elements of the programmable pipeline. The main parts of the pipeline are as follows:

Vertex shaders (VS) replace the "Transform and lighting engine" logic prevalent in
previous generations of graphics hardware. The VS can only manipulate vertices and
transform the shapes of objects from the 3D model space to be displayed on a 2D
screen. The VS also does per-vertex lighting based on computed color to give the vertex
more detail. The VS cannot create or destroy any vertices and the unit can only work on
one vertex at a time (in the API level). Actual graphics hardware may process batches or
packets of vertices in parallel to increase throughput.

S3 Graphics
DirectX 10 Architecture
for Chrome 400 Series Processors

WP016-A.0 7/21/2007 Page 4 of 19

- Rasterization is the process of mapping a triangle from object to image space (combining vertices from the VS output) and determining which screen pixels cover the triangle. All pixels inside the triangle are tested for visibility using the depth buffer and are kept if the triangle being rasterized is closer from a viewer perspective than other triangles. All invisible triangles and pixels are discarded since they will not be seen onscreen. This step prepares the object to be modified at the pixel level by the pixel shader.
- **Pixel shaders (PS)** calculate color and texture on each individual pixel. They give flexibility to developers by allowing high quality details to be shown on each object.
- The 2D and 3D **Raster Operation Pipeline** (ROP) is responsible for outputting the rendered object to the render target buffer from the pipeline after textures and blending have been applied.
- The graphics memory stores vertex and texture data in addition to the final object and frame that is to be drawn onscreen.

Limitations of DirectX 8/9

Microsoft designed DirectX 10 to address some of the following key disadvantages identified in the DirectX 8/9 architectures. These include the following.

1. API overhead is high for DX8/9

- When a DX9 application requires use of the graphics hardware to draw an object onscreen, the application needs to perform a call to the DX8/9 API to tell the OS what to do. The OS would then call the graphics driver, which would instruct the graphics hardware to perform the assigned task for the application.
- The DX8/9 API runtime provides resource management like allocation, virtualization, and initialization for the graphics hardware for vertex buffers, texture maps, and state changes. With the introduction of programmable shaders, runtime allocation tends to be harder to manage since there are more levels of abstraction, control and detail per scene.
- As Figure 2 illustrates, all DX8/9 functional or runtime calls from an application to the graphics hardware were done by the CPU (once per object), causing CPU bottlenecks whenever many objects need to be rendered for the current frame. The high API overhead also limits the number of objects per scene, causing potential loss of detail in each frame.
- State changes within the GPU for the shaders and textures generate additional overhead as the CPU had to decode state change instructions in order to implement visual details for realistic rendering to object surfaces and textures. If multiple visual effects need to be performed on an object, multiple passes through the hardware could be required. That translates into multiple state changes per pass performed by the CPU.
- The CPU overhead required to direct the GPU, in essence, became the bottleneck between the DX8/9 application and DX8/9 hardware, which limits the overall capacity for creating stunning visuals.

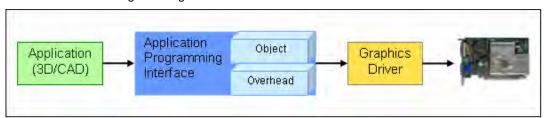

Figure 2. DirectX 8/9 Graphics API Interface

2. Vendor Variations in DirectX features

• Differences in DirectX feature support across GPU vendors, and even within a vendor's product lines, frequently cause problems for application development, because of the numerous levels of support that must be implemented across these multiple hardware platforms. Typical issues that must be addressed include allowing for the resource limitations of different hardware. The lack of support for optional features may prevent an application from running at its highest level on a particular platform. Differences in arithmetic precision in the hardware shaders, instruction and data types, and variations in storage of intermediate data formats may all affect the rendering process.

3. Hardware resource limitations

- The number of separate VS and PS units in the GPU are fixed. Applications requiring heavy use of one type of shader will cause the other shader to be idle. For example, large triangles create heavy loading for the PS, idling the VS. Since there is the possibility of an application being shader-limited, throughput of the rendering pipeline will be limited by the number and type of shaders. The DirectX 10 API allows graphics hardware to overcome this resource bottleneck by introducing a novel architecture which has been incorporated into all S3 Graphics Chrome 400 Series graphics processors.
- Another drawback of DX8/9 generation GPU architectures is their specialized focus
 on one task, that of 3D graphics rendering. A DirectX 8/9 GPU was designed to
 optimize that task, which in effect limited its ability to perform additional computing
 tasks. With the introduction of GPU architecture designed for DirectX 10, the GPU
 can now take on additional capabilities and complexity. The processor now becomes
 more of a general compute processor, capable of offloading the CPU from some
 basic tasks, and thus takes a significant step towards becoming a general purpose
 GPU (GPGPU).

DirectX 10 New Capabilities and Benefits

The main objective for redesigning the entire DirectX 10 API and hardware architecture was to provide a solution for the CPU overhead problem and the hardware capability issues. This re-design also incorporated benefits from the application development, API, and hardware perspectives. The improvements based on this extensive research and re-design are as follows:

1. Efficient runtime (lower API overhead)

- In DirectX 10 the number of possible states that need to be tracked by the system has been reduced, minimizing the overhead related to state changes.
- Overhead per object has been reduced which allows more objects per frame. This
 produces better graphic realism and a higher level of detail than was possible with
 previous generations of the API.
- The validation of objects has been redefined and the process is now more efficient. Validation checks the format of commands and the integrity of data sent by the application to make sure there are no interoperability issues with the hardware. The drawback of validation is a large CPU overhead at runtime. DX10 uses this feature minimally by only validating each object once when it is created, rather than every time the object is used, as was the case in DX9.

2. Reduced CPU loading

Rendering an object or applying multiple textures to an object in a repeated manner uses up valuable CPU cycles and overhead. DX10 has introduced several new instructions and hardware capabilities to help overcome rendering limitations.

- A new 3D pipeline unit called the geometry shader (GS) has been introduced with this iteration of DirectX. The GS can modify, create, or destroy primitive vertex data from the VS without CPU intervention, so no resource-intensive state changes or associated overhead is required by the API. In the past, any changes to the vertex data needed CPU-GPU coordination and state changes.
- The new hardware model in the DX10 pipeline gives more capability to the GPU to handle state changes and instructions. The DX10 GPU now includes built-in arithmetic and flow control logic, thereby providing flexibility in primitive shading and state change handling, and offloading the tasks once performed by the CPU.
- Stream out is a new feature that allows the VS/GS to output data directly into graphics memory where the data can be accessed automatically and repeatedly by the shader units. This is a great new feature controlled entirely by the GPU (with no CPU overhead), for recursive rendering on objects that require multiple passes through the pipeline. In addition, data from any step in the pipeline can go directly to memory. By avoiding the need to send data completely through the pipeline, resources are not wasted on processing intermediate vertices or pixels.
- Arrayed resources allow texture maps to be created as a linear array of up to 512 elements. Developers now have index instructions to access elements within the array in a single pass, so the GPU can work on multiple elements without any static switching overhead. For example, an environmental cube map can be stored in an

S3 Graphics
DirectX 10 Architecture
for Chrome 400 Series Processors

WP016-A.0 7/21/2007 Page 8 of 19

- array as six elements (one for each face of the cube), and the GPU can work on all six elements concurrently in one pass.
- **Multiple render targets** allow the GPU to create different versions of a scene in a single pass. DX10 has the ability to create up to eight render targets at a time.
- High dynamic-range rendering is another feature that brings realistic graphics rendering to the user experience. Formats used in the past to represent color in floating-point representation took at least twice the amount of storage compared to integer formats with half the precision. DX10 provides more efficient mechanism for storage of color components by providing floating point format RGB 11:11:10 (R/G 11-bits each, B 10-bits) and RGBE format (5-bit shared exponent for R/G/B with 9-bit mantissas for each). These formats allow a wider range of color and more vivid detail to be represented as seen in the examples below.

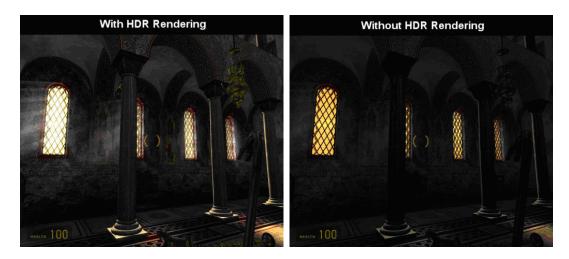

Figure 3. High Dynamic Range Rendering in Half-Life 2: Lost Coast

- A more complex method of utilizing occlusion query has also been implemented to conserve valuable GPU and CPU resources. Occlusion query is a method where non-visible primitives and objects in the Z-buffer are not rendered to save hardware computational resources. Because frame-to-frame rendering is very dynamic and implementation may vary with the application, occlusion query is not guaranteed to omit unseen pixels. DX10 takes it one step further by allowing the GPU to render complex objects in simple line drawing approximations. If the object needs to be drawn onscreen, the GPU already has the framework ready. If the object is not needed or is invisible onscreen, the GPU can throw away the object approximation, without wasting many CPU and GPU cycles.
- Data and resource mapping enhancements improve the ability of the GPU to access data in a timely manner. As an example, vertex buffer data for an application needs to be mapped to its memory address space, since that data can only be used by the application. The API and driver will allocate this buffer space at runtime either from the graphics memory (frame buffer) or system memory. While access to frame buffer is almost instantaneous, access to system memory is many magnitudes slower because of the communication lag between the GPU and system memory via the chipset. In DX10 resources are mapped according to how frequently they are used

S3 Graphics
DirectX 10 Architecture
for Chrome 400 Series Processors

WP016-A.0 7/21/2007 Page 9 of 19 (reads/writes) with four resource classes: default, immutable, dynamic, and staging. Using these new resource classes, developers can optimize performance by putting frequently used data in the frame buffer to be closer to the GPU and putting seldom-used data in system memory.

3. Additional constructs to improve efficiency

In graphics, multiple iterations of textures and blending usually take place to produce realistic images, such as re-creating hair moving in the wind or the ripples on the surface of a lake. These multiple loops previously required state changes and extensive CPU work to be performed. With DX10, state objects and constant buffers are now available to manage multiple loops in the rendering pipeline and increase the range of processing that can be done in one pass.

- State objects define what the graphics pipeline units should do as an object travels through the pipeline. The state objects have information to tell the pipeline which textures to blend or to tell the GS to create more detail for specific vertices in a part of the rendered frame. DX10 handles all of these details by introducing five state object commands, and programmers can work using a high-level language, instead of low-level constructs where they would need to keep track of all the pipeline stage units. The commands InputLayout, Sampler, Rasterizer, DepthStencil, and Blend are performed in the GPU, with minimal CPU intervention for state changes.
- Constant buffers store large amounts of predefined values (data) for items in a scene, so the CPU or GPU does not have to keep track of those values constantly. Each buffer stores up to 4096 constants hold information such as camera view/projection and light source color/position/intensity. Since these items have update intervals which may be once per frame or once per object, doing several hundred of these constant updates one at a time required significant CPU overhead when done using DirectX 9 or earlier. In DX10, the constant buffer groups the constants based on frequency of use and does batch processing to update the constants, which significantly reduces CPU use and dependence.

4. DX10 hardware specification set

- In pre-DX10 revisions of the API, hardware vendors were able to provide capability bits to inform the system about what features were supported in hardware. DX10 has changed this scheme. DX10 binds the 3D hardware feature set with a DirectX version number, so consistency across all hardware vendors exists and identifies support for a set of same basic features. Implementation of these features is the key for differentiating the graphics quality seen across vendors. S3 Graphics Chrome 400 Series processors have proprietary design implementations that give them an edge over the competition in visual quality and rendering capability.
- The basic programmable and fixed function pipelines of the past have been redesigned or eliminated. New and powerful hardware is capable of extending the implementation scope beyond the limits of rendering-only applications to provide high-throughput computing implementations for physics and AI.

S3 Graphics
DirectX 10 Architecture
for Chrome 400 Series Processors

WP016-A.0 7/21/2007 Page 10 of 19 The additional capabilities available in DX10 hardware and software offload most of the runtime events associated with rendering an object from the CPU to the GPU. With new and even more powerful functional units, an expanded instruction set, a new architecture that streamlines the graphics pipeline, efficient memory access methods, and multi-pass rendering capability, DX10 has introduced an astounding ability to generate graphics realism into our computing lives today and in the immediate future.

DX10 Pipeline Introduction

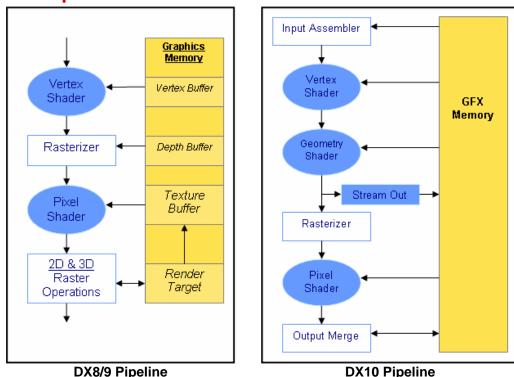

Figure 4. DX8/9 Pipeline Compared to DX10 Pipeline

Figure 4 shows a DX8/9 pipeline (left) compared to the latest DX10 hardware. Common functional units like the vertex/pixel shaders, rasterizer, and ROP/Output Merge (OM) block exist in both architectures and perform similar functions. The Input Assembler (IA) converts or replicates input vertex data from incoming streams (vertex structure) to be used by the pipeline. The key difference is the introduction of the Geometry Shader (GS) and Stream Output (SO) described below.

• The Geometry Shader (GS) takes the vertices of a primitive, such as a line, point, or triangle, and will either create additional vertices (generate data) or destroy the vertices. The GS increases the number of vertices by creating additional primitives composed of up to 1024 32-bit vertex data per instance. If a vertex is not needed, the GS can delete it from the rendering pipeline. The GS can also add additional elements to a primitive without needing to create a new vertex stream. In the past, the pipeline could not create or destroy vertices, only modify them. DX10 moves one step ahead by allowing even more flexibility and power in hardware, where the GS performs per-primitive modifications and also accesses adjacent primitive information. For example, in a GS implementation for a realistic shadow rendering, the GS can control a point or line and its neighboring primitive, as well as control the displacement mapping, where more detail can be shown with the creation of new primitives based on height maps.

S3 Graphics
DirectX 10 Architecture
for Chrome 400 Series Processors

WP016-A.0 7/21/2007 Page 12 of 19

- Stream output can write vertex or primitive information from the VS/GS to a stream buffer
 in memory immediately after the GS stage. In the past a primitive had to exit the PS and
 then it could be written to the render target buffer in memory. Now data in the stream
 buffer can be used recursively or iteratively by other functional blocks in the pipeline on
 an as-needed basis to improve data re-use efficiency. Other uses of this feature are
 physics calculation support such as used in particle systems where ongoing calculations
 are needed to generate and destroy primitives to simulate water, smoke, and clouds.
- Graphics memory has been changed from an area that stored vertex and texture data separately, to memory where each independent shader unit can access the same data. The data storage formats have also been updated to allow the pipeline to store and use multiple format types to increase flexibility. The memory can store data in arrays which allows recirculation of data and texture fetches by the VS, GS, and PS.

DX10 introduces a unified architecture that builds upon the pipeline diagramed in Figure 4. The DX10 pipeline combines three types of shaders into unified execution units capable of handling VS, GS, and PS instructions. The DX10 pipeline architectural design has solved many issues seen in previous generations of DirectX. It has added significant changes to the software, instruction set, instruction support/capability, as well as requiring new hardware blocks and features.

This new design still has a limitation in the utilization rate for each shader type based on the application (see Figure 5 below). If complex geometry calculations and processing are needed, then the VS may be fully utilized while the PS might remain idle. If an application is pixel processing heavy, then the PS may be running at full speed while the VS will only be partially loaded.

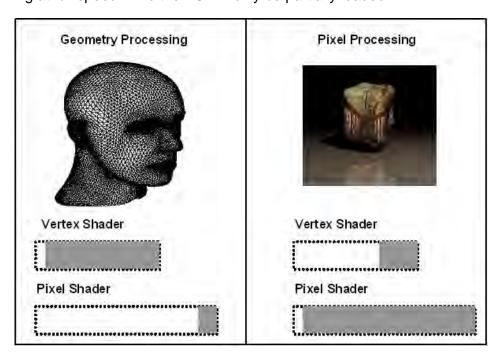

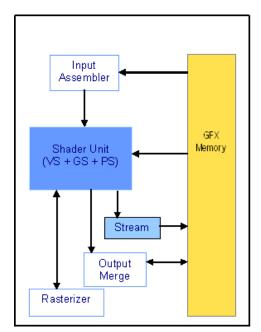

Figure 5. Vertex and Pixel Shader Resource Utilization for Different Applications

DX10 Shader Model 4.0

Shader Model 4.0 (SM4.0) is the new instruction set architecture (ISA) for DX10 that looks at the graphics in a unified way. Some keys advantages of SM4.0 are:

- Easy Programmability: Developers do not need to be bogged down with the low-level details of the hardware. In the past, programmers needed to control and write different low-level program code for each individual shader (VS/PS). Each shader was also considered an individual virtual machine that had separate input/output/general registers that had to be tracked for shader I/O, memory transfers, and intermediate data storage. SM4.0 instructions hide the low-level implementation details and incorporate all the pipeline flow control.
- Flexible Load Balancing: The new unified ISA allows flexibility. Developers can now look at these shaders units as one cohesive block (single common core virtual machine) instead of separate blocks, as shown in Figure 6. The unified shader is made up of shader blocks that can handle all vertex, pixel, and geometry instructions, so the GPU is fully utilized without concern for shader loading imbalances (geometry processing vs. pixel processing, as shown in Figure 5). There is also additional logic to load balance the shader units to keep all functional units fully utilized. If more pixel processing is needed, then more of the unified shader blocks can be allocated to pixel processing to increase throughput. The same shader-type allocation can be done with the VS and GS, as seen in Figure 7.
- Unified Shader Code: Developers code in "shader" instructions, not VS/PS/GS specific
 code.
- **Programmable Offloading:** The unified model helps offload the CPU state change overhead by incorporating flow control logic that programmers can control.

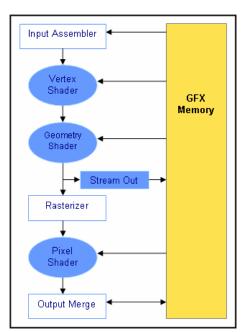

Figure 6. Unified Shader Model (Left) Compared to Basic DX10 Pipeline (Right)

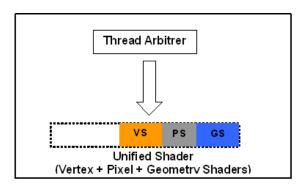

Figure 7. Unified Shader Utilized for Different Shader Types

 Additional resources, data formats, and instructions are available to the programmer for more efficient use and coupling of the graphics hardware to the application level.

Feature	DX9	DX10	
Instruction Slots	512	64K	
Constant Registers	256	4096 (x16)	
Temporary Registers	32	4096	
Render Targets	4	8	
Textures	16	128	
Texture Size	2K x 2K	8K x 8K	
Load Operations	No	Yes	
Sample Offsets	No	Yes	
Flow Control	Static/Dynamic	Dynamic	

Table 1. Basic Comparison Table of DX9 and DX10

- Full integer and bitwise instructions allow the GPU to compute complex algorithms more efficiently in integer format instead of converting between floating point and integer.
- Switch statements are another great addition because they provide multiple paths/options
 when rendering objects on a per-primitive basis. This means the GPU can replicate
 objects (instancing) and also provide unique characteristics for each object independently
 of the other objects in the scene.
- Increased texture support and size greatly enhance visual quality.
 - o In DX9, developers only had 16 textures to work with at a given time and their size limitation was 4096 x 4096. Since the application of multiple textures required multiple texture changes and multiple state changes (large CPU overhead), developers were limited in what they could do. If developers needed multiple textures, they created a texture atlas that combined many smaller textures that could be accessed by indexing into the atlas. This method proved very inefficient since the boundaries between smaller textures were not as clearly defined and the atlas could only hold a certain amount of textures so there was a trade-off between storing fewer (larger) textures or more (smaller) textures.
 - SM4.0 has new instructions and indexed texture arrays, which can store 512 textures with resolutions of up to 8192 x 8192. This method effectively replaces the texture atlas with a large array that can be indexed into easy-to-access multiple textures. In addition, the number of textures a shader can use has increased from 16 to 128, allowing hardware to take advantage of the texture array to add more detail to all objects in a frame.

WP016-A.0 7/21/2007 Page 15 of 19

High-Level Shader Language (HLSL 10)

HLSL 10 is the name given to the programming language developers use to take advantage of DX10 shader and hardware capabilities. The advantages of HLSL are many.

- Application developers do not need to worry about using assembly-like instructions to control the shader and pipeline at the hardware level.
- · Applications can offload the task of resource management.
- Bind-by-name to bind-by-position allows less overhead at runtime. Bind-by-name in DX9 performs checks like matching input/output between hardware functional units and matching vertex buffer format with the vertex shader. Any type mismatch would cause huge overhead since the hardware was not as flexible. In DX10 shader units have associated signatures with their inputs and outputs. As long as the output of the preceding stage is compatible with the input of the following stage, then the data type mismatch is allowed since DX10 allows multiple data formats to be used at any stage in the pipeline.
- DX10 has a "view" method for representing resources such as vertex buffers or texture maps, which can be read in many different formats, so that they are not type-set. This allows resources to be used in multiple parts of the pipeline. Data from one shader can be used in another for on-the-fly updates, regardless of the format type of the intermediate data.

Conclusion

The introduction of DirectX 10 brings an inflection point to the graphics market where the rendering capabilities of advanced hardware and the creativity of software developers can now bring real-life 3D graphics to our daily lives. Features, which once were found only in luxury high-end graphics products costing several thousands of dollars, can now be achieved using the new DirectX 10 companion GPUs of the S3 Graphics Chrome 400 Series product line.

S3 Graphics Chrome 400 Series graphics processors are technological marvels with their multiple programmable DX10/SM4.0 execution units which provide a unified shader architecture. With support for all the new DX10 features such as stream processing, geometry shaders, and HLSL 10 programming, S3 Graphics continues its position as an industry leader in visual computing for current and future generations of the DirectX 3D API.

vectored interrupt noun interrupt signal which directs the processor to a routine at a particular address

QUOTE: the great advantage of the vector-scan display is that it requires little memory to store a picture

Electronics & Power

374

Veitch diagram noun graphical representation of a truth table

velocity noun speed; the disk drive motor spins at a constant velocity

velocity (of sound) noun speed of sound which is equal to 331 metres per second through air; the speed of sound varies in different materials

vendor noun person who manufactures or sells or supplies hardware or software products; vendor independent = hardware or software that will work with hardware and software manufactured by other vendors; opposite is PROPRIETARY; vendor-independent messaging = see VIM vendor-independent messaging see VIM

Venn diagram graphical noun representation of the relationships between the states in a system or circuit

verification noun checking that data has been keyboarded correctly or that data transferred from one medium to another has been transferred correctly; keystroke verification = check made on each key pressed to make sure it is valid for a particular application; verification and validation (V & V) = testing a system to check that it is functioning correctly and that it is suitable for the tasks intended

verifier noun special device for verifying input data

verify verb to check that data recorded or entered is correct

Veronica tool that works with Gopher to help a user find information or files on the Internet

version noun copy or program or statement which is slightly different from others; the latest version of the software includes an improved graphics routine; version control = utility software that allows several programmers to work on a source file and monitors the changes that have been made by each programmer; version

number = number of the version of a product

vertex noun point in space defined by the three coordinates x, y, and z

vertical adjective at right angles to the application vertical horizontal: application software that has been designed for a specific use, rather than for general use; your new software to manage a florist's is a good vertical application; vertical blanking interval = see RASTER; vertical format unit (VFU) = part of the control system of a printer which governs the vertical format of the document to be printed (such as vertical spacing, page length); vertical interval time code = see VITC; vertical justification = adjustment of the spacing between lines of text to fit a section of text into a page; vertical parity check = error detection test in which the bits of a word are added and compared with a correct total; vertical portal (VORTAL) = website that contains information for just one particular industry or interest group; vertical redundancy check (VRC) = (odd) parity check on each character of a block received, to detect any errors; vertical scan frequency = number of times a picture beam in a monitor moves from the last line back up to the first; vertical scrolling = displayed text which moves up or down the computer screen one line at a time; vertical sync signal = (in a video signal) signal which indicates the end of the last trace at the bottom of the display; vertical tab = number of lines that should be skipped before printing starts again

vertically adverb from top to bottom or going up and down at right angles to the horizontal; the page has been justified vertically

very large scale integration (VLSI) noun integrated circuit with 10,000 to 100,000 components

VIDEO ELECTRONICS VESA = STANDARDS ASSOCIATION: VESA local bus or VL-bus = (in an IBM PC) standard defined by VESA which allows up to three special expansion slots that provide direct, bus-master control of the central processor and allow very high speed data transfers between main memory and the expansion card without using the processor:

A 195 mW/152 mW Mobile Multimedia SoC With Fully Programmable 3-D Graphics and MPEG4/H.264/JPEG

Jeong-Ho Woo, Student Member, IEEE, Ju-Ho Sohn, Associate Member, IEEE, Hyejung Kim, Student Member, IEEE, and Hoi-Jun Yoo, Fellow, IEEE

Abstract—In this paper, we present a low power multimedia SoC with fully programmable 3-D graphics, MPEG4 codec, H.264 decoder, and JPEG codec for mobile devices. The mobile unified shader in 3-D graphics engine provides fully programmable 3-D graphics pipeline with 35% area and 28% power reduction. Low power lighting engine which employs logarithmic number datapath and the specialized lighting instruction enable 9.1 Mvertices/s vertex fill rate, which is 2.5 times improvement compared with previous works including transformations and OpenGL lighting. The SoC consumes less than 152 mW for video applications and less than 195 mW for 3-D graphics applications. The mobile unified shader and merged JPEG/MPEG4 codec reduce the silicon area and the SoC consumes 6.4 mm \times 6.4 mm in 0.13 μ m CMOS logic process.

Index Terms—Low power design, mobile multimedia SoC, mobile unified shader, programmable 3-D graphics.

I. INTRODUCTION

RECENTLY, multiple multimedia applications are merged into the mobile devices to be a personal multimedia terminal [2]. The digital camera and real-time audio playback are widely incorporated and recently even digital multimedia broadcasting (DMB) and real-time 3-D graphics are employed for mobile entertainments. The real-time 3-D graphics has been used for various applications such as 3-D games or 3-D user-interfaces and recently portable navigation devices (PND) try to employ the real-time 3-D graphics for 3-D map displaying and 3-D navigation services.

In mobile devices, since users often hold the small screens closer to their eyes, the average eye-to-pixel angle is larger than that of a PC [3]. Therefore, every pixel in mobile applications should be drawn with realistic 3-D graphics effects, which can be achieved by a fully programmable 3-D graphics. In PC graphics, dedicated vertex shader and pixel shader carry out the fully programmable 3-D graphics and they make realistic 3-D images [9]. But, that PC graphics architecture cannot be migrated into the mobile devices due to its silicon area and power consumption.

Manuscript received October 29, 2007; revised May 5, 2008. Current version published September $10,\,2008.$

Since the mobile devices restrict silicon area and power consumption, various multimedia applications should be implemented with small area and low power consumption. Although there have been many publications on mobile multimedia solutions [2]–[8], these chips did not integrate the full multimedia functions such as digital camera, video, audio and real-time 3-D graphics on a single die due to its huge gate counts and design complexity. Moreover, they could not provide a fully programmable 3-D graphics pipeline, which is required for realistic 3-D graphics effects compatible with OpenGL|ES-2.0.

In this work [1], a low power multimedia SoC with full integration of a fully programmable 3-D graphics and MPEG4, H.264 and JPEG processing is presented for mobile devices.

For the purpose to achieve low power, small area, and high performance, the programmable 3-D graphics engine with unique unified shader architecture [10] is employed. Its mobile unified shader is power optimized single shader for mobile devices in contrast to that of console device which has multiple general purpose unified shaders. The lighting engine and specialized lighting instruction are adopted for low power and high performance.

This paper consists of six sections. The system architecture and video engine will be discussed in Section II, and the programmable 3-D graphics engine and details of mobile unified shader will follow in Section III and Section IV, respectively. The chip implementation of the SoC and performance comparison will be described in Section V, and finally the conclusion of our work will be made in Section VI.

II. SYSTEM ARCHITECTURE AND VIDEO ENGINE

Fig. 1(a) shows a block diagram of the developed SoC. It integrates a 3-D graphics engine dedicated for acceleration of the fully programmable 3-D graphics pipeline, the ARM9 RISC processor, video engine, display engine and other peripheral IPs. Since most of the current mobile multimedia SoCs employ the AMBA bus so that the IPs are connected to the single layer AMBA bus. The video engine is employed to support video application such as DMB or digital camera. It is dedicated to MPEG encoding/decoding, H.264 decoding and JPEG image processing using dedicated hardwired blocks. Since both the JPEG codec and the MPEG codec use DCT, IDCT, VLC and VLD units, the JPEG and MPEG codec shares those functional blocks to reduce silicon area and power consumption. The fully hardwired H.264 decoder consists of a content-addressable variable-length decoder (CAVLD), an inverse-transform, a motion compensator and de-blocking filter. The video engine

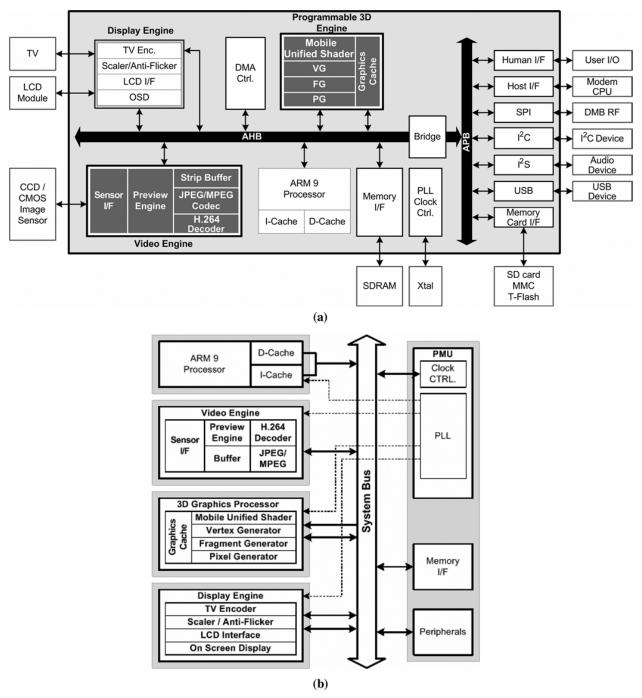

Fig. 1. Mobile multimedia SoC. (a) System architecture. (b) Power and clock domains.

supports up to 3M pixels image sensors, MPEG4 @ simple profile Lv.0 \sim 3 encoding/decoding and H.264 baseline Lv.0 \sim 3 decoding of 30 fps for CIF image resolution. During video operation, it consumes less than 152 mW at 1.2 V supply voltage and 48 MHz operating frequency.

For low power consumption, the developed SoC adopts block level clock gating and power gating. The SoC consists of five voltage islands and five clock domains as shown in Fig. 1(b). According to the operating mode, the power sources and clocks

of the functional blocks are selectively turned off. In the sleep mode, all IPs except wake-up logics are turned off and the SoC consumes less than 150 μ W. In normal operation mode, the RISC processor controls whether the IPs are turned off or not.

Since the IPs shares bus bandwidth, the bandwidth occupation is one of the important design issues in mobile multimedia SoC. During the 3-D graphics applications, the ARM processor computes application programs and transfer graphics processor (GPU) commands and primitive vertex indexes to the GPU

through the system bus. Using the GPU commands, the GPU performs geometry operations and rendering operations. For geometry and rendering operations, the GPU fetches primitive vertex attributes, depth, color, and texture from the system memory. Those graphics data are transferred through the system bus and they consumes about 700 MBs/s if the GPU computes the graphics data at the speed of 10 Mvertices/s-296 MB/s for primitive vertices and 400 MB/s for rendering. Although the AMBA bus has 400 MB/s bus bandwidth, it can provide less than 120 MB/s bus bandwidth to GPU because the ARM processor and other peripherals operate simultaneously with the GPU. To reduce the data transaction of the GPU, the GPU employs vertex cache [4] for primitive vertex, texture cache with 1:4 texture compression for texture, and 2-D direct mapped cache [3] for color and depth. With those techniques, the required data bandwidth is reduced to 116.4 MB/s for drawing 10 Mvertices/s.

III. PROGRAMMABLE 3-D GRAPHICS ENGINE

A. Internal Architecture

The programmable 3-D graphics engine consists of Mobile Unified Shader, Vertex Generator, Fragment Generator, Pixel Generator, Matrix/Quaternion-Vector Generator and graphics caches as shown in Fig. 2.

The mobile unified shader is designed to perform both programmable vertex operation and programmable pixel operation, which are fully compatible with the mobile 3-D graphics API – OpenGL|ES2.0. Since the redundant functional blocks of the vertex shader and the pixel shader into a single hardware, the mobile unified shader reduces silicon area and power consumption. The SIMD datapath and special functional unit

MG_INVERT	Inverse a Matrix
MG_Determinant	Get Determinant of Matrix
MG_MMUL	Matrix Multiplication

(SFU) of the mobile unified shader are responsible for the computational works and the texture engine [3] is responsible for texture address generation, texture fetch, and texture filtering. The vertex generator, fragment generator, and pixel generator are responsible for the rest of the 3-D graphics pipelines, clipping, triangle setup, rasterization, and blending, respectively. To reduce power consumption, the fragment generator employs low power SlimShader architecture [3].

During the per-vertex operation, the mobile unified shader uses several floating-point matrices related to rotation, transportation, scale, and projection and those matrices are generated by the embedded RISC processor. Since the embedded RISC processor has only integer datapaths, the floating point computations are done by complex emulation equations. Therefore, thousands of cycles are consumed for matrix operations and this computation cycles limit the 3-D graphics performance. In order to accelerate those matrix operations, the mobile unified shader employs the matrix generator. The matrix generator consists of 6 floating-point multipliers, 6 floating-point adders, a floating-point divider, a floating-point square-root block and a floating-point trigonometric function block and it is controlled by the RISC processor using the dedicated matrix generator instructions as shown in Table I. With those matrix instructions, the matrix generator calculates transformation and projection matrices by matrix basis while embedded RISC processor computes by components basis. In addition, since the matrix generator and the mobile unified shader have independent commands and datapaths respectively, user can use the matrix generator and the mobile unified shader at the same time. For example, when the shader program contains complex matrix operations, users can use matrix generator instead of shader datapath to simplify the shader operations.

B. Pixel-Vertex Multi Threading

Fig. 3(a) shows a data flow diagram of the programmable 3-D graphics pipeline. In conventional architecture, the primitive vertices are computed in the vertex shader for per-vertex operations such as transformation and lighting. After per-vertex operations, vertex generator and fragment generator perform clipping and rasterization and they generate interpolated pixels (fragments). After that, the fragments are modified in the pixel shader using per-pixel effects and blending operations generate final pixel data. In contrast with conventional architecture, the

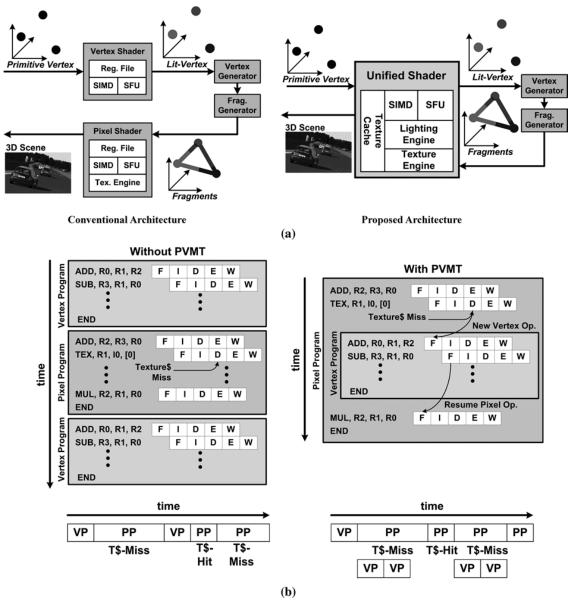

Fig. 3. Pixel-vertex multi-threading. (a) Data flow of the programmable 3-D graphics pipeline. (b) Pixel-vertex multi-threading.

mobile unified shader is responsible for both per-vertex operations and per-pixel operations in a single hardware. Therefore, the graphics data traverse the mobile unified shader twice in a single 3-D graphics pipeline as shown in Fig. 3(a) and thus, the 3-D graphics performance is limited less than the half of the its peak performance. Moreover, texture cache miss wastes a few tens of cycles until the cache is filled up and it degrades the graphics performance is degraded further.

To improve the 3-D graphics performance, the 3-D graphics processor adopts a Pixel-Vertex-Multi-Threading (PVMT), which utilizes datapaths of the mobile unified shader in parallel. Since the texture engine performs texture fetching and filtering independent with SIMD datapath and SFU, those datapaths are idle during the texture operations. Therefore, the PVMT enables SIMD datapath and SFU to compute per-vertex

operations during the texture cache miss as shown in Fig. 3(b). When the texture cache miss occurs during per-pixel operations and vertex buffer contains vertices to be computed, PVMT issues next vertices and SIMD datapath and SFU perform per-vertex operations. If the texture cache filling is finished during the per-vertex operations, the mobile unified shader moves back to per-pixel operation and finalize the remaining pixel operations. Otherwise, the PVMT issues next vertices and performs per-vertex operations continuously.

Since the PVMT uses wasted cycles by the texture cache miss, the efficiency of the PVMT depends on the application characteristics such as vertex/pixel ratio or texture cache miss rate. In mobile 3-D graphics, the texture cache miss is occurred with about 10% probability in average and it consumes as short as 64 cycles, or 148 cycles at the most in the developed mobile

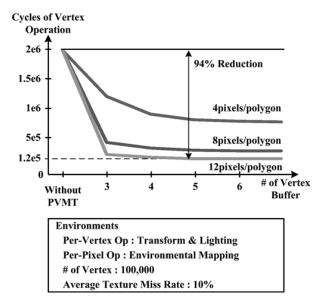

Fig. 4. Efficiency of pixel-vertex multi-threading.

multimedia SoC. Since the per-vertex operations such as transform and lighting (TnL) consume about 20 cycles in the test contents, more than three vertices could be computed during the texture cache miss if the vertex buffers are enough. Fig. 4 shows the efficiency of the PVMT versus the number of vertex buffers and the vertex/pixel ratio. While the effects of the PVMT vary from the vertex/pixel ratio, the PVMT reduces the cycles of the vertex operation as short as 60%, or 94% at the most. Although the PVMT reduces cycles of the vertex operations, the effect of the PVMT is bounded when the vertex buffer has five entries because the PVMT uses wasted cycles by the texture cache miss and the cycle counts are limited around 100 cycles in average. Therefore, the developed 3-D graphics processor has 5 entries vertex buffer for trade-off between hardware cost and the performance. By employing PVMT with five-entries vertex buffer, about 90% of the vertex operations are interleaved into the pixel operations and we can remove the cycle time of the vertex operations from the graphics pipeline.

IV. MOBILE UNIFIED SHADER

A. Internal Architecture

The mobile unified shader is a SIMD processor for fully programmable 3-D graphics. It consists of 128 bits, 4 × 32 bit SIMD datapath, SFU, texture engine, logarithmic lighting engine, dedicated register file and control logic as shown in Fig. 5. The SIMD datapath is responsible to vector arithmetic operations such as Addition (ADD), Multiplication (MUL) and inner product (DOT). The SFU is dedicated to special functional scalar operations such as Logarithm (LOG), Exponent (EXP), Reciprocal (RCP) and Reciprocal-square-root (RSQ). And the texture engine and the lighting engine perform texture related operations and lighting operations, respectively.

Since the LOG, EXP, RCP and RSQ operations are difficult to compute in ordinary number datapaths, the SFU employs the logarithmic number system (LNS) [11]. In the LNS, since the

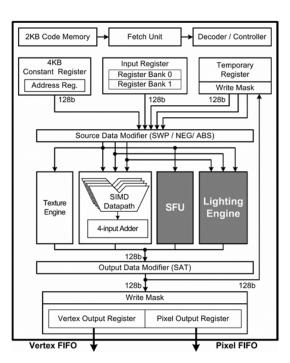

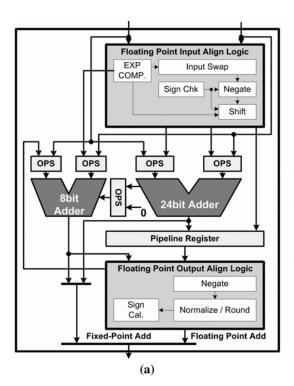

Fig. 5. Mobile unified shader architecture.

ordinary number data should be converted into the LNS and the results should be converted into ordinary number, one of the critical issues is the data conversion error. Therefore, we employed more precise LOG and EXP converts, which use 16 piecewise-linear-regions. By employing precise LNS datapath, the SFU computes the LOG, EXP, RCP and RSQ in only two cycles keeping the error bound much below the standard graphics API, OpenGL|ES-2.0. Since the vertex shading is performed in IEEE-754 floating point number system and pixel shading is performed in 32 bit fixed-point number system, the SFU is designed to handle both number systems in a single hardware.

For streaming graphics processing, the mobile unified shader contains multiple register files—input registers, output registers, constant register and temporary SIMD registers. The input register is used to hold the vertex attributes such as position and normal vector and pixel attributes such as position, color and texture coordinate. In order to reduce data fetch time, the input register consists of two register banks for double buffering. The constant register stores the coefficients for the 3-D graphics operations. The temporal register is used to store temporary results during vertex program and pixel program execution. The modified vertex and modified pixel information are transformed into output register.

B. Unified SIMD Datapaths

The SIMD datapath is responsible for vector and matrix arithmetic operations such as Addition (ADD), Multiplication (MUL), and Inner Product (DOT). Since, in mobile 3-D graphics API-OpenGL|ES, per-vertex operations use IEEE-754 floating-point number system for wide dynamic range and per-pixel operations use fixed-point number system for high throughput, the conventional vertex shader has floating-point

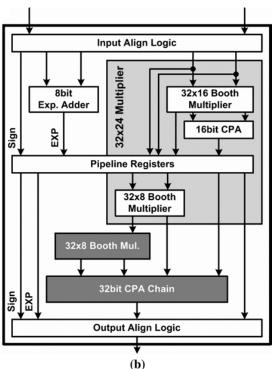

Fig. 6. Unified SIMD datapath. (a) Unified adder. (b) Unified multiplier.

SIMD datapath and pixel shader has fixed-point SIMD datapath. To compute both operations in a single mobile unified shader, we employed the unified datapaths, adder and multiplier, which computes IEEE-754 floating-point numbers and fixed-point numbers in a single hardware.

Since the fixed-point adder requires 32 bit addition and the floating point adder requires 8 bit addition for exponent and 24 bit addition for mantissa, the 32 bit adder can be shared for both number systems. Therefore, the unified adder has configurable 32 bit adder, which consists of a 24 bit adder and 8 bit adder as shown in Fig. 6(a). The configurable 32 bit adder is configured by operands selection and it computes floating-point addition with 2 cycle latency and 1 cycle throughput, and fixed-point addition in a single cycle. The unified multiplier consists of common 32 bit \times 24 bit multiplier, optional 32 bit \times 8 bit multiplier, and 8 bit adder for floating-point exponent as shown in Fig. 6(b) because the floating point multiplication includes 24 bit by 24 bit multiplication for mantissa and fixed point multiplication includes 32 bit by 32 bit multiplication. The final 32 \times 8 multiplier is conditionally enabled and the CPA chain selects the input between 24 bit result and 32 bit result. The unified multiplier calculates both floating-point MUL and floating-point MUL with 2 cycle latency and 1 cycle throughput. By sharing the common functional blocks of floating point datapath and fixed point datapath, the unified SIMD datapath reduces silicon area by 47% and power consumption by 42% compared with separated floating-point and fixed-point SIMD datapaths.

C. Low Power Lighting Engine

The lighting equation is the most complex operation during the vertex operation due to the power (POW) operation of specular lighting. To accelerate the lighting equation with low power consumption, the low power lighting engine is employed. The OpenGL lighting equation which includes an ambient light, a diffuse light and a specular light is described in (1):

$$Color_{ORD} = C_{amb} + \{ (N' \bullet L_{dir}) \times C_{diff} \} + \{ (N' \bullet H)^{C_{pow}} \times C_{spec} \}. \quad (1)$$

In conventional implementation [9], the lighting equation is performed sequential fashion as shown in Fig. 7(a). At first, the LIT instruction computes lighting coefficients. Then multiplications and additions are performed. During lighting computation, the data dependency wastes several cycles and it degrades graphics performance. However, as shown in (2), the lighting equation consists of three independent components and it can be computed in parallel:

$$Color_{LNS} = C_{amb} + \{ (N' \bullet L_{dir}) \times C_{diff} \} + 2 \{ log_2(N' \bullet H) \times C_{pow} + log_2 C_{spec} \}. \quad (2)$$

To improve lighting computation, the lighting engine and specialized lighting instruction are designed to compute three components simultaneously. Since the POW operation can be converted into a multiplication as shown in (2), the lighting engine employs the logarithmic number datapaths [11] for specular lighting. Therefore, the lighting engine consists of ordinary number datapaths for ambient and diffuser lighting computation and logarithmic number datapaths to accelerate specular lighting computation as shown in Fig. 7(b). To utilize the lighting engine efficiently by graphics APIs, the specialized lighting instruction, TLT, is proposed. The TLT instruction

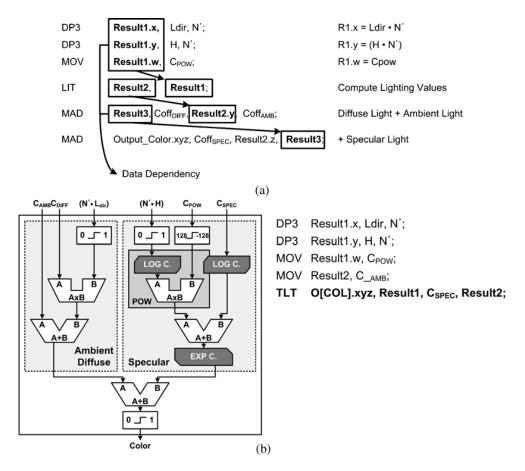

Fig. 7. Low power lighting engine. (a) Conventional lighting computation. (b) Proposed lighting engine.

combines the coefficient calculation and the multiplication of coefficients and materials together as shown in Fig. 7(b). The lighting engine with TLT instruction computes the lighting equation without data dependency so that, the lighting engine with TLT instruction generates lit vertex in every two cycles. For compatibility with OpenGL|ES interface, the lighting engine supports both the conventional LIT instruction and TLT instruction. In the conventional lighting operation, the lighting engine accelerates the POW operations and it computes only the lighting coefficients, which are used for complex 3-D graphics effects such as user-defined lighting. Otherwise, the TLT instruction is used to accelerate the common lighting environments, which is widely used in commercial mobile 3-D contents. By adopting logarithmic LE and TLT instruction, the mobile unified shader generates a lit-vertex in every two cycles and it achieves 9.1 Mverticies/s, which is 2.5 times higher performance compared with previous implementation [3].

D. Micro-Level Power Management

For low power consumption of the mobile unified shader, it implements instruction-level power management. To activate the 3-D graphics processor, the ARM processor must drive activation signal to 3-D graphics processor and the 3-D GPU controller drive enable signal to the unified shader only when the

current shader instruction is valid. Using this enable signal, the clock signals of the SIMD register files can be gated off when the write operations of the register files are not required. The read operations of the register files are still possible in the clock-off state. Like the same way, the enable signal also reduces the power dissipation of SIMD arithmetic units by eliminating the unnecessary signal transition. Therefore, the power consumption of the mobile unified shader is controlled on an instruction level. In the mobile unified shader, since the SIMD register files and datapath consumes about 80% of power, about 85% activation ratio in full 3-D graphics pipeline achieves up to 12% power reduction of the mobile unified shader. For power management of the pixel-operations, it implements pixel-level clock gating. The pixel operation includes fragment generator for triangle setup and rasterization, mobile unified shader for per-pixel operations, and pixel generator for blending operations. To reduce power consumption, the fragment generator allows clock gating, which uses depth-comparison results generated in early stage of rendering pipeline. If a new pixel to be drawn is already covered by the pixels near from the viewpoint, the remaining operations does not need to process further. To use this property, per-pixel operations of the mobile unified shader is killed and the clock signal of the pixel generator is gated-off to prevent unnecessary operations.

V. IMPLEMENTATION RESULTS

The mobile multimedia SoC is fabricated using a 0.13 μ m seven-metal CMOS logic process. It contains 18.6 M transistors including 128 KB SRAM in 6.4 \times 6.4 mm². Fig. 8 shows the chip microphotograph and Table II summarizes chip features. By using this chip, realistic 3-D graphics effects can be processed with 9.1 Mvertices/s peak graphics performance and 30 fps MPEG4 encoding/decoding and 30 fps H.264 decoding can be processed in the mobile devices. The 3-D graphics images with realistic graphics effects are successfully demonstrated by the fabricated chip on the system evaluation board as shown in Fig. 9. For a demo content which uses both the per-vertex operations such as transformation and lighting and the per-pixel operations such as environmental mapping, the developed SoC continuously draws the 3-D images at the speed of 7.4 Mpixels/s.

With the mobile unified shader, the developed SoC can provide fully programmable 3-D graphics pipeline, per-vertex

Fig. 9. System evaluation board.

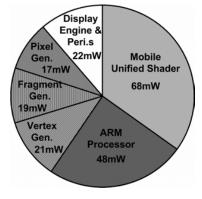

Fig. 10. Power dissipation of the 3-D graphics applications.

operations and per-pixel operations, and thus, it can completely generate realistic 3-D graphics effects such as environmental mapping or per-pixel lighting. The proposed mobile unified shader reduces silicon area of the 3-D graphics processor by 35% with the help of the unified SIMD datapaths, logarithmic datapath. The logarithmic datapaths, low power register file, and micro-level (instruction-level and pixel-level) clock gating reduces the power consumption by 28%. The developed SoC consumes 195 mW in continuous calculation of 9.1 Mvertices/s full 3-D graphics pipeline including programmable per-vertex operations and programmable per-pixel operations at 100 MHz operating frequency and 1.2 V supply voltage and it consumes 152 mW in continuous calculation of CIF 30 fps H.264 decoding including audio playback at 48 MHz operating frequency and 1.2 V supply voltage. The power dissipations of the functional blocks are summarized in Fig. 10.

Fig. 11 shows the 3-D graphics performance comparison with that of the previous implementations [3], [5], [12]. The 3-D graphics performance is measured including transformation and OpenGL lighting with one ambient light, one diffuse light, and one specular light for geometry and texture blending for rendering. The developed SoC provides 9.1 Mvertices/s fully programmable 3-D graphics including transformation and lighting and, with the help of the lighting engine and specialized lighting instruction, it improves 2.1 times vertex fill rate compared with

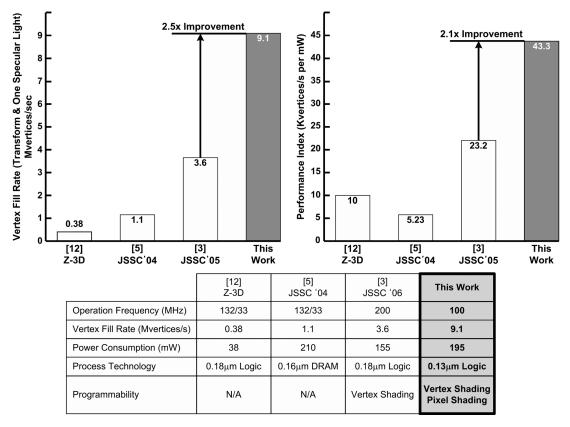

Fig. 11. 3-D graphics performance comparison.

previous implementation [3]. The 3-D graphics performance in the mobile devices cannot be compared directly in terms of processing speed such as vertex fill rate because the power consumption must be taken into account as well [5]. Based on the performance index of the mobile 3-D graphics [3], which is the vertex fill rate normalized by the power consumption, the developed SoC shows 46.67 Kvertices/s/mW, which is about 2 times improvement over the previous implementation [3].

VI. CONCLUSION

A low power multimedia SoC is designed for mobile devices. It integrates fully programmable 3-D graphics engine, MPEG4/JPEG codec and H.264 decoder in a single chip. The mobile unified shader provides a fully programmable 3-D graphics with 35% area reduction and 28% power reduction. Low power lighting engine and the specialized lighting instruction achieves 9.1 MVertices/s vertex fill rate which is 2.5 times improvement over previous works including transformation and OpenGL lighting. The PVMT improves graphics performance by interleaving the vertex operations into pixel operations and as a result, up to 94% vertex operations are hided into the pixel operations. The SoC consumes less than 195 mW at 1.2 V supply voltage and 100 MHz operating frequency for 3-D graphics and less than 152 mW at 1.2 V supply voltage and 48 MHz operating frequency for video operations. With the help of the mobile unified shader and merged JPEG/MPEG4 codec engine, the SoC reduces silicon area and it is implemented in 6.4 mm \times 6.4 mm using 0.13 μ m CMOS logic process.

Jeong-Ho Woo (S'02) received the B.S. and M.S. degrees in electrical engineering from the Korea Advanced Institute of Science and Technology (KAIST), Daejeon, Korea, in 2002 and 2004, respectively. He is currently working toward the Ph.D. degree in electrical engineering at KAIST.

His research includes design of low-power mobile multimedia system with 3-D computer graphics and its implementation. In particular, he is now working on a low-power programmable 3-D graphics processor for mobile devices.

Ju-Ho Sohn (A'07) received the B.S. (*summa cum laude*), M.S., and Ph.D. degrees in electrical engineering from the Korea Advanced Institute of Science and Technology (KAIST), Daejeon, Korea, in 2001, 2003, and 2006, respectively. During the period in KAIST, he developed low-power programmable 3-D graphics processor integrated with vertex shader and DSP engine.

His research interests include low-power high-performance circuits and multimedia system design with specific interest in 3-D computer graphics and video

processing architecture. Currently, he is with LG Electronics, Seoul, Korea, designing a digital TV image enhancement chip.

Hyejung Kim (S'04) received the B.S. and M.S. degrees in electrical engineering from the Korea Advanced Institute of Science and Technology (KAIST), Daejeon, Korea, in 2004 and 2006, respectively. She is currently working toward the Ph.D. degree in the same department at KAIST.

Her research interests include low-power arithmetic unit and microprocessor design for mobile and implantable system applications.

Hoi-Jun Yoo (M'95–SM'04–F'08) graduated from the Electronic Department of Seoul National University, Seoul, Korea, in 1983 and received the M.S. and Ph.D. degrees in electrical engineering from the Korea Advanced Institute of Science and Technology (KAIST), Daejeon, Korea, in 1985 and 1988, respectively. His Ph.D. work concerned the fabrication process for GaAs vertical optoelectronic integrated circuits.

From 1988 to 1990, he was with Bell Communications Research, Red Bank, NJ, where he invented the

two-dimensional phase-locked VCSEL array, the front-surface-emitting laser, and the high-speed lateral HBT. In 1991, he became Manager of a DRAM design group at Hyundai Electronics and designed a family of fast-1 M DRAMs and 256 M synchronous DRAMs. In 1998 he joined the faculty of the Department of Electrical Engineering at KAIST and now is a full Professor. From 2001 to 2005, he was the Director of the System Integration and IP Authoring Research Center (SIPAC), funded by the Korean government to promote worldwide IP authoring and its SoC application. From 2003 to 2005, he was the full-time Advisor to the Minister of Korea Ministry of Information and Communication and National Project Manager for SoC and Computer. In 2007, he founded SDIA (System Design Innovation and Application Research Center) at KAIST to research and develop SoCs for intelligent robots, wearable computers and biosystems. His current interests are high-speed and low-power networks-on-chips, 3-D graphics, body area networks, biomedical devices and circuits, and memory circuits and systems. He is the author of the books DRAM Design (Hongleung, 1996; in Korean), High Performance DRAM (Sigma, 1999; in Korean), and chapters of Networks on Chips (Morgan Kaufmann, 2006).

Dr. Yoo received the Electronic Industrial Association of Korea Award for his contribution to DRAM technology in 1994, the Hynix Development Award in 1995, the Korea Semiconductor Industry Association Award in 2002, the Best Research of KAIST Award in 2007, the Design Award of 2001 ASP-DAC, and Outstanding Design Awards at 2005, 2006, and 2007 A-SSCC. He is a member of the executive committees of ISSCC, Symposium on VLSI, and A-SSCC. He is the TPC chair of A-SSCC 2008.

Introduction

In this technical brief we introduce NVIDIA's new GeForce® GTX 200 GPU family, the first GPUs to implement NVIDIA's second-generation unified graphics and computing architecture. The high-end, enthusiast-class GeForce GTX 280 GPU and performance-oriented GeForce GTX 260 GPU are the first members of the GeForce GTX 200 GPU family and deliver the ultimate visual computing and extreme high-definition (HD) gaming experience.

We'll begin by describing architectural design goals and key features, and then dive into the technical implementation of the GeForce GTX 200 GPUs. We assume you have a basic understanding of first-generation NVIDIA unified GPU architecture, including unified shader design, scalar processing cores, decoupled texture and math units, and other architectural features. If you are not well versed in NVIDIA unified GPU architecture, we suggest you first read the Technical Brief titled NVIDIA GeForce 8800 GPU Architecture Overview. You can also refer to Appendix A for a historical retrospective.

GeForce GTX 200 Architectural Design Goals and Key Capabilities

GeForce GTX 200 GPUs are massively multithreaded, many-core, visual computing processors that incorporate both a second-generation unified graphics architecture and an enhanced high-performance, parallel-computing architecture.

Two overarching themes drove GeForce GTX 200 architectural design and are represented by two key phrases: **"Beyond Gaming"** and **"Gaming Beyond."**

Beyond Gaming means the GPU has evolved beyond being used primarily for 3D games and driving standard PC display capabilities. More and more, GPUs are accelerating non-gaming, computationally-intensive applications for both professionals and consumers.

Gaming Beyond means that the GeForce GTX 200 GPUs enable amazing new gaming effects and dynamic realism, delivering much higher levels of scene and character detail, more natural character motion, and very accurate and convincing physics effects.

The GeForce GTX 200 GPUs are designed to be fully compliant with Microsoft DirectX 10 and Open GL 2.1.

Architectural Design Goals

NVIDIA engineers specified the following design goals for the GeForce GTX 200 GPUs:

- Design a processor with up to twice the performance of GeForce 8800
- Rebalance the architecture for future games that use more complex shaders and more memory
- ☐ Improve architectural efficiency per watt and per square millimeter
- ☐ Improve performance for DirectX 10 features such as geometry shading and stream out
- □ Provide significantly enhanced computation ability for highperformance CUDA™ applications and GPU physics
- Deliver improved power management capability, including a substantial reduction in idle power.

GeForce GTX 200 GPUs enable major new graphics and compute capabilities, providing the most realistic 3D graphics effects ever rendered by GPUs to date, while also providing nearly a teraflop of computational power.

May 2008 | TB-04044-001_v01

Gaming Beyond: Dynamic 3D Realism

While prior-generation GPUs could deliver real-time images that appeared true-to-life in many cases, frame rates could drop to unplayable levels in complex scenes with significant animation, numerous physical effects, and multiple characters. The combination of the sheer shader processing power of GeForce GTX 200 GPUs and NVIDIA's new PhysX™ technology facilitates many new high-end graphics effects including:

- ☐ Convincing facial and character animation
- ☐ Multiple ultra-high polygon characters in complex environments
- ☐ Advanced volumetric effects (smoke, fog, mist, etc.)
- ☐ Fluid and cloth simulation
- Fully simulated physical effects such as live debris, explosions, and fires.
- Physical weather effects such as accumulating snow and water, sand storms, soaking, drying, dampening, overheating, and freezing
- Better lighting for dramatic and spectacular effect, including ambient occlusion, global illumination, soft shadows, color bleeding, indirect lighting, and accurate reflections.

Figure 1: Realistic warrior from NVIDIA "Medusa" demo

6 May, 2008 | TB-04044-001_v01

Gaming Beyond: Extreme HD

GeForce GTX 200 GPUs provide 50-100% more performance over priorgeneration GPUs, permitting increased frame rates and higher visual quality settings at extreme resolutions, resulting in a truly cinematic gaming experience.

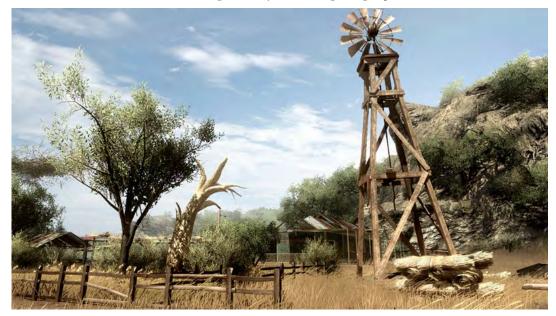

Figure 2: Far Cry 2 - Extreme HD Dynamic Beauty! (Ubisoft)

Support for the new DisplayPort interface allows resolutions beyond 2560×1600 , and 10-bit color support permits up to a billion different colors on screen (driver, display, and application support is also required). Note that prior-generation GPUs included internal 10-bit processing, but could only output 8-bit component colors (RGB). GeForce GTX 200 GPUs permit both 10-bit internal processing and 10-bit color output.

Gaming Beyond: SLI

NVIDIA's SLI® technology is the industry's leading multi-GPU technology, giving you an easy, low-cost, high-impact performance upgrade. PC gaming simply doesn't get any faster or more realistic than running GeForce GTX 200 GPU-based boards in SLI mode on the latest nForce® motherboards.

Two flavors of SLI are supported by the initial GeForce GTX 200 GPUs:

- □ Standard SLI (two GPU boards), which typically boosts supported game performance by 60-90% and permits higher quality settings
- 3-way SLI, which provides even higher frame rates and permits higher quality settings for the ultimate experience in PC gaming when connected to a high-end, high-resolution monitor.

GeForce GTX 200 GPUs process and display complex DirectX 10 and OpenGL game environments with amazing graphics effects and high frame rates at extreme, high-definition resolutions.

Beyond Gaming: High-Performance Visual Computing and Professional Computation

With the power of CUDA technology and the new CUDA runtime for Windows Vista, intensive computational tasks can be offloaded from the CPU to the GPU. GeForce GTX 200 GPUs can accelerate numerous rich-media and computationally-intensive applications such as video and audio transcoding, or running distributed computing applications like Folding@home in the background while surfing the web. Examples of GPU-enabled applications include the RapidHD video transcoding application from Elemental and various video and photo editing applications.

Many engineering, scientific, medical, and financial areas demand high-performance computational horsepower for numerous applications.

Figure 3 shows the amazing speedups that can be achieved by using a GPU instead of a CPU in a number of professional visual computing applications, in addition to mainstream video transcoding. Appendix B lists references and details for these applications.

Speedups Using GPU vs CPU

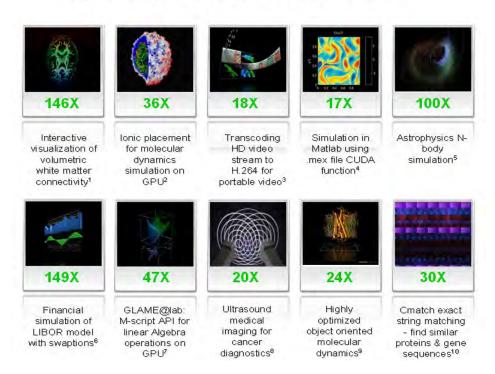

Figure 3: Significant Speedup Using GPU

With an understanding of the GeForce GTX 200 GPU design goals and key objectives, let's delve deeper into its internal architecture, looking at both the graphics and parallel processing capabilities.

GeForce GTX 200 GPU Architecture

GeForce GTX 200 GPUs are the first to implement NVIDIA's second-generation unified shader and compute architecture. The GeForce GTX 200 GPUs include significantly enhanced features and deliver, on average, 1.5× the performance of GeForce 8 or 9 Series GPUs.

Manufactured using TSMC's 65 nm fabrication process, GeForce GTX 200 GPUs include 1.4 billion transistors and are the largest, most powerful, and most complex GPU ever made. All GTX 200 GPUs are built to operate comfortably within the power and heat specifications of high-end PCs.

You may recall that the first-generation NVIDIA unified visual computing architecture in GeForce 8 and 9 Series GPUs was based on a Scalable Processor Array (SPA) framework. The second-generation architecture in GeForce GTX 200 GPUs is based on a reengineered, enhanced, and extended SPA architecture.

The SPA architecture consists of a number of TPCs, which stands for "Texture Processing Clusters" in graphics processing mode, and "Thread Processing Clusters" in parallel compute mode. Each TPC is in turn made up of a number of streaming multiprocessors (SMs), and each SM contains eight processor cores (also called streaming processors (SPs) or thread processors). Every SM also includes texture filtering processors used in graphics processing, but also useful for various filtering operations in compute mode, such as filtering images as they are zoomed in and out.

More Processor Cores

The new second-generation SPA architecture in the GeForce GTX 280 improves performance compared to the prior generation G80 and G92 designs on two levels. First, it increases the number of SMs per TPC from two to three. Second, it increases the maximum number of TPCs per chip from 8 to 10. The effect is multiplicative, resulting in 240 processor cores.

Chip	TPCs	SMs per TPC	SPs per SM	Total SPs
GeForce 8 & 9 Series	8	2	8	128
GeForce GTX 200 GPUs	10	3	8	240

Table 1: Number of GPU Processing Cores

Based on traditional processing core designs that can perform integer and floatingpoint math, memory operations, and logic operations, each processing core is a hardware-multithreaded processor with multiple pipeline stages that execute an instruction for each thread every clock.

Various types of threads exist, including pixel, vertex, geometry, and compute. For graphics processing, threads execute a shader program and many related threads often simultaneously execute the same shader program for greater efficiency.

All GeForce GTX 200 GPUs include a substantial portion of die area dedicated to processing, unlike CPUs where a majority of die area is dedicated to onboard cache memory. Rough estimates show 20% of the transistors of a CPU are dedicated to computation, compared to 80% of GPU transistors. GPU processing is centered on computation and throughput, where CPUs focus heavily on reducing latency and keeping their pipelines busy (high cache hit rates and efficient branch prediction).

Graphics Processing Architecture

As mentioned earlier, the GeForce GTX 200 GPUs include two different architectural personalities—graphics and computing. Figure 4 represents the GeForce 280 GTX in graphics mode. You can see the shader thread dispatch logic at the top, in addition to setup and raster units. The ten TPCs each include three SMs, and each SM has 24 processing cores for a total of 240 scalar processing cores. ROP (raster operations processors) and memory interface units are located at the bottom.

GeForce GTX 280 Graphics Processing Architecture

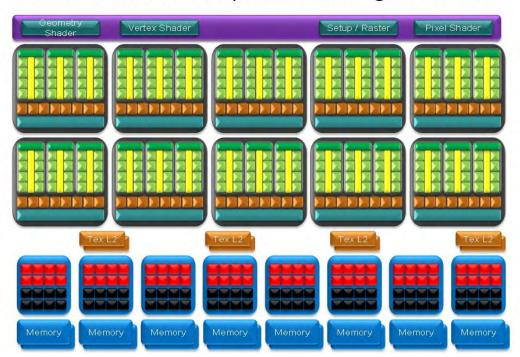

Figure 4: GeForce GTX 280 GPU Graphics Processing Architecture

Although not apparent in the above diagram, the architectural efficiency of the GeForce GTX 200 GPUs is substantially enhanced over the prior generation. We'll be discussing many areas that were improved in more detail, such as texture processing, geometry shading, dual issue, and stream out. In directed tests, GeForce GTX 200 GPUs can attain efficiencies closer to the theoretical performance limits than could prior generations.

Table 2 compares the GeForce 8800 GTX to the new GeForce GTX 280 GPU. You will notice sizable increases in a number of important measurable parameters.

Features	8800 GTX	GTX 280	% Increase
Cores	128	240	87.5 %
TEX	64t/clk	80t/clk	25 %
ROP Blend	12p/clk	32p/clk	167 %
Precision	fp32	fp64	
GFLOPs	518	933	80 %
FB Bandwidth	86 GB	142 GB	65 %
Texture Fill	37 GT/s	48 GT/s	29.7 %
ROP Blend	7 GBL/s	19 GBL/s	171 %
PCI Express	6.4 GB	12.8 GB	100 %
Video	VP1	VP2	

Table 2: GeForce 8800 GTX vs GeForce GTX 280

Parallel Computing Architecture

Figure 5 depicts a high-level view of the GeForce GTX 280 GPU parallel computing architecture. A hardware-based thread scheduler at the top manages scheduling threads across the TPCs. You'll also notice the compute mode includes texture caches and memory interface units. The texture caches are used to combine memory accesses for more efficient and higher bandwidth memory read/write operations. The elements indicated as "atomic" refer to the ability to perform atomic read-modify-write operations to memory. Atomic access provides granular access to memory locations and facilitates parallel reductions and parallel data structure management.

GeForce GTX 280 Parallel Computing Architecture

Figure 5: GeForce GTX 280 GPU Parallel Computing Architecture

A TPC in compute mode is represented in Figure 6 below. You can see local shared memory is included in each of the three SMs. Each processing core in an SM can share data with other processing cores in the SM via the shared memory, without having to read or write to or from an external memory subsystem. This contributes greatly to increased computational speed and efficiency for a variety of algorithms.

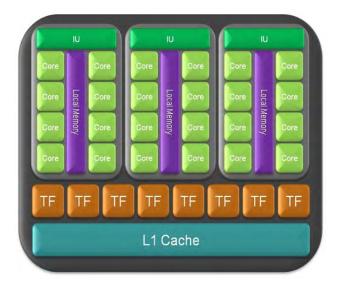

Figure 6: TPC (Thread Processing Cluster)

SIMT Architecture

NVIDIA's unified shading and compute architecture uses two different processing models. For execution across the TPCs, the architecture is MIMD (multiple instruction, multiple data). For execution across each SM, the architecture is SIMT (single instruction, multiple thread).

SIMT improves upon pure SIMD (single instruction, multiple data) designs in both performance and ease of programmability. Being scalar, SIMT has no set vector width and therefore performs at full speed irrespective of vector sizes.

In contrast, SIMD machines operate at a reduced capacity if the input is smaller than the MIMD or SIMD width. SIMT ensures the processing cores are fully utilized at all times.

From the programmer's perspective, SIMT also allows each thread to take on its own path. Since branching is handled by the hardware, there is no need to manually manage branching within the vector width.

Greater Number of Threads in Flight

GeForce GTX 200 GPUs support over thirty thousand threads in flight. Hardware thread scheduling ensures all processing cores attain nearly 100% utilization. The GPU architecture is latency-tolerant—if a particular thread is waiting for a memory access, the GPU can perform zero-cost hardware-based context switching and immediately switch to another thread to process.

The SIMT multithreaded instruction unit within an SM creates, manages, schedules, and executes threads in groups of 32 parallel threads called "warps." Up to 32 warps/SM are supported in GeForce GTX 200 GPUs, versus 24 warps/SM in GeForce 8 or 9 Series GPUs.

Chip	TPCs	SM per TPC	Threads per SM	Total Threads Per Chip
GeForce 8 & 9 Series	8	2	768	12,288
GeForce GTX 200 GPUs	10	3	1,024	30,720

Table 3: Maximum Number of Threads

Doing the math results in 32 x 32, or 1,024 maximum concurrent threads that can be managed by each SM. With 30 SMs in total, the GeForce GTX 280 supports up to 30,720 concurrent threads in hardware (versus 768 threads/SM \times 2 SMs/TPC \times 8 TPCs = 12,288 maximum concurrent threads in GeForce 8800 GTX).

Larger Register File

The local register file size has doubled per SM in GeForce GTX 200 GPUs compared to GeForce 8 & 9 Series GPUs. The older GPUs could run into situations with long shaders where registers would be exhausted, generating the need to swap to memory. A much larger register file permits larger and more complex shaders to be run on the GeForce GTX 200 GPUs faster and more efficiently. In terms of die size increase, the additional register file takes only a small fraction of SM die area.

Games are employing more and more complex shaders that require more register space. Figure 7 below highlights performance improvements 2× register file size in 3D Mark Vantage.

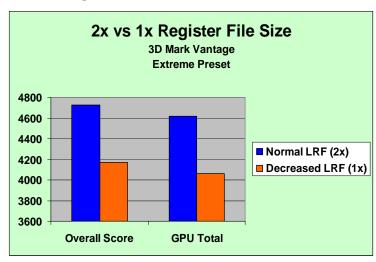

Figure 7: Local Register File 2× versus 1×

14 May, 2008 | TB-04044-001_v01

Improved Dual Issue

Special function units (SFUs) in the SMs compute transcendental math, attribute interpolation (interpreting pixel attributes from a primitive's vertex attributes), and perform floating-point MUL instructions. The individual streaming processing cores of GeForce GTX 200 GPUs can now perform near full-speed dual-issue of multiply-add operations (MADs) and MULs (3 flops/SP) by using the SP's MAD unit to perform a MUL and ADD per clock, and using the SFU to perform another MUL in the same clock. Optimized and directed tests can measure around 93-94% efficiency.

The entire GeForce GTX 200 GPU SPA delivers nearly one teraflop of peak, single-precision, IEEE 754, floating-point performance.

Double Precision Support

A very important new addition to the GeForce GTX 200 GPU architecture is double-precision, 64-bit floating point computation support. This benefits various high-end scientific, engineering, and financial computing applications or any computational task requiring very high accuracy of results. Each SM incorporates a double-precision 64-bit floating math unit, for a total of 30 double-precision 64-bit processing cores.

The double-precision unit performs a fused MAD, which is a high-precision implementation of a MAD instruction that is also fully IEEE 754R floating-point specification compliant. The overall double-precision performance of all 10 TPCs of a GeForce GTX 280 GPU is roughly equivalent to an eight-core Xeon CPU, yielding up to 78 gigaflops.

Improved Texturing Performance

The eight TPCs of the GeForce 8800 GTX allowed for 64 pixels per clock of texture filtering, 32 pixels per clock of texture addressing, 32 pixels per clock of 2× anisotropic bilinear filtering (8-bit integer), or 32-bilinear-filtered pixels per clock (8-bit integer or 16-bit floating point). Subsequent GeForce 8 and 9 Series GPUs balanced texture addressing and filtering.

☐ For example, the GeForce 9800 GTX can address and filter 64 pixels per clock, supporting 64-bilinear-filtered pixels per clock (8-bit integer) or 32-bilinear-filtered pixels per clock (16-bit floating point).

GeForce GTX 200 GPUs also provide balanced texture addressing and filtering and each of the 10 TPCs includes a dual-quad texture unit capable of addressing and filtering eight bilinear pixels/clock, or four 2:1 anisotropic filtered pixels/clock, or four FP16 bilinear-filtered pixels/clock. Total bilinear texture addressing and filtering capability for an entire high-end GeForce GTX 200 GPU is 80 pixels per clock.

GeForce GTX 200 GPUs employ a more efficient scheduler, allowing the chips to attain close to theoretical peak performance in texture filtering. In real world measurements, it is 22% more efficient than the GeForce 9 Series.

Chip	Theoretical Bilinear Fillrate	Measured Rate (3DMark multitex)	Measured Performance / Theoretical Performance
GeForce 9 Series	33,600	25,600	76.2%
GeForce GTX 200 GPUs	51,840	48,266	93.1%

Table 4: Theoretical vs Measured Texture Filtering Rates

Higher Shader to Texture Ratio

Because games and other visual applications are continually employing more and more complex shaders, the GeForce GTX 200 GPU design shifts the balance to a higher shader to texture ratio. By adding one more SM to each TPC, and keeping texturing hardware constant, the shader to texture ratio is increased by 50%. This shift allows the GeForce GTX 200 GPUs to perform efficiently for both today's and tomorrow's games.

ROP Improvements

The previous-generation GeForce 8 series ROP subsystem supported multisampled, supersampled, transparency adaptive, and coverage sampling antialiasing. It also supported frame buffer (FB) blending of floating-point (FP16 and FP32) render target surfaces, and either type of FP surface could be used in conjunction with multisampled antialiasing for outstanding HDR rendering quality.

The new GeForce GTX 200 GPU ROP subsystem supports all of the previous generation features, and delivers a maximum of 32 pixels per clock output, equating to 4 pixels/clock per ROP partition × 8 partitions. Up to 32 color and Z samples per clock for 8 × MSAA are supported per ROP partition. Pixels using U8 (8-bit unsigned integer) data format can be blended at twice the rate per TPC of the oldergeneration GPUs. Given the prior generation GPU had six ROP partitions, it could output 24 pixels/clock and blend 12 pixels/clock. In contrast the GeForce GTX 280 can output and blend 32 pixels/clock.

1 GB Framebuffer

Today's 3D games use a variety of textures to attain realism. Normal maps are used to enhance surface realism, cubemaps for reflections, and high-resolution perspective shadow maps for soft shadows. This means much more memory is needed to render a single scene than classic rendering which relied mainly on the base texture. Deferred rendering engines also make extensive use of multiple render targets, where attributes of the image are rendered off screen before the final image is composed. These techniques consume an immense amount of video memory and memory bandwidth, especially when used in conjunction with antialiasing.

The GeForce GTX 280 and GeForce GTX 260 support 1,024 MB and 896 MB of frame buffer respectively, a two-fold improvement from over prior generation GPUs. With 1 GB of frame buffer, high-resolution antialiasing performance is dramatically improved. For example, deferred rendered games like S.T.A.L.K.E.R. can now be enjoyed with antialiasing.

Geometry Shading and Stream Out

Internal output buffer structures have been significantly upsized by a factor of 6× in GeForce GTX 200 GPUs compared to the prior generation, providing much faster geometry shading and stream out performance. Figure 8 shows the latest RightMark 3D 2.0 benchmark results, including geometry shading tests. The GeForce GTX 280 GPU is significantly faster than prior generation NVIDIA GPUs and competitive products.

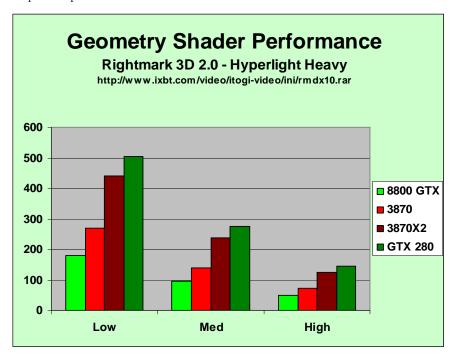

Figure 8: Geometry Shading Performance

Our own Medusa demo is highly dependent on the much faster geometry and stream out performance.

512-bit Memory Interface

Maximum memory interface width is expanded from 384 bits in previous-generation GPUs to 512 bits in GeForce GTX 200 GPUs, using eight 64-bit-wide frame buffer interface units. Memory bandwidth has been significantly increased.

In terms of rebalancing the architecture versus prior generations, the texture to frame buffer (TEX:FB) bandwidth ratio has also been modified to best support current and future workloads. NVIDIA engineers tested many applications to arrive

at the right balance of frame buffer bandwidth required to keep the texture units fully utilized and not starved for data.

General frame buffer efficiency has been improved for GeForce GTX 200 GPUs. We reworked the critical paths in the frame buffer to allow higher speed memory operation, up to 1.1 GHz GDDR3 stock speed. Memory bank access patterns and caching algorithms have also been improved. Additional compression hardware in GeForce GTX 200 GPUs effectively increase frame buffer bandwidth by permitting more data to traverse the interface per unit time, enabling better performance at higher resolutions.

Power Management Enhancements

GeForce GTX 200 GPUs include a more dynamic and flexible power management architecture than past generation NVIDIA GPUs. Four different performance / power modes are employed:

- ☐ Idle/2D power mode (approx 25 W)
- □ Blu-ray DVD playback mode (approx 35 W)
- □ Full 3D performance mode (varies—worst case TDP 236 W)
- HybridPowerTM mode (effectively 0 W)

Using a HybridPower-capable nForce motherboard, such as those based on the nForce 780a chipset, a GeForce GTX 200 GPU can be fully powered off when not performing intensive graphics operations and graphics output can be handled by the motherboard GPU (mGPU).

For 3D graphics-intensive applications, the NVIDIA driver can seamlessly switch between the power modes based on utilization of the GPU. Each of the new GeForce GTX 200 GPUs integrates utilization monitors ("digital watchdogs") that constantly check the amount of traffic occurring inside of the GPU. Based on the level of utilization reported by these monitors, the GPU driver can dynamically set the appropriate performance mode (i.e., a defined clock and voltage level) that minimizes the power draw of the graphics card—all fully transparent to the end

The GPU also has clock-gating circuitry, which effectively "shuts down" blocks of the GPU which are not being used at a particular time (where time is measured in milliseconds), further reducing power during periods of non-peak GPU utilization.

All this enables GeForce GTX 200 graphics cards to deliver idle power that is nearly 1/10th of its maximum power (approximately 25 W on GeForce GTX 280 GPUs). This dynamic power range gives you incredible power efficiency across a full range of applications (gaming, video playback, surfing the web, etc).

Many other areas of the GeForce GTX 200 GPU pipeline have been reworked to improve performance and reduce various processing bottlenecks.

Additional Pipeline and Architecture Enhancements

Starting from the top of the GeForce GTX 200 GPUs, the front-end unit communicates with the graphics driver running on the host system to accept commands and data. The communication protocol and certain software classes have

been modified to improve efficiency of data transfer between the driver and the front end.

The memory crossbar between the data assembler and the frame buffer units has been optimized, allowing the GeForce GTX 200 GPUs to run at full speed when performing indexed primitive fetches (unlike the prior generation which suffered some contention between the front end and data assembler).

The post-transform cache size has been increased, resulting in fewer pipeline stalls and faster communication from the geometry and vertex stages to the viewport clip/cull stage. (Setup rates are similar to prior generation, supporting up to one primitive per clock).

Z-Culling performance has also been improved, especially at high resolutions. Early-Z rejection rates have been increased because the number of ZROPs was increased. The maximum ZROP cull rate is 256 samples/clock or 32 pixels/clock.

GeForce GTX 200 GPUs also include significant micro-architectural improvements in register allocation, instruction scheduling, and instruction issue. The GPUs can now feed the execution units more swiftly. These improvements are responsible for the ability to dual-issue instructions to SPs and SFUs as previously discussed. Scheduling of work between texture units and the SM controller has also been improved.

Summary

NVIDIA's second generation unified visual computing architecture as embodied in the new GeForce GTX 200 GPUs is a significant evolution over the original unified architecture of GeForce 8 and 9 series GPUs. Numerous extensions and functional enhancements to the architecture permit a performance increase averaging 1.5× the prior architecture. Improvements in sheer processing power combined with improved architectural efficiency allow amazing speedups in gaming, visual computing, and high-end computation.

Compared to earlier GPUs such as GeForce 8800 GTX, the GeForce GTX 280 provides:

- ☐ 1.88× more processing cores
- □ 2.5× more threads per chip
- Doubled register file size
- ☐ Double-precision floating-point support
- Much faster geometry shading
- □ 1 GB frame buffer with 512-bit memory interface
- ☐ More efficient instruction scheduling and instruction issue
- ☐ Higher clocked and more efficient frame buffer memory access
- ☐ Improvements in on-chip communications between various units
- Improved Z-cull and compression supporting higher performance at high resolutions, and
- □ 10-bit color support

These all result in enough graphics and compute power to deliver the most intensive and extreme 3D gaming experiences and teraflop performance for demanding highend compute-intensive applications.

NVIDIA SLI technology is taken to new levels with GeForce GTX 200 GPUs and NVIDIA PhysX technology will add amazing new graphical effects to upcoming game titles. CUDA applications will benefit from additional cores, far more threads, double-precision math, and increased register file size.

Wise users purchasing new systems will conduct performance analyses to optimize their PC architecture. They will find that a lower-end CPU paired with a higher-end GPU produces more performance than the reverse and for the same price. This heterogeneous computing using the right processors for the right tasks and designing optimized PCs to take advantage of it is the wave of the future.

Appendix A: Retrospective

Over the past decade, NVIDIA's graphics processing units (GPUs) have evolved from specialized, fixed-function 3D graphics processors to highly programmable, massively multithreaded, parallel-processing architectures used for visual computing and high-performance computation.

NVIDIA GeForce GPUs enable incredibly realistic 3D gaming and outstanding high-definition video playback, while NVIDIA Quadro[®] GPUs provide the highest quality and fastest workstation graphics for professional design and creation. For high-performance computing tasks in various engineering, scientific, medical, and financial fields, NVIDIA's new Tesla[™] GPUs and CUDA parallel programming environment enable supercomputing-level performance on the desktop, at a fraction of the cost of comparably performing CPU-based multiprocessor clusters.

The GeForce 8800 GPU was launched in November 2006. It was the world's first DirectX 10 GPU with a unified shader architecture. This was important as each of the unified shader processing cores could be dynamically allocated to vertex, pixel, and geometry workloads, making it far more efficient than prior-generation GPUs, which used a fixed number of pixel processing units and a fixed number of vertex processing units. This same unified architecture provided the framework for efficient high-end computation using NVIDIA CUDA software technology.

The GeForce 9 Series GPUs were introduced in 2007, offering a vastly improved price-performance ratio and advanced PureVideo® features. Its smaller chip allowed dual-GPU GeForce 9800 GX2 graphics boards to be built more efficiently, while offering up to twice the performance of the GeForce 8800 GTX.

As of May 2008, over 70 million NVIDIA GeForce 8 and 9 Series GPUs have shipped and each supports CUDA technology, allowing greatly accelerated performance for mainstream visual computing applications like audio and video encoding and transcoding, image processing, and photo editing. These GPUs also support the new NVIDIA PhysX technology for enabling real-time physics in games.

GPUs are the most important and most powerful processors in the new era of visual computing. High-end GeForce GTX 200 GPUs provide the best user experience when running intensive DirectX 10-based games like *Crysis* at high quality and high resolution settings. Very capable motherboard and mid-range GPUs are also needed for stutter-free, high-definition video playback on the PC while simultaneously displaying the Aero 3D user interface of Windows Vista.

Software Source Code Disclaimer

Any software source code reprinted in this document is furnished under a software license and may only be used or copied in accordance with the terms of that license:

Intel Sample Source Code License Agreement

This license governs use of the accompanying software. By installing or copying all or any part of the software components in this package, you ("you" or "Licensee") agree to the terms of this agreement. Do not install or copy the software until you have carefully read and agreed to the following terms and conditions. If you do not agree

to the terms of this agreement, promptly return the software to Intel Corporation ("Intel").

Definitions:

- A. "Materials" are defined as the software (including the Redistributables and Sample Source as defined herein), documentation, and other materials, including any updates and upgrade thereto, that are provided to you under this Agreement.
- B. "Redistributables" are the files listed in the "redist.txt" file that is included in the Materials or are otherwise clearly identified as redistributable files by Intel.
- C. "Sample Source" is the source code file(s) that: (i) demonstrate(s) certain functions for particular purposes; (ii) are identified as sample source code; and (iii) are provided hereunder in source code form.
- D. "Intel's Licensed Patent Claims" means those claims of Intel's patents that (a) are infringed by the Sample Source or Redistributables, alone and not in combination, in their unmodified form, as furnished by Intel to Licensee and (b) Intel has the right to license.
- 2. License Grant: Subject to all of the terms and conditions of this Agreement:
 - A. Intel grants to you a non-exclusive, non-assignable, copyright license to use the Material for your internal development purposes only.
 - B. Intel grants to you a non-exclusive, non-assignable copyright license to reproduce the Sample Source, prepare derivative works of the Sample Source and distribute the Sample Source or any derivative works thereof that you create, as part of the product or application you develop using the Materials.
 - C. Intel grants to you a non-exclusive, non-assignable copyright license to distribute the Redistributables, or any portions thereof, as part of the product or application you develop using the Materials.
 - D. Intel grants Licensee a non-transferable, non-exclusive, worldwide, non-sublicenseable license under Intel's Licensed Patent Claims to make, use, sell, and import the Sample Source and the Redistributables.

3. Conditions and Limitations:

- This license does not grant you any rights to use Intel's name, logo or trademarks.
- B. Title to the Materials and all copies thereof remain with Intel. The Materials are copyrighted and are protected by United States copyright laws. You will not remove any copyright notice from the Materials. You agree to prevent any unauthorized copying of the Materials. Except as expressly provided

Intel® Processor Graphics DirectX* Developer's Guide

herein, Intel does not grant any express or implied right to you under Intel patents, copyrights, trademarks, or trade secret information.

- C. You may NOT: (i) use or copy the Materials except as provided in this Agreement; (ii) rent or lease the Materials to any third party; (iii) assign this Agreement or transfer the Materials without the express written consent of Intel; (iv) modify, adapt, or translate the Materials in whole or in part except as provided in this Agreement; (v) reverse engineer, decompile, or disassemble the Materials not provided to you in source code form; or (vii) distribute, sublicense or transfer the source code form of any components of the Materials and derivatives thereof to any third party except as provided in this Agreement.
- 4. No Warranty:

THE MATERIALS ARE PROVIDED "AS IS". INTEL DISCLAIMS ALL EXPRESS OR IMPLIED WARRANTIES WITH RESPECT TO THEM, INCLUDING ANY IMPLIED WARRANTIES OF MERCHANTABILITY, NON-INFRINGEMENT, AND FITNESS FOR ANY PARTICULAR PURPOSE.

- 5. Limitation of Liability: NEITHER INTEL NOR ITS SUPPLIERS SHALL BE LIABLE FOR ANY DAMAGES WHATSOEVER (INCLUDING, WITHOUT LIMITATION, DAMAGES FOR LOSS OF BUSINESS PROFITS, BUSINESS INTERRUPTION, LOSS OF BUSINESS INFORMATION, OR OTHER LOSS) ARISING OUT OF THE USE OF OR INABILITY TO USE THE SOFTWARE, EVEN IF INTEL HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. BECAUSE SOME JURISDICTIONS PROHIBIT THE EXCLUSION OR LIMITATION OF LIABILITY FOR CONSEQUENTIAL OR INCIDENTAL DAMAGES, THE ABOVE LIMITATION MAY NOT APPLY TO YOU.
- 6. USER SUBMISSIONS: You agree that any material, information or other communication, including all data, images, sounds, text, and other things embodied therein, you transmit or post to an Intel website or provide to Intel under this Agreement will be considered non-confidential ("Communications"). Intel will have no confidentiality obligations with respect to the Communications. You agree that Intel and its designees will be free to copy, modify, create derivative works, publicly display, disclose, distribute, license and sublicense through multiple tiers of distribution and licensees, incorporate and otherwise use the Communications, including derivative works thereto, for any and all commercial or non-commercial purposes
- 7. TERMINATION OF THIS LICENSE: This Agreement becomes effective on the date you accept this Agreement and will continue until terminated as provided for in this Agreement. Intel may terminate this license at any time if you are in breach of any of its terms and conditions. Upon termination, you will immediately return to Intel or destroy the Materials and all copies thereof.
- 8. U.S. GOVERNMENT RESTRICTED RIGHTS: The Materials are provided with "RESTRICTED RIGHTS". Use, duplication or disclosure by the Government is subject to restrictions set forth in FAR52.227-14 and DFAR252.227-7013 et seq. or its successor. Use of the Materials by the Government constitutes acknowledgment of Intel's rights in them.

9. APPLICABLE LAWS: Any claim arising under or relating to this Agreement shall be governed by the internal substantive laws of the State of Delaware, without regard to principles of conflict of laws. You may not export the Materials in violation of applicable export laws.

1 About this Document

This document provides development hints and tips to ensure that your customers will have a great experience playing your games and running other interactive 3D graphics applications on Intel® Processor Graphics. This document details software development practices using the latest generation of Intel processor graphics: Intel® Processor Graphics as well as two previous generations of the Intel® Graphics Media Accelerator with a focus on performance analysis using Microsoft DirectX*. Intel tools useful in optimizing graphics applications are introduced in a section detailing performance analysis with the Intel® Graphics Performance Analyzers (Intel® GPA).

Intel® Graphics is split into product generations. The latest one was introduced in 2011 with Intel® microarchitecture codename Sandy Bridge. This family of processors is now on the same silicon as the CPU and it is now called *Intel® Processor Graphics*. In addition to vastly improved performance, Intel Processor Graphics also adds significant new features and functionalities over the previous generation of Intel Graphics called Intel® HD Graphics. Intel Processor Graphics currently represents the most common graphics solution chosen by new PC purchasers. This document is meant to help you include this broad market as a target for your applications and optimize the experience for widest people. By following the tips and tricks in this document, you have the opportunity to make your application shine with the graphics volume market leader.

1.1 Intended Audience

This document is targeted at experienced graphics developers who are familiar with OpenGL*/Microsoft DirectX*, C/C++, multithreading and shader programming, Microsoft Windows* operating systems, and 3D graphics.

1.2 Conventions, Symbols, and Terms

Table 1 Coding Style used in the Document

```
Source code:

{
   cout << i << endl;
}</pre>
```

The following terms are used in this document.

Table 2 Terms Used in this Document

- HDG -Intel® HD Graphics, the generation of graphics from Intel which was characterized by the graphics subsystem being on a separate die from the CPU
- 2. **Processor Graphics** The latest generation of graphics from Intel® included in the same processor die of the Intel® microarchitecture codename Sandy Bridge family of processors
- 3. **UMA** Unified Memory Architecture an architecture where the graphics subsystem does not have exclusive dedicated memory and uses the host system's memory (SDRAM)
- 4. **DVMT** Dynamic Video Memory Technology a memory allocation scheme in UMA systems which allocates an exclusive, dynamically resizable chunk of main memory to the graphics (driver)
- 5. VF Vertex Fetch
- 6. VS Vertex Shader
- 7. PS Pixel Shader
- 8. **GS** Geometry Shader
- 9. **EU** Execution Unit, a vector machine component
- 10. Is Instruction cache
- 11. SO Stream Output
- 12. **HWVP** Hardware vertex processing see the following Intel document for more information on this: http://www.intel.com/assets/pdf/whitepaper/318888.pdf

1.3 Further Help Beyond this Guide

There are several other places you can look for additional information on Intel Processor Graphics, including the following sites:

Intel® HD Graphics (previous generation): http://software.intel.com/en-us/articles/intel-graphics-developers-quides/

Intel® 4 Series Chipsets (the Intel® 4500, X4500, and X4500HD GMAs) Developer's Guide: http://software.intel.com/en-us/articles/intel-graphics-media-accelerator-developers-quide/

Intel® 3 Series Express Chipsets including the Intel® 3000 GMA and Intel® X3000 GMA Developer's Guide: http://software.intel.com/en-us/articles/intel-gma-3000-and-x3000-developers-quide/.

We hope your questions are covered in these resources, including this Guide. We are constantly updating these resources and welcome your comments and suggestions. If you have questions not answered in these resources, or have suggestions on improving the Guide, please get in touch with us at: GameDevInput@intel.com. If you are actively working with Intel already, you can also reach us through your engineering or account management contacts.

2 Intel® HD Graphics to Intel® Processor Graphics

2.1 Intel® HD Graphics is Becoming Core

Several versions of the Intel® $Core^{TM}$ i3, $Core^{TM}$ i5, and $Core^{TM}$ i7 processors have launched in 2011 using Intel® microarchitecture codename Sandy Bridge. These represent the first instantiation of complete platform integration, with Intel® Processor Graphics co-residing on the CPU die.

Two key versions of graphics will be available, Intel® Processor Graphics 2000 and Intel® Processor Graphics 3000, with Intel® Processor Graphics 2000 targeting lower voltage (lower power) applications and Intel® Processor Graphics 3000 a more mainstream set of applications.

Table 3 Evolution of Intel® Processor Graphics

2009	2010	2011	
GMA Series 4 Chipset	Intel codename Ironlake - 1st Gen CPU Integration	Intel® microarchitecture codename Sandy Bridge 1st Gen CPU/Graphics single die	
DirectX* 10 SM4, OpenGL* 2.0	DirectX* 10, SM4, OpenGL* 2.1	DirectX* 10.1 SM4.1 , OpenGL* 3.0, DirectX* 11 API on DirectX* 10 hardware	
Mobile / Desktop*: 21 / 32 GFLOPs	Mobile / Desktop: 37 / 43 GFLOPs	Mobile / Desktop: ~105-125 GFLOPs for Processor Graphics 3000 & ~55-65 GFLOPS for Processor Graphics 2000	
Mobile/Desktop 400 - 533 MHz/ 800 MHz	Mobile/Desktop 500-766 MHz/ 533 - 900 MHz	Mobile/Desktop Base: 350-650 MHz/650-850 MHz Turbo: 900-1250 MHz/1100-1350 MHz	
	1.7x 3D performance increase	Intel® Processor Graphics 2000: 6 Execution Units ≥1x with lower voltage requirements.	Intel® Processor Graphics 3000: 12 Execution Units 1.5-2.5x performance increase
* Single precision peak values with MAD instructions.			

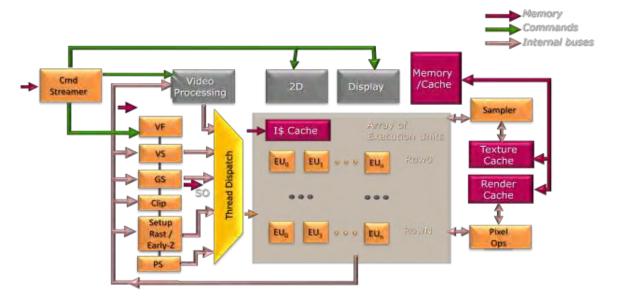

Figure 1 Intel® Processor Graphics Architecture Diagram

Intel® Processor Graphics has been architected to support Microsoft DirectX* 10.1 and take advantage of a generalized unified shader model including support for Shader Model 4.1 and lower. The platform also has support for DirectX* 11 on DirectX* 10 hardware. The graphics core executes vertex, geometry, and pixel shaders on the programmable array of Execution Units (EUs). The EUs have programmable SIMD (Single Instruction, Multiple Data) widths of 4 and 8 element vectors (two 4 element vectors paired) for geometry processing and 8 and 16 single data element vectors for pixel processing). Each EU is capable of executing multiple threads to cover latency. The new generation of Intel® Processor Graphics now integrates transcendental shader instructions into the EU units, rather than a shared math box found in prior generations, resulting in improved processing of instructions such as POW, COS, SIN. Clipping and setup have moved to Fixed Function units, further increasing performance by reducing contention within the EU's. The end result is the fastest Intel® Processor Graphics to date.

2.2 What's New in Intel® Processor Graphics

2.2.1.1 Graphics Features

The latest version of Intel® Processor Graphics includes several performance changes since the previous generation:

Table 4 Intel® Processor Graphics Feature Specifications

3D Pipeline	Key Improvements in Intel® Processor Graphics
Geometry Processing	 Improved throughput up to 2x better than previous generations Sharing of the last level cache with the CPU Increased number of threads for vertex shading Faster clip, cull, and setup Improved throughput of geometry shader and stream out OpenGL* driver now uses hardware geometry processing
Rasterization and Z	 Improved hierarchical Z performance Improved clear performance Added OpenGL* MSAA 4X support Added 2X and 4X MSAA support under DirectX* 9 and DirectX* 10
Computes	> 3X increase in transcendental computations Overall arithmetic performance improvement in shaders due to math box integration within EU's
Texture and Pixel Processing	 Added support for Gather4, Target Independent Blend Modes, Per Sample Shader Frequency, TextureCubeArray, VS/GS 32 Registers, per the DirectX* 10.1 specification Improved fill rate for short shaders due to fixed function setup management of barycentric coefficients

2.2.1.2 Intel® Turbo Boost Technology

Intel® Processor Graphics utilizes a dynamic frequency on mobile and desktop graphics to automatically increase the clock frequencies of the CPU cores and the graphics cores to boost performance when the workload demands it and also to scale back the frequencies when demand decreases. Intel® microarchitecture codename Sandy Bridge supports higher performance boosts after extended CPU idle periods. In addition to the Intel® Turbo Boost Technology on the CPU, a similar technology has been extended to graphics on both the mobile and desktop platforms. This allows the graphics subsystem to run at higher frequencies when the CPU is not using its nominal thermal design power (TDP). In combination, these technologies dynamically manage the CPU and graphics core performances based on workload demands, to allow for better performance when needed and minimize power usage when possible.

2.3 Intel® Processor Graphics Specifications

Table 5 Intel® Processor Graphics Feature Specifications

Intel Graphics Core	Intel® Processor Graphics				
Intel Chipset (see Error! Reference source not found.)	Intel® microarchitecture codename Sandy Bridge				
Graphics Architecture	Intel® Processor Graphics 3000 Intel® Processor Graphics 3000				
Segment	Desktop/Mobile Desktop/Mobile)/Mobile		
Maximum Video Memory	Depends on system memory and operating system. Windows Vista*/Windows* 7: refer to the table below: System Memory 1GB 2GB >2GB				
	Max Available Video Memory	256 IVIB		783 MB	1692 MB
DirectX* Support	10.1, DirectX* 11 on DirectX* 10 hardware, Compute Shader 4.x, DirectX* 11 API multi-threaded rendering on DirectX* 10 hardware (asynchronous object creation supported, software support for asynchronous command list in the runtime)				
OpenGL* Support	3.0				
Shader Model Support	4.1				

Quick Tips: Graphics Performance Tuning

3.1.1 Optimizing for the vertex cache

Use IDirect3DDevice9::DrawIndexedPrimitive (DirectX* 9) or ID3D10Device::DrawIndexed (DirectX* 10) to maximize reuse of the vertex cache.

Pre- and post-transform vertex cache sizes can vary significantly, even across different generations of Intel Graphics platforms. To maximize performance of vertex processing, it can help to optimize the ordering of vertices and triangle indices in your vertex and index buffers.

There are two methods you can use to optimize your data for the vertex cache:

The preferred method is to use the D3DXOptimizeFaces and D3DXOptimizeVertices APIs. These apply a good generalized optimization that will work well for all cache sizes (and across all hardware). Since this optimization works well across all hardware, it can be applied at authoring time (e.g. when exporting mesh data from your content creation pipeline), cutting down level load times.

The code snippet below demonstrates how to use these APIs on mesh data:

```
void OptimizeMesh( WORD * Indices, // [In/Out] - Index buffer data
                   DWORD NumFaces, // Number of faces in the mesh
                   Vertex * Vertices, // [In/Out] - Vertex buffer data
                   DWORD NumVertices ) // Number of vertices in the mesh
   HRESULT hr;
    // Create a "re-map" buffer for the new face ordering, and
    // calculate the new order.
   DWORD *Remap = new DWORD[ NumFaces ];
   hr = D3DXOptimizeFaces( IndicesIn, NumFaces, NumVertices,
                            FALSE, Remap );
   // Make a copy of the old indices, which we'll pull from for the new
    // re-ordered list of indices.
    WORD *OldIndices = new WORD[ NumFaces * 3 ];
    memcpy( OldIndices, IndicesIn, sizeof(WORD) * NumFaces * 3 );
    WORD * NewFaces = Indices;
    // Apply the new mapping.
    for( DWORD i = 0; i < NumFaces; ++i )</pre>
        WORD *OldFaceBase = OldIndices + ( Remap[ i ] * 3 );
        NewFaces[0] = OldFaceBase[0];
```

How to maximize graphics performance on Intel® Integrated Graphics

15

```
NewFaces[1] = OldFaceBase[1];
    NewFaces[2] = OldFaceBase[2];
    NewFaces += 3;
delete[] Remap;
delete[] OldIndices;
// Create a "re-map" buffer for the new vertex ordering, and
// calculate the new order.
DWORD ActualVertexCount = 0;
Remap = new DWORD[ NumVertices ];
hr = D3DXOptimizeVertices( Indices, NumFaces, NumVertices,
              FALSE, Remap );
// Count how many vertices we actually have. Remap indices of
// Oxffffffff indicate a vertex that was not referenced by any faces.
DWORD dwVertexCount = 0;
for( DWORD i = 0; i < NumVertices; ++i )</pre>
    if( aRemap[ i ] == 0xffffffff )
        break;
    ++ActualVertexCount;
    // Copy the vertex data into a temp buffer.
Vertex *OldVertices = new Vertex[ NumVertices ];
memcpy( OldVertices, Vertices, sizeof(Vertex) * NumVertices );
// Perform the remapping
const DWORD *CurrentRemap = Remap;
const SVertex *OldVertex = OldVertices;
for( DWORD i = 0; i < ActualVertexCount; ++i )</pre>
    aVertices[ *( CurrentRemap++ ) ] = *( OldVertex++ );
// We'll also need to re-index our vertices to point to the new
// vertex locations.
for( DWORD i = 0; i < NumFaces * 3; i++ )</pre>
    Indices[ i ] = ( WORD )aRemap[ Indices[ i ]];
delete[] Remap;
delete[] OldVertices;
```

3.1.2 Other Tips On Vertex/Primitive Processing

- 1. Ensure adequate batching of primitives to amortize runtime and driver overhead.
 - a. Use instancing to enable better vertex throughput especially for small batch sizes. This also minimizes state changes and Draw calls.

- b. Aim for 2000 or fewer draw-calls per frame (or less than 50,000 draws per second). Above this number the CPU overhead in the driver can become prohibitive.
- Minimize render state changes between batches to reduce the number of pipeline flushes.
- 2. Use static vertex buffers where possible.
- 3. Use visibility tests to reject objects that fall outside the view frustum to reduce the impact of objects that are not visible.
 - a. Set D3DRS CLIPPING to FALSE for objects that do not need clipping.
- 4. Take advantage of Early-Z rejection.
 - a. Render with a Z-only pass (meaning no color buffer writes or pixel shader execution) followed by a normal render pass. This uses the higher performance of Early-Z to reject occluded fragments which reduces compute times and raster operations.
 - b. Balance a Z-only pass against the inherent cost of such an additional pass. A Z-only pass increases the number of draw calls (which can impact the CPU usage) as well as the amount of work done up to the Rasterizer. Measure the performance difference between the two approaches to assess the actual benefit.
 - c. Avoid writing Z values (depth) in the pixel shader. Writing the depth value will skip the Early-Z hardware optimization algorithm since it potentially changes the visibility of the fragment.
- 5. Use the Occlusion Query feature of Microsoft DirectX* to reduce overdraws for complex scenes. Render the bounding box or a simplified model if it returns zero, then the object does not need to be rendered at all.
 - a. Allow sufficient time between Occlusion Query tests and verifying the results to avoid serializing the platform. See the Microsoft DirectX* 10 "Draw Predicated" sample included in the Microsoft DirectX* SDK for more information on this.
 - See Section 3.10.5 Avoid Tight Polling on Queries for more tips on using queries properly.
- 6. Consider drawing the opaque overlays in the scene such as heads up displays (HUD) first and writing them to the Z buffer. This reduces the screen rendering area leading to considerable performance improvement.

3.2 Shader Capabilities

Intel® Processor Graphics includes support for Microsoft DirectX* Shader Model 4.1 for 10.1 devices and Shader Model 3.0 for DirectX* 9 devices. Intel® microarchitecture codename Sandy Bridge provides significantly improved computational capability and better handling of large and complicated shaders over prior architectures.

3.2.1 DirectX* 11 on 10

In addition to DirectX* 10.1 hardware support, Intel® Processor Graphics includes partial DirectX11 API support. This allows developers to use the DirectX* 11 API on DirectX* 10 (or 10.1) level hardware. There are two DirectX11-specific features exposed through this paradigm, specifically:

- Multithreading: The D3D11 API provides means to record command lists on multiple threads (multithreaded rendering) as well as object creation on multiple threads. The Processor Graphics driver currently supports driver-level concurrent object creation.
- 2. Compute Shader 4 (CS4): A limited subset of DirectX11-level compute shader (CS5) a number of restrictions, specifically:
 - Maximum threads is limited to 768.
 - Z dimension of numthreads/dispatch limited to 1.
 - Only one unordered access view bound per shader (and only RWStructuredBuffers and RWByteAddressBuffers are bindable).
 - Threads are limited to writing to only their own region of groupshared memory (although they can thread from any location).
 - SV_GroupIndex must be used when accessing groupshared memory for writing.
 - Groupshared memory limited to 16KB per group.
 - Atomics and double-precision are not available.

Other Direct X^* 11 features (Tessellation, CS5, extended texture formats such as BC6/7) are not supported.

 $\label{thm:condition} \begin{tabular}{ll} Utilize the DirectX* \ \ \ ID3D11Device:: CheckFormatSupport() \ \ API for individual format support of the D3D11_FORMAT_SUPPORT enumeration. \end{tabular}$

3.2.2 Tips on Shader Capabilities

- Reduce texture sampling intensive operations when possible. The following common shader effects typically affect performance and should be tested for performance and optimization. Pay special attention to full screen post processing effects including per-pixel and multiple pass techniques when evaluating graphics related performance bottlenecks.
 - a. Glow/Bloom
 - b. Motion blur
 - c. Depth of field
 - d. HDR/tone mapping
 - e. Heat distortion
 - f. Atmospheric effects
 - g. Dynamic Ambient Occlusion
 - h. High quality soft shadows
 - i. Parallax occlusion mapping with a wide radius
- 2. Balance texture samples and shader complexity.

- a. Recommend greater than 4:1 ratio of ALU: Sample for better latency coverage. A larger ratio may be better for floating point textures, higher order filtering, and 3D textures.
- 3. Space your texture sampling calls away from where it is used in pixel shaders when possible and practical to maximize EU utilization.
- 4. Generically speaking where a choice is available between using programmable shading and fixed function pipeline, programmable shading gives better performance.
 - In particular, use shader-based fog instead of fixed function fog on DirectX*
 Fixed Function fog has been deprecated on SM 3.0.
 - b. One notable exception to this rule is the use of the *texkill* instruction. Consider using alpha test to achieve the same result if possible, as it performs better on this platform.
- 5. Use flow control wisely it can be expensive. In some cases, it might be advantageous to split a single shader into multiple ones, to avoid flow control statements.
 - a. The pixel shader operates on up to 16 pixels in parallel. This means the benefits of dynamic flow control will depend on the likelihood of the number of pixels taking the same branch. If any 2 of those pixels take different paths, all pixels will execute both branches of the control flow.
 - b. Dynamic flow control can provide significant benefits by skipping a large number of computations. Ensure that this is used where a large number of instructions can be skipped.
- 6. Shader Model 3.0 supports dynamic flow instructions such as if bool, break, and break_comp. It also supports predication registers. Often the dynamic flow control instructions can be eliminated by using predication registers in their place. When possible, use predication instructions over dynamic flow control for shorter branching instruction sequences. Optimize your shader performance by adequate use of your processor graphics mask alpha if you are not using it.
- 7. Minimize the usage of geometry shaders, especially in cases where they result in geometry amplification (more geometry output from the GS than came in). If in doubt, examine your application's performance with and without geometry shaders to determine if they are a significant performance issue.
- 8. In general, minimize use of StreamOut and DrawAuto() for optimal performance, since they can incur a significant bandwidth penalty with their usage of system memory.

3.3 Texture Sample and Pixel Operations

Table 6 Intel® Processor Graphics Texture Sampling and Pixel Specifications

CPU Product	See Error! Reference source not found.
Graphics Architecture	Desktop and Mobile (Processor Graphics 2000 & 3000)
Format Support	16/32-bit fixed point
	16/32-bit floating point operations
Max # of Samplers	Up to 16
Vertex Textures	Yes
Max 2D/3D/Cube Textures	8Kx8K/2Kx2Kx2K/8K
Filtering Type Support	BLF, TLF and Dynamic AF with up to 16 degrees of anisotropic filtering + DirectX* 10.1
Texture Compression	DirectX* 9: DXT1/3/5, ATI1, ATI2; DirectX* 10: BCx
Multi-Sample Render	MSAA 4X
Multi-Target Render	8
Alpha-Blend FP formats	FP16 and FP32 formats are supported. For a complete list, do a caps check on DirectX* 9 and on DirectX* 10, utilize the DirectX* CheckFormatSupport() call as format support may be added in future driver versions.

Table 7 Intel® Processor Graphics Sampler Filtering Specifications

Product	See Error! Reference source not found.			
32-bit Texels (per clock cycle) e.g. RGBA UNORM8, RG FP16, R FP32				
Point/Bilinear	1X			
Trilinear	1X			
Anisotropic (n samples)	0.5X/n			
64-bit Texels (per clock cycle) e.g. RG FP32, RGBA FP16, RGBA UINT16				
Point/Bilinear	Point/Bilinear 1X			
Trilinear 0.5X				
Anisotropic (n samples) 0.25X/n				
128-bit Texels (per clock cycle) e.g. RGBA FP32, RGBA UINT32				
Point	0.25X			
Bilinear	0.25X			
Trilinear 0.125X				

All sampler filtering types are supported, including dynamic anisotropic filtering.

3.3.1 Tips on Texture Sampling / Pixel Operations

- 1. Use compressed textures and mip-maps and minimize the use of large textures. Even though the architecture supports up to 8K×8K textures, for optimal performance it is best to use smaller textures.
- 2. Minimize the use of Anisotropic Filtering, and both Trilinear and Anisotropic filtering for floating point textures. With floating point texture formats, the performance of bilinear and trilinear filtering are not equivalent.

Examine the scene to determine where you can make performance/quality tradeoffs with texture filtering. Prefer bilinear filtering where there is little visual difference.

- Generically speaking, the more compact the texture format being used, the better the performance. DXT compressed formats are best. Minimize the use of 32-bit floating point textures, since they carry a heavy bandwidth penalty and fill the texture caches faster.
- 4. Use as few render targets as possible, ideally keeping it to less than four. More render targets requires more bandwidth. If in doubt, analyze your performance using a tool such as Intel® GPA to determine if you are fill bound.
- 5. Minimize the number of Clear calls. Clear surfaces, Color and Z/Stencil buffer at the same time when required.
- 6. Avoid stencil shadows as they are fill intensive.

3.4 Microsoft DirectX* 10 Optional Features

D3D10 specifies optional features that can be checked for support in the code through API functions like *CheckFormatSupport(...)*, *CheckMultipleQualityLevels(...)*, *CheckFeatureSupport(...)*

The current platform supports more of those optional features than the previous ones and even more features will likely be supported in future. So it is better to explicitly test for such features using those APIs rather than relying on vendor and device ID's for the platform.

For example, DirectX* 10 specifies a large number of resource types and data formats that are optional. Utilize the DirectX* 10 CheckFormatSupport(...) call to determine which ones are supported. Also, utilize the DirectX* 10 CheckFormatSupport(...) call for UNORM and SNORM blending support

The following optional features are supported at the time of review of this Guide:

- 1. MSAA 2X and 4X on DirectX* 10.
- 2. 32-bit floating point blending

3.5 Managing Constants on Microsoft DirectX*

Constants are external variables passed as parameters to the shaders; their values remain "constant" during each invocation of the shader program. Despite their name, constants are one of the most frequently changing values in a Microsoft DirectX*

application. A shader program can initialize a constant value statically to a value in the shader file or at runtime through the application.

Many of the recommendations described here are standard in the industry. They are very much applicable to Intel processor graphics and the recommendations attempt to detail them in a cohesive manner.

In addition to these points it is worth noting that care should be taken when porting from Microsoft DirectX* 9 to Microsoft DirectX* 10 to maintain performance. For more information on this topic, see the Intel publication "DirectX* Constants Optimizations For Intel® Processor graphics" [2] available on the Intel Software Network.

3.5.1 Tips on Managing Constants on Microsoft DirectX* 9

- The driver optimizes access to the most frequently used constants. Use less than 32 (FLOAT4) constants per shader to achieve the best performance gain from this feature. Limit the use of dynamic indexed constants (C[ax], C[r]) as these cannot be optimized by the driver and will result in high latency in shaders (dynamic indexed constants are normally found in vertex shaders).
- Prefer local constants over global constants the former are better for performance.
- 3. Immediate constants provide better performance than dynamic indexed constants. In dynamic indexed constants the driver cannot determine a previous index value and needs to create a full size constant buffer space in memory, instead of using the hardware constant buffer.

3.5.2 Tips on Managing Constants on Microsoft DirectX* 10

- As previously detailed for DirectX* 9 above, the driver optimizes access to the
 most frequently used constants. The same advice applies for DirectX* 10: use
 less than 32 constants per shader to achieve the best performance gain from this
 feature, and limit the use of dynamic indexed constants (C[ax], C[r]) as these
 cannot be optimized by the driver.
- 2. For better performance prefer multiple, smaller constant buffers. The constant buffers need to be loaded to the graphics subsystem ahead of the shader execution, and the entire buffer needs to reloaded every time its contents change. Larger the size of the buffer, longer it takes to load the buffer to the graphics subsystem, causing significant performance impacts. If multiple buffers are combined into a single larger buffer, every time any of the contents changes, the entire large buffer will have to be loaded again, degrading the performance. And, because of the performance impact that reloading a constant buffer can have, where possible, if multiple shaders share the same buffer that could help the performance. Whether that performance gain is actually realized depends on whether the shared buffer is still resident when the second shader sharing the buffer is executed. But sharing the buffers between shaders can help but does not hurt the performance. For optimal constant buffer management, smaller packed constant buffers grouped by frequency of update and access pattern are

ideal for higher performance. As an example: organize Per Frame/ Per Pass/ Per Instance constant buffers first which tend to be smaller in size and have a low update rate followed by Per Draw/Per Material constant buffers which may also be small but have a higher update rate. Put large constant buffers like skinning constants last.

- 3. If there are constants that are unused by most of the shaders move those to the bottom of the constant definition list so that you can bind a smaller buffer to those shaders
- 4. Break up constant buffers based on features that are optional in games (e.g. shadows, post-processing effects, etc.). Very likely, due to performance constraints for integrated platforms, some of these features are either going to be disabled or run with a lower setting. So it would be beneficial to break up the constants into separate buffers and then selectively disable the updates to these constant buffers based on the settings selected by the user.
- 5. When using indexed constant buffers, it is recommended to keep the buffer size tailored to actual needs. For example, if the shader iterates over five elements only, declare a 5-element constant buffer for this shader rather than a general purpose 50-element constant buffer shared among shaders. This allows the driver to optimize placement so that it incurs a low latency path.

3.6 Advanced DirectX* 9 Capabilities

Several advanced features beyond those required by the DirectX* 9 specifications are supported by the Intel Graphics Platforms. This section provides the details on some of them.

The feature list is current for Intel® microarchitecture codename Sandy Bridge, when this Guide is being prepared and is likely to be extended over time. Further, support for the features vary between different Intel platforms. We strongly advise the developers to first confirm in their code that the feature of interest is supported and provide alternative execution paths in the code where features are not supported.

These are capabilities not directly exposed by DirectX* 9 interfaces. Developers will have to use indirect methods to check for their availability. Code segments showing how to check for such features are given in this section.

3.6.1 FourCC and other surface and texture formats

Intel Graphics platforms support multiple surface-formats beyond those required by the DirectX* 9 specifications. These are listed in Table 8.

Table 8 Additional DirectX* 9 texture and surface formats supported on Intel platforms

Format	Resource Type	Usage	Description
INTZ	Texture	Depth/Stencil	For reading depth buffer as a texture
DF16	Texture	Depth/Stencil	For reading depth buffer as a texture
RESZ	Surface	Render Target	For converting a multisampled depth buffer into a depth stencil texture.
ATI1N	Texture	Texture	Single Channel Texture Compression. Functionally equivalent (but not identical) to DirectX* 10 BC4 format.
ATI2N	Texture	Texture	Two-channel Texture Compression. Functionally equivalent (but not identical) to DirectX* 10 BC5 format.
NULL	Texture	Render Target	Render Target with no memory allocated. Useful as a dummy render target to render exclusively to a depth buffer.
ATOC	Surface	Render Target	Alpha to coverage multisampling.

The following code segment shows a sample outline and works for most FourCC

formats.

See the code accompanying this Guide for an example of how to test for more formats.

3.6.2 Notes on supported FourCC texture formats

1. INTZ is a depth texture format meant for accessing 24-bit depth buffer and 8-bit stencil buffer. In addition to depth operations this allows for using it for stencil operations as well.

This surface cannot be used as a texture when it is being used for depth buffering, unless the depth writes are disabled.

- 2. DF24 and DF16 formats are meant for use in Percentage-Closer Filtering (PCF) used in shadow mapping applications that use PCF. DF16 has better performance.
- 3. Intel® microarchitecture codename Sandy Bridge supports MSAA under DirectX*
- 9. RESZ provides the ability to use multisampling in depth buffer and then copy the result as a single value into a depth-stencil buffer. This process is often referred to as "resolving" a multi-sample depth-stencil buffer into a single-sample depth-stencil buffer.
- 4. Some ISV's use FourCC formats at times known as ATI1N which allows for the compression of single channel textures. The latest Intel platforms support this for the benefit of those ISV's.
- 5. 3DC format is also known in the industry as ATI2N format. This format is also supported in the latest Intel platforms.
- 6. A *NULL Render Target* is a dummy render target format which acts like a valid render target with a crucial difference that the driver will not allocate any memory for it. DX9 requires that a color render target be used for *all* rendering operations. Since a color render target is often not used with depth-only render targets, using a NULL render target in such cases can avoid memory allocation for a color render target will not be used.
- 7. ATOC, short for "Alpha To Coverage", is meant for interpreting the alpha channel value for approximating the multichannel pixel coverage. The texture itself has no practical use; but you use it as an argument in the <code>SetRenderState(...)</code> function, to convert the incoming alpha value output by the pixel shader into multichannel pixel coverage value.

3.6.3 MSAA Under DirectX* 9

2x and 4X MSAA are supported in DX9 on the latest Intel platforms. In general MSAA requires the graphics engine to do more work and hence impacts the performance to varying degrees. The developers should weigh in the tradeoffs ahead of using MSAA in their titles.

3.7 Graphics Memory Allocation

Processor graphics will continue to use the Unified Memory Architecture (UMA) and Dynamic Video Memory Technology (DVMT) as noted in the chart below. As with past processor graphics solutions, UMA specifies that memory resources can be used for video memory when needed. DVMT is an enhancement of the UMA concept, wherein

system memory is allocated for balanced graphics and system performance. DVMT dynamically responds to system requirements and application demands, by allocating the proper amount of display, texturing, and buffer. The operating system views the Intel graphics driver as an application, which uses system memory to request allocation of additional memory for 3D applications, and returns the memory to the operating system when no longer required.

Table 9 Intel® Processor Graphics Memory Specifications

CPU Product	See Error! Reference source not found.	
Segment	Processor Graphics 2000	Processor Graphics 3000
Memory BW (GB/s)	17.1 - 21.3 17.1-25.6	
UMA Capability	2x DDR3 up to 1333	2x DDR3 up to 1600
Max DVMT (XP) 1 or 2GB System Memory	Limited to 1GB max for all system memory configurations	
Max DVMT (Windows Vista*/Windows* 7) x86/x64: System Memory	The memory is managed by the operating system and the driver.	
Memory Interface	64 bits	

3.7.1 Checking for Available Memory

Graphics applications often check for the amount of available free video memory early in execution. Developers typically want to know the amount of memory that the graphics device can access at full performance.

As a result of the dynamic allocation of graphics memory performed by the Intel® Processor Graphics devices (based on application requests), memory checks that only request the amount of 'local' or 'dedicated' graphics memory available do not supply a number that is appropriate for the Intel® Processor Graphics devices.

The Microsoft DirectX* SDK (June 2010) includes the VideoMemory sample code which demonstrates 5 commonly used methods to detect the total amount of video memory. Of these tests, GetVideoMemoryViaWMI is recommended. All other methods either return the local/dedicated graphics memory and consequently will report incorrect results on Intel® Processor Graphics, or will report the sum of the dedicated memory and the shared memory, something that is typically not suitable for discrete graphics devices. For more information, see the sample code: http://msdn.microsoft.com/en-us/library/ee419018(v=VS.85).aspx

3.7.2 Tips On Resource Management

 Allocate surfaces in priority order. The render surfaces that will be used most frequently should be allocated first. On Microsoft DirectX* 10, memory is taken care of for you by the OS. On Microsoft DirectX* 9:

- a. Use D3DPOOL DEFAULT for lockable memory (dynamic vertex/index buffers).
- b. Use D3DPOOL MANAGED for non-lockable memory (textures, back buffers, etc).
- 2. On D3D10, use of the <code>Copy...()</code> methods are preferred over calling the <code>Update...()</code> operations. Partial or sub-resource copies should be used sparingly. For example when updating all or most of the LODs of a resource use <code>CopyResource()</code> rather than multiple <code>CopySubResource()</code>.

3.8 Identifying Intel® Processor Graphics and Specifying Graphics Presets

Games often specify a range of graphics capabilities and presets to identify with a Low, Medium, and High fidelity level. Please refer to the Appendix for sample code that demonstrates how to identify Intel® Processor Graphics versions and set fidelity levels for older generations (Low) to the most recent (Medium) based on the requested D3D*_FEATURE_LEVEL.

Note that on Windows* 7, multiple graphics adapters are supported so care should be taken in determining which adapter will be used for rendering.

3.9 Surviving a Graphics Hardware Switch on the Fly

Intel in combination with third party graphics vendors jointly developed a switchable graphics solution that allows end users to switch on-the-fly, between two heterogeneous graphics hardware systems without a reboot. This functionality can incorporate the energy efficiency of Intel processor graphics with the 3D performance of discrete graphics hardware in a single notebook solution. This technology is applicable to about 30 million discrete graphics hardware notebooks purchased annually. Currently most applications running on PC platforms with heterogeneous graphics hardware do not survive when switched between the two at run-time as they do not re-query underlying graphics capability when the active adapter changes.

Keys to handling graphics hardware switches:

- New applications should be aware of multiple graphics hardware configurations and handle the D3DERR DEVICELOST and WM DISPLAYCHANGE messages properly.
- Legacy applications where possible should develop and distribute patches for old games to handle the D3DERR_DEVICELOST and WM_DISPLAYCHANGE messages.

3.9.1 Microsoft DirectX* 9 Algorithm

Microsoft DirectX* 9 applications should follow the below procedure to query GFX adapter's capabilities (re-create DX object/device) on D3DERR DEVICELOST:

- Manually save the current context including state and draw information in the application.
- 2. Query if the graphics adapter has changed, using the Windows* API's EnumDisplaySettings() or EnumDisplayDevices().
- 3. If the adapter has changed, then:
 - a. Recreate a Microsoft DirectX* device.
 - b. Restore the context.
 - c. Continue rendering from last scene rendered before the D3DERR_DEVICELOST event occurred.

3.9.2 Algorithm for DirectX* 10

By design, DirectX* 10 does not have the concept of device lost until the next Present, and the developer is guaranteed the API will keep working until then. The changes in Microsoft DirectX* 10 applications are:

- 1. Check for WM DISPLAYCHANGE windows message in the message handler.
- 2. Query if the graphics adapter has changed using the Windows* API's EnumDisplaySettings() or EnumDisplayDevices().
- 3. If yes, then save off the current context including state and draw information in the application and then:
 - a. Recreate the Microsoft DirectX* device.
 - b. Restore the context.
 - Continue rendering from the last scene rendered before the WM DISPLAYCHANGE message occurred.

3.10 Some suggestions, tips & tricks from the field

The items in this section are based on the observations of Intel engineers with code from developers with different levels of experiences. These are collected here as a checklist for reference for developers. Some of the items are generic to all graphics platforms.

3.10.1 Device Capabilities

Intel® microarchitecture codename Sandy Bridge supports DirectX* functionality up to and including full D3D10.1 support.

If you encounter a Direct3D feature that does not work on the latest drivers on this device, please contact your Intel Account Manager. Intel will investigate these issues for future drivers and should be able to suggest workarounds.

How to maximize graphics performance on Intel® Integrated Graphics

3.10.2 DirectX* 9 Extensions

Several hardware vendors support their own extensions to the DirectX* 9 specifications through specific texture formats and render paths that are not part of Microsoft's official DirectX* 9 specifications.

To ensure maximum compatibility with these extensions, Intel now supports many of those extensions. A list of those, current as of the release of this Guide, is given in section 3.6 Advanced DirectX* 9 Capabilities (page 24).

If there are additional extensions that you believe are useful, (or have OpenGL* extensions that you require) please let your Intel Account Manager know.

3.10.3 Revisit Assumptions on Performance

Intel® Processor Graphics is continually increasing functionality and performance. As well as the addition of full D3D10.1 support and increased capabilities previously mentioned, the performance profile has been improved significantly for this platform. As such, it is advised to remove previous restrictions and scale your title to match this increased performance and functionality.

Should you see unexpected issues, please follow these steps:

- Verify you are running the latest drivers. This platform is evolving, so there will be frequent driver updates. Check for updates at http://www.intel.com and if you are an Intel software partner, at http://platformsw.intel.com.
 - Intel graphics drivers follow a naming convention that use four field numbers for example, 15.21.8.2279. The number in the last field 2279 in the example increases sequentially with each driver release. So a driver with a higher number there is more recent. You always want to have the most recent driver installed on your system.
- 2. If you suspect that it is a functionality bug, try to recreate the bug with the reference rasterizer.
- 3. Look for easily fixed hotspots using the Intel® Graphics Performance Analyzers (Intel® GPA). Talk to your Intel Account Manager if you do not already have access to this tool.
- 4. If the above steps do not resolve the issue, or you need additional help determining the root cause, please contact us see the section Further Help Beyond this Guide in this document. Intel engineers are available to help enable your title to run effectively on our platforms. This enabling can potentially include (but is not limited to):
 - a. Training on using Intel GPA to get the best results for your title.
 - b. In-depth performance analysis of your code running on our platform, with specific feedback on optimization opportunities.
 - c. Championing the resolution of your issues within Intel, such as helping resolve or workaround driver issues, addressing tool issues, etc.

30 Document Number: 321371-002US

3.10.4 Avoid Writing to Unlocked Buffers

We have found multiple cases of corruption which were caused by the writes to unlocked buffers. Typically the title first locked the buffer, then unlocked the buffer and then attempted to write to the buffer that is already unlocked. This *sometimes* works because the system might have not moved the buffer and has not dispatched the rendering commands to the graphics hardware. This is inconsistent with Microsoft DirectX* specifications and it is not safe for applications to expect it to work consistently.

Avoid writing to buffers that have not been locked. Some drivers on other hardware platforms are more forgiving of this approach, and may handle it gracefully. The Intel driver makes optimizations based on the specified behavior of the API, so the behavior of this platform will be undefined in this case.

Always test your application with the DirectX* debug runtime enabled. The debug runtime will catch scenarios like this and help you avoid problems should driver behavior change in the future.

3.10.5 Avoid Tight Polling on Queries

Tight polling on event/occlusion queries degrades performance by interfering with the graphics subsystem's turbo mode operation.

Allow for queries to work asynchronously and avoid waiting on the query response immediately after sending the query. Issue queries as early as possible in the frame, and issue their dependent draws as late as possible. If the query result is not available at the time the draw is to be submitted just issue the draw. Any additional delay at this point will cause a pipeline stall.

4 Appendix: Sample Code for Identifying Intel® Processor Graphics and Specifying Graphics Presets

The following sample code and configuration file demonstrates how to identify Intel® Processor Graphics versions and set fidelity levels for older generations (Low) to the most recent (Medium) based on the requested D3D*_FEATURE_LEVEL.

1 Executive summary

Mobile gaming is the fastest growing segment in the game industry. Today's consumers want immersive, connected gaming with all-day battery life that provides visually stunning graphics and high-fidelity audio. Android is helping fulfill that desire. With a large user base, Android devices provide a growing opportunity for game developers to generate revenue on a global scale.

The rapid iteration and fast innovation of Android have created a thriving ecosystem with numerous custom-designed form factors across device tiers. However, there are three challenges to taking Android gaming to the next level, including:

- How to create immersive gaming experiences within the power and thermal constraints of mobile devices?
- How to develop a game that addresses a sizeable portion of the mobile gaming segment with minimal code variations?
- How to take advantage of the hardware's capabilities without sacrificing time-to-market?

Qualcomm Technologies, Inc. (QTI) was the number one provider of Android smartphone application processor (AP) shipments in 2013.² Its Qualcomm® Snapdragon™ processors³ are fully integrated system on a chip (SoC) solutions designed with mobile in mind, handling everything from the most advanced, console-quality mobile games to the most popular casual games, all while delivering long battery life. This paper will describe the rise of mobile gaming on Android and how QTI is meeting the three challenges by:

- Creating low-power mobile processors by taking a heterogeneous computing (HC) approach and designing an efficient SoC architecture.
- Providing a consistent development platform across tiers due to its scalable architecture.
- Offering tools, support, and advanced technologies to easily unlock the full potential of Snapdragon processors for developers.

2 The rise of mobile gaming on Android

Mobile gaming is the fastest growing segment in the game industry, with a 30% compound annual revenue growth rate projected from 2013 to 2015.¹

Android burst onto the scene in 2008. The *open* nature and rapid iteration of the platform, combined with improving hardware, and a growing installed base of devices worldwide, has created excellent opportunities for the mobile gaming ecosystem.

Source: Gartner, October 2013, "Forecast Video Game Ecosystem Worldwide"

Source: Strategy Analytics, April 2014

Snapdragon processors extend across four product tiers: Snapdragon 800, Snapdragon 600, Snapdragon 400, and Snapdragon 200.

Through standard application program interfaces (APIs), Android exposes key platform capabilities to developers, such as connectivity, sensors, and graphics rendering. Android also has a history of quickly adopting the latest graphics standards, like OpenGL ES. The consistent release of new APIs helps limit fragmentation, improve ease of use, and decrease time-to market.

To take advantage of increasing consumer engagement on the Google Play app store, developers are now creating games that utilize the latest Android capabilities (e.g., 3D graphics). As a result, new game brands have been introduced (e.g., *Real Soccer, Asphalt, Real Racing*, and *Modern Combat*). Debuting in the smartphone, Android is now extending to other form factors, including tablets, handheld gaming devices, set-top-boxes, TVs, and more.

Total mobile gaming revenues (for all platforms) are projected to grow from \$13 billion in 2013 to \$22 billion in 2015⁴. Within this category, the Android platform provides a large and growing opportunity for developers. On the device side, 78.4% of smartphones shipped last year were Android, outselling devices based on the next leading smartphone mobile OS by almost 5x.⁵ Android device shipments (smartphones and tablets) are projected to exceed one billion units in 2014.⁶ On the apps side, 75% of Android users play games⁷, accounting for 90% of the app-generated revenue on Google Play⁸.

3 Immersive mobile gaming experiences at low power

Immersive gaming requires more than just console-quality graphics. Other elements include cinemaquality sound, realistic effects, instantaneous response times (low latency), and the ability to play anywhere. Figure 1 highlights the key components that contribute to the overall gaming experience.

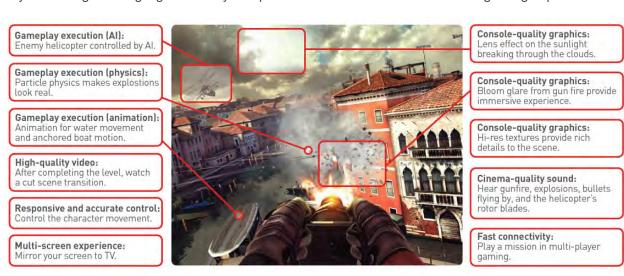

Figure 1: Example of key gaming components in Modern Combat 5: Blackout by Gameloft

Gartner, October 2013, "Forecast Video Game Ecosystem Worldwide"

Gartner, "Gartner Says Annual Smartphone Sales Surpassed Sales of Feature Phones for the First Time in 2013"

Gartner, "Gartner Says Worldwide Traditional PC, Tablet, Ultramobile and Mobile Phone Shipments On Pace to Grow 7.6% in 2014"

Kris Holt, "Google Adds Some Serious Oomph to Play Games"

eMarketer, "Game Apps Are No. 1 for Amazon, Apple and Google"

Today's mobile graphics are approaching the visual quality of consoles and PCs with high-end graphics cards.

Figure 2: Mobile (left) vs. PC (right) rendering for Epic Unreal Engine 4

Consumers expect console-quality graphics and long battery life when playing any mobile game, from simple casual games like *Candy Crush* to more immersive games like *Modern Combat 5: Blackout*. However, enabling advanced mobile gaming experiences for sustained periods is challenging. Consoles and PCs have the luxury of being able to use fans (and large heat sinks) while drawing triple-digit wattages from an external power outlet. Mobile devices, on the other hand, are *passively* cooled, powered by a battery, and limited to single-digit wattages in order to meet the power and thermal constraints of the thin form factor.

Through its Snapdragon processors, QTI is addressing the performance and power challenge by:

- Taking a power-optimized, heterogeneous approach to mobile computing.
- Analyzing performance bottlenecks and designing an *efficient SoC architecture* that improves each generation.

Figure 3: Asphalt 8: Airborne by Gameloft

"Qualcomm® Snapdragon™ processors really help enable us to create an immersive experience for the gamer..."

Sylvain Baudry Business Development Director Gameloft

3.1 Heterogeneous computing: specialized engines designed for efficient processing

QTI has a long history of taking a heterogeneous computing approach. This approach intelligently utilizes specialized engines, such as the GPU, DSP, and display engine, to support new immersive experiences, while helping to maximize battery life and thermal efficiency.

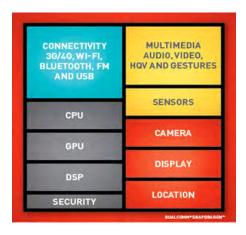

Figure 4: Snapdragon processing engines

As mentioned in Section 3, games are comprised of multiple components. These components may be implemented as one or more tasks. To support the optimal gaming experience at the lowest power and thermal levels, each task should be designed to run on the most appropriate engine. Figure 5 is an example of this.

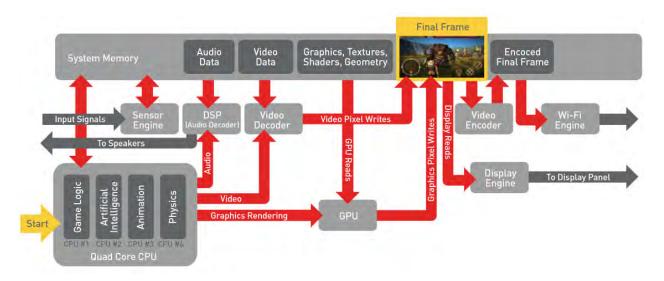

Figure 5: High-level view of gaming tasks being appropriately distributed to specialized engines

The rest of this section provides examples of how Snapdragon processors are designed to run key gaming tasks on the most appropriate processing engines.

Controlling gameplay execution — **keeping everything in sync:** The CPU dispatches work to the appropriate specialized engine and processes individual functions within the game as separate tasks. For example AI, animation, physics, and gameplay are processed on the CPU.

Functions like physics and AI require high-precision math, which can be efficiently processed on the VeNum floating point units of QTI's custom-designed Krait™ CPU. In addition, because the tasks are independent, they can be written as separate threads and run on separate CPUs for optimal performance and latency.

QTI has been innovating its power management and scheduling software for years to provide the different amounts of processing that various tasks require. For example, Krait CPUs have long employed asynchronous symmetric multi-processing (aSMP) so that optimized performance is delivered per CPU core, thus saving power.

Console-quality graphics — advanced features and graphics rendering (at low power): When most people think of modern mobile gaming, it is the console-quality graphics that immediately come to mind. Rendering graphics at low power and at high frame rates requires a specialized engine, the GPU. QTI's custom-designed Qualcomm® Adreno™ GPUs are a family of low power, fully programmable GPUs that are designed for optimal mobile gaming performance.

Adreno GPUs provide comprehensive support for the latest graphics APIs. The Khronos OpenGL ES specifications define the primary graphics APIs for Android gaming. QTI works closely with the Khronos group to help define the standards, and the Adreno GPU is optimized to support OpenGL ES (from the silicon to the drivers and software stack).

Adreno GPUs have a long history of graphics technology leadership. They support many design innovations for efficient graphics processing, including a flexible, power-efficient unified shader architecture, which is designed to support dynamic resource allocation (for optimal shader processing).

"Epic now has brought Unreal Engine 4 to Android with the Snapdragon 800 and 805 chipsets from Qualcomm Technologies. Recently we worked with Qualcomm [Technologies] to elevate graphics to the next level on the ... Adreno GPU hardware, which delivers some of the most power-efficient unified shader capabilities we've seen yet for Android smartphones and tablets." — Niklas "Smedis" Smedberg, Epic Games

The Adreno GPU also supports dynamic <u>FlexRender™</u> technology, which is designed to intelligently choose between immediate/direct mode and deferred/tile-based rendering, to render various tasks (such as user interface and gameplay) in a more efficient manner.

Custom designing the Adreno GPUs allows QTI to evolve the architecture in a timely manner for emerging mobile use cases, such as new gaming features and APIs. For example, the newest Adreno 4x series GPUs are designed to the DirectX11FL_11_2 specification, the same graphics specification as today's high-end desktop graphics cards and the latest gaming consoles.

To support next-gen features (beyond the newly announced Khronos OpenGL ES 3.1 APIs), Adreno 4x series GPUs extended their unified shader architecture by adding several completely new shaders (e.g., geometry and tessellation).

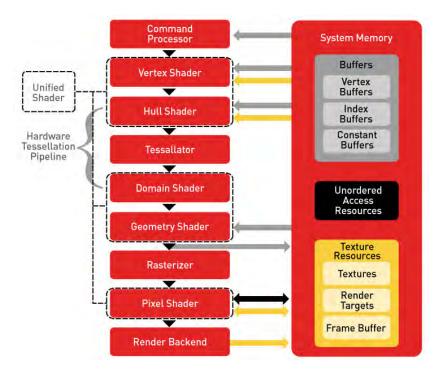

Figure 6: Adreno 4x series GPU's DirectX11 FL_12 based 3D hardware pipeline

The Adreno 420 GPU is one of the first commercial mobile GPUs to support dynamic hardware tessellation. Dynamic hardware tessellation is designed to help developers to provide greater detail for more visually realistic scenes in a manner that requires less memory bandwidth, lower power consumption, and lower overall memory footprint for the application.

Traditionally, in order for most 3D games to be visually immersive, the programmer must include a substantial amount of geometry detail per object. The denser the geometric mesh used to create an object in the scene (human or monster for example) of a game, the smoother and more realistic its surfaces will look. In traditional mobile GPUs, these additional geometry assets (required for improved visual realism) need to be stored in memory as part of the game binary package. These assets have to be copied or written by the CPU to the system memory and eventually have to be read into the GPU for further processing. These additional read and write operations could increase the memory bandwidth usage and power consumption to unsustainable levels (for console-quality games) on mobile devices.

Dynamic hardware tessellation helps solve this problem by allowing the GPU to generate additional geometry on-chip, without requiring additional data transfers from off-chip, system memory. Dynamic hardware tessellation can help significantly reduce bandwidth and power consumption. Another advantage is that the developer doesn't have to author and store these additional geometry details into their game package, which significantly reduces the memory footprint and the overall binary size of the game.

The image below shows the additional detail that tessellation provides to both the wireframe and the final image rendered. For this simple "Hornet" graphics scene, hardware tessellation delivers a bandwidth savings of ~360MB/s, and a memory footprint savings of ~20MB⁹. For larger games, the savings on memory footprint could be in GBs.

Figure 7: Tessellation (OFF: left, ON: right) provides more realistic and detailed graphics

By providing more detail, tessellation is designed to help significantly improve the gaming experience, not only for high resolution content, but also for low resolution content that needs to be upscaled.

The Adreno 4x series GPUs are a great example of QTI's commitment to bringing console-quality gaming up to 4K Ultra HD (4K) resolution to mobile devices.

"[Adreno 420 is] the most aggressive move in mobile graphics by any company, to add all the shader types, and HW tessellation, on top of what they did in Subdiv for Motorola, shows Qualcomm [Technologies] as the most committed mobile graphics supplier today. It really is bringing console-class graphics to mobile devices." — Jon Peddie, Jon Peddie Research.

Multi-screen experiences — **high fidelity on your screens:** Playing a game on a high-quality, high-resolution screen significantly enhances the gaming experience. The display engine enhances images, composites multiple images, and supports high resolution (both on-device and on external displays) of up to 4K.

For image enhancement, the display engine utilizes QTI's Qualcomm® TruPalette™ and Qualcomm® EcoPix™ feature sets, which include high quality post-processing algorithms for superior picture quality, including picture adjustment, color enhancement, contrast enhancement, scaling, sharpening, and power efficiency. For example, using the ecoPix sunlight visibility improvement technology, the display engine can use information from the device's light sensor to enhance the rendered game content to make it much more visible in bright conditions (e.g., outdoors on a sunny day) through tone correction.

Numbers based on QTI internal testing

Jon Peddie, "Qualcomm Moves to 4K with Snapdragon 805"

Figure 8: Snapdragon display engine TruPalette and EcoPix feature sets

Device-to-device connectivity further elevates the mobile gaming experience. External displays, such as a TV, are driven by either a wired (e.g., HDMI) or wireless connection (e.g., Miracast). It is the task of the display engine to efficiently process both types of connections. With the wireless display feature, you can send the contents of your mobile device screen to your smart TV screen. QTI supports wireless display standards, like Miracast, and is adding wireless display support to an increasing number of Android devices.

Cinema-quality sound — efficient audio processing in sync with the graphics: Just as sound is a huge part of the movie-going experience, it is also important in the world of immersive mobile gaming. Accordingly, QTI provides a comprehensive audio solution, including hardware and software, which offers high-fidelity audio and advanced features like 24-bit/96kHz play back and cinema-quality 7.1 surround sound audio.

The processing required to efficiently support these computationally complex audio features is primarily handled by QTI's Hexagon™ DSP, which is custom designed for heavy signal processing tasks, like audio. The real-time processing capabilities of QTI's Hexagon DSP are designed to keep the audio in sync with the graphics rendering. QTI has also worked with industry leaders, such as DTS and Dolby, to provide an optimal audio experience on Snapdragon processors, including support for headphone surround virtualization.

High-quality video — **specialized video engine:** Some games incorporate pre-rendered cut scenes to enhance the overall gaming experience. To save memory, these scenes are compressed into encoded video. To playback video, Snapdragon processors are designed to use a specialized video engine to decompress encoded videos at low power. For higher resolutions and more complex codecs, a specialized engine becomes even more important.

Figure 9 shows that running H.265 HEVC decode on a specialized video engine versus a CPU reduces power consumption, while still meeting the frame rate requirements¹¹.

¹¹ Estimated numbers based on QTI internal testing

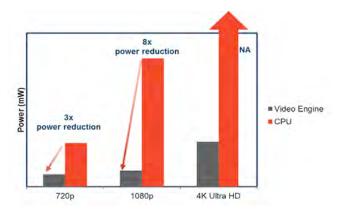

Figure 9: Power reduction by running HEVC decode on specialized video engine versus the CPU

Fast connectivity — **multi-player gaming:** Connected gaming experiences, like massively multiplayer online (MMO) games, require fast and reliable connectivity solutions with low latency where the difference between winning and losing often comes down to milliseconds. To achieve that, Snapdragon processors include connectivity technologies, such as 802.11ac Wi-Fi and 3G/4G LTE.

QTI has a long history of being an industry leader in advanced connectivity solutions. Its latest Snapdragon 810 processor continues the tradition, integrating a Cat 6 LTE Advanced multimode modem that is designed to support reliable communication at speeds of up to 300 Mbps. QTI optimizes the software stack for connectivity to achieve low client-server ping times on Snapdragon processors, so gamers can worry less about a slow connection and focus more on enjoying the game.

Responsive and accurate control — supporting multiple input methods: A good gaming experience requires an input method that gives precise control at low latency. There are multiple ways to control and interface to games, such as through a touch screen, device movement, a game controller, and gestures. Snapdragon processors have been designed to reduce latency and provide accurate control for these methods. For example, device movement generally is determined by processing data from motion sensors, such as the accelerometer or gyroscope. Sensor processing requires intensive signal processing, control processing, and real-time processing. QTI's specialized sensor engine, which excels at handling these tasks, is integrated in Snapdragon processors. As a result, the response time for device movement is faster — and at low power.

3.2 Efficient SoC architecture: smart management of system resources

An efficient SoC architecture is required in order to sustain console-quality gaming at high frame rates within the thermal and power constraints of mobile devices. As noted above, the majority of the processing engines within the SoC are running concurrently in a heterogeneous manner to efficiently process gaming tasks. Beyond heterogeneous computing, smartly managing the shared system resources, such as memory bandwidth, power budget, and thermal budget, is necessary to support sustained gameplay of a visually complex game.

Efficient memory bandwidth: While playing a game, the processing engines need to be fed data (starving a processing engine of data can lead to lower frame rates). To prevent bottlenecks, Snapdragon processors use advanced memory management techniques. The memory controller is designed to deliver high quality of service (QoS) for different throughput and latency requirements of different processing engines, while still maximizing the memory utilization. By minimizing the overhead associated with memory transactions, the memory controller helps increase memory utilization and minimizes power consumption.

Snapdragon processors are also designed to deploy smart caching mechanisms in many processing engines to help minimize the need for frequent DRAM access. For example, the Adreno GPU's tile-based architecture, which subdivides the graphics image into smaller tiles and renders them to the tile-buffer cache, helps minimize DRAM bandwidth and saves power.

Advanced power and thermal management technology: Drawing high power not only reduces battery life, it also releases excess heat. This will raise the skin temperature of the device, making it uncomfortable to hold. To reduce the system power, Snapdragon processors are designed to deploy sophisticated algorithms that manage power based on workload requirements. They support a wide range Dynamic Clock and Voltage Scaling (DCVS). DCVS dynamically varies the clock frequencies and voltages of the processing engines. For example, the Adreno 420 GPU now has more granular DCVS power control levels, so it can run most use cases at a nominal voltage state, thus saving power.

Several of the specialized engines have innovative, power-saving techniques. For example, the display engine also uses a proprietary compression scheme called Frame Buffer Compression (FBC), which compresses display data by up to 66% in a visually lossless manner—before transmission to the display panel.¹²

The Adreno 420 GPU also has an increased Z-reject rate for graphics rendering so that pixels that are not going to be visible (because they are blocked by a pixel on top) are not processed. An increased Z-reject rate means lower power per pixel—and improved performance.

4 Providing a consistent development platform at scale

To attract game developers, devices with Snapdragon processors provide an excellent opportunity with a consistent development environment.

4.1 Android gaming on Snapdragon: an excellent opportunity

As of January 2014, over 1,350 devices with Snapdragon processors had been announced or were commercially shipping. In addition, more than 525 new device designs are in development, and QTI is currently working with over 85 manufacturers worldwide. QTI was the #1 provider of Android smartphone AP shipments in 2013.¹³

Strategy Analytics, April 2014

¹² QTI internal metrics

By optimizing their games on Snapdragon processors, developers have the opportunity to reach this very large and growing installed base of Android devices with Snapdragon processors that span across various price tiers and regions.

Figure 10: Devices with Snapdragon processors

Examples include iconic flagship Android-based devices like the Nexus 5 by Google, LG G Pro2, and Samsung Galaxy Note 3. Recently launched devices, including the HTC One (M8), One+ One, LG G3, Samsung Galaxy S5, and the Sony Xperia Z2, are powered by the Snapdragon 801 processor. Amazon Kindle Fire HDX 8.9 and Fire TV, based on Fire OS, are also powered by Snapdragon processors.

Refer to the <u>smartphones</u> and <u>tablets</u> websites for the latest devices powered by Snapdragon processors. With Adreno 4x series GPUs on the verge of being launched in commercial devices, Snapdragon processors continue to provide graphics and gaming technology leadership.

According to Jon Peddie Research, "Qualcomm [Technologies] is clearly the largest SoC supplier". For Q2 2013 and as indicated in Figure 11, QTI was the single largest GPU supplier for personal devices, which includes smartphones, tablets, and dedicated handheld game consoles. ¹⁴

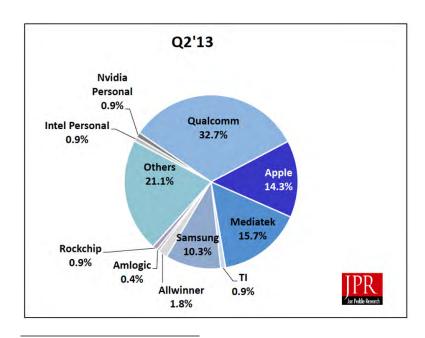

Figure 11: Share of personal systems SoC suppliers for Q2 2013

Jon Peddie Research, Oct. 2013, "Mobile Devices and the GPUs inside"

4.2 Scalable architecture: consistent gaming experiences across various tiers

Consumers expect immersive gaming experiences whether they own a premium or an entry-level mobile device. Snapdragon processors are designed to support great gaming experiences across the spectrum of device tiers. Apart from offering backwards-compatible software between different tiers, Snapdragon processors with the scalable Adreno GPU are designed to provide consistent features and APIs across tiers. Using APIs as an example, Adreno 3x series GPUs (and above) support OpenGL ES 3.0. Having common support of APIs and features ranging from entry-level to premium devices helps make it easier for developers to introduce next-generation features to mass audiences, without having to custom design for each tier.

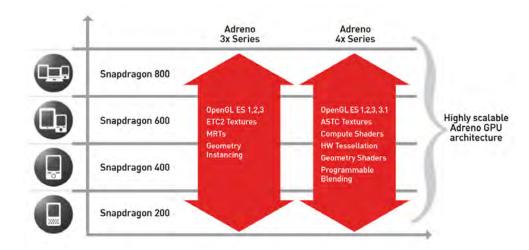

Figure 12: Snapdragon processors with the scalable Adreno GPU are designed to provide consistent features across tiers

Snapdragon processors are software compatible, helping both OEMs and developers to efficiently invest and develop across multiple device types and tiers. With a consistent software stack, including graphics drivers, devices with Snapdragon processors are designed to provide a consistent and optimized gaming platform across various tiers.

5 Unlocking the potential of Snapdragon processors for developers

QTI and its affiliates have a long history of technology leadership in supporting the mobile gaming ecosystem, dating back to 2001 with the Brew™ platform. This breakthrough development platform allowed native C/C++ games to be written "closer to the metal," supporting higher-quality and higher-performance games, and helped usher in some of the world's first 3D games in mobile. Brew was also one of the earliest monetization platforms for mobile applications, paying out more than \$3 billion to developers¹⁵.

https://www.brewmp.com/about

The introduction of 3G in the early 2000s enabled faster downloads of larger games, multi-player gaming, and more robust client-server-based game designs. In addition, Qualcomm Ventures also helped fund mobile gaming pioneers such as JAMDAT Mobile and more recently invested in companies such as Bluestacks, Gaikai, Grand Cru, Playdek, Playnery, and TabTale.

It takes more than just great hardware to advance the mobile gaming industry. To support game developers in producing immersive games, QTI provides comprehensive tools, extensive support, and advanced technologies.

5.1 Supporting developers with comprehensive tools

QTI supports developers in unlocking the performance and advanced features of Snapdragon processors by not only offering comprehensive development tools, but by also working closely with the gaming ecosystem.

Game engine optimization — access to the latest features and reduced time-to-market: QTI works closely with the world's leading third-party game engine providers, such as Unity Technologies and Epic Games, to optimize their engines for Snapdragon processors. Additionally, QTI helps expose the latest graphics APIs and advanced features of Adreno GPUs to developers through these engines. For example, QTI worked closely with Epic Games to optimize Unreal Engine's advanced lighting and post processing pipeline for Snapdragon processors.

"Bringing Unreal Engine 4 PC AAA graphics to mobile has enabled us to do content that we've never been able to do before. A big advantage has been our close relationship with Qualcomm [Technologies]. Without that close relationship we wouldn't have been able to reach this point."

Niklas "Smedis" Smedberg Senior Engine Programmer – Mobile Graphics Epic Games

Figure 13: Unreal Engine 4 demo showcasing optimized post-processing on Adreno GPU

QTI also worked with Unity Technologies to help accelerate the support of new features, making the Unity Engine one of the first gaming engines to support important OpenGL ES 3.0 features like ETC2 textures, multiple render targets (MRT), and transform feedback in Unity 4.x. Unity and QTI continue this work by helping bring new Unity 5.0 innovative features like physically based shading to Snapdragon processors.

"We're excited to work with an innovative global mobile technology provider such as Qualcomm Technologies and support their incredible Snapdragon processors, which are at the heart of many Android and Windows mobile devices across the globe."

David Hegalson CEO Unity Technologies

Figure 14: Unity 5 demo showcasing physically based shading technique on Adreno GPU

By using these popular game engines, which have been optimized for Snapdragon processors, developers can focus their time on content creation.

In addition, QTI also works closely with developers to help optimize their proprietary in-house game engines so that they run well on Snapdragon processors. In turn, these developers can then utilize their optimized engines across their internal studios when developing mobile games.

Game development tools — developing, debugging, and optimizing games: For those who are programming directly to the hardware and not using a third-party game engine, QTI has created (and made available) powerful game development tools, which are designed to help debug and optimize games, while reducing time-to-market. These tools include the <u>Adreno SDK</u>, <u>Adreno Profiler</u>, and <u>Trepn™ Profiler</u>.

The Adreno SDK includes tools, emulators, libraries, documentation, samples, and tutorials. The desktop OpenGL ES emulator is designed to eliminate the need to have a device early in the development process. Adreno SDK supports the most common APIs such as OpenGL ES, DirectX, and OpenCL. In addition, the Adreno SDK contains several time-saving utilities and over 100 samples and tutorials, including 50 advanced shader effects.

The Adreno Profiler provides developers with detailed GPU utilization analysis to help them optimize their games for faster frame rates, smoother rendering, and longer battery life. It works on commercial devices without making changes within a game, device drivers, or builds, which helps further save development time and reduce setup complexity.

Figure 15: Adreno Profiler helps optimize games

The Trepn Profiler is designed to integrate directly into a developer's workflow, which helps him or her see how much power a game is consuming, pinpoint issues and quickly resolve them. Consumers expect all day battery life, consistent performance, and a device that stays cool. In fact, battery life has become an extremely important decision factor for consumers when buying smartphones. Managing power consumption and remaining within the thermal envelope of mobile devices are key development considerations. Exceeding the thermal envelope will not only heat up the device, but also throttle the game's frame rate, which negatively affects gameplay.

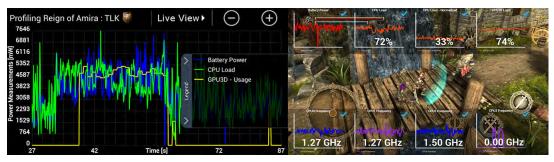

Figure 16: Trepn Profiler provides diagnostic views, such as battery power, CPU load, and GPU usage

"I would definitely recommend developers work with Qualcomm [Technologies] and use the Snapdragon tools. I know they've been a big go-to for me."

Eric Froemling

Figure 17: BombSquad by Eric Froemling

Development devices — optimizing games for real hardware:

Mobile development platforms (MDP) powered by certain Snapdragon processors in the form of tablets and smartphones are currently available to game developers prior to the launch of commercial OEM devices. These MDPs provide early access to new features of Snapdragon processors and are designed to allow developers to optimize their games in advance of the commercial launch of devices with Snapdragon processors. Devices with Snapdragon processors are available across tiers, and developers can select from a wide range of existing commercial devices to complete final testing and validation of their games.

Figure 18: Snapdragon Mobile Development Platform

"Developing on the kits is a great help for us as a development team because it allows us to address a wide installed base since many devices use the same Snapdragon chipset."

Francois Bodson Studio Manager Ubisoft Paris / Mobile

Figure 19: Assassin's Creed Pirates by Ubisoft Entertainment

5.2 Supporting the developer community

QTI can provide game developers with technical support to shorten time-to-market and improve game quality. QTI also can provide business and marketing support to help developers promote their games and facilitate potential business opportunities.

Technical support for developers — **providing expert game optimization:** Such technical support is provided via QTI's internal game studio, which is comprised of developers with comprehensive prior work experience in console, PC, and mobile gaming. Support activities range from tools, training, technical feedback on optimizations and builds (from alpha to beta to release candidates), and new feature support.

To take advantage of the capabilities of Snapdragon processors and to extend, enhance, and differentiate their games, QTI can help developers add full screen post-processing effects, OpenGL ES 3.0/3.1 features, and more. There is also a <u>developer forum</u> where developers can ask questions and engage with the QTI team and others in the Snapdragon developer community.

"The Qualcomm® Snapdragon™ processor has allowed us to create a better experience in our game Gates of Osiris because it's allowed us to develop faster, push our graphics, and understand how to optimize our game to be the best it can possibly be."

Brian McRae CEO Fenix Fire

Figure 20: QTI worked closely with Fenix Fire to optimize Gates of Osiris on Snapdragon

Business and marketing support for developers — facilitating business opportunities: QTI is engaged with some of the world's leading publishers and developers, from traditional console and PC to indies. The list includes companies such as EA, Gameloft, Activision Blizzard, Ubisoft, Square Enix, Mojang, and Take-Two Interactive. QTI also facilitates introductions for engagements with OEMs and carriers across the global gaming ecosystem.

Throughout the year, QTI has a presence at several key mobile and gaming tradeshows, where it helps developers obtain exposure to show attendees, press, and OEMs. In the past year, QTI participated in shows such as CES, MWC, GDC, E3, SIGGRAPH, Unite, and many more, reaching hundreds of thousands of attendees. In addition, QTI often features games on the latest Snapdragon development platforms and commercial devices with Snapdragon processors.

Figure 21: Showcasing games at the QTI booth during CES 2014 (left); GDC 2013 (right)

5.3 Next-generation gaming experiences

QTI continues to push the mobile gaming industry forward by developing new and innovative technologies.

QTI actively develops tech demos to showcase the latest Snapdragon features and advanced capabilities. The "Swimmer" demo is a recent example of how developers can utilize OpenGL ES 3.0 APIs for advanced rendering techniques. The demo shows advanced skin rendering using subsurface scattering techniques running optimally at 60 frames per second, at 2K resolutions.

Figure 22: QTI "Swimmer" technology demo

To help further advance the evolution of gaming, QTI and its affiliates have developed (and continue to develop) innovative technologies that support ever-more advanced capabilities and features including vision-based augmented reality (Qualcomm® Vuforia™), proximal peer-to-peer networking (AllJoyn™), biometrics, and more. For example, Vuforia supports the Smart Terrain™ feature, which is designed to provide real-time 3D mapping of a physical play area, including intelligent interaction with objects and surfaces. With this technology, gamers can create user-generated, playable content from physical objects by using their mobile device as a level editor. Another example of a promising new technology that can be utilized by game designers is biometrics data from a wearable. By capturing measurements from pulse and blood pressure sensors, gameplay can be adjusted accordingly to either reward or penalize a player.

6 Conclusion

Consumer demand for gaming on mobile devices is growing rapidly, generating strong momentum and opportunity. The Android platform is thriving and offers game developers a growing opportunity to generate revenue on a global scale. QTI is helping the mobile gaming industry to take advantage of this opportunity by solving three key challenges for developers:

- To support immersive gaming experiences within the power and thermal constraints of mobile devices, QTI creates low-power SoCs by taking a heterogeneous computing approach and designing an efficient SoC architecture.
- To efficiently address a sizeable portion of the Android gaming segment with minimal code variations, QTI's scalable architecture is designed to provide a consistent development platform across tiers.
- To take advantage of Snapdragon processors' capabilities and to help reduce development time and costs, QTI offers developers a comprehensive set of tools, support, and advanced technologies.

Snapdragon processors are purpose-built and custom designed with mobile in mind, supporting gaming experiences from simple casual games to console-quality games, so consumers can play longer and recharge less. This is yet another example of how QTI is once again re-inventing the mobile world we live in.
