Claim 14

obtaining a **previous state** of the six-axis motion sensor module; wherein the **previous state** includes an initial-value se with **previous angular velocities** gained from the motion sensor signals of the six-axis motion sensor module at a previous

The previous state is obtained through an update program that includes a predict () function and an update () function functions that are used to update the global variable x0 based on x0 (the **previous state**) associated with **previous angu** w gained at a previous time T-1 to obtain an updated state x0. The updated state x0 becomes the previous state x0 at time terration) of the update program to obtain the updated state x0 at time T.

```
void Fusion::predict(const vec3_t& w, float dT)

const vec4_t q = x0; ← previous state

x0 = 0*q;
