## ABSTRACT

Traditional graphics hardware architectures, with their emphasis on the graphics pipeline, are becoming less useful. As graphics algorithms evolve and grow more capable, it becomes much harder to implement them in silicon. By using general-purpose hardware technology effectively, one can build powerful graphics hardware that is very flexible, yet inexpensive. In this paper we would like to discuss one such architecture that allows for both traditional interactive graphics (polygon scan conversion) as well as more advanced graphics (ray tracing and radiosity).

## KEYWORDS

computer graphics hardware

## INTRODUCTION

The graphics pipeline has had a long history in computer graphics [1]. Consisting of a front end that performs simple, repetitive floating point calculations on short vectors (for transformations, clipping, perspective) and a back end that scan converts primitives into pixels and determines visibility, it easily became a candidate for hardware acceleration [2, 3, 4]. However, as graphics algorithms evolve and become more capable the utility of this specialized hardware is reduced. The required functionality can no longer be incorporated easily in hardware and instead must increasingly be performed in software on the host system.

VLSI technology is squeezing more and more onto a chip. However, designing a special-purpose chip is getting harder as more functionality is added. This is especially true of custom graphics chips. Most effort in semiconductor houses is now being put into creating more powerful microprocessors and ever larger DRAMs and VRAMs.

In this paper we want to explore an architecture that tries to take advantage of the growing power of VLSI by concen-

trating on these general-purpose products and using them effectively. We wanted an architecture that minimized graphics hardware. The result, we believe, is an inexpensive, powerful and flexible system.

As well, we will describe a design that utilizes this architecture. The origin of this design came from our experiences with the AT&T Pixel Machine. We wanted to produce a low-cost next-generation machine. Let us first review architecture of the Pixel Machine.

## THE PIXEL MACHINE

The Pixel Machine (PXM) was designed as a programmable computer subsystem with pipeline and parallel processing closely coupled to a display system [5]. Built by Pixel Machines Corp, a subsidiary of AT&T, it was launched in 1987. An important design goal was flexibility. Graphics algorithms were not hardwired into the design. Instead, digital signal processors (DSP32) were the basic building blocks (nodes) of the PXM. This allowed for a lot of flexibility as new functionality could be programmed in afterwards. In fact, most of the algorithms were written in C with only the critical sections written in assembler. This resulted in a product that was ideal for research and development.

The PXM consisted of a large box (containing up to 20 VME boards) which was connected to the host computer via a series of registers in the memory address space of the host computer. Data and commands reaching the PXM would first be sent through a pipeline board consisting of nine DSP32 *pipe nodes*. For interactive graphics, the pipe nodes would do transformations, clipping and lighting calculations for the various graphics primitives. A second pipeline board could be added to the PXM to increase performance.

Next, the primitives would be broadcast to 16-64 (depend-

# Explore Litigation Insights

Docket Alarm provides insights to develop a more informed litigation strategy and the peace of mind of knowing you're on top of things.

## Real-Time Litigation Alerts

Keep your litigation team up-to-date with **real-time alerts** and advanced team management tools built for the enterprise, all while greatly reducing PACER spend.

Our comprehensive service means we can handle Federal, State, and Administrative courts across the country.

## Advanced Docket Research

With over 230 million records, Docket Alarm's cloud-native docket research platform finds what other services can't. Coverage includes Federal, State, plus PTAB, TTAB, ITC and NLRB decisions, all in one place.

Identify arguments that have been successful in the past with full text, pinpoint searching. Link to case law cited within any court document via Fastcase.

## Analytics At Your Fingertips

Learn what happened the last time a particular judge, opposing counsel or company faced cases similar to yours.

Advanced out-of-the-box PTAB and TTAB analytics are always at your fingertips.

## API

Docket Alarm offers a powerful API (application programming interface) to developers that want to integrate case filings into their apps.

## LAW FIRMS

Build custom dashboards for your attorneys and clients with live data direct from the court.

Automate many repetitive legal tasks like conflict checks, document management, and marketing.

## FINANCIAL INSTITUTIONS

Litigation and bankruptcy checks for companies and debtors.

## E-DISCOVERY AND LEGAL VENDORS

Sync your system to PACER to automate legal marketing.
