Abstract

This dissertation studies user acceptance of mobile services based on a series of case studies of mobile Internet and location-aware information services targeted at consumers and accessed mainly by mobile phones. The studies were carried out in connection with technology research projects, where the objectives were to develop technical infrastructures, to pilot the technology in demonstrator services, and to collect user feedback in field studies to assist in focusing future commercial deployment of the technology. A Technology Acceptance Model for Mobile Services is proposed on the basis of the results of the case studies. According to the model, user acceptance is built on three factors: perceived value of the service, perceived ease of use, and trust. A fourth user acceptance factor: perceived ease of adoption is required to get the users from intention-to-use to actual usage. Based on the Technology Acceptance Model for Mobile Services, design implications for each user acceptance factor are proposed.

Instead of implementing collections of useful features, the design of mobile services should be focused on key values provided to the user. The value of mobile services can be built on utility, communication or fun. Successful service content is comprehensive, topical and familiar, and it includes personal and user-generated content. The users appreciate seamless service entities rather than separate services. Ease of use requires a clear overview of the service entity, fluent navigation on a small display, and smooth user interaction with the service. The users should get personally and situationally relevant services and information without needing to expend effort on personalisation. The services should be designed to be adaptive to the wide variety of devices and networks. As the services increasingly support individual users in their daily tasks and the services are increasingly dealing with personal data, user trust in the services is becoming more and more important. The user should be able to assess whether (s)he can rely on the service in the intended contexts of use. The user needs to feel and really be in control, and the privacy of the user must be protected.

Explore Litigation Insights

Docket Alarm provides insights to develop a more informed litigation strategy and the peace of mind of knowing you're on top of things.

Real-Time Litigation Alerts

Keep your litigation team up-to-date with **real-time alerts** and advanced team management tools built for the enterprise, all while greatly reducing PACER spend.

Our comprehensive service means we can handle Federal, State, and Administrative courts across the country.

Advanced Docket Research

With over 230 million records, Docket Alarm's cloud-native docket research platform finds what other services can't. Coverage includes Federal, State, plus PTAB, TTAB, ITC and NLRB decisions, all in one place.

Identify arguments that have been successful in the past with full text, pinpoint searching. Link to case law cited within any court document via Fastcase.

Analytics At Your Fingertips

Learn what happened the last time a particular judge, opposing counsel or company faced cases similar to yours.

Advanced out-of-the-box PTAB and TTAB analytics are always at your fingertips.

API

Docket Alarm offers a powerful API (application programming interface) to developers that want to integrate case filings into their apps.

LAW FIRMS

Build custom dashboards for your attorneys and clients with live data direct from the court.

Automate many repetitive legal tasks like conflict checks, document management, and marketing.

FINANCIAL INSTITUTIONS

Litigation and bankruptcy checks for companies and debtors.

E-DISCOVERY AND LEGAL VENDORS

Sync your system to PACER to automate legal marketing.
