(57) **ABSTRACT**

A method of triggering functions in a computer application comprises the steps of: providing a digitizer having a pointing device, wherein the digitizer and pointing device are operably associated with a computer having an operating system and an application; applying pressure to the digitizer with the pointing device; sensing the applied pressure; triggering in the application a first function if the sensed applied pressure exceeds a first pressure threshold; and triggering in the application a second function if the sensed applied pressure exceeds a second pressure threshold. The second pressure threshold is greater than the first pressure threshold.
