ABSTRACT

This invention relates to compounds useful for treating fungal infections, more specifically topical treatment of onychomycosis and/or cutaneous fungal infections. This invention is directed to compounds that are active against fungi and have properties that allow the compound, when placed in contact with a patient, to reach the particular part of the skin, nail, hair, claw or hoof infected by the fungus. In particular the present compounds have physiochemical properties that facilitate penetration of the nail plate.

BORON-CONTAINING SMALL MOLECULES

CROSS-REFERENCE TO RELATED APPLICATIONS

The present application is a continuation of U.S. patent application Ser. No. 15/091,394, filed Apr. 5, 2016, which is a continuation of U.S. patent application Ser. No. 15/068, 352, filed Mar. 11, 2016, which is a continuation of U.S. patent application Ser. No. 15/046,322, filed on Feb. 17, 10 2016, which is a continuation of U.S. patent application Ser. No. 14/537,771, filed Nov. 10, 2014, which is a continuation of U.S. patent application Ser. No. 14/201,459, filed Mar. 7, 2014, now U.S. Pat. No. 9,353,133, which is a continuation of U.S. patent application Ser. No. 13/356,488, filed Jan. 23, 15 2012, now U.S. Pat. No. 8,722,917, which is a continuation of U.S. patent application Ser. No. 12/629,753, filed Dec. 2, 2009, now U.S. Pat. No. 8,115,026, which is a divisional of U.S. patent application Ser. No. 11/505,591, filed Aug. 16, 2006, now U.S. Pat. No. 7,767,657, which claims the benefit 20 of U.S. Provisional Patent Application No. 60/755,227, filed Dec. 30, 2005, and the benefit of U.S. Provisional Patent Application No. 60/746,361, filed May 3, 2006, all of which are incorporated by reference in their entirety for all purposes. U.S. patent application Ser. No. 11/505,591 is also a 25 continuation-in-part of U.S. patent application Ser. No. 11/357,687, filed Feb. 16, 2006, now U.S. Pat. No. 7,582, 621, which claims the benefit of U.S. Provisional Patent Application No. 60/654,060, filed Feb. 16, 2005, all of which are incorporated by reference in their entirety for all 30 fungal solutions have also been developed. These dosage purposes. U.S. patent application Ser. No. 14/537,771 is also a continuation-in-part of U.S. patent application Ser. No. 13/874,329, filed Apr. 30, 2013, now U.S. Pat. No. 8,889, 656, which is a continuation of U.S. patent application Ser. No. 13/224,252, filed Sep. 1, 2011, now U.S. Pat. No. 35 8,440,642, which is a continuation of U.S. patent application Ser. No. 12/507,010, filed Jul. 21, 2009, now U.S. Pat. No. 8,039,451, which is a continuation of U.S. patent application Ser. No. 11/357,687, filed Feb. 16, 2006, now U.S. Pat. No. 7,582,621, which claims the benefit of 60/654,060, filed Feb. $^{\rm 40}$ 16, 2005, all of which are incorporated by reference in their entirety for all purposes.

BACKGROUND FOR THE INVENTION

Infections of the nail and hoof, known as ungual and/or periungual infections, pose serious problems in dermatology. These ungual and/or periungual can be caused by sources such as fungi, viruses, yeast, bacteria and parasites. Onvchomycosis is an example of these serious ungual 50 and/or periungual infections and is caused by at least one fungus. Current treatment for ungual and/or periungual infections generally falls into three categories: systemic administration of medicine; surgical removal of all or part of the nail or hoof followed by topical treatment of the exposed 55 tissue; or topical application of conventional creams, lotions, gels or solutions, frequently including the use of bandages to keep these dosage forms in place on the nail or hoof. All of these approaches have major drawbacks. The following discussion is particularly directed to drawbacks associated 60 with current treatment of ungual and/or periungual antifungal infections.

Long term systemic (oral) administration of an antifungal agent for the treatment of onychomycosis is often required to produce a therapeutic effect in the nail bed. For example, 65 oral treatment with the antifungal compound terbinafine typically requires administration of 200 to 400 mg/day for

12 weeks before any significant therapeutic benefit is realized. Such long term, high dose systemic therapy can have significant adverse effects. For example, terbinafine has been reported to have liver toxicity effects and reduces testosterone levels in blood due to adverse effects on the testes. Patient compliance is a problem with such long term therapies especially those which involve serious adverse effects. Moreover, this type of long term oral therapy is inconvenient in the treatment of a horse or other ruminants afflicted with fungal infections of the hoof. Accordingly, the risks associated with parenteral treatments generate significant disincentive against their use and considerable patient noncompliance.

Surgical removal of all or part of the nail followed by topical treatment also has severe drawbacks. The pain and discomfort associated with the surgery and the undesirable cosmetic appearance of the nail or nail bed represent significant problems, particularly for patients more sensitive to physical appearance. Generally, this type of treatment is not realistic for ruminants such as horses.

Topical therapy has significant problems too. Topical dosage forms such as creams, lotions, gels etc., can not keep the drug in intimate contact with the infected area for therapeutically effective periods of time. Bandages have been used to hold drug reservoirs in place in an attempt to enhance absorption of the pharmaceutical agent. However the bandages are thick, awkward, troublesome and generally lead to poor patient compliance.

Hydrophilic and hydrophobic film forming topical antiforms provide improved contact between the drug and the nail. Topical formulations for fungal infection treatment have largely tried to deliver the drug to the target site (an infected nail bed) by diffusion across or through the nail.

Nail is more like hair than stratum corneum with respect to chemical composition and permeability. Nitrogen is the major component of the nail attesting to the nail's proteinaceous nature. The total lipid content of mature nail is 0.1-1.0%, while the stratum corneum lipid is about 10% w/w. The nail is 100-200 times thicker than the stratum corneum and has a very high affinity and capacity for binding and retaining antifungal drugs. Consequently little if any drug penetrates through the nail to reach the target site. Because of these reasons topical therapy for fungal infections have generally been ineffective.

Compounds known as penetration or permeation enhancers are well known in the art to produce an increase in the permeability of skin or other body membranes to a pharmacologically active agent. The increased permeability allows an increase in the rate at which the drug permeates through the skin and enters the blood stream. Penetration enhancers have been successful in overcoming the impermeability of pharmaceutical agents through the skin. However, the thin stratum corneum layer of the skin, which is about 10 to 15 cells thick and is formed naturally by cells migrating toward the skin surface from the basal layer, has been easier to penetrate than nails. Moreover, known penetration enhancers have not proven to be useful in facilitating drug migration through the nail tissue.

Antimicrobial compositions for controlling bacterial and fungal infections comprising a metal chelate of 8-hydroxyquinoline and an alkyl benzene sulfonic acid have been shown to be efficacious due to the increased ability of the oleophilic group to penetrate the lipoid layers of micro-cells. The compounds however, do not effectively increase the ability to carry the pharmaceutically active antifungal through the cornified layer or stratum corneum of the skin.

U.S. Pat. No. 4,602,011, West et al., Jul. 22, 1986; U.S. Pat. No. 4,766,113, West et al., Aug. 23, 1988.

Therefore, there is a need in the art for compounds which can effectively penetrate the nail. There is also need in the art for compounds which can effectively treat ungual and/or 5 periungual infections. These and other needs are addressed by the current invention.

Aminoacyl-tRNA synthetases (ARS) are a family of essential enzymes that attach amino acids to the 3' terminal adenosine end of tRNAs, the charged tRNAs are then used 10 by the translation machinery to synthesis proteins from mRNA. Although there are few exceptions, for example in Gram-positive bacteria and archaea, most organisms have at least one ARS for each amino acid. In the case of eukaryotes, they have two ARS, one is localized to the cytoplasm while 15 the other ARS is located in the organelle(s). The ARS catalyzes two reactions, as outlined below, the first reaction adenylates the amino acid with ATP followed by its transfer to the 2'- or 3'-hydroxyl of the terminal adenosine of tRNA.

Amino acid (AA)+ATP-+AA-AMP+PPi;

AA-AMP+tRNA-tRNA-AA+AMP

The family of 20 ARS fall into two distinct structural classes as determined by their crystal structure. Class I, 25 which have a Rossman like fold, include the ARS for the following amino acids-arginine, cysteine, glutamate, glutamine, isolelucine, leucine, lysine (in archaea and some bacteria), valine, methionine, tryptophan and tyrosine. Class II ARS include the enzymes for the amino acids, alanine, 30 asparagine, aspartate, glycine, histidine, lysine, phenylalanine, proline, serine and threonine. The ARS mediated reaction is the major checkpoint of specificity that ensures the correct amino acid is charged to its cognate tRNA. Since some amino acids only differ by a single methylene group, 35 for example valine and isoleucine, it has been postulated that the specificity of the synthetic reaction alone can't explain the observed in vivo accuracy of tRNA charging. The synthetic active site should be able to exclude amino acids that are not close analogs of the cognate amino acid, but 40 analogous amino acids pose a bigger problem. Therefore to increase specificity, proof-reading and editing must occur. So far nine ARS have been shown to have an editing mechanism that significantly reduces the frequency of mischarged tRNAs. The enzymes for the following amino acids 45 have been shown to have editing activity-alanine, isoleucine, leucine, methionine, lysine, phenylalanine, proline, threonine and valine. These ARS can hydrolyse the incorrectly adenylated amino acid AA-AMP (pre-transfer editing) or the incorrectly charged tRNA (post-transfer editing). To date the 50 isoleucyl, leucyl and valyl-tRNA synthetases have the bestcharacterized editing mechanisms; an additional structural domain called the connective polypeptide I (CP1) inserted in the synthetic domain has been shown to contain the editing active site. This is located more than 25 Å away from the 55 synthetic active site, which suggests that both the adenylated amino acid intermediate and amino acid tethered to the 3'end of the tRNA must be moved from the active site in the synthetic domain to the editing site for the reaction to be proof-read. It has been postulated that the 3'end of the 60 charged tRNA is translocated in a similar manner to that of the proof-reading mechanism of DNA polymerases. Much less is known about the translocation of the adenvlated amino acid. A similar CPI domain is also present in the methionine and cysteine ARS enzymes, but it is much 65 smaller than that found in the valine, isoleucine and leucine enzymes. Despite the absence of a direct homolog to the

CP1-like domain in class II ARS, separate editing domains have been found in the enzymes for proline and threonine. Although editing is important to ensure the correct charging of tRNAs, it is not essential for viability and is not required for the synthesis of charged tRNAs. For example, in *Escherichia coli*, in which 10 amino acids in the editing domain of isoleucyl-tRNA synthetase were changed to alanine, the resulting mutant was still viable, although it did have many pleiotropic effects, including a noticeable cell growth defect.

In spite of significant homologies between human, bacterial and fungal ARS there are a number of compounds that have been developed as anti-infectives. The most notable example of an ARS inhibitor is the commercial antibiotic mupirocin (pseudomonic acid), which is sold under the label Bactroban. Mupirocin specifically inhibits bacterial isoleucyl-tRNA synthetases, while its activity against the human homolog is more than 1,000 times less active. Mupirocin binds specifically to the synthetic active site and mutants that are resistant to this drug have mutations in the synthetic domain of leucyl-tRNA synthetase. Likewise, reveromycin A inhibits the eukaryotic isoleucyl-tRNA synthetases: Saccharomyces cerevisiae resistance mutants have mutations in the synthetic domain. So far all attempts to develop better ARS inhibitors than mupirocin, an isoleucineadenylate analogue, have relied on inhibiting the synthetic reactions.

Since it has been previously thought not to be essential for the synthesis of charged tRNAs, the editing domain of tRNA synthetases has not been thought a promising target for drug development. Data from mutational analysis of the ARS editing domains tend to suggest that inhibition of the editing mechanism leads only to an increase in mischarged tRNAs and does not lead to cell death. Compounds that are active against, and specific for, the editing domain of the tRNA synthetase would provide access to a new class of antimicrobial therapeutics to augment the arsenal of agents currently in use. Quite surprisingly, the present invention provides such compounds and methods of using these compounds.

SUMMARY OF THE INVENTION

In one aspect, the invention provides a structure according to the following formula:

in which R^1 and R^2 are members independently selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl, and substituted or unsubstituted heteroaryl. R^1 and R^2 , together with the atoms to which they are attached, can be optionally joined to form a 4- to 7-membered ring. 21 is a member selected from

35

 R^{3a} and R^{4a} are members independently selected from H, cyano, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl, and substituted or unsubstituted heteroaryl. R⁵ is a member selected from halogen and OR^g. R^g is a member selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl, 10 10(5), FIG. 10(6), FIG. 10(7), FIG. 10(8), FIG. 10(9) are and substituted or unsubstituted heteroaryl. A is a member selected from CR9a and N. D is a member selected from CR^{10a} and N. E is a member selected from CR^{11a} and N. G is a member selected from CR^{12a} and N. R^{9a}, R^{10a}, R^{11a} and R^{12a} are members independently selected from H, OR*, 15 $NR^{*}R^{**}$, SR^{*} , $-S(O)R^{*}$, $-S(O)_{2}R^{*}$, $-S(O)_{2}NR^{*}R^{**}$, nitro, halogen, cyano, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl, and substi- 20 tuted or unsubstituted heteroaryl. Each R* and R** are members independently selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted arvl, 25 and substituted or unsubstituted heteroaryl. R^{9a} and R^{10a} , along with the atoms to which they are attached, are optionally joined to form a ring. R^{10a} and R^{11a}, along with the atoms to which they are attached, are optionally joined to form a ring. R^{11a} and R^{12a} , along with the atoms to which 30 they are attached, are optionally joined to form a ring. The combination of nitrogens (A+D+E+G) is an integer selected from 0 to 3.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1A, FIG. 1B, FIG. 1C are a table of minimum inhibitory concentration (MIC) data of cyclic boronic esters against various fungi.

FIG. 2A displays minimum inhibitory concentration 40 (MIC) for C10, ciclopirox, terbinafine, fluconazole and itraconazole (comparator drugs) against 19 test strains of fungi.

FIG. 2B displays minimum fungicidal concentration (MFC) for C10, ciclopirox, terbinafine and itraconazole 45 display exemplary compounds of the invention. (comparator drugs) against 2 test strains of fungi.

FIG. 3 displays a comparison of Normalized C10 and Ciclopirox Equivalent in Each Part of Nail Plate Samples after 14-day Treatment.

FIG. 4 displays a comparison of C10 and Ciclopirox 50 Equivalent in Cotton Ball Supporting Bed Samples after 14-day Treatment.

FIG. 5 displays the results of a placebo for C10 (50:50 propylene glycol and ethyl acetate) applied per day over five days. Full carpet growth of the organism T. rubrum was 55 observed.

FIG. 6 displays the results of a 40 μ L/cm² aliquot of C10 10% w/v solution applied per day over five days. Zones of inhibition (in the order of the cells shown in the figure) of 100%, 67%, 46%, 57%, 38% and 71% were observed for the 60 growth of T. rubrum. Green arrow indicates the measurement of zone of inhibition.

FIG. 7 displays the results of a 40 μ L/cm² aliquot of C10 10% w/v solution applied per day over five days. Zones of inhibition (in the order of the cells shown in the figure) of 65 74%, 86%, 100%, 82%, 100% and 84% were observed for the growth of T. rubrum.

FIG. 8 displays the results of a 40 μ L/cm² aliquot of 8% ciclopirox in w/w commercial lacquer applied per day over five days. No zone of inhibition observed; full carpet growth of T. rubrum.

FIG. 9 displays the results of a 40 μ L/cm² aliquot of 5% amorolfine w/v in commercial lacquer applied per day over five days. No zone of inhibition observed; full carpet growth of T. rubrum.

FIG. 10(1), FIG. 10(2), FIG. 10(3), FIG. 10(4), FIG. Amino acid sequences for leucyl-tRNA synthetase editing domains and nucleotide sequences for tRNA-Leu and tRNA-Ile. (A) Amino acid sequences for leucyl-tRNA synthetase editing domain from S. cerivisiae in wild type (SEQ ID NO: 1) and over-expressing form (SEQ ID NO: 2); (B) Amino acid sequences for leucyl-tRNA synthetase editing domains from indicated species; (C) Genomic nucleotide sequence for tRNA-leu and tRNA-ile from S. cerivisiae; in one embodiment of the invention, an aminoacyl tRNA synthetase will bind to the transcribed and methylated products for which these sequences serve as a template; (D) tRNA-Leu nucleotide sequences from indicated species.

FIG. 11A, FIG. 11B, FIG. 11C, FIG. 11D, FIG. 11E, FIG. 11F display structures of cyclic boronic esters.

FIG. 12A. FIG. 12B, FIG. 12C, FIG. 12D, FIG. 12E. FIG. 12F, FIG. 12G, FIG. 12H, FIG. 12I display different structures for portions of the compounds of the invention.

FIG. 13 Effect of ATP on binding of C10 to cdc60. The binding assay was conducted with an initial [C10] concentration of approximately 72-79 µM (pre-equilibrium).

FIG. 14 Binding curve of cdc60 against concentration of free [C10]

FIG. 15 Data from PPi exchange reaction experiment to determine rate of editing in the presence and absence of C10.

FIG. 16 Data from an aminoacylation experiment showing the effect of C10 at different concentrations on the aminoacylation of tRNA^{leu}.

FIG. 17 Results from post transfer editing assay conducted in S. cerevisiae at differing concentrations of C10 across a range of time points.

FIG. 18A, FIG. 18B, FIG. 18C display the names of exemplary compounds of the invention.

FIG. 19A, FIG. 19B, FIG. 19C, FIG. 19D, FIG. 19E, FIG. 19F, FIG. 19G, FIG. 19H, FIG. 19I, FIG. 19J, FIG. 19K

FIG. 20A, FIG. 20B, FIG. 20C, FIG. 20D, FIG. 20E, FIG. 20F, FIG. 20G, FIG. 20H display exemplary compounds of the invention.

DETAILED DESCRIPTION OF THE INVENTION

I. Definitions and Abbreviations

The abbreviations used herein generally have their conventional meaning within the chemical and biological arts.

"Compound of the invention," as used herein refers to the compounds discussed herein, pharmaceutically acceptable salts and prodrugs of these compounds.

"Boron containing compounds", as used herein, refers to the compounds of the invention that contain boron as part of their chemical formula.

MIC, or minimum inhibitory concentration, is the point where the compound stops more than 50% of cell growth, preferably 60% of cell growth, preferably 70% of cell growth, preferably 80% of cell growth, preferably 90% of cell growth, relative to an untreated control.

10

50

Where substituent groups are specified by their conventional chemical formulae, written from left to right, they equally encompass the chemically identical substituents, which would result from writing the structure from right to left, e.g., -CH₂O is intended to also recite -OCH₂.

The term "poly" as used herein means at least 2. For example, a polyvalent metal ion is a metal ion having a valency of at least 2.

"Moiety" refers to the radical of a molecule that is attached to another moiety.

The symbol *m*, whether utilized as a bond or displayed perpendicular to a bond, indicates the point at which the displayed moiety is attached to the remainder of the molecule.

The term "alkyl," by itself or as part of another substitu- 15 ent, means, unless otherwise stated, a straight or branched chain, or cyclic hydrocarbon radical, or combination thereof, which may be fully saturated, mono- or polyunsaturated and can include di- and multivalent radicals, having the number of carbon atoms designated (i.e. C1-C10 means one to ten 20 carbons). Examples of saturated hydrocarbon radicals include, but are not limited to, groups such as methyl, ethyl, n-propyl, isopropyl, n-butyl, t-butyl, isobutyl, sec-butyl, (cyclohexyl)methyl, cyclopropylmethyl, cyclohexyl, homologs and isomers of, for example, n-pentyl, n-hexyl, 25 2-piperidinyl, 3-piperidinyl, 4-morpholinyl, 3-morpholinyl, n-heptyl, n-octyl, and the like. An unsaturated alkyl group is one having one or more double bonds or triple bonds. Examples of unsaturated alkyl groups include, but are not limited to, vinyl, 2-propenyl, crotyl, 2-isopentenyl, 2-(butadienyl), 2,4-pentadienyl, 3-(1,4-pentadienyl), ethynyl, 1- 30 and 3-propynyl, 3-butynyl, and the higher homologs and isomers. The term "alkyl," unless otherwise noted, is also meant to include those derivatives of alkyl defined in more detail below, such as "heteroalkyl." Alkyl groups that are limited to hydrocarbon groups are termed "homoalkyl".

The term "alkylene" by itself or as part of another substituent means a divalent radical derived from an alkane, as exemplified, but not limited, by --CH2CH2CH2CH2CH2-, and further includes those groups described below as "heteroalkylene." Typically, an alkyl (or alkylene) group will 40 have from 1 to 24 carbon atoms, with those groups having 10 or fewer carbon atoms being preferred in the present invention. A "lower alkyl" or "lower alkylene" is a shorter chain alkyl or alkylene group, generally having eight or fewer carbon atoms.

The terms "alkoxy," "alkylamino" and "alkylthio" (or thioalkoxy) are used in their conventional sense, and refer to those alkyl groups attached to the remainder of the molecule via an oxygen atom, an amino group, or a sulfur atom, respectively.

The term "heteroalkyl," by itself or in combination with another term, means, unless otherwise stated, a stable straight or branched chain, or cyclic hydrocarbon radical. or combinations thereof, consisting of the stated number of carbon atoms and at least one heteroatom. In an exemplary 55 embodiment, the heteroatoms can be selected from the group consisting of B, O, N and S, and wherein the nitrogen and sulfur atoms may optionally be oxidized and the nitrogen heteroatom may optionally be quaternized. The heteroatom(s) B, O, N and S may be placed at any interior position 60 of the heteroalkyl group or at the position at which the alkyl group is attached to the remainder of the molecule. -CH=CH-O-CH₃, -CH₂-CH=N-OCH₃, and

8

-CH=CH-N(CH₃)-CH₃. Up to two heteroatoms may be consecutive, such as, for example, --CH₂--NH--OCH₃. Similarly, the term "heteroalkylene" by itself or as part of another substituent means a divalent radical derived from heteroalkyl, as exemplified, but not limited by, -CH2--- CH_2 -S- CH_2 - CH_2 - and $-CH_2$ -S- CH_2 - CH_2 NH-CH2-. For heteroalkylene groups, heteroatoms can also occupy either or both of the chain termini (e.g., alkyleneoxy, alkylenedioxy, alkyleneamino, alkylenediamino, and the like). Still further, for alkylene and heteroalkylene linking groups, no orientation of the linking group is implied by the direction in which the formula of the linking group is written. For example, the formula $-C(O)_2R'$ represents both $-C(O)_2R'$ and $-R'C(O)_2$.

The terms "cycloalkyl" and "heterocycloalkyl", by themselves or in combination with other terms, represent, unless otherwise stated, cyclic versions of "alkyl" and "heteroalkyl", respectively. Additionally, for heterocycloalkyl, a heteroatom can occupy the position at which the heterocycle is attached to the remainder of the molecule. Examples of cycloalkyl include, but are not limited to, cyclopentyl, cyclohexyl, 1-cyclohexenyl, 3-cyclohexenyl, cycloheptyl, and the like. Examples of heterocycloalkyl include, but are not limited to, 1-(1,2,5,6-tetrahydropyridyl), 1-piperidinyl, tetrahydrofuran-2-yl, tetrahydrofuran-3-yl, tetrahydrothien-2-yl, tetrahydrothien-3-yl, 1-piperazinyl, 2-piperazinyl, and the like.

The terms "halo" or "halogen," by themselves or as part of another substituent, mean, unless otherwise stated, a fluorine, chlorine, bromine, or iodine atom. Additionally, terms such as "haloalkyl," are meant to include monohaloalkyl and polyhaloalkyl. For example, the term "halo(C, - C_{4})alkyl" is mean to include, but not be limited to, trifluo-4-chlorobutyl, 35 romethyl, 2.2.2-trifluoroethyl, 3-bromopropyl, and the like.

The term "aryl" means, unless otherwise stated, a polyunsaturated, aromatic, substituent that can be a single ring or multiple rings (preferably from 1 to 3 rings), which are fused together or linked covalently. The term "heteroaryl" refers to aryl groups (or rings) that contain from one to four heteroatoms. In an exemplary embodiment, the heteroatom is selected from B, N, O, and S, wherein the nitrogen and sulfur atoms are optionally oxidized, and the nitrogen 45 atom(s) are optionally quaternized. A heteroaryl group can be attached to the remainder of the molecule through a heteroatom. Non-limiting examples of aryl and heteroaryl groups include phenyl, 1-naphthyl, 2-naphthyl, 4-biphenyl, 1-pyrrolyl, 2-pyrrolyl, 3-pyrrolyl, 3-pyrazolyl, 2-imidazolyl, 4-imidazolyl, pyrazinyl, 2-oxazolyl, 4-oxazolyl, 2-phenyl-4-oxazolyl, 5-oxazolyl, 3-isoxazolyl, 4-isoxazolyl, 5-isoxazolyl, 2-thiazolyl, 4-thiazolyl, 5-thiazolyl, 2-furyl, 3-furyl, 2-thienyl, 3-thienyl, 2-pyridyl, 3-pyridyl, 4-pyridyl, 2-pyrimidyl, 4-pyrimidyl, 5-benzothiazolyl, purinyl, 2-benzimidazolyl, 5-indolyl, 1-isoquinolyl, 5-isoquinolyl, 2-quinoxalinyl, 5-quinoxalinyl, 3-quinolyl, 6-auinolvl. dioxaborolane, dioxaborinane and dioxaborepane. Substituents for each of the above noted aryl and heteroaryl ring systems are selected from the group of acceptable substituents described below.

For brevity, the term "aryl" when used in combination with other terms (e.g., aryloxy, arylthioxy, arylalkyl) includes both aryl and heteroaryl rings as defined above. Thus, the term "arylalkyl" is meant to include those radicals in which an aryl group is attached to an alkyl group (e.g., benzyl, phenethyl, pyridylmethyl and the like) including those alkyl groups in which a carbon atom (e.g., a methylene group) has been replaced by, for example, an oxygen atom (e.g., phenoxymethyl, 2-pyridyloxymethyl, 3-(1-naphth-yloxy)propyl, and the like).

Each of the above terms (e.g., "alkyl," "heteroalkyl," "aryl" and "heteroaryl") are meant to include both substituted and unsubstituted forms of the indicated radical. Preferred substituents for each type of radical are provided below.

Substituents for the alkyl and heteroalkyl radicals (including those groups often referred to as alkylene, alkenyl, 10 heteroalkylene, heteroalkenyl, alkynyl, cycloalkyl, heterocycloalkyl, cycloalkenyl, and heterocycloalkenyl) are generically referred to as "alkyl group substituents," and they can be one or more of a variety of groups selected from, but not limited to: -OR', =O, =NR', =N-OR', 15 —NR'R", -SR', -halogen, -OC(O)R', -C(O)R', $-CO_2R'$, -CONR'R'', -OC(O)NR'R'', -NR''C(O)R', -NR'-C(O)NR'R''', $-NR''C(O)_2R'$, -NR-C—NR'—C(O)NR"R"", (NR'R"R")=NR"", -NR-C(NR'R")=NR", -S(O)R', $-S(O)_2R'$, $-S(O)_2NR'R''$, $-NRSO_2R'$, -CN and $-NO_2$ 20 in a number ranging from zero to (2m'+1), where m' is the total number of carbon atoms in such radical. R', R", R" and R"" each preferably independently refer to hydrogen, substituted or unsubstituted heteroalkyl, substituted or unsubstituted aryl, e.g., aryl substituted with 1-3 halogens, sub- 25 stituted or unsubstituted alkyl, alkoxy or thioalkoxy groups, or arylalkyl groups. When a compound of the invention includes more than one R group, for example, each of the R groups is independently selected as are each R', R", R" and R"" groups when more than one of these groups is present. 30 When R' and R" are attached to the same nitrogen atom, they can be combined with the nitrogen atom to form a 5-, 6-, or 7-membered ring. For example, -NR'R" is meant to include, but not be limited to, 1-pyrrolidinyl and 4-morpholinyl. From the above discussion of substituents, one of 35 skill in the art will understand that the term "alkyl" is meant to include groups including carbon atoms bound to groups other than hydrogen groups, such as haloalkyl (e.g., -CF₃ and $-CH_2CF_3$) and acyl (e.g., $-C(O)CH_3$, $-C(O)CF_3$, $-C(O)CH_2OCH_3$, and the like). 40

Similar to the substituents described for the alkyl radical, substituents for the aryl and heteroaryl groups are generically referred to as "aryl group substituents." The substituents are selected from, for example: halogen, -OR', =O, =NR', =N-OR', -NR'R", -SR', -halogen, -OC(O)R', 45 --OC(O)NR'R", $-CO_2R'$, -CONR'R'', -C(O)R'-NR'C(O)R', -NR'-C(O)NR''R''', -NR"C(O),R', $-NR-C(NR'R"R"')=NR"', NR-C(NR'R")=NR"', -S(O)R', -S(O)_2R', -S(O)_2NR'R", -NRSO_2R', -CN$ -NR-C(NR'R"R"")=NR"", and $-NO_2$, -R', $-N_3$, $-CH(Ph)_2$, fluoro(C_1 - C_4)alkoxy, 50 and fluoro(C_1 - C_4)alkyl, in a number ranging from zero to the total number of open valences on the aromatic ring system; and where R', R", R" and R"" are preferably independently selected from hydrogen, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or 55 unsubstituted aryl and substituted or unsubstituted heteroaryl. When a compound of the invention includes more than one R group, for example, each of the R groups is independently selected as are each R', R", R" and R"" groups when more than one of these groups is present. 60

Two of the substituents on adjacent atoms of the aryl or heteroaryl ring may optionally be replaced with a substituent of the formula -T-C(O)— $(CRR')_q$ —U—, wherein T and U are independently —NR—, —O—, —CRR'— or a single bond, and q is an integer of from 0 to 3. Alternatively, two 65 of the substituents on adjacent atoms of the aryl or heteroaryl ring may optionally be replaced with a substituent of the

formula -A-(CH₂),—B-, wherein A and B are independently -CRR'-, -O-, -NR-, -S-, -S(O)-, $-S(O)_2-$, $-S(O)_2NR'-$ or a single bond, and r is an integer of from 1 to 4. One of the single bonds of the new ring so formed may optionally be replaced with a double bond. Alternatively, two of the substituents on adjacent atoms of the aryl or heteroaryl ring may optionally be replaced with a substituent of the formula $-(CRR')_{s}-X-(CR"R''')_{a}-$, where s and d are independently integers of from 0 to 3, and X is -O-, -NR'-, -S-, -S(O)-, $-S(O)_2-$, or $-S(O)_2NR'-$. The substituents R. R', R'' and R''' are preferably independently selected from hydrogen or substituted or unsubstituted (C₁-C₆)alkyl.

"Ring" as used herein, means a substituted or unsubstituted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl, or substituted or unsubstituted heteroaryl. A ring includes fused ring moieties. The number of atoms in a ring is typically defined by the number of members in the ring. For example, a "5- to 7-membered ring" means there are 5 to 7 atoms in the encircling arrangement. The ring optionally included a heteroatom. Thus, the term "5- to 7-membered ring" includes, for example pyridinyl and piperidinyl. The term "ring" further includes a ring system comprising more than one "ring", wherein each "ring" is independently defined as above.

As used herein, the term "heteroatom" includes atoms other than carbon (C) and hydrogen (H). Examples include oxygen (O), nitrogen (N) sulfur (S), silicon (Si), germanium (Ge), aluminum (Al) and boron (B).

The symbol "R" is a general abbreviation that represents a substituent group that is selected from substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted aryl, substituted or unsubstituted heteroaryl, substituted or unsubstituted yeloalkyl and substituted or unsubstituted heterocycloalkyl groups.

The term "derived from" includes its plain language meaning and also refers to a molecule that is 99%, 98%, 97%, 96%, 95%, 94%, 93%, 92%, 91%, 90%, 89%, 88%, 87%, 86%, 85%, 84%, 83%, 82%, 81%, 80%, 75%, 70%, 65%, or 60% homologous to a referenced molecule. The molecules referred to in this definition include chains of RNA or DNA, oligonucleotides, polypeptides, or proteins of any length and composition.

The term "immunological marker" includes oligonucleotides, proteins, antibodies, peptides, polypeptides, enzymes, or any other molecule able to induce an immune response in appropriate animals or cells or to bind with specific antibodies.

The term "noncognate" is meant to encompass both the singular and plural forms of the word, i.e. the phrase "noncognate amino acid" comprises one or more amino acids.

By "effective" amount of a drug, formulation, or permeant is meant a sufficient amount of a active agent to provide the desired local or systemic effect. A "Topically effective," "Cosmetically effective," "pharmaceutically effective," or "therapeutically effective" amount refers to the amount of drug needed to effect the desired therapeutic result.

"Topically effective" refers to a material that, when applied to the skin, nail, hair, claw or hoof produces a desired pharmacological result either locally at the place of application or systemically as a result of transdermal passage of an active ingredient in the material.

"Cosmetically effective" refers to a material that, when applied to the skin, nail, hair, claw or hoof, produces a desired cosmetic result locally at the place of application of an active ingredient in the material.

The term "pharmaceutically acceptable salts" is meant to include salts of the compounds of the invention which are prepared with relatively nontoxic acids or bases, depending on the particular substituents found on the compounds described herein. When compounds of the present invention contain relatively acidic functionalities, base addition salts can be obtained by contacting the neutral form of such compounds with a sufficient amount of the desired base, 10 either neat or in a suitable inert solvent. Examples of pharmaceutically acceptable base addition salts include sodium, potassium, calcium, ammonium, organic amino, or magnesium salt, or a similar salt. When compounds of the present invention contain relatively basic functionalities. 15 acid addition salts can be obtained by contacting the neutral form of such compounds with a sufficient amount of the desired acid, either neat or in a suitable inert solvent. Examples of pharmaceutically acceptable acid addition salts include those derived from inorganic acids like hydrochlo- 20 ric, hydrobromic, nitric, carbonic, monohydrogencarbonic, phosphoric, monohydrogenphosphoric, dihydrogenphosphoric, sulfuric, monohydrogensulfuric, hydriodic, or phosphorous acids and the like, as well as the salts derived from relatively nontoxic organic acids like acetic, propionic, 25 isobutyric, maleic, malonic, benzoic, succinic, suberic, fumaric, lactic, mandelic, phthalic, benzenesulfonic, p-tolylsulfonic, citric, tartaric, methanesulfonic, and the like. Also included are salts of amino acids such as arginate and the like, and salts of organic acids like glucuronic or galac- 30 tunoric acids and the like (see, for example, Berge et al., "Pharmaceutical Salts", Journal of Pharmaceutical Science 66: 1-19 (1977)). Certain specific compounds of the present invention contain both basic and acidic functionalities that allow the compounds to be converted into either base or acid 35 addition salts.

The neutral forms of the compounds are preferably regenerated by contacting the salt with a base or acid and isolating the parent compounds in the conventional manner. The parent form of the compound differs from the various salt 40 forms in certain physical properties, such as solubility in polar solvents.

In addition to salt forms, the present invention provides compounds which are in a prodrug form. Prodrugs of the compounds or complexes described herein readily undergo 45 chemical changes under physiological conditions to provide the compounds of the present invention. Additionally, prodrugs can be converted to the compounds of the present invention by chemical or biochemical methods in an ex vivo environment. 50

Certain compounds of the present invention can exist in unsolvated forms as well as solvated forms, including hydrated forms. In general, the solvated forms are equivalent to unsolvated forms and are encompassed within the scope of the present invention. Certain compounds of the present 55 invention may exist in multiple crystalline or amorphous forms. In general, all physical forms are equivalent for the uses contemplated by the present invention and are intended to be within the scope of the present invention.

Certain compounds of the present invention possess 60 asymmetric carbon atoms (optical centers) or double bonds; the racemates, diastereomers, geometric isomers and individual isomers are encompassed within the scope of the present invention.

The compounds of the present invention may also contain 65 unnatural proportions of atomic isotopes at one or more of the atoms that constitute such compounds. For example, the

compounds may be radiolabeled with radioactive isotopes, such as for example tritium (³H), iodine-125 (¹²⁵I) or carbon-14 (¹⁴C). All isotopic variations of the compounds of the present invention, whether radioactive or not, are intended to be encompassed within the scope of the present invention.

The term "pharmaceutically acceptable carrier" or "pharmaceutically acceptable vehicle" refers to any formulation or carrier medium that provides the appropriate delivery of an effective amount of a active agent as defined herein, does not interfere with the effectiveness of the biological activity of the active agent, and that is sufficiently non-toxic to the host or patient. Representative carriers include water, oils, both vegetable and mineral, cream bases, lotion bases, ointment bases and the like. These bases include suspending agents, thickeners, penetration enhancers, and the like. Their formulation is well known to those in the art of cosmetics and topical pharmaceuticals. Additional information concerning carriers can be found in *Remington: The Science and Practice of Pharmacy*, 21st Ed., Lippincott, Williams & Wilkins (2005) which is incorporated herein by reference.

"Pharmaceutically acceptable topical carrier" and equivalent terms refer to pharmaceutically acceptable carriers, as described herein above, suitable for topical application. An inactive liquid or cream vehicle capable of suspending or dissolving the active agent(s), and having the properties of being nontoxic and non-inflammatory when applied to the skin, nail, hair, claw or hoof is an example of a pharmaceutically-acceptable topical carrier. This term is specifically intended to encompass carrier materials approved for use in topical cosmetics as well.

The term "pharmaceutically acceptable additive" refers to preservatives, antioxidants, fragrances, emulsifiers, dyes and excipients known or used in the field of drug formulation and that do not unduly interfere with the effectiveness of the biological activity of the active agent, and that is sufficiently non-toxic to the host or patient. Additives for topical formulations are well-known in the art, and may be added to the topical composition, as long as they are pharmaceutically acceptable and not deleterious to the epithelial cells or their function. Further, they should not cause deterioration in the stability of the composition. For example, inert fillers, anti-irritants, tackifiers, excipients, fragrances, opacifiers, antioxidants, gelling agents, stabilizers, surfactant, emollients, coloring agents, preservatives, buffering agents, other permeation enhancers, and other conventional components of topical or transdermal delivery formulations as are known in the art.

The terms "enhancement," "penetration enhancement" or "permeation enhancement" relate to an increase in the permeability of the skin, nail, hair, claw or hoof to a drug, so as to increase the rate at which the drug permeates through the skin, nail, hair, claw or hoof. The enhanced permeation effected through the use of such enhancers can be observed, for example, by measuring the rate of diffusion of the drug through animal or human skin, nail, hair, claw or hoof using a diffusion cell apparatus. A diffusion cell is described by Merritt et al. Diffusion Apparatus for Skin Penetration, J of Controlled Release, 1 (1984) pp. 161-162. The term "permeation enhancer" or "penetration enhancer" intends an agent or a mixture of agents, which, alone or in combination, act to increase the permeability of the skin, nail, hair or hoof to a drug.

The term "excipients" is conventionally known to mean carriers, diluents and/or vehicles used in formulating drug compositions effective for the desired use.

50

The term "topical administration" refers to the application of a pharmaceutical agent to the external surface of the skin, nail, hair, claw or hoof, such that the agent crosses the external surface of the skin, nail, hair, claw or hoof and enters the underlying tissues. Topical administration 5 includes application of the composition to intact skin, nail, hair, claw or hoof, or to an broken, raw or open wound of skin, nail, hair, claw or hoof. Topical administration of a pharmaceutical agent can result in a limited distribution of the agent to the skin and surrounding tissues or, when the 10 agent is removed from the treatment area by the bloodstream, can result in systemic distribution of the agent.

The term "transdermal delivery" refers to the diffusion of an agent across the barrier of the skin, nail, hair, claw or hoof resulting from topical administration or other application of 15 a composition. The stratum corneum acts as a barrier and few pharmaceutical agents are able to penetrate intact skin. In contrast, the epidermis and dermis are permeable to many solutes and absorption of drugs therefore occurs more readily through skin, nail, hair, claw or hoof that is abraded or 20 otherwise stripped of the stratum corneum to expose the epidermis. Transdermal delivery includes injection or other delivery through any portion of the skin, nail, hair, claw or hoof or mucous membrane and absorption or permeation through the remaining portion. Absorption through intact 25 skin, nail, hair, claw or hoof can be enhanced by placing the active agent in an appropriate pharmaceutically acceptable vehicle before application to the skin, nail, hair, claw or hoof. Passive topical administration may consist of applying the active agent directly to the treatment site in combination 30 with emollients or penetration enhancers. As used herein, transdermal delivery is intended to include delivery by permeation through or past the integument, i.e. skin, nail, hair, claw or hoof.

The term "microbial infection" refers to any infection of 35 a host tissue by an infectious agent including, but not limited to, viruses, bacteria, mycobacteria, fungus and parasites (see, e.g., Harrison's Principles of Internal Medicine, pp. 93-98 (Wilson et al., eds., 12th ed. 1991); Williams et al., J. of Medicinal Chem. 42:1481-1485 (1999), herein each 40 incorporated by reference in their entirety).

"Biological medium," as used herein refers to both in vitro and in vivo biological milieus. Exemplary in vitro "biological media" include, but are not limited to, cell culture, tissue culture, homogenates, plasma and blood. In 45 vivo applications are generally performed in mammals, preferably humans.

"Inhibiting" and "blocking," are used interchangeably herein to refer to the partial or full blockade of an editing domain of a tRNA synthetase.

"Ventral/intermediate center" as used herein refers to powdered nail samples drilled from the center of the inner surface (facing the nail bed) approximately 0.3-0.5 mm in depth to the surface. The area is beneath the dosed site of the nail place but does not include dosed surface (dorsal nail 55 surface).

"Ventral/intermediate center" as used herein refers to the immediate area of dosed site.

"Remainder nail" as used herein refers to the remaining part of the nail that has not been dosed. 60

"Supporting bed" as used herein refers to the cotton ball placed within the Teflon chamber of the diffusion cell to provide moisture to the nail plate and also to receive chemicals penetrating through the nail plate.

"Surfacing washing" as used herein refers to ethanol (or 65 other organic solvents) and soap/water washing on the surface of the dosed site.

"Cell washing" as used herein, refers to ethanol (or other organic solvents) and soap/water wash of the inside of the diffusion cell.

A "human nail unit", as defined herein, can be the nail plate, the nail bed, proximal nail fold, lateral nail fold and combinations thereof.

The term "leaving group" means a functional group or atom which can be displaced by another functional group or atom in a substitution reaction, such as a nucleophilic substitution reaction. By way of example, representative leaving groups include triffate, chloro, bromo and iodo groups; sulfonic ester groups, such as mesylate, tosylate, brosylate, nosylate and the like; and acyloxy groups, such as acetoxy, trifluoroacetoxy and the like.

The term "amino-protecting group" means a protecting group suitable for preventing undesired reactions at an amino nitrogen. Representative amino-protecting groups include, but are not limited to, formyl; acyl groups, for example alkanoyl groups, such as acetyl, trichloroacetyl or trifluoroacetyl; alkoxycarbonyl groups, such as tert-butoxycarbonyl (Boc); arylmethoxycarbonyl groups, such as tert-butoxycarbonyl (Cbz) and 9-fluorenylmethoxycarbonyl (Fmoc); arylmethyl groups, such as benzyl (Bn), trityl (Tr), and 1,1-di-(4'-methoxyphenyl)methyl; silyl groups, such as trimethylsilyl (TMS) and tert-butyldimethylsilyl (TBS); and the like.

The term "hydroxy-protecting group" means a protecting group suitable for preventing undesired reactions at a hydroxy group. Representative hydroxy-protecting groups include, but are not limited to, alkyl groups, such as methyl, ethyl, and tert-butyl; acyl groups, for example alkanoyl groups, such as acetyl; arylmethyl groups, such as benzyl (Bn), p-methoxybenzyl (PMB), 9-fluorenylmethyl (Fm), and diphenylmethyl (benzhydryl, DPM); silyl groups, such as trimethylsilyl (TMS) and tert-butyldimethylsilyl (TBS); and the like.

Boron is able to form dative bonds with oxygen, sulfur or nitrogen under some circumstances in this invention. Dative bonds are usually weaker than covalent bonds. In situations where a boron is covalently bonded to at least one oxygen, sulfur or nitrogen, and is at the same time datively bonded to an oxygen, sulfur or nitrogen, respectively, the dative bond and covalent bond between the boron and the two identical heteroatoms can interconvert or be in the form of a resonance hybrid. There is potential uncertainty surrounding the exact nature and extent of electron sharing in these situations. The structures supplied are not intended to include any and all possible bonding scenarios between boron and the atom to which it is bound. Non limiting examples of these bonds are as follows:

30

In another example, dimers of C17 can form under the following conditions:

"Salt counterion", as used herein, refers to positively charged ions that associate with a compound of the invention ⁴⁵ when the boron is fully negatively or partially negatively charged. Examples of salt counterions include H^+ , H_3O^+ , ammonium, potassium, calcium, magnesium and sodium.

The compounds comprising a boron bonded to a carbon $_{50}$ and three heteroatoms (such as three oxygens described in this section) can optionally contain a fully negatively charged boron or partially negatively charged boron, due to the nature of the dative bond between the boron and one of the oxygens. Due to the negative charge, a positively 55 charged counterion may associate with this compound, thus forming a salt. Examples of positively charged counterions include H⁺, H₃O⁺, calcium, sodium, ammonium, potassium. The salts of these compounds are implicitly contained in descriptions of these compounds.

The present invention also encompasses compounds that are poly- or multi-valent species, including, for example, species such as dimers, trimers, tetramers and higher homologs of the compounds of use in the invention or 65 reactive analogues thereof. For example, dimers of C10 can form under the following conditions:

The present invention also encompasses compounds that are anhydrides of the cyclic boronic esters are synthesized by subjecting these compounds to dehydrating conditions. Examples of these anhydrides are provided below:

25

30

N

Trimers of the compounds of the invention are also produced. For example, trimers of acyclic boronic esters can be formed as follows:

18

-continued

OH

Polymers of the compounds of the invention are also produced through the removal of certain protecting groups in strong acid. For example, trimers of acyclic boronic esters can be formed as follows:

Also of use in the present invention are compounds that 50 are poly- or multi-valent species, including, for example, species such as dimers, trimers, tetramers and higher homologs of the compounds of use in the invention or reactive analogues thereof. The poly- and multi-valent species can be assembled from a single species or more than one 55 species of the invention. For example, a dimeric construct can be "homo-dimeric" or "heterodimeric." Moreover, polyand multi-valent constructs in which a compound of the invention or a reactive analogue thereof, is attached to an oligomeric or polymeric framework (e.g., polylysine, dextran, hydroxyethyl starch and the like) are within the scope 60 of the present invention. The framework is preferably polyfunctional (i.e. having an array of reactive sites for attaching compounds of use in the invention). Moreover, the framework can be derivatized with a single species of the invention or more than one species of the invention. 65

Moreover, the present invention includes the use of compounds within the motif set forth in the formulae contained 20

herein, which are functionalized to afford compounds having water-solubility that is enhanced relative to analogous compounds that are not similarly functionalized. Thus, any of the substituents set forth herein can be replaced with analogous radicals that have enhanced water solubility. For example, it is within the scope of the invention to replace a hydroxyl group with a diol, or an amine with a quaternary amine, hydroxy amine or similar more water-soluble moiety. In a preferred embodiment, additional water solubility is imparted by substitution at a site not essential for the activity towards the editing domain of the compounds set forth herein with a moiety that enhances the water solubility of the parent compounds. Methods of enhancing the water-solubility of organic compounds are known in the art. Such methods include, but are not limited to, functionalizing an organic nucleus with a permanently charged moiety, e.g., quaternary ammonium, or a group that is charged at a physiologically relevant pH, e.g. carboxylic acid, amine. Other methods include, appending to the organic nucleus hydroxyl- or amine-containing groups, e.g. alcohols, polyols, polyethers, and the like. Representative examples include, but are not limited to, polylysine, polyethyleneimine, poly(ethyleneglycol) and poly(propyleneglycol). Suitable functionalization chemistries and strategies for these compounds are known in the art. See, for example, Dunn, R. L., et al., Eds. POLYMERIC DRUGS AND DRUG DELIVERY SYSTEMS, ACS Symposium Series Vol. 469, American Chemical Society, Washington, D.C. 1991.

II. Introduction

The present invention provides novel boron compounds and methods for the preparation of these molecules. The invention further provides boron compounds as analogs ³⁵ comprising a functional moiety, such as a drug moiety and methods of use for said analogs.

III. The Compounds

III.a) Cyclic Boronic Esters

In a first aspect, the invention provides a compound having a structure according to Formula I:

(I)

wherein B is boron. R^{1a} is a member selected from a negative charge, a salt counterion, H, cyano, substituted or unsubstituted alkyl, substituted or unsubstituted alkyl, substituted or unsubstituted or unsubstituted or unsubstituted aryl, substituted or unsubstituted aryl, and substituted or unsubstituted heteroaryl. M is a member selected from oxygen, sulfur and NR^{2a} . R^{2a} is a member selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted or unsubstituted alkyl, substituted or unsubstituted heteroaryl. M is a member selected from H, substituted or unsubstituted or unsubstited or unsubs

15

25

independently selected from H, cyano, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl, and substituted or unsubstituted heteroaryl. The index n1 is an 5 integer selected from 0 to 2. W is a member selected from C=O (carbonyl), $(CR^{6a}R^{7a})_{m1}$ and CR^{8a} . R^{6a} , R^{7a} , and R^{8a} . are members independently selected from H, cyano, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted arvl, and substituted or unsubstituted heteroary). The index m1 is an integer selected from 0 and 1. A is a member selected from CR^{9a} and N. D is a member selected from CR^{10a} and N. E is a member selected from CR^{11a} and N. G is a member selected from CR^{12a} and N. R^{9a} , R^{10a} , R^{11a} and R^{12a} are members independently selected from H, OR*, NR*R**, SR*, -S(O)R*, -S(O) $_{2}R^{*}$, $-S(O)_{2}NR^{*}R^{**}$, $-C(O)R^{*}$, $-C(O)OR^{*}$, -C(O)NR*R**, nitro, halogen, cyano, substituted or unsubstituted 20 alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl, and substituted or unsubstituted heteroaryl. Each R* and R** are members independently selected from H, nitro, halogen, cvano, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl, and substituted or unsubstituted heteroaryl. The combination of nitrogens (A+D+E+ G) is an integer selected from 0 to 3. A member selected from \mathbb{R}^{3a} , \mathbb{R}^{4a} and \mathbb{R}^{5a} and a member selected from \mathbb{R}^{6a} , \mathbb{R}^{7a} and \mathbb{R}^{8a} , together with the atoms to which they are attached, are optionally joined to form a 4 to 7 membered ring. R^{3a} and R^{4a} , together with the atoms to which they are attached, are optionally joined to form a 4 to 7 membered ring. R⁶ and \mathbb{R}^{7a} , together with the atoms to which they are attached, are optionally joined to form a 4 to 7 membered ring. R^{9a} and R^{10a}, together with the atoms to which they are attached, are optionally joined to form a 4 to 7 membered ring. R^{10a} 40 and R^{11a} together with the atoms to which they are attached, are optionally joined to form a 4 to 7 membered ring. R¹¹ and $R^{12\alpha}$, together with the atoms to which they are attached, are optionally joined to form a 4 to 7 membered ring.

In an exemplary embodiment, the compound has a structure according to Formula (Ia):

In another exemplary embodiment, each R^{3a} and R^{4a} is a member independently selected from H, cyano, substituted 60 or unsubstituted methyl, substituted or unsubstituted ethyl, trifluoromethyl, substituted or unsubstituted hydroxymethyl, substituted or unsubstituted hydroxyalkyl, substituted or unsubstituted benzyl, substituted or unsubstituted phenyl, substituted or unsubstituted mercaptomethyl, substituted or 65 unsubstituted mercaptoalkyl, substituted or unsubstituted aminomethyl, substituted or unsubstituted alkylaminom22

ethyl, substituted or unsubstituted dialkylaminomethyl, substituted or unsubstituted arylaminomethyl, substituted or unsubstituted indolyl and substituted or unsubstituted amido. In another exemplary embodiment, each R^{3a} and R^{4a} is a member independently selected from cyano, substituted or unsubstituted methyl, substituted or unsubstituted ethyl, trifluoromethyl, substituted or unsubstituted hydroxymethyl, substituted or unsubstituted hydroxyalkyl, substituted or unsubstituted benzyl, substituted or unsubstituted phenyl, substituted or unsubstituted mercaptomethyl, substituted or unsubstituted mercaptoalkyl, substituted or unsubstituted aminomethyl, substituted or unsubstituted alkylaminomethyl, substituted or unsubstituted dialkylaminomethyl, substituted or unsubstituted arylaminomethyl, substituted or unsubstituted indolyl, substituted or unsubstituted amido.

In another exemplary embodiment, each R^{3a} and R^{4a} is a member selected from H, substituted or unsubstituted methyl, substituted or unsubstituted ethyl, substituted or unsubstituted propyl, substituted or unsubstituted isopropyl, substituted or unsubstituted butyl, substituted or unsubstituted t-butyl, substituted or unsubstituted phenyl and substituted or unsubstituted benzyl. In another exemplary embodiment, R^{3a} and R^{4a} is a member selected from methyl, ethyl, propyl, isopropyl, butyl, t-butyl, phenyl and benzyl. In another exemplary embodiment, R^{3a} is H and R^{4a} is a member selected from methyl, ethyl, propyl, isopropyl, butyl, t-butyl, phenyl and benzyl. In another exemplary embodiment, R^{3a} is H and R^{4a} H.

In another exemplary embodiment, each R^{9a}, R^{10a}, R^{11a} and R^{12a} is a member independently selected from H, OR*, $NR^{*R^{**}}, SR^{*}, -S(O)R^{*}, -S(O)_2R^{*}, -S(O)_2NR^{*R^{**}},$ -C(O)R*, -C(O)OR*, -C(O)NR*R**, halogen, cyano, nitro, substituted or unsubstituted methoxy, substituted or unsubstituted methyl, substituted or unsubstituted ethoxy, substituted or unsubstituted ethyl, trifluoromethyl, substi-35 tuted or unsubstituted hydroxymethyl, substituted or unsubstituted hydroxyalkyl, substituted or unsubstituted benzyl, substituted or unsubstituted phenyl, substituted or unsubstituted phenyloxy, substituted or unsubstituted phenyl methoxy, substituted or unsubstituted thiophenyloxy, substituted or unsubstituted pyridinyloxy, substituted or unsubstituted pyrimidinyloxy, substituted or unsubstituted benzylfuran, substituted or unsubstituted methylthio, substituted or unsubstituted mercaptomethyl, substituted or unsubstituted 45 mercaptoalkyl, substituted or unsubstituted phenylthio, substituted or unsubstituted thiophenylthio, substituted or unsubstituted phenyl methylthio, substituted or unsubstituted pyridinylthio, substituted or unsubstituted pyrimidinylthio, substituted or unsubstituted benzylthiofuranyl, sub-50 stituted or unsubstituted phenylsulfonyl, substituted or unsubstituted benzylsulfonyl, substituted or unsubstituted phenylmethylsulfonyl, substituted or unsubstituted thiophenylsulfonyl, substituted or unsubstituted pyridinylsulfonyl. substituted or unsubstituted pyrimidinylsulfonyl, substituted 55 or unsubstituted sulfonamidyl, substituted or unsubstituted phenylsulfinyl, substituted or unsubstituted benzylsulfinyl, substituted or unsubstituted phenylmethylsulfinyl, substituted or unsubstituted thiophenylsulfinyl, substituted or unsubstituted pyridinylsulfinyl, substituted or unsubstituted pyrimidinylsulfinyl, substituted or unsubstituted amino, substituted or unsubstituted alkylamino, substituted or unsubstituted dialkylamino, substituted or unsubstituted trifluoromethylamino, substituted or unsubstituted aminomethyl, substituted or unsubstituted alkylaminomethyl, substituted or unsubstituted dialkylaminomethyl, substituted or unsubstituted arylaminomethyl, substituted or unsubstituted benzylamino, substituted or unsubstituted phenylamino, substi-

tuted or unsubstituted thiophenylamino, substituted or unsubstituted pyridinylamino, substituted or unsubstituted pyrimidinylamino, substituted or unsubstituted indolyl, substituted or unsubstituted morpholino, substituted or unsubstituted alkylamido, substituted or unsubstituted arylamido, ⁵ substituted or unsubstituted or unsubstituted arylamido, ⁵ substituted or unsubstituted or unsubstituted carbamoyl, and substituted or unsubstituted piperizinyl. In an exemplary embodiment, R^{9a} , R^{10a} , R^{11a} and R^{12a} are selected from the previous list of substituents with the exception of $-C(O)R^*$, $-C(O)OR^*$, $-C(O)NR^*R^{**}$.

In another exemplary embodiment, R^{9a}, R^{10a}, R^{11a} and R^{12a} are members independently selected from fluoro, chloro, bromo, nitro, cyano, amino, methyl, hydroxylmethyl, trifluoromethyl, methoxy, trifluoromethyoxy, ethyl, 15 diethylcarbamoyl, pyridin-2-yl, pyridin-3-yl, pyridin-4-yl, pyrimidinyl, piperizino, piperizinyl, piperizinocarbonyl, piperizinylcarbonyl, carboxyl, 1-tetrazolyl, 1-ethoxycarbonylmethoxy, carboxymethoxy, thiophenyl, 3-(butylcarbonyl) phenylmethoxy, 1H-tetrazol-5-yl, 1-ethoxycarbonylm- 20 ethyloxy-, 1-ethoxycarbonylmethyl-, 1-ethoxycarbonyl-, carboxymethoxy-, thiophen-2-yl, thiophen-2-ylthio-, thiophen-3-yl, thiophen-3-ylthio, 4-fluorophenylthio, butylcarbonylphenylmethoxy, butylcarbonylphenylmethyl, butylcar-1-(piperidin-1-yl)carbonyl)methyl, 25 bonylmethyl, 1-(piperidin-1-yl)carbonyl)methoxy, 1-(piperidin-2-yl)carbonyl)methoxy, 1-(piperidin-3-yl)carbonyl)methoxy, 1-(4-(pyrimidin-2-yl)piperazin-1-yl)carbonyl)methoxy, 1-(4-(pyrimidin-2-yl)piperazin-1-yl)carbonyl)methyl, 1-(4-(pyrimidin-2-yl)piperazin-1-yl)carbonyl, 1-4-(pyrimidin-2-³⁰ 1-(4-(pyridin-2-yl)piperazin-1-yl) yl)piperazin-1-yl, 1-(4-(pyridin-2-yl)piperazin-1-yl) carbonyl), carbonylmethyl, (1-(4-(pyridin-2-yl)piperazin-1-yl) 1-(4-(pyridin-2-yl)piperazin-1-yl, 35 carbonyl)-methoxy), 1H-indol-1-yl, morpholino-, morpholinyl, morpholinocarbonyl, morpholinylcarbonyl, phenylureido, phenylcarbamoyl, acetamido, 3-(phenylthio)-1H-indol-1-yl, 3-(2-cyanoethylthio)-1H-indol-1-yl, benzylamino, 5-methoxy-3-5-methoxy-3-(2- 40 (phenylthio)-1H-indol-1-yl, 5-chloro-1H-indol-1-yl, cyanoethylthio)-1H-indol-1-yl)), 5-chloro-3-(2-cyanoethylthio)-1H-indol-1-yl)), dibenzylamino, benzylamino, 5-chloro-3-(phenylthio)-1H-indol-1yl)), 4-(1H-tetrazol-5-yl)phenoxy, 4-(1H-tetrazol-5-yl)phe-2-cyanophenoxy, 45 nyl, 4-(1H-tetrazol-5-yl)phenylthio, 3-cyanophenoxy, 4-cyanophenoxy, 2-cyanophenylthio, 3-cyanophenylthio, 4-cyanophenylthio, 2-chlorophenoxy, 3-chlorophenoxy, 4-chlorophenoxy, 2-fluorophenoxy, 2-cyanobenzyloxy, 3-fluorophenoxy. 4-fluorophenoxy. 3-cyanobenzyloxy, 4-cyanobenzyloxy, 2-chlorobenzyloxy, 50 3-chlorobenzyloxy, 4-chlorobenzyloxy, 2-fluorobenzyloxy, 3-fluorobenzyloxy, 4-fluorobenzyloxy, unsubstituted phenyl, unsubstituted benzyl. In an exemplary embodiment, R^{9a} is H and R^{12a} is H.

In an exemplary embodiment, the compound according to 55 Formula (I) or Formula (Ia) is a member selected from:

In an exemplary embodiment, the compound has a formula according to Formulae (II)-(Io) wherein R^{1a} is a member selected from H, a negative charge and a salt counterion and each of the remaining three R groups (R^{9a}, R^{10a} , R^{11a} in (II), R^{9a} , R^{10a} , R^{12a} in (Im), R^{9a} , R^{11a} , R^{12a} in 20 (In), R^{10a}, R^{11a}, R^{12a} in (Io)) is a member independently selected from fluoro, chloro, bromo, nitro, cyano, amino, methyl, hydroxylmethyl, trifluoromethyl, methoxy, trifluoromethyoxy, ethyl, diethylcarbamoyl, pyridin-2-yl, pyridin-25 3-yl, pyridin-4-yl, pyrimidinyl, piperizino, piperizinyl, piperizinocarbonyl, piperizinylcarbonyl, carboxyl, 1-tetrazolyl, 1-ethoxycarbonylmethoxy, carboxymethoxy, thiophenyl, phenylmethoxy, 1H-tetrazol-5-yl, 3-(butylcarbonyl) 1-ethoxycarbonylmethyloxy-, 1-ethoxycarbonylmethyl-, 30 1-ethoxycarbonyl-, carboxymethoxy-, thiophen-2-yl, thiophen-2-ylthio-, thiophen-3-yl, thiophen-3-ylthio, 4-fluorophenylthio, butylcarbonylphenylmethoxy, butylcarbonylphenylmethyl, butylcarbonylmethyl, 1-(piperidin-1-yl) 1-(piperidin-1-yl)carbonyl)methoxy, carbonyl)methyl, 1-(piperidin-2-yl)carbonyl)methoxy, 1-(piperidin-3-yl)carbonyl)methoxy, 1-(4-(pyrimidin-2-yl)piperazin-1-yl)carbonyl)methoxy, 1-(4-(pyrimidin-2-yl)piperazin-1-yl)carbonyl) methyl, 1-(4-(pyrimidin-2-yl)piperazin-1-yl)carbonyl, 1-4- 40 (pyrimidin-2-yl)piperazin-1-yl, 1-(4-(pyridin-2-yl) piperazin-1-yl)carbonyl), 1-(4-(pyridin-2-yl)piperazin-1-yl) carbonylmethyl, (1-(4-(pyridin-2-yl)piperazin-1-yl) carbonyl)-methoxy), 1-(4-(pyridin-2-yl)piperazin-1-yl, 1H-indol-1-yl, morpholino-, morpholinyl, morpholinocarbonyl, morpholinylcarbonyl, phenylureido, phenylcarbamoyl, acetamido, 3-(phenylthio)-1H-indol-1-yl, 3-(2-cyanoethylthio)-1H-indol-1-yl, benzylamino, 5-methoxy-3-5-methoxy-3-(2- 50 (phenvlthio)-1H-indol-1-vl. cyanoethylthio)-1H-indol-1-yl)), 5-chloro-1H-indol-1-yl, 5-chloro-3-(2-cvanoethylthio)-1H-indol-1-yl)), dibenzylamino, benzylamino, 5-chloro-3-(phenylthio)-1H-indol-1yl)), 4-(1H-tetrazol-5-yl)phenoxy, 4-(1H-tetrazol-5-yl)phenyl, 4-(1H-tetrazol-5-yl)phenylthio, 2-cyanophenoxy, 55 3-cyanophenoxy, 4-cyanophenoxy, 2-cyanophenylthio, 3-cyanophenylthio, 4-cyanophenylthio, 2-chlorophenoxy, 3-chlorophenoxy, 4-chlorophenoxy, 2-fluorophenoxy, 2-cyanobenzyloxy, 60 3-fluorophenoxy, 4-fluorophenoxy, 3-cyanobenzyloxy, 4-cyanobenzyloxy, 2-chlorobenzyloxy, 3-chlorobenzyloxy, 4-chlorobenzyloxy, 2-fluorobenzyloxy, 3-fluorobenzyloxy, and 4-fluorobenzyloxy.

In an exemplary embodiment, there is a proviso that the compound cannot be a member selected from FIG. 11. In 65 another exemplary embodiment, there is a proviso that the compound cannot be a member selected from C1-C40.

28

In another exemplary embodiment, there is a proviso that the compound cannot have a structure according to Formula (Ix):

wherein R^{7b} is a member selected from H, methyl, ethyl and phenyl. R^{10b} is a member selected from H. OH, NH₂, SH, halogen, substituted or unsubstituted phenoxy, substituted or unsubstituted phenylalkyloxy, substituted or unsubstituted phenylthio and substituted or unsubstituted phenylalkylthio. R^{11b} is a member selected from H, OH, NH₂, SH, methyl, substituted or unsubstituted phenoxy, substituted or unsubstituted phenylalkyloxy, substituted or unsubstituted phenylthio and substituted or unsubstituted phenylalkylthio. In another exemplary embodiment, there is a proviso that the compound cannot have a structure according to Formula (Ix) wherein R^{1b} is a member selected from a negative charge, H and a salt counterion. In another exemplary embodiment, there is a proviso that the compound cannot have a structure according to Formula (Ix) wherein R^{10b} and R^{11b} are H. In another exemplary embodiment, there is a proviso that the compound cannot have a structure according to Formula (Ix) wherein one member selected from R^{10b} and R^{11b} is H and the other member selected from R^{10b} and R^{11b} is a member selected from halo, methyl, cyano, methoxy, hydroxymethyl and p-cyanophenyloxy. In another exemplary embodiment, there is a proviso that the compound cannot have a structure according to Formula (lx) wherein R^{10b} and R^{11b} are members independently selected from fluoro, chloro, methyl, cyano, methoxy, hydroxymethyl, and p-cyanophenyl. In another exemplary embodiment, there is a proviso that the compound cannot have a structure according to Formula (Ix) wherein R^{1b} is a member selected from a negative charge, H and a salt counterion; R^{7b} is H; R^{10b} is F and R^{11b} is H. In another exemplary embodiment, there is a proviso that the compound cannot have a structure according to Formula (Ix) wherein R^{11b} and R^{12b}, along with the atoms to which they are attached, are joined to form a phenyl group. In another exemplary embodiment, there is a proviso that the compound cannot have a structure according to Formula (Ix) wherein R^{1b} is a member selected from a negative charge, H and a salt counterion; R^{7b} is H; R^{10b} is 4-cyanophenoxy; and R^{11b} is H.

In another exemplary embodiment, there is a proviso that the compound cannot have a structure according to Formula (Iy)

(Iy)

(Iab) 40

65

(R8)q

wherein R^{10b} is a member selected from H, halogen, CN and substituted or unsubstituted C_{1-4} alkyl.

In another exemplary embodiment, there is a proviso that a structure does not have the which is a member selected from Formulae (I) to (Io) at least one member selected from 5 R^{3a} , R^{4a} , R^{5a} , R^{6a} , R^{7a} , R^{8a} , R^{9a} , R^{10a} , R^{11a} and R^{12a} is nitro, cyano or halogen. In another exemplary embodiment, there is a proviso that when M is oxygen, W is a member selected from $(CR^{a}R^{a})_{m1}$, wherein nl is 0, J is a member selected from $(CR^{a}R^{a})_{m1}$, wherein nl is 1, A is CR^{9a} , D is CR^{10a} , E is CR^{11a} , G is CR^{12a} , the R^{9a} is not halogen, 10 methyl, ethyl, or optionally joined with R^{10a} to form a phenyl ring; R^{10a} is not unsubstituted phenoxy, $C(CH_3)_3$, halogen, CF₃, methoxy, ethoxy, or optionally joined with R^{9a} to form a phenyl ring; R^{11a} is not halogen or optionally joined with R^{10a} to form a phenyl ring; and R^{12a} is not 15 halogen. In another exemplary embodiment, there is a proviso that when M is oxygen, W is a member selected from $(CR^{3a}R^{4a})_{n1}$, wherein n1 is 0, J is a member selected from $(CR^{6a}R^{7a})_{m1}$, wherein n1 is 1, A is CR^{9a} , D is CR^{10a} , E is CR^{11a} , G1 is CR^{12a} , then neither R^{6a} nor R^{7a} are 20 halophenyl. In another exemplary embodiment, there is a proviso that when M is oxygen, W is a member selected from $(CR^{3a}R^{4a})_{n1}$, wherein n1 is 0, J is a member selected from $(CR^{6a}R^{7a})_{m1}$, wherein m1 is 1, A is CR^{9a} , D is CR^{10a} , E is CR^{11a} , G is CR^{12a} , and R^{9a} , R^{10a} and R^{11a} are H, then 25 R^{6a} , R^{7a} and R^{12a} are not H. In another exemplary embodiment, there is a proviso that when M is oxygen wherein n1 is 1, J is a member selected from $(CR^{\delta_a}R^{7a})_{m1}$, wherein m1 is 0, A is CR^{9a} , D is CR^{10a} , E is CR^{11a} , G is CR^{12a} , R^{9a} is H, R^{10a} is H, R^{11a} is H, R^{δ_a} is H, R^{7a} is H, R^{12a} is H, then 30 W is not C=O (carbonyl). In another exemplary embodiment, there is a proviso that when M is oxygen, W is CR^{5a} , J is CR^{8a} , A is CR^{9a} , D is CR^{10a} , F is CR^{11a} , G is CR^{12a} , R^{6a} , R^{7a} , R^{9a} , R^{10a} , R^{11a} and R^{12a} are H, then R^{5a} and R^{8a} , together with the atoms to which they are attached, do not 35 form a phenyl ring.

In an exemplary embodiment, the compound of the invention has a structure which is a member selected from:

(Iaf)

in which q is a number between 0 and 1. \mathbb{R}^{g} is halogen. \mathbb{R}^{a} , \mathbb{R}^{b} , \mathbb{R}^{c} , \mathbb{R}^{d} and \mathbb{R}^{e} are members independently selected from a member selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted or unsubstituted or unsubstituted or unsubstituted or unsubstituted heteroalkyl, substituted or unsubstituted heteroayl, and substituted or unsubstituted heteroaryl. In an exemplary embodiment, there is a proviso that the compound is not a member selected from

- 55 In an exemplary embodiment, the compound has a structure which is described in FIG. 19. In an exemplary embodiment, the compound has a structure which is described in FIG. 20.
- In an exemplary embodiment, the compound has a struc-60 ture according to a member selected from Formulae I(b), I(c), I(d), and I(e) wherein said remaining R group (R^{9a} for I(b), R^{10a} for I(c), R^{11a} for I(d) and R^{12a} for I(e)) is carboxymethoxy.
- In an exemplary embodiment, the compound has a struc-65 ture which is a member selected from Formulae (If)-(Ik), wherein either R^{9a} or R^{10a} for Formula (If), either R^{9a} or R^{11a} for Formula (Ig), either R^{9a} or R^{12a} for Formula (Ib),

either R^{10a} or R^{11a} for Formula (Ii), either R^{10a} or R^{12a} for Formula (Ij), either R^{11a} or R^{12a} for Formula (Ik) is halogen, and the other substituent in the pairing (ex. if R^{9a} is F in Formula (If), then R^{10a} is selected from the following substituent listing), is a member selected from NII₂, N(CH₃) ⁵ H, and N(CH₃)₂.

In another exemplary embodiment, the compound has a structure which is a member selected from:

in which R^* and R^{**} are members selected from: H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstisubstituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl, and substituted or unsubstituted heteroaryl. In an exemplary embodiment, the compound is a member selected from

wherein R^{1a} is a member selected from a negative charge, H 50 and a salt counterion.

In another exemplary embodiment, the compound has a structure which is a member selected from:

(Iak)

45

wherein q is 1 and \mathbb{R}^{g} is a member selected from fluoro, 65 chloro and bromo.

In another exemplary embodiment, the compounds and embodiments described above in Formulae (1)-(10) can form

I. b.) Cyclic Borinic Esters

In one aspect, the invention provides compounds useful in the methods which have a structure according to Formula VII:

(VII)

wherein the variables R^{1a}, A, D, E, G, J, W and M are described elsewhere herein.

In an exemplary embodiment of Formula (VII), R¹ is $_{60}$ substituted or unsubstituted alkyl (C₁-C₄). In an exemplary embodiment of Formula (VII), R¹ is substituted or unsubstituted alkyloxy. In an exemplary embodiment of Formula (VII), R^1 is substituted or unsubstituted cycloalkyl (C_3 - C_7). In an exemplary embodiment of Formula (VII), R¹ is sub-65 stituted or unsubstituted alkenyl. In a further exemplary embodiment thereof, the substituted alkenyl has the structure

15

25

(VIla)

52

wherein R²³, R²⁴, and R²⁵ are each members independently 10 selected from H, haloalkyl, aralkyl, substituted aralkyl, (CH₂), OH (where r=1 to 3), CH₂NR²⁶R²⁷ (wherein R²⁶ and R²⁷ are independently selected from hydrogen and alkyl), CO2H, CO2alkyl, CONH2, S-alkyl, S-aryl, SO2alkyl, SO3H, SCF₃, CN, halogen, CF₃, NO₂, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl, and substituted or unsubstituted heteroaryl.

In another exemplary embodiment of Formula (VII), R¹ is ²⁰ a substituted or unsubstituted alkynyl. In a further exemplary embodiment thereof, the substituted alkynyl has the structure

wherein R²³ is defined as before.

In an exemplary embodiment of Formula (VII), R^1 is substituted or unsubstituted aryl. In a further exemplary 35 embodiment thereof the substituted aryl has the structure

wherein R²⁸, R²⁹, R³, R³¹ and R³² are each members independently selected from H, aralkyl, substituted aralkyl, 50 (CH₂)_sOH (where s=1 to 3), CO₂H, CO₂alkyl, CONH₂, CONHalkyl, CON(alkyl)2, OH, alkoxy, aryloxy, SH, S-alkyl, S-aryl, SO2alkyl, SO3H, SCF3, CN, halogen, CF3, NO2, (CH2),NR²⁶R²⁷ (wherein R²⁶ and R²⁷ are indepen-55 dently selected from hydrogen, alkyl, and alkanoyl)(t=0 to SO₂NH₂, OCH₂CH₂NH₂, OCH₂CH₂NHalkyl, 2), OCH₂CH₂N(alkyl)₂, oxazolidin-2-yl, alkyl substituted oxazolidin-2-yl, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubsti- 60 tuted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl, and substituted or unsubstituted heteroaryl.

In an exemplary embodiment of Formula (VII), R¹ is a 65 substituted or unsubstituted aralkyl. In a further exemplary embodiment thereof the substituted aralkyl has the structure

wherein R²⁸, R²⁹, R³, R³¹ and R³² are defined as before, and n1 is an integer selected from 1 to 15.

In an exemplary embodiment of Formula (VII), R¹ is a substituted or unsubstituted heteroaryl. In a further exemplary embodiment thereof, heteroaryl has the structure

(VIIc)

(VIId)

wherein X is a member selected from CH=CH, N=CH, NR³⁵ (wherein R³⁵=H, alkyl, aryl or benzyl), O, or S. Y=CH or N. R³³ and R³⁴ are each members independently selected from H. haloalkyl, aralkyl, substituted aralkyl, (CH₂), OH (where u=1, 2 or 3), (CH₂), NR²⁶R²⁷ (wherein R²⁶ and R²⁷ are independently selected from hydrogen, alkyl and alkanoyl)(v=0 to 3), CO₂H, CO₂alkyl, CONH₂, S-alkyl, S-aryl, SO₂alkyl, SO₃H, SCF₃, ČN, halogen, ČF₃, NO₂, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl, and substituted or unsubstituted heteroaryl.

The structures of the invention also permit solvent interactions that may afford structures (Formula VIIg) that include atoms derived from the solvent encountered by the compounds of the invention during synthetic manipulations and therapeutic uses. Structure VIIg arises from the formation of a dative bond between the solvent(s) with the Lewis acidic boron center. Thus, such solvent complexes could be stable entities with comparative bioactivities. Such structures are expressly contemplated by the present invention where R*** is H or alkyl.

In an exemplary embodiment, the compound has a structure which is a member selected from 2-(3-Chlorophenyl)-

51

[1,3,2]-dioxaborolane, (3-Chlorophenyl)(4'-fluoro-(2'-(methoxymethoxy)-methyl)-phenyl)-borinic acid, 1-(3-Chlorophenyl)-5-fluoro-1,3-dihydrobenzo[c][1,2] oxaborole, 1-(3-Chlorophenyl)-6-fluoro-1,3-dihydrobenzo [c][1,2]oxaborole, 1-(3-Chlorophenyl)-1,3-dihydrobenzo[c] 5 5-Chloro-1-(3-Fluorophenyl)-1,3-[1,2]oxaborole, dihydrobenzo[c][1,2]oxaborole, 2-(3-fluorophenyl)-[1,3,2]dioxaborolane, 3-(Benzo[c][1,2]oxaborol-1(3H)-yl) 2-(3-cyanophenyl)-[1,3,2]-dioxaborolane, benzonitrile, (3-Chlorophenyl)(5'-fluoro-(2'-(methoxymethoxy)methyl)-10 phenyl)-borinic acid, 1-(3-Chlorophenyl)-1,3-dihydro-3, 3dimethylbenzo[c][1,2]oxaborole, (3-Chlorophenyl)(2-(2-(methoxymethoxy)propan-2yl)phenylborinic acid, 1-(3-Chlorophenyl)-1,3-dihydro-3,3-dimethylbenzo[c][1,2] oxaborole, 1-(4-Chlorophenyl)-1,3-dihydrobenzo[c][1,2] 15 2-(4-chlorophenyl)-[1,3,2]-dioxaborolane, oxaborole, 4-(Benzo[c][1,2]oxaborol-1(3H)-yl)benzonitrile, 2-(4-cyanophenyl)-[1,3,2]-dioxaborolane, 4-(5-Fluorobenzo[c][1,2] oxaborol-1(3H)-yl)benzonitrile, 2-(4-cyanophenyl)-[1,3,2]dioxaborolane, 3-(5-Fluorobenzo[c][1,2]oxaborol-1(3H)-yl) 20 2-(3-cyanophenyl)-[1,3,2]-dioxaborolane, benzonitrile, 3-(6-Fluorobenzo[c][1,2]oxaborol-1(3H)-yl)benzonitrile, 2-(3-cyanophenyl)-[1,3,2]-dioxaborolane, 1-(3-Cyanophenyl)-5,6-dimethoxy-1,3-dihydrobenzo[c][1,2]-oxaborole, 2-(3-chlorophenyl)-[1,3,2]-dioxaborolane, (4-(5-(Fluo- 25 robenzo[c][1,2]oxaborol-1(3H)-yl)phenylmethanamine, 5-Fluoro-2-(methoxymethoxymethyl)phenyl]-[1,3,2]-dioxaborolane, 4-(5-(Fluorobenzo[c][1,2]oxaborol-1(3H)-yl) phenylmethanamine, (3-(5-(Fluorobenzo[c][1,2]oxaborol-1 (3H)-yl)-phenylmethanamine, (4-(5-(Fluorobenzo[c][1,2] 30 oxaborol-1(3H)-yl)phenyl)methanol, (3-(5-(Fluorobenzo[c] [1,2]oxaborol-1(3H)-yl)phenyl)methanol, 3-(6-Fluorobenzo [c][1,2]oxaborol-1(3H)-yl)phenol, 3-(5-Fluorobenzo[c][1,2] oxaborol-1(3H)-yl)pyridine, (2-(Benzo[c][1,2]oxaborol-1 2-[(Methoxymethoxy)methyl] 35 (3H)-yl)phenyl)methanol, phenyl boronic acid, 2-[(Methoxymethoxymethyl)pheny]-[1,3,2]-dioxaborolane, Bis [2-(methoxymethoxymethyl) phenyl]borinic acid, (2-(Benzo[c][1,2]oxaborol-1(3H)-yl) (2-(Benzo[c][1,2]oxaborol-1(3H)-yl) phenyl)methanol, phenyl)-N,N-dimethylmethanamine, (2-(Benzo[c][1,2] 40)oxaborol-1(3H)-yl)-5-chlorophenyl)-N,Ndimethylmethanamine, (2-(Benzo[c][1,2]oxaborol-1(3H)yl)-5-chlorophenyl)methanol, (2-(Benzo[c][1,2]oxaborol-1 (3H)-yl)-5-chlorophenyl)methanol, (5-Chloro-2-(5chlorobenzo[c][1,2]oxaborol-1(3H)-yl)phenyl)methanol, Bis[4-chloro-2-(methoxymethoxymethyl)phenyl]borinic acid, (5-Chloro-2-(5-chlorobenzo[c][1,2]oxaborol-1(3H)-(5-Chloro-2-(5-chlorobenzo[c][1,2] yl)phenyl)methanol, oxaborol-1(3H)-yl)phenyl-N,N-dimethylmethanamine, 1-(4-chloro-2-methoxyphenyl)-1,3-dihydrobenzo[c][1,2] benzoxaborole, 4-Chloro-2-methoxyphenylboronic acid ethylene glycol ester, 1-(4-chloro-2-methoxyphenyl)-1,3-dihydrobenzo[c][1,2]benzoxaborole, 2-(Benzo[c][1,2]oxaboral-1(3H)-yl)-5-chlorophenol, 2-(3-(Benzo[c][1.2]oxaborol-1(3H)-yl)phenoxy)-5-chlorophenol, 2-(3-(Benzo[c][1,2]) 55oxaborol-1(3H)-yl)Phenoxy)-5-chlorophenol 4-((3-(5-Fluorobenzo[c][1,2]oxaborol-1(3H)-yl)phenyl)methyl) morpholine. 3-(5-Fluorobenzo[c][1,2]oxaborol-1(3H)-yl] phenyl)-methyl 8-hydroxy-quinoline-2-carboxylate, 1-(3-Chlorophenyl)-2,3-dihydro-2-(methoxymethy)-1H-benzo [c][1,2]azaborole, 3-Chlorophenyl 2-[N,N-bis (methoxymethyl)aminomethyl]phenylborinic acid, 1-(3-Chlorophenyl)-2,3-dihydro-2-(methoxymethy)-1H-benzo [c][1,2]azaborole, 1-(3-Chlorophenyl)-1.3,4,5tetrahydrobenzo-[c][1,2]-oxaborepine, 1-(3-Chlorophenyl)- 65 1,3,4,5-tetrahydrobenzo[c][1,2]oxaborepine, 1-(3-Chlorophenyl)-3,4-dihydro-1H-benzo[c][1,2]-oxaborinine,

54

2-(3-Chlorophenyl)-[1,3,2]dioxaborolane, (3-Chlorophenyl) (2'-(2-(methoxymethoxy)ethyl)phenyl)borinic acid, and 1-(3-Chlorophenyl)-3,4-dihydro-1H-benzo[c][1,2]oxaborinine.

I. c.) 2'-amino ribofuranoses

In another aspect, the invention provides compounds useful in the methods which is a 2'-amino ribofuranose. In an exemplary embodiment, the 1'-position of the ribofuranose is substituted with a member selected from substituted or unsubstituted aryl and substituted or unsubstituted heteroaryl. In another exemplary embodiment, the 1'-position of the ribofuranose is substituted with a member selected from substituted or unsubstituted purine, substituted or unsubstituted pyrimidine, substituted or unsubstituted pyridine and substituted or unsubstituted imidazole. In another exemplary embodiment, the 1'-position of the ribofuranose is substituted with a member selected from substituted or unsubstituted nicotinic acid, substituted or unsubstituted nicotinamide, substituted or unsubstituted nucleic acid base, substituted or unsubstituted adenine,

substituted or unsubstituted cytosine, substituted or unsubstituted guanine, substituted or unsubstituted thymine, substituted or unsubstituted uracil, substituted or unsubstituted N,N-dimethyl guanine, substituted or unsubstituted dihydrouracil, substituted or unsubstituted 4-thiouridine and substituted or unsubstituted inosine. In another exemplary embodiment, the compound has a structure according to Formula (VIII):

(VIII)

wherein L is a member selected from substituted or unsubstituted purine, substituted or unsubstituted pyrimidine, substituted or unsubstituted pyridine and substituted or unsubstituted imidazole. M, as defined herein earlier, is a member selected from O, S, and NR². R⁴⁰ and R⁴¹ are each members independently selected from H, aralkyl, substituted aralkyl, (CH₂)_sOH (where s=1 to 3), CO₂H, CO₂alkyl, C(O)NH₂, C(O)NHalkyl, CON(alkyl)₂, C(O)R²³, OH, alkoxy, aryloxy, SH, S-alkyl, S-aryl, SO₂alkyl, SO₃H, SCF₃, CN, halogen, CF₃, NO₂, (CH₂)_sNR²⁶R²⁷ (wherein R²⁶ and R²⁷ are independently selected from hydrogen, alkyl, and alkanoyl)(t=0 to 2), SO₂NH₂, OCH₂CH₂NH₂, OCH₂CH₂NHalkyl, OCH₂CH₂N(alkyl)₂, oxazolidin-2-yl, alkyl substituted oxazolidin-2-yl, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubsti-

tuted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl, substituted or unsubstituted heteroaryl,

R⁴³, R⁴⁴, and R⁴⁵ are each members independently selected from substituted or unsubstituted alkyl, substituted or unsub-15 stituted heteroalkyl, substituted or unsubstituted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl and substituted or unsubstituted heteroaryl. R^{43} and R^{44} , together with the atoms to which they are attached, are optionally joined to form a 4 to 7 membered 20 ring. R⁴³ and R⁴⁵, together with the atoms to which they are attached, are optionally joined to form a 4 to 7 membered ring. R⁴⁴ and R⁴⁵, together with the atoms to which they are attached, are optionally joined to form a 4 to 7 membered ring. A, D, E and G are all defined elsewhere herein. Z is a 25 member selected from CR⁴⁶ and N. The combinations of nitrogens (A+D+E+G+Z) is an integer selected from 0 to 4. At least two members selected from R⁹, R¹⁰, R¹¹, R¹² and R^{46} , together with the atoms to which they are attached, are $_{30}$ optionally joined to form a 4 to 7 membered ring.

In an exemplary embodiment,

I. d.) 3'-amino ribofuranoses

In another aspect, the invention provides compounds 30 useful in the methods which is a 3'-amino ribofuranose. In an exemplary embodiment, the 1'-position of the ribofuranose is substituted with a member selected from substituted or unsubstituted aryl and substituted or unsubstituted het-35 eroaryl. In another exemplary embodiment, the 1'-position of the ribofuranose is substituted with a member selected from substituted or unsubstituted purine, substituted or unsubstituted pyrimidine, substituted or unsubstituted pyri-40 dine, and substituted or unsubstituted imidazole. In another exemplary embodiment, the 1'-position of the ribofuranose is substituted with a member selected from substituted or unsubstituted nicotinic acid, substituted or unsubstituted 45 nicotinamide, substituted or unsubstituted nucleic acid base, substituted or unsubstituted adenine,

25

substituted or unsubstituted cytosine, substituted or unsub-60 stituted guanine, substituted or unsubstituted thymine, sub-81 stituted or unsubstituted uracil, substituted or unsubstituted N,N-dimethyl guanine, substituted or unsubstituted dihy-82 drouracil, substituted or unsubstituted 4-thiouridine and 83 substituted or unsubstituted inosine. In another exemplary 84 embodiment, the compound has a structure according to 85 Formula (VIIIc):

wherein L is a member selected from substituted or unsubstituted purine, substituted or unsubstituted pyrimidine, substituted or unsubstituted pyridine and substituted or unsubstituted imidazole. M, as defined herein earlier, is a member 15 selected from O, S, and NR². R⁴⁰ and R⁴¹ are each members independently selected from H, aralkyl, substituted aralkyl, (CH₂),OH (where s=1 to 3), CO₂H, CO₂alkyl, C(O)NH₂, $C(O)NHalkyl, CON(alkyl)_2, C(O)R^{23}, OH, alkoxy, aryloxy,$ SH, S-alkyl, S-aryl, SO₂alkyl, SO₃H, SCF₃, CN, halogen, 20 CF₃, NO₂, (CH₂), NR²⁶R²⁷ (wherein R²⁶ and R²⁷ are independently selected from hydrogen, alkyl, and alkanoyl)(t=0 to 2), SO₂NH₂, OCH₂CH₂NH₂, OCH₂CH₂NHalkyl, OCH2CH2N(alkyl)2, oxazolidin-2-yl, alkyl substituted oxazolidin-2-yl, substituted or unsubstituted alkyl, substi- 25 tuted or unsubstituted heteroalkyl, substituted or unsubstituted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl, substituted or unsubstituted heteroaryl,

R⁴³, R⁴⁴, and R⁴⁵ are each members independently selected 40 from substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl and substituted or unsubstituted heteroaryl. R43 and R44, together with the atoms to which they 45 are attached, are optionally joined to form a 4 to 7 membered ring. R⁴³ and R⁴⁵, together with the atoms to which they are attached, are optionally joined to form a 4 to 7 membered ring. R⁴⁴ and R⁴⁵, together with the atoms to which they are 50 attached, are optionally joined to form a 4 to 7 membered ring. A, D, E and G are all defined elsewhere herein. Z is a member selected from CR46 and N. The combinations of nitrogens (A+D+E+G+Z) is an integer selected from 0 to 4. At least two members selected from R⁹, R¹⁰, R¹¹, R¹² and 55 R⁴⁶, together with the atoms to which they are attached, are optionally joined to form a 4 to 7 membered ring.

In an exemplary embodiment,

is a member selected from:

wherein each R^{3a} and R^{4a} is a member independently selected from H, cyano, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or 10 unsubstituted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl, and substituted or unsubstituted heteroaryl. R⁵ is a member selected from halogen and OR⁶. R⁶ is a member selected from H, cyano, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted 15 cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl, and substituted or unsubstituted heteroaryl. A is a member selected from CR^{9a} and N. D is a member selected from CR^{10a} and N. E is a member selected from CR^{11a} and N. G is a member selected from 20 CR^{12a} and N. R^{9a} , R^{10a} , R^{11a} and R^{12a} are members independently selected from H, OR*, NR*R**, SR*, $-S(O)R^*$, $-S(O)_2R^*$, $-S(O)_2NR^*R^{**}$, $-C(O)R^*$, $-C(O)OR^*$, -C(O)NR*R**, nitro, halogen, cyano, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, 25 substituted or unsubstituted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl, and substituted or unsubstituted heteroaryl. Each R* and R** is a member independently selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted het-30 eroalkyl, substituted or unsubstituted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl, and substituted or unsubstituted heteroaryl. R^{9a} and R^{10a}, along with the atoms to which they are attached, are optionally joined to form a ring. R^{10a} and R^{11a}, along 35 with the atoms to which they are attached, are optionally joined to form a ring. R^{11a} and R^{12a} , along with the atoms to which they are attached, are optionally joined to form a ring. The combination of nitrogens (A+D+E+G) is an integer selected from 0 to 3.

In an exemplary embodiment, there is a proviso that the 40 compound is not a member selected from:

72

In an exemplary embodiment, the compound has a structure according to Formula IXa

(IXa)

In another exemplary embodiment, each \mathbb{R}^{3a} and \mathbb{R}^{4a} is a member independently selected from H, cyano, substituted or unsubstituted methyl, substituted or unsubstituted ethyl, trifluoromethyl, substituted or unsubstituted hydroxymethyl, substituted or unsubstituted hydroxyalkyl, substituted or unsubstituted benzyl, substituted or unsubstituted phenyl, substituted or unsubstituted mercaptomethyl, substituted or unsubstituted mercaptoalkyl, substituted or unsubstituted aminomethyl, substituted or unsubstituted alkylaminomethyl, substituted or unsubstituted dialkylaminomethyl, substituted or unsubstituted arylaminomethyl, substituted or unsubstituted indolyl and substituted or unsubstituted amido. In another exemplary embodiment, each R^{3a} and R^{4a} is a member independently selected from cyano, substituted or unsubstituted methyl, substituted or unsubstituted ethyl, trifluoromethyl, substituted or unsubstituted hydroxymethyl, substituted or unsubstituted hydroxyalkyl, substituted or unsubstituted benzyl, substituted or unsubstituted phenyl, substituted or unsubstituted mercaptomethyl, substituted or unsubstituted mercaptoalkyl, substituted or unsubstituted aminomethyl, substituted or unsubstituted alkylaminomethyl, substituted or unsubstituted dialkylaminomethyl, substituted or unsubstituted arylaminomethyl, substituted or unsubstituted indolyl, substituted or unsubstituted amido.

In another exemplary embodiment, each R^{3a} and R^{4a} is a member selected from H. substituted or unsubstituted methyl, substituted or unsubstituted ethyl, substituted or unsubstituted propyl, substituted or unsubstituted isopropyl, substituted or unsubstituted butyl, substituted or unsubstituted t-butyl, substituted or unsubstituted phenyl and sub-45 stituted or unsubstituted benzyl. In another exemplary embodiment, R^{3a} and R^{4a} is a member selected from methyl, ethyl, propyl, isopropyl, butyl, t-butyl, phenyl and benzyl. In another exemplary embodiment, R^{3a} is H and R^{4a} is a member selected from methyl, ethyl, propyl, isopropyl, butyl, t-butyl, phenyl and benzyl. In another exemplary embodiment, R^{3a} is H and R^{4a} H.

In another exemplary embodiment, Z1 is CHO. In another exemplary embodiment, Z1 is

50

55

60

substituted or unsubstituted trialkylsialyl, wherein said trialkylsialyl is a member selected from substituted or unsubstituted trimethylsilyl, substituted or unsubstituted tert-butyldimethylsilyl, and substituted or unsubstituted tributylsilyl. In another exemplary embodiment, R⁵ is substituted or unsubstituted methoxy, substituted or unsubstituted ethoxy, substituted or unsubstituted or unsubstituted ethoxy, substituted ethoxyethoxy, and substituted or unsubstituted tetrahydro-2H-pyran-2yloxy. In another exemplary embodiment, R⁵ is a member selected from ¹⁰ methoxy, ethoxy, methoxymethoxy, ethoxyethoxy and tetrahydro-2H-pyran-2yloxy. In another exemplary embodiment, Z1 is

In an exemplary embodiment, R^{9a}, R^{10a}, R^{11a} and R^{12a} is a member independently selected from H, OR*, NR*R**, SR^* , $-S(O)R^*$, $-S(O)_2R^*$, $-S(O)_2NR^*R^{**}$, $-C(O)R^*$, -C(O)OR*, -C(O)NR*R**, halogen, cyano, nitro, substituted or unsubstituted methoxy, substituted or unsubstituted methyl, substituted or unsubstituted ethoxy, substituted or unsubstituted ethyl, trifluoromethyl, substituted or unsubstituted hydroxymethyl, substituted or unsubstituted hydroxyalkyl, substituted or unsubstituted benzyl, substituted or unsubstituted phenyl, substituted or unsubstituted phenyloxy, substituted or unsubstituted phenyl methoxy, substituted or unsubstituted thiophenyloxy, substituted or unsubstituted pyridinyloxy, substituted or unsubstituted 35 pyrimidinyloxy, substituted or unsubstituted benzylfuran, substituted or unsubstituted methylthio, substituted or unsubstituted mercaptomethyl, substituted or unsubstituted mercaptoalkyl, substituted or unsubstituted phenylthio, substituted or unsubstituted thiophenylthio, substituted or 40 unsubstituted phenyl methylthio, substituted or unsubstituted pyridinylthio, substituted or unsubstituted pyrimidinylthio, substituted or unsubstituted benzylthiofuranyl, substituted or unsubstituted phenylsulfonyl, substituted or unsubstituted benzylsulfonyl, substituted or unsubstituted 45 phenylmethylsulfonyl, substituted or unsubstituted thiophenylsulfonyl, substituted or unsubstituted pyridinylsulfonyl, substituted or unsubstituted pyrimidinylsulfonyl, substituted or unsubstituted sulfonamidyl, substituted or unsubstituted phenylsulfinyl, substituted or unsubstituted benzylsulfinyl, substituted or unsubstituted phenylmethylsulfinyl, substituted or unsubstituted thiophenylsulfinyl, substituted or unsubstituted pyridinylsulfinyl, substituted or unsubstituted pyrimidinylsulfinyl, substituted or unsubstituted amino, sub- 55 stituted or unsubstituted alkylamino, substituted or unsubstituted dialkylamino, substituted or unsubstituted trifluoromethylamino, substituted or unsubstituted aminomethyl, substituted or unsubstituted alkylaminomethyl, substituted or unsubstituted dialkylaminomethyl, substituted or unsub- 60 stituted arylaminomethyl, substituted or unsubstituted benzylamino, substituted or unsubstituted phenylamino, substituted or unsubstituted thiophenylamino, substituted or unsubstituted pyridinylamino, substituted or unsubstituted pyrimidinylamino, substituted or unsubstituted indolyl, sub- 65 stituted or unsubstituted morpholino, substituted or unsubstituted alkylamido, substituted or unsubstituted arylamido,

74

substituted or unsubstituted ureido, substituted or unsubstituted carbamoyl, and substituted or unsubstituted piperizinyl. In an exemplary embodiment, R^{9a} , R^{10a} , R^{11a} and R^{12a} are selected from the previous list of substituents with the exception of $-C(O)R^*$, $-C(O)OR^*$, $-C(O)NR^*R^{**}$.

In another exemplary embodiment, R^{9a}, R^{10a}, R^{11a} and R^{12a} are members independently selected from fluoro, chloro, bromo, nitro, cyano, amino, methyl, hydroxylmethyl, trifluoromethyl, methoxy, trifluoromethyoxy, ethyl, diethylcarbamoyl, pyridin-2-yl, pyridin-3-yl, pyridin-4-yl, pyrimidinyl, piperizino, piperizinyl, piperizinocarbonyl, piperizinylcarbonyl, carboxyl, 1-tetrazolyl, 1-ethoxycarbonylmethoxy, carboxymethoxy, thiophenyl, 3-(butylcarbo-15 nyl) phenylmethoxy, 1H-tetrazol-5-yl, 1-ethoxycarbonylmethyloxy-, 1-ethoxycarbonylmethyl-, 1-ethoxycarbonyl-, carboxymethoxy-, thiophen-2-yl, thiophen-2-ylthio-, thiophen-3-yl, thiophen-3-ylthio, 4-fluorophenylthio, butylcar-20 bonylphenylmethoxy, butylcarbonylphenylmethyl, butylcarbonylmethyl, 1-(piperidin-1-yl)carbonyl)methyl, 1-(piperidin-1-yl)carbonyl)methoxy, 1-(piperidin-2-yl)carbonyl)methoxy, 1-(piperidin-3-yl)carbonyl)methoxy, 1-(4-(pyrimidin-2-yl)piperazin-1-yl)carbonyl)methoxy, 1-(4-(py-25 rimidin-2-yl)piperazin-1-yl)carbonyl)methyl, 1-(4-(pyrimidin-2-yl)piperazin-1-yl)carbonyl, 1-4-(pyrimidin-2yl)piperazin-1-yl, 1-(4-(pyridin-2-yl)piperazin-1-yl) 1-(4-(pyridin-2-yl)piperazin-1-yl) carbonyl), carbonylmethyl, (1-(4-(pyridin-2-yl)piperazin-1-yl) carbonyl)-methoxy), 1-(4-(pyridin-2-yl)piperazin-1-yl, 1H-indol-1-yl, morpholino-, morpholinyl, morpholinocarbonyl, morpholinylcarbonyl, phenylureido, phenylcarbamoyl, acetamido, 3-(phenylthio)-1H-indol-1-yl, 3-(2-cyanoethylthio)-1H-indol-1-yl, benzylamino, 5-methoxy-3-(phenylthio)-1H-indol-1-yl, 5-methoxy-3-(2cyanoethylthio)-1H-indol-1-yl)), 5-chloro-1H-indol-1-yl, 5-chloro-3-(2-cyanoethylthio)-1H-indol-1-yl)), dibenzylamino, benzylamino, 5-chloro-3-(phenylthio)-1H-indol-1yl)), 4-(1H-tetrazol-5-yl)phenoxy, 4-(1H-tetrazol-5-yl)phenvl. 4-(1H-tetrazol-5-vl)phenvlthio. 2-cvanophenoxy. 3-cyanophenoxy, 4-cyanophenoxy, 2-cvanophenvlthio, 3-cyanophenylthio, 4-cyanophenylthio, 2-chlorophenoxy, 3-chlorophenoxy, 4-chlorophenoxy, 2-fluorophenoxy, 3-fluorophenoxy, 4-fluorophenoxy, 2-cyanobenzyloxy, 3-cyanobenzyloxy, 4-cyanobenzyloxy, 2-chlorobenzyloxy, 3-chlorobenzyloxy, 4-chlorobenzyloxy, 2-fluorobenzyloxy, 3-fluorobenzyloxy, 4-fluorobenzyloxy, unsubstituted phenyl, unsubstituted benzyl. In an exemplary embodiment, R^{9a} is H and R^{12a} is H. In an exemplary embodiment, the compound has a subsitutent combination for R^{9a}, R^{10a}, R^{11a}, and R^{12a} which is a member selected from those described in Formulae (I), (Ia) (Ib), (Ic), (Id), (Ie), (If), (Ig), (Ih), (Ii), (Ij), (Ik), (Il), (Im), (In), (Io), (Ip), (Iq), (Ir), (Is), (It), (Iu), (Iv), (Iw), (Iz), (Iaa), (Iab), (Iac), (Iad), (Iae), (Iaf), (Iag), (Iah), (Iai), (Iaj), (Iak), above, and/or the subsequent paragraphs describing Formulae (I), (Ia) (Ib), (Ic), (Id), (Ic), (If), (Ig), (Ih), (Ii), (Ij), (Ik), (Il), (Im), (In), (Io), (Ip), (Iq), (Ir), (Is), (It), (Iu), (Iv), (Iw), (Iz), (Iaa), (Iab), (Iac), (Iad), (Iae), (Iaf), (Iag), (Iah), (Iai), (Iaj), (Iak).

In an exemplary embodiment, the compound is an acyclic boronic acid or ester in which a portion of the acyclic boronic acid or ester as in Figure (IXb) below

5

I. f.) Acyclic Boronic Acids and Esters, Part II

Acyclic boronic acids and esters described herein can also be utilized in the invention. These compounds can be used to kill or inhibit the growth of the microorganisms described ¹⁰ herein, as well as treat the diseases described herein. In addition, these compounds can be used as synthetic intermediates in the generation of other compounds described herein. In an exemplary embodiment, these other compounds are the cyclic boronic esters and cyclic borinic esters 15 described herein.

In another aspect, the compound has a structure according to the following formula:

(X)

in which R¹ and R² are members independently selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl, and substituted or unsubstituted heteroaryl. R^1 and R^2 , together with the atoms to which they are attached, can be optionally joined to form a 35 4- to 7-membered ring. X is a member selected from substituted or unsubstituted triflate, halogen, substituted or unsubstituted sulfonic esters and substituted or unsubstituted acyloxy groups, and substituted or unsubstituted diazo. R^{3a} and R^{4a} are members independently selected from H, cyano, đ۵ substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl, and substituted or unsubstituted het-45 eroaryl. A is a member selected from CR^{9a} and N. D is a member selected from CR^{10a} and N. E is a member selected from CR^{11a} and N. G is a member selected from CR^{12a} and N. \mathbb{R}^{9a} , \mathbb{R}^{10a} , \mathbb{R}^{11a} and \mathbb{R}^{12a} are members independently selected from H, OR*, NR*R**, SR*, -S(O)R*, -S(O)₂ 50 \mathbb{R}^{\bullet} , $-S(O)_2 N \mathbb{R}^{\bullet} \mathbb{R}^{\bullet \bullet}$, $-C(O) \mathbb{R}^{\bullet}$, $-C(O) O \mathbb{R}^{\bullet}$, -C(O)NR*R**, nitro, halogen, cyano, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl, and substituted or unsubstituted heteroaryl. Each R* and R** is a 55 member independently selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl, and substituted or unsubstituted heteroaryl. R^{9a} and R^{10a} 60 along with the atoms to which they are attached, are optionally joined to form a ring. R^{10a} and R^{11a}, along with the atoms to which they are attached, are optionally joined to form a ring. R^{11a} and R^{12a}, along with the atoms to which herein can be used as intermediates in the synthesis of a 65 they are attached, arc optionally joined to form a ring. The combination of nitrogens (A+D+E+G) is an integer selected from 0 to 3.

In an exemplary embodiment, this aspect has the proviso that the compound is not:

In an exemplary embodiment, the compound has a structure according to Formula (Xa)

In another exemplary embodiment, each R^{3a} and R^{4a} is a member independently selected from H, cyano, substituted or unsubstituted methyl, substituted or unsubstituted ethyl, trifluoromethyl, substituted or unsubstituted hydroxymethyl, substituted or unsubstituted hydroxyalkyl, substituted or unsubstituted benzyl, substituted or unsubstituted phenyl, 30 substituted or unsubstituted mercaptomethyl, substituted or unsubstituted mercaptoalkyl, substituted or unsubstituted aminomethyl, substituted or unsubstituted alkylaminomethyl, substituted or unsubstituted dialkylaminomethyl, substituted or unsubstituted arylaminomethyl, substituted or 35 unsubstituted indolyl and substituted or unsubstituted amido. In another exemplary embodiment, each R^{3a} and R^{4a} is a member independently selected from cyano, substituted or unsubstituted methyl, substituted or unsubstituted ethyl, trifluoromethyl, substituted or unsubstituted hydroxymethyl, 40 substituted or unsubstituted hydroxyalkyl, substituted or unsubstituted benzyl, substituted or unsubstituted phenyl, substituted or unsubstituted mercaptomethyl, substituted or unsubstituted mercaptoalkyl, substituted or unsubstituted aminomethyl, substituted or unsubstituted alkylaminom- 45 R^{12a} are members independently selected from fluoro, ethyl, substituted or unsubstituted dialkylaminomethyl, substituted or unsubstituted arylaminomethyl, substituted or unsubstituted indolyl, substituted or unsubstituted amido.

In another exemplary embodiment, each R^{3a} and R^{4a} is a member selected from H, substituted or unsubstituted 50 methyl, substituted or unsubstituted or unsubstituted or unsubstituted propyl, substituted or unsubstituted isopropyl, substituted or unsubstituted butyl, substituted or unsubstituted t-butyl, substituted or unsubstituted phenyl and substituted or unsubstituted benzyl. In another exemplary 55 embodiment, R^{3a} and R^{4a} is a member selected from methyl, ethyl, propyl, isopropyl, butyl, t-butyl, phenyl and benzyl. In another exemplary embodiment, R^{3a} is H and R^{4a} is a member selected from methyl, ethyl, propyl, isopropyl, butyl, t-butyl, phenyl and benzyl. In another exemplary 60 embodiment, R^{3a} is H and R^{4a} H.

In another exemplary embodiment, R^{9a} , R^{10a} , R^{11a} and R^{12a} is a member selected from H, OR*, NR*R**, SR*, $-S(O)R^*$, $-S(O)_2R^*$, $-S(O)_2NR^*R^{**}$, $-C(O)R^*$, $-C(O)R^*$, $-C(O)NR^*R^{**}$, halogen, cyano, nitro, sub- 65 stituted or unsubstituted methoxy, substituted or unsubstituted theoxy, substituted ethoxy, substituted or unsubstituted methyl, substituted or unsubstituted ethoxy, substituted theoxy, substited theoxy, substituted theoxy, substituted the

88

or unsubstituted ethyl, trifluoromethyl, substituted or unsubstituted hydroxymethyl, substituted or unsubstituted hydroxyalkyl, substituted or unsubstituted benzyl, substituted or unsubstituted phenyl, substituted or unsubstituted phenyloxy, substituted or unsubstituted phenyl methoxy, substituted or unsubstituted thiophenyloxy, substituted or unsubstituted pyridinyloxy, substituted or unsubstituted pyrimidinyloxy, substituted or unsubstituted benzylfuran, substituted or unsubstituted methylthio, substituted or unsubstituted mercaptomethyl, substituted or unsubstituted 10 mercaptoalkyl, substituted or unsubstituted phenylthio, substituted or unsubstituted thiophenylthio, substituted or unsubstituted phenyl methylthio, substituted or unsubstituted pyridinylthio, substituted or unsubstituted pyrimidi-(Xa) 15 nylthio, substituted or unsubstituted benzylthiofuranyl, substituted or unsubstituted phenylsulfonyl, substituted or unsubstituted benzylsulfonyl, substituted or unsubstituted phenylmethylsulfonyl, substituted or unsubstituted thiophenylsulfonyl, substituted or unsubstituted pyridinylsulfonyl, substituted or unsubstituted pyrimidinylsulfonyl, substituted 20 or unsubstituted sulfonamidyl, substituted or unsubstituted phenylsulfinyl, substituted or unsubstituted benzylsulfinyl, substituted or unsubstituted phenylmethylsulfinyl, substituted or unsubstituted thiophenylsulfinyl, substituted or 25 unsubstituted pyridinylsulfinyl, substituted or unsubstituted pyrimidinylsulfinyl, substituted or unsubstituted amino, substituted or unsubstituted alkylamino, substituted or unsubstituted dialkylamino, substituted or unsubstituted trifluoromethylamino, substituted or unsubstituted aminomethyl, substituted or unsubstituted alkylaminomethyl, substituted or unsubstituted dialkylaminomethyl, substituted or unsubstituted arylaminomethyl, substituted or unsubstituted benzylamino, substituted or unsubstituted phenylamino, substituted or unsubstituted thiophenylamino, substituted or unsubstituted pyridinylamino, substituted or unsubstituted pyrimidinylamino, substituted or unsubstituted indolyl, substituted or unsubstituted morpholino, substituted or unsubstituted alkylamido, substituted or unsubstituted arylamido, substituted or unsubstituted ureido, substituted or unsubstituted carbamoyl, and substituted or unsubstituted piperizinyl. In an exemplary embodiment, R^{9a}, R^{10a}, R^{11a} and R^{12a} are selected from the previous list of substituents with the exception of $-C(O)R^{\bullet}$, $-C(O)OR^{\bullet}$, $-C(O)NR^{*}R^{**}$.

In another exemplary embodiment, R^{9a}, R^{10a}, R^{11a} and chloro, bromo, nitro, cyano, amino, methyl, hydroxylmethyl, trifluoromethyl, methoxy, trifluoromethyoxy, ethyl, diethylcarbamoyl, pyridin-2-yl, pyridin-3-yl, pyridin-4-yl, pyrimidinyl, piperizino, piperizinyl, piperizinocarbonyl, piperizinylcarbonyl, carboxyl, 1-tetrazolyl, 1-ethoxycarbonylmethoxy, carboxymethoxy, thiophenyl, 3-(butylcarbonyl) phenylmethoxy, 1H-tetrazol-5-yl, 1-ethoxycarbonylmethyloxy-, 1-ethoxycarbonylmethyl-, 1-ethoxycarbonyl-, carboxymethoxy-, thiophen-2-yl, thiophen-2-ylthio-, thiophen-3-yl, thiophen-3-ylthio, 4-fluorophenylthio, butylcarbonylphenylmethoxy, butylcarbonylphenylmethyl, butylcarbonylmethyl, 1-(piperidin-1-yl)carbonyl)methyl, 1-(piperidin-1-yl)carbonyl)methoxy, 1-(piperidin-2-yl)carbonyl)methoxy, 1-(piperidin-3-yl)carbonyl)methoxy, 1-(4-(pyrimidin-2-yl)piperazin-1-yl)carbonyl)methoxy, 1-(4-(pyrimidin-2-yl)piperazin-1-yl)carbonyl)methyl, 1-(4-(pyrimidin-2-yl)piperazin-1-yl)carbonyl, 1-4-(pyrimidin-2yl)piperazin-1-yl, 1-(4-(pyridin-2-yl)piperazin-1-yl) carbonyl), 1-(4-(pyridin-2-yl)piperazin-1-yl) carbonylmethyl, (1-(4-(pyridin-2-yl)piperazin-1-yl) carbonyl)-methoxy), 1-(4-(pyridin-2-yl)piperazin-1-yl, 1H-indol-1-yl, morpholino-, morpholinyl, morpholinocar-

bonyl, morpholinylcarbonyl, phenylureido, phenylcarbamoyl, acetamido, 3-(phenylthio)-1H-indol-1-yl, 3-(2-cyanoethylthio)-1H-indol-1-yl, benzylamino, 5-methoxy-3-(phenylthio)-1H-indol-1-yl, 5-methoxy-3-(2-5-chloro-1H-indol-1-yl, 5 cyanoethylthio)-1H-indol-1-yl)), 5-chloro-3-(2-cyanoethylthio)-1H-indol-1-yl)), dibenzylamino, benzylamino, 5-chloro-3-(phenylthio)-1H-indol-1yl)), 4-(1H-tetrazol-5-yl)phenoxy, 4-(1H-tetrazol-5-yl)phenyl, 4-(1H-tetrazol-5-yl)phenylthio, 2-cyanophenoxy, 3-cyanophenoxy, 4-cyanophenoxy, 2-cyanophenylthio, 3-cyanophenylthio, 4-cyanophenylthio, 2-chlorophenoxy, 3-chlorophenoxy, 4-chlorophenoxy, 2-fluorophenoxy, 2-cvanobenzyloxy, 3-fluorophenoxy, 4-fluorophenoxy, 3-cyanobenzyloxy, 4-cyanobenzyloxy, 2-chlorobenzyloxy, 3-chlorobenzyloxy, 4-chlorobenzyloxy, 2-fluorobenzyloxy, 3-fluorobenzyloxy, 4-fluorobenzyloxy, unsubstituted phenyl, unsubstituted benzyl. In an exemplary embodiment, R^{9a} is H and R^{12a} is H. In an exemplary embodiment, the compound has a subsitutent combination for R^{9a}, R^{10a}, R^{11a} 20 and R^{12a} which is a member selected from those described in Formulae (I), (Ia) (Ib), (Ic), (Id), (Ie), (If), (Ig), (Ih), (Ii), (Ij), (Ik), (II), (Im), (In), (Io), (Ip), (Iq), (Ir), (Is), (It), (Iu), (Iv), (Iw), (Iz), (Iaa), (Iab), (Iac), (Iad), (Iae), (Iaf), (Iag), (Iah), (Iai), (Iaj), (Iak), above, and/or the subsequent para-25 graphs describing Formulae (I), (Ia) (Ib), (Ic), (Id), (Ie), (If), (lg), (lh), (li), (lj), (lk), (ll), (Im), (ln), (lo), (lp), (lq), (lr), (Is), (It), (Iu), (Iv), (Iw), (Iz), (Iaa), (Iab), (Iac), (Iad), (Iae), (Iaf), (Iag), (Iah), (Iai), (Iaj), (Iak).

In an exemplary embodiment, the compound is an acyclic boronic acid or ester in which a portion of the acyclic boronic acid or ester is as in Figure (IXb) below

is a member selected from a structure in FIG. 12. In another exemplary embodiment, the compound is a dimer, anhydride 45 or trimer of an acyclic boronic acid or ester described herein. In another exemplary embodiment, the compound is a dimer, anhydride or trimer of an acyclic boronic acid or ester in which a portion of the acyclic boronic acid or ester as in Figure (IXb) is a member selected a structure in FIG. 12. 50

In an exemplary embodiment, R¹ and R² are each members independently selected from H, substituted or unsubstituted methyl, substituted or unsubstituted ethyl, substituted or unsubstituted propyl, substituted or unsubstituted isopropyl, substituted or unsubstituted butyl, substituted or 55 unsubstituted t-butyl, substituted or unsubstituted phenyl and substituted or unsubstituted benzyl. R¹ and R², together with the atoms to which they are joined, can optionally form a member selected from substituted or unsubstituted dioxaborolane, substituted or unsubstituted dioxaborinane, sub- 60 stituted or unsubstituted dioxaborepane.

In an exemplary embodiment, X is a member selected from triflate, chloro, bromo, iodo, substituted or unsubstituted sulfonic esters, substituted or unsubstituted acyloxy groups, and substituted or unsubstituted diazo. In an exem- 65 plary embodiment, X is a sulfonic ester group, which is a member selected from substituted or unsubstituted mesylate,

90

substituted or unsubstituted tosylate, substituted or unsubstituted brosylate and substituted or unsubstituted nosylate. In an exemplary embodiment, X is an acyloxy group, which is a member selected from substituted or unsubstituted acetoxy and substituted or unsubstituted trifluoroacetoxy. In another exemplary embodiment, X is a member selected from bromo, iodo, mesylate and diazo. In another exemplary embodiment, X is a member selected from bromo and iodo.

In another exemplary embodiment, R¹ and R², together with the atoms to which they are joined, form a member selected from dioxaborolane, substituted or unsubstituted tetramethyldioxaborolane, substituted or unsubstituted phenyldioxaborolane, dioxaborinane, dimethyldioxaborinane and dioxaborepane.

In another exemplary embodiment, R^{3a} and R^{4a} are each members independently selected from H, methyl, ethyl, propyl, butyl, phenyl, benzyl, cyano, halogen and nitro.

In an exemplary embodiment, the compound is a member selected from

In an exemplary embodiment, the compound is a member 35 selected from

In an exemplary embodiment, acyclic boronic esters described herein can be used as intermediates in the synthesis of the compounds described herein. In another exem-⁴⁵ plary embodiment, the acyclic boronic esters described herein can be used as intermediates in the synthesis of a compound which is a member selected from Formulae (I), (Ia) (Ib), (Ic), (Id), (Ie), (If), (Ig), (Ih), (Ii), (Ij), (Ik), (II), (Im), (In), (Io), (Ip), (Iq), (Ir), (Is), (It), (Iu), (Iv), (Iw), (Iz), ⁵⁰ (Iaa), (Iab), (Iac), (Iad), (Iae), (Iaf), (Iag), (Iah), (Iai), (Iaj), (Iak).

I. e.) Additional Compounds

Compounds such as those described herein can also be utilized in the invention. The compounds of the invention can form between the 2',3' diol of the ribose ring of a nucleic acid, nucleoside or nucleotide, and a cyclic or acyclic boronic ester such as those described herein. These compounds can be used in a human or in an animal to kill or inhibit the growth of the microorganisms described herein, as well as to treat the diseases described herein. These compounds can be formed in vitro as well as in vivo. Methods of making these compounds are provided in the 55 Examples section.

In another aspect, the invention provides a compound having a structure according to the following formula:

(XII)

99

wherein B is boron. L is a member selected from OR⁷, substituted or unsubstituted purine, substituted or unsubstituted pyrimidine, substituted or unsubstituted pyridine and substituted or unsubstituted imidazole. R⁷ is a member selected from H. substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted cycloalkyl, substituted or unsubstituted aryl and substituted or unsubstituted heteroaryl. A is a member selected from OH, substituted or unsubstituted monophosphate, substituted or unsubstituted diphosphate, substituted or unsubstituted triphosphate,

and 100 nucleotides. Q is a member selected from substituted or unsubstituted heterocycloalkyl and substituted or unsubstituted heteroaryl. Q comprises said boron and at least one oxygen.

that the compound cannot comprise a member selected from C1-C40.

In an exemplary embodiment, the aspect has a proviso that the compound cannot comprise a member which is aspect has a proviso that the compound cannot involve a compound which is described in expired U.S. Pat. No. 5,880,188.

In an exemplary embodiment, the compound has a structure according to the following formula (XIIa):

wherein M is a member selected from O and S. J is a member members independently selected from H. halogen, cyano, substituted or unsubstituted alkyl, substituted or unsubsti-

100

tuted heteroalkyl, substituted or unsubstituted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted arvl. and substituted or unsubstituted heteroaryl. n1 is an integer selected from 0 to 2. W is a member selected from C==O (carbonyl), (CR^{6a}R^{7a})_m and CR^{8a}. R^{6a} 5 R^{7a} , and R^{8a} are members independently selected from H, halogen, cyano, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted cycloalkyl, substituted or unsubstituted heterocy-10 cloalkyl, substituted or unsubstituted aryl, and substituted or unsubstituted heteroaryl. The index m1 is an integer selected from 0 and 1. A is a member selected from CR^{9a} and N. D is a member selected from CR^{10a} and N. E is a member selected from CR^{11a} and N. G is a member selected from CR^{12a} and N. R^{9a}, R^{10a}, R^{11a} and R^{12a} are members inde-15 pendently selected from H, OR*, NR*R**, SR*, -S(O)R*, $-S(O)_2 R^*$, $-S(O)_2 NR^* R^{**}$, $-C(O)R^*$, $-C(O)OR^*$ -C(O)NR*R**, nitro, halogen, cyano, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, 20 substituted or unsubstituted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted arvl. and substituted or unsubstituted heteroaryl. Each R* and R** are members independently selected from H, nitro, halogen, cyano, substituted or unsubstituted alkyl, substi-25 tuted or unsubstituted heteroalkyl, substituted or unsubstituted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl, and substituted or unsubstituted heteroaryl. The combination of nitrogens (A+D+E+G) is an integer selected from 0 to 3. A member selected from R^{3a}, R^{4a} and R^{5a} and a member selected from R^{6a} , R^{7a} and R^{8a} , together with the atoms to which they are attached, are optionally joined to form a 4 to 7 membered ring. R^{3a} and R^{4a} , together with the atoms to which they are attached, are optionally joined to form a 4 to 7 membered A1 is a nucleic acid sequence which comprises between 1 35 ring R^{6a} and R^{7a}, together with the atoms to which they are attached, are optionally joined to form a 4 to 7 membered ring. R^{9a} and R^{10a} , together with the atoms to which they are attached, are optionally joined to form a 4 to 7 membered ring. R^{10a} and R^{11a} , together with the atoms to which they In an exemplary embodiment, the aspect has the proviso 40 are attached, are optionally joined to form a 4 to 7 membered ring. R^{11a} and R^{12a} , together with the atoms to which they are attached, are optionally joined to form a 4 to 7 membered ring.

In another exemplary embodiment, each R^{3a} and R^{4a} is a described in FIG. 11. In an exemplary embodiment, the 45 member independently selected from H, cyano, substituted or unsubstituted methyl, substituted or unsubstituted ethyl, trifluoromethyl, substituted or unsubstituted hydroxymethyl, substituted or unsubstituted hydroxyalkyl, substituted or unsubstituted benzyl, substituted or unsubstituted phenyl, 50 substituted or unsubstituted mercaptomethyl, substituted or unsubstituted mercaptoalkyl, substituted or unsubstituted aminomethyl, substituted or unsubstituted alkylaminomethyl, substituted or unsubstituted dialkylaminomethyl, substituted or unsubstituted arylaminomethyl, substituted or 55 unsubstituted indolyl and substituted or unsubstituted amido. In another exemplary embodiment, each R^{3a} and R^{4a} is a member independently selected from cyano, substituted or unsubstituted methyl, substituted or unsubstituted ethyl, trifluoromethyl, substituted or unsubstituted hydroxymethyl, substituted or unsubstituted hydroxyalkyl, substituted or unsubstituted benzyl, substituted or unsubstituted phenyl, substituted or unsubstituted mercaptomethyl, substituted or unsubstituted mercaptoalkyl, substituted or unsubstituted aminomethyl, substituted or unsubstituted alkylaminomsclected from $(CR^{3a}R^{4a})_{n1}$ and CR^{5a} . R^{3a} , R^{4a} , and R^{5a} are 65 ethyl, substituted or unsubstituted dialkylaminomethyl, substituted or unsubstituted arylaminomethyl, substituted or unsubstituted indolyl, substituted or unsubstituted amido.

In another exemplary embodiment, each R^{3a} and R^{4a} is a member selected from H, substituted or unsubstituted methyl, substituted or unsubstituted ethyl, substituted or unsubstituted propyl, substituted or unsubstituted isopropyl, substituted or unsubstituted butyl, substituted or unsubstistituted t-butyl, substituted or unsubstituted phenyl and substituted or unsubstituted benzyl. In another exemplary embodiment, R^{3a} and R^{4a} is a member selected from methyl, ethyl, propyl, isopropyl, butyl, t-butyl, phenyl and benzyl. In another exemplary embodiment, R^{3a} is H and R^{4a} is a 10 member selected from methyl, ethyl, propyl, isopropyl, butyl, t-butyl, phenyl and benzyl. In another exemplary embodiment, R^{3a} is H and R^{4a} H.

In another exemplary embodiment, each R^{9a}, R^{10a}, R^{11a} and $R^{12\alpha}$ is a member independently selected from H, OR*, 15 NR*R**, SR*, $-S(O)R^*$, $-S(O)_2R^*$, $-S(O)_2NR^*R^{**}$, $-C(O)R^*$, $-C(O)OR^*$, $-C(O)NR^*R^{**}$, halogen, cyano, nitro, substituted or unsubstituted methoxy, substituted or unsubstituted methyl, substituted or unsubstituted ethoxy, substituted or unsubstituted ethyl, trifluoromethyl, substi- 20 tuted or unsubstituted hydroxymethyl, substituted or unsubstituted hydroxyalkyl, substituted or unsubstituted benzyl, substituted or unsubstituted phenyl, substituted or unsubstituted phenyloxy, substituted or unsubstituted phenyl methoxy, substituted or unsubstituted thiophenyloxy, sub- 25 stituted or unsubstituted pyridinyloxy, substituted or unsubstituted pyrimidinyloxy, substituted or unsubstituted benzylfuran, substituted or unsubstituted methylthio, substituted or unsubstituted mercaptomethyl, substituted or unsubstituted mercaptoalkyl, substituted or unsubstituted phenylthio, sub- 30 stituted or unsubstituted thiophenylthio, substituted or unsubstituted phenyl methylthio, substituted or unsubstituted pyridinylthio, substituted or unsubstituted pyrimidinylthio, substituted or unsubstituted benzylthiofuranyl, substituted or unsubstituted phenylsulfonyl, substituted or 35 unsubstituted benzylsulfonyl, substituted or unsubstituted phenylmethylsulfonyl, substituted or unsubstituted thiophenylsulfonyl, substituted or unsubstituted pyridinylsulfonyl, substituted or unsubstituted pyrimidinylsulfonyl, substituted or unsubstituted sulfonamidyl, substituted or unsubstituted 40 phenylsulfinyl, substituted or unsubstituted benzylsulfinyl, substituted or unsubstituted phenylmethylsulfinyl, substituted or unsubstituted thiophenylsulfinyl, substituted or unsubstituted pyridinylsulfinyl, substituted or unsubstituted pyrimidinylsulfinyl, substituted or unsubstituted amino, sub- 45 stituted or unsubstituted alkylamino, substituted or unsubstituted dialkylamino, substituted or unsubstituted trifluoromethylamino, substituted or unsubstituted aminomethyl, substituted or unsubstituted alkylaminomethyl, substituted or unsubstituted dialkylaminomethyl, substituted or unsub- 50 stituted arylaminomethyl, substituted or unsubstituted benzylamino, substituted or unsubstituted phenylamino, substituted or unsubstituted thiophenylamino, substituted or unsubstituted pyridinylamino, substituted or unsubstituted pyrimidinylamino, substituted or unsubstituted indolyl, sub- 55 stituted or unsubstituted morpholino, substituted or unsubstituted alkylamido, substituted or unsubstituted arylamido, substituted or unsubstituted ureido, substituted or unsubstituted carbamoyl, and substituted or unsubstituted piperizinyl. In an exemplary embodiment, R^{9a}, R^{10a}, R^{11a} and R^{12a} 60 are selected from the previous list of substituents with the exception of ---C(O)R*, ---C(O)OR*, ---C(O)NR*R**.

In another exemplary embodiment, R^{9a} , R^{10a} , R^{11a} and R^{12a} are members independently selected from fluoro, chloro, bromo, nitro, cyano, amino, methyl, hydroxylm- 65 ethyl, trifluoromethyl, methoxy, trifluoromethyoxy, ethyl, diethylcarbamoyl, pyridin-2-yl, pyridin-3-yl, pyridin-4-yl,

102

pyrimidinyl, piperizino, piperizinyl, piperizinocarbonyl, piperizinylcarbonyl, carboxyl, 1-tetrazolyl, 1-ethoxycarbonylmethoxy, carboxymethoxy, thiophenyl, 3-(butylcarbonvl) phenvlmethoxy, 111-tetrazol-5-yl, 1-ethoxycarbonylmethyloxy-, 1-ethoxycarbonylmethyl-, 1-ethoxycarbonyl-, carboxymethoxy-, thiophen-2-yl, thiophen-2-ylthio-, thiophen-3-vl. thiophen-3-vlthio, 4-fluorophenvlthio, butylcarbonylphenylmethoxy, butylcarbonylphenylmethyl, butylcarbonylmethyl, 1-(piperidin-1-yl)carbonyl)methyl, 1-(piperidin-1-yl)carbonyl)methoxy, 1-(piperidin-2-yl)carbonyl)methoxy, 1-(piperidin-3-yl)carbonyl)methoxy, 1-(4-(pyrimidin-2-yl)piperazin-1-yl)carbonyl)methoxy, 1-(4-(pyrimidin-2-yl)piperazin-1-yl)carbonyl)methyl, 1 - (4 -(pyrimidin-2-yl)piperazin-1-yl)carbonyl, 1-4-(pyrimidin-2yl)piperazin-1-yl, 1-(4-(pyridin-2-yl)piperazin-1-yl) carbonyl), 1-(4-(pyridin-2-yl)piperazin-1-yl) carbonylmethyl, (1-(4-(pyridin-2-yl)piperazin-1-yl) 1-(4-(pyridin-2-yl)piperazin-1-yl, carbonyl)-methoxy), 1H-indol-1-yl, morpholino-, morpholinyl, morpholinocarbonyl, morpholinylcarbonyl, phenylureido, phenylcarbamoyl, acetamido, 3-(phenylthio)-1H-indol-1-yl, 3-(2-cyanoethylthio)-1H-indol-1-yl, benzylamino, 5-methoxy-3-5-methoxy-3-(2-(phenylthio)-1H-indol-1-yl, cvanoethylthio)-1H-indol-1-yl)), 5-chloro-1H-indol-1-yl, 5-chloro-3-(2-cyanoethylthio)-1H-indol-1-yl)), dibenzylamino, benzylamino, 5-chloro-3-(phenylthio)-1H-indol-1yl)), 4-(1H-tetrazol-5-yl)phenoxy, 4-(1H-tetrazol-5-yl)phenyl, 4-(1H-tetrazol-5-yl)phenylthio, 2-cyanophenoxy, 3-cyanophenoxy, 4-cyanophenoxy, 2-cyanophenylthio, 3-cvanophenylthio, 4-cvanophenylthio, 2-chlorophenoxy, 3-chlorophenoxy, 4-chlorophenoxy, 2-fluorophenoxy, 3-fluorophenoxy, 4-fluorophenoxy, 2-cyanobenzyloxy, 3-cyanobenzyloxy, 4-cyanobenzyloxy, 2-chlorobenzyloxy, 3-chlorobenzyloxy, 4-chlorobenzyloxy, 2-fluorobenzyloxy, 3-fluorobenzyloxy, 4-fluorobenzyloxy, unsubstituted phenyl, unsubstituted benzyl.

In an exemplary embodiment, the compound has a structure according to the following formula:

(ХПЬ)

In another exemplary embodiment, R^{9a}, R^{10a}, R^{11a} and R^{12a} are members independently selected from H, halogen, cyano, nitro, substituted or unsubstituted methoxy, substituted or unsubstituted or unsubstituted ethoxy, substituted or unsubstituted ethyl, trifluoromethyl, substituted or unsubstituted hydroxyalkyl, substituted or unsubstituted benzyl, substituted or unsubstituted or unsubstituted phenyl, substituted or unsubstituted or unsubstituted phenyl, substituted or unsubstituted primidinyloxy, substituted or unsubstituted benzyl-furan, substituted or unsubstituted methyl, substituted or unsubstituted benzyl-furan, substituted or unsubstituted benzyl-furan, substituted or unsubstituted or uns

103

mercaptoalkyl, substituted or unsubstituted phenylthio, substituted or unsubstituted thiophenylthio, substituted or unsubstituted phenyl methylthio, substituted or unsubstituted pyridinylthio, substituted or unsubstituted pyrimidinylthio, substituted or unsubstituted benzylthiofuranyl, substituted or unsubstituted phenylsulfonyl, substituted or unsubstituted benzylsulfonyl, substituted or unsubstituted phenylmethylsulfonyl, substituted or unsubstituted thiophenylsulfonyl, substituted or unsubstituted pyridinylsulfonyl, 10 substituted or unsubstituted pyrimidinylsulfonyl, substituted or unsubstituted sulfonamidyl, substituted or unsubstituted phenylsulfinyl, substituted or unsubstituted benzylsulfinyl, substituted or unsubstituted phenylmethylsulfinyl, substituted or unsubstituted thiophenylsulfinyl, substituted or 15 unsubstituted pyridinylsulfinyl, substituted or unsubstituted pyrimidinylsulfinyl, substituted or unsubstituted amino, substituted or unsubstituted alkylamino, substituted or unsubstituted dialkylamino, substituted or unsubstituted trifluoromethylamino, substituted or unsubstituted aminomethyl, 20 substituted or unsubstituted alkylaminomethyl, substituted or unsubstituted dialkylaminomethyl, substituted or unsubstituted arylaminomethyl, substituted or unsubstituted benzylamino, substituted or unsubstituted phenylamino, substituted or unsubstituted thiophenylamino, substituted or 25 unsubstituted pyridinylamino, substituted or unsubstituted pyrimidinylamino, substituted or unsubstituted indolyl, substituted or unsubstituted morpholino, substituted or unsubstituted alkylamido, substituted or unsubstituted arylamido, 30 substituted or unsubstituted ureido, substituted or unsubstituted carbamoyl, and substituted or unsubstituted piperizinyl.

In another exemplary embodiment, R^{9a}, R^{10a}, R^{11a} and R^{12a} are members independently selected from H, fluoro, 35 chloro, bromo, nitro, cyano, amino, methyl, hydroxylmethyl, trifluoromethyl, methoxy, trifluoromethyoxy, ethyl, diethylcarbamoyl, pyridin-2-yl, pyridin-3-yl, pyridin-4-yl, pyrimidinyl, piperizino, piperizinyl, piperizinocarbonyl, piperizinylcarbonyl, carboxyl, 1-tetrazolyl, 1-ethoxycarbo- 40 nylmethoxy, carboxymethoxy, thiophenyl, 3-(butylcarbonyl) phenylmethoxy, 1H-tetrazol-5-yl, 1-ethoxycarbonylmethyloxy-, 1-ethoxycarbonylmethyl-, 1-ethoxycarbonyl-, carboxymethoxy-, thiophen-2-yl, thiophen-2-ylthio-, thiophen-3-yl, thiophen-3-ylthio, 4-fluorophenylthio, butylcar- 45 bonylphenylmethoxy, butylcarbonylphenylmethyl, butylcar-1-(piperidin-1-yl)carbonyl)methyl, bonylmethyl, 1-(piperidin-1-yl)carbonyl)methoxy, 1-(piperidin-2-yl)carbonyl)methoxy, 1-(piperidin-3-yl)carbonyl)methoxy, 1-(4-50 (pyrimidin-2-yl)piperazin-1-yl)carbonyl)methoxy, 1-(4-(pyrimidin-2-yl)piperazin-1-yl)carbonyl)methyl, 1-(4-(pyrimidin-2-yl)piperazin-1-yl)carbonyl, 1-4-(pyrimidin-2yl)piperazin-1-yl, 1-(4-(pyridin-2-yl)piperazin-1-yl) carbonyl), 1-(4-(pyridin-2-yl)piperazin-1-yl) 55 carbonylmethyl, (1-(4-(pyridin-2-yl)piperazin-1-yl) 1-(4-(pyridin-2-yl)piperazin-1-yl, carbonyl)-methoxy), 1H-indol-1-yl, morpholino-, morpholinyl, morpholinocarbonyl, morpholinylcarbonyl, phenylureido, phenylcarbamoyl, acetamido, 3-(phenylthio)-1H-indol-1-yl, 3-(2-cyano- 60 ethylthio)-1H-indol-1-yl, benzylamino, 5-methoxy-3-(phenylthio)-1H-indol-1-yl, 5-methoxy-3-(2cyanoethylthio)-1H-indol-1-yl)), 5-chloro-1H-indol-1-yl, 5-chloro-3-(2-cvanoethylthio)-1H-indol-1-vl)). dibenzylamino, benzylamino, 5-chloro-3-(phenylthio)-1H-indol-1- 65 yl)), 4-(1H-tetrazol-5-yl)phenoxy, 4-(1H-tetrazol-5-yl)phe-

nyl, 4-(1H-tetrazol-5-yl)phenylthio, 2-cyanophenoxy,

104

3-cyanophenoxy, 4-cvanophenoxy. 2-cyanophenylthio, 3-cyanophenylthio, 4-cyanophenylthio, 2-chlorophenoxy, 3-chlorophenoxy. 4-chlorophenoxy, 2-fluorophenoxy. 2-cyanobenzyloxy, 3-fluorophenoxy, 4-fluorophenoxy, 3-cyanobenzyloxy, 4-cyanobenzyloxy, 2-chlorobenzyloxy, 3-chlorobenzyloxy, 4-chlorobenzyloxy, 2-fluorobenzyloxy, 3-fluorobenzyloxy, and 4-fluorobenzyloxy. In an exemplary embodiment, \mathbb{R}^{9a} is H and \mathbb{R}^{12a} is H. In an exemplary embodiment, the compound has a subsitutent combination for \mathbb{R}^{9a} , \mathbb{R}^{10a} , \mathbb{R}^{11a} , and \mathbb{R}^{12a} which is a member selected from those described in Formulae (I), (Ia) (Ib), (Ic), (Id), (le), (lf), (lg), (lh), (li), (lj), (lk), (ll), (lm), (ln), (lo), (lp), (Iq), (Ir), (Is), (It), (Iu), (Iv), (Iw), (Iz), (Iaa), (Iab), (Iac), (Iad), (Iae), (Iaf), (Iag), (Iah), (Iai), (Iaj), (Iak) above, and/or the subsequent paragraphs describing Formulae (I), (Ia) (Ib), (Ic), (Id), (Ie), (If), (Ig), (Ih), (Ii), (Ij), (Ik), (Il), (Im), (In), (Io), (Ip), (Iq), (Ir), (Is), (It), (Iu), (Iv), (Iw), (Iz), (Iaa), (Iab), (Iac), (Iad), (Iae), (Iaf), (Iag), (Iah), (Iai), (Iaj), (Iak).

In an exemplary embodiment, the portion of the cyclic boronic ester as in the figure below

is a member selected from a structure in FIG. 12. In an exemplary embodiment, the compound has a structure according to the following formula:

(XIIc)

In an exemplary embodiment, the compound has a structure according to the following formula:

(XIId)

106

105 In an exemplary embodiment, the compound has a structure according to the following formula:

In another exemplary embodiment, the compound has a structure which is a member selected from Formulae (XII), (XIIa), (XIIb), (XIIc), (XIId) and (XIIe) wherein L is a ⁵ member selected from substituted or unsubstituted adenine, substituted or unsubstituted uracil, and substituted or unsubstituted thymine. In another exemplary embodiment, L is OH. In another exemplary embodiment, L is adenine.

¹⁵ In another exemplary embodiment, the compound has a structure which is a member selected from

35

107

In another exemplary embodiment, A1 is a nucleic acid sequence between 72 and 90 nucleotides. In another exemplary embodiment, A1 is a nucleic acid sequence between 35 and 150 nucleotides. In another exemplary embodiment, A1 is a nucleic acid sequence between 50 and 100 nucleotides. In another exemplary embodiment, A1 is a nucleic acid sequence between 75 and 85 nucleotides. In another exemplary embodiment. A1 is a nucleic acid sequence which is a tRNA or a portion of a tRNA. In another exemplary embodiment, said tRNA or the portion of said tRNA is a member 10 selected from alanyl tRNA, isoleucyl tRNA, leucyl tRNA, methionyl tRNA, lysyl tRNA, phenylalanyl tRNA, prolyl tRNA, threonyl tRNA and valyl tRNA. In another exemplary embodiment, said tRNA or the portion of said tRNA is leucyl tRNA. In another exemplary embodiment, said 15 tRNA or the portion of said tRNA has a sequence which is a member selected from SEQ ID NOS: 18-62. In another exemplary embodiment, A1 is a nucleic acid sequence wherein two final nucleotides are each cytidine.

In another exemplary embodiment, the compound further 20 comprises a tRNA synthetase or a portion of a tRNA synthetase which comprises the editing domain, wherein said compound is noncovalently attached to the editing domain of said tRNA synthetase. In another exemplary embodiment, the tRNA synthetase is a member selected 25 from a mitochondrial tRNA synthetase and a cytoplasmic tRNA synthetase. In another exemplary embodiment, the tRNA synthetase is a member selected from alanyl tRNA synthetase, isoleucyl tRNA synthetase, leucyl tRNA synthetase, 30 phenylalanyl tRNA synthetase, nolyl tRNA synthetase, throonyl tRNA synthetase and valyl tRNA synthetase.

In an exemplary embodiment, the compound described herein is present in a microorganism described in this application.

In another exemplary embodiment, there is a proviso that the compound is not present in a microorganism that is a member selected from Saccharomyces cerevisiae, Aspergillus niger, Pseudomonas aeruginosa, Staphylococcus aureus, Aureobasidium pullulans, Fusarium solani, Penicillium 40 pinophilum, Scopulariopsis brevicaulis, Streptoverticillium waksmanii, Alternaria alternata, Cladosporium herbarum, Phoma violacea, Stemphylium dentriticum, Candida albicans, Escherichia coli, and Glioclasium roseum. In another exemplary embodiment, there is a proviso that when the 45 compound is present in a fungus, the fungus is not a member selected from Saccharomyces cerevisiae, Aspergillus niger, Fusarium solani, Penicillium pinophilum, Scopulariopsis brevicaulis, Streptoverticillium waksmanii, Alternaria alternata, Cladosporium herbarum, Phoma violacea, Stemphy- 50 lium dentriticum. Candida albicans, and Glioclasium roseum

In an exemplary embodiment, the compound is present in a microorganism which is a member selected from a dermatophyte, *Trichophyton, Microsporum, Epidermophyton* 55 and yeast-like fungi. In an exemplary embodiment, there is a proviso that when the compound is present in a yeast-like fungus, that yeast-like fungus is not a member selected from *Aspergillus niger* and *Candida albicans*. In another exemplary embodiment, the microorganism is a member selected 60 from a dermatophyte, *Trichophyton, Microsporum, Epidermophyton* and yeast-like fungi. In an exemplary embodiment, the microorganism is a dermatophyte. In another exemplary embodiment, the microorganism is a member selected from *Trichophyton* species. In an exemplary 65 embodiment, the microorganism is a member selected from is a member selected from *T. rubrum* and *T. menagrophytes*.

108

In an exemplary embodiment, the microorganism is a dermatophyte and said dermatophyte is a member selected from *T. rubrum* and *T. menagrophytes*.

In another exemplary embodiment, the compound is present in a human or an animal. In another exemplary embodiment, the compound is present in a microorganism which is in, or on the surface of, a human or an animal. In another exemplary embodiment, the compound is present in a microoganism which is present in a human nail unit of a human or a nail, hoof, or horn component of an animal. In another exemplary embodiment, the compound is present in a microoganism which is present in a member selected from a human nail plate, human nail bed, proximal nail fold, lateral nail fold and combinations thereof. In another exemplary embodiment, the compound is present in a microoganism which is present in a member selected from a human nail plate and a human nail bed. In another exemplary embodiment, the compound is present in a microoganism which is present in a member selected from a proximal nail fold and a lateral nail fold. In another exemplary embodiment, the microorganism is a member selected from dermatophyte, Trichophyton, Microsporum, Epidermophyton and yeast-like fungi. In another exemplary embodiment, wherein said compound is a dermatophyte. In another exemplary embodiment, the dermatophyte is a member selected from T. rubrum and T. menagrophytes.

I. f) Formulations with Keratin

When a compound of the invention described herein is applied to a nail component of a human, the compound absorbs or penetrates into the nail. The human nail is primarily composed of keratin (i.e. hair keratin or α -keratin) as well as trace amounts of lipid components. Therefore, in the process of treating a disease of the nail or killing or inhibiting the growth of a microorganism, a formulation comprising a human nail unit and a compound of the invention is formed.

In another aspect, the invention provides a formulation comprising: (a) a compound which is a member selected from a boron-containing compound, a 2'-amino ribofuranose-containing compound, a 3'-amino ribofuranose-containing compound, and combinations thereof; and (b) a keratin containing component which is a member selected from a human nail unit, skin and hair. In an exemplary embodiment, the compound of part (a) contacts the component of part (b). In an exemplary embodiment, the keratin containing component is a nail plate of the human nail unit. In an exemplary embodiment, the keratin containing component is a nail bed of the human nail unit. In an exemplary embodiment, the keratin containing component is a proximal nail fold of the human nail unit. In an exemplary embodiment, the keratin containing component is a lateral nail fold of the human nail unit. In another exemplary embodiment, the human nail unit comprises a member selected from keratin and lipid. In another exemplary embodiment, keratin is a member selected from skin keratin and nail/hair keratin. In another exemplary embodiment, lipid is a member selected from cholesterol sulfate, cerebroside, ceramide, free sterol, free fatty acids, triglycerides, sterol esters, wax esters, and squalene.

In an exemplary embodiment, the compound is present in the formulation at a concentration which is a member selected from about 0.001%, about 0.01%, about 0.05%, about 0.1%, about 0.5%, about 1%, about 1.5%, about 2%, about 2.5%, about 3%. In another exemplary embodiment, the keratin is present in said formulation at a concentration

109

which is a member selected from about 99.99%, about 99.95%, about 99.90%, about 99.5%, about 99.0%, about 98.5%, about 98.0%, about 97.5% and about 97%. In another exemplary embodiment, the compound is a compound described herein. In another exemplary embodiment, 5 the compound is as described in Formulae (I), (Ia) (Ib), (Ic), (Id), (Ie), (If), (Ig), (Ih), (Ii), (Ij), (Ik), (Il), (Im), (In), (Io), (Ip), (Iq), (Ir), (Is), (It), (Iu), (Iv), (Iw), (Iz), (Iaa), (Iab), (Iac), (Iad), (Iae), (Iaf), (Iag), (Iah), (Iai), (Iaj), (Iak), (Il), (IIa), (IIb), (IIc), (IId), and (III). In another exemplary 10 embodiment, the compound is an acyclic boronic ester as described herein. In another exemplary embodiment, the compound is a member selected from C1-C96 described herein. In another exemplary embodiment, the compound is a member selected from a compound appearing in FIG. 19. 15 In another exemplary embodiment, the compound is a member selected from a compound appearing in FIG. 20. In another exemplary embodiment, the compound is 1.3-dihydro-5-fluoro-1-hydroxy-2,1-benzoxaborole. In another exemplary embodiment, 1,3-dihydro-5-fluoro-1-hydroxy-2, 20 1-benzoxaborole is present is said formulation at a concentration which is a member selected from about 0.001%, about 0.01%, about 0.05%, about 0.1%, about 0.5%, about 1%, and about 1.5%.

In another aspect, the invention provides a method of ²⁵ h forming this formulation, wherein said method comprises applying said compound to a formulation comprising keratin, thereby forming said formulation. In an exemplary embodiment, the formulation comprising keratin is a human nail unit. In an exemplary embodiment, the formulation comprising keratin is a member selected from a nail plate, nail bed, proximal nail fold, and lateral nail fold. Methods of making these formulations are described in the Examples section.

I. g.) Preparation of Boron-Containing Editing Domain Inhibitors

Compounds of use in the present invention can be prepared using commercially available starting materials, 40 known intermediates, or by using the synthetic methods published in references described and incorporated by reference herein.

I. h.) Boronic Esters

The following exemplary schemes illustrate methods of preparing boron-containing molecules of the present invention. These methods are not limited to producing the compounds shown, but can be used to prepare a variety of 50 molecules such as the compounds and complexes described herein. The compounds of the present invention can also be synthesized by methods not explicitly illustrated in the schemes but are well within the skill of one in the art. The compounds can be prepared using readily available materi- 55 als of known intermediates.

In the following schemes, the symbol X represents bromo or iodo. The symbol Y is selected from H, lower alkyl, and arylalkyl. The symbol Z is selected from H, alkyl, and aryl. The symbol PG represents protecting group. The symbols A, 60 D, E, G, R^x, R^y, R^z, R^{1a}, R^{2a}, R^{3a}, R^{4a}, R^{5a}, R^{6a}, R^{7a}, R^{8a}, R^{9a}, R^{10a}, R^{11a}, and R^{12a} can be used to refer to the corresponding symbols in the compounds described herein. Boronic Acid Preparation Strategy #1

In Scheme 1, Step 1 and 2, compounds 1 or 2 are 65 converted into alcohol 3. In step 1, compound 1 is treated with a reducing agent in an appropriate solvent. Suitable

110

reducing agents include borane complexes, such as borane-tetrahydrofuran, borane-dimethylsulfide, combinations thereof and the like. Lithium aluminum hydride, or sodium borohydride can also be used as reducing agents. The reducing agents can be used in quantities ranging from 0.5 to 5 equivalents, relative to compound 1 or 2. Suitable solvents include diethyl ether, tetrahydrofuran, 1,4-dioxane, 1,2-dimethoxyethane, combinations thereof and the like. Reaction temperatures range from 0° C. to the boiling point of the solvent used; reaction completion times range from 1 to 24 h.

In Step 2, the carbonyl group of compound 2 is treated with a reducing agent in an appropriate solvent. Suitable reducing agents include borane complexes, such as boranetetrahydrofuran, borane-dimethylsulfide, combinations thereof and the like. Lithium aluminum hydride, or sodium borohydride can also be used as reducing agents. The reducing agents can be used in quantities ranging from 0.5 to 5 equivalents, relative to compound 2. Suitable solvents include lower alcohol, such as methanol, ethanol, and propanol, diethyl ether, tetrahydrofuran, 1,4-dioxane and 1,2dimethoxyethane, combinations thereof and the like. Reaction temperatures range from 0° C. to the boiling point of the solvent used; reaction completion times range from 1 to 24

In Step 3, the hydroxyl group of compound 3 is protected with a protecting group which is stable under neutral or basic conditions. The protecting group is typically selected from methoxymethyl, ethoxyethyl, tetrahydropyran-2-yl, trimethylsilyl, tert-butyldimethylsilyl, tributylsilyl, combinations thereof and the like. In the case of methoxymethyl, compound 3 is treated with 1 to 3 equivalents of chloromethyl methyl ether in the presence of a base. Suitable bases include sodium hydride, potassium tert-butoxide, tertiary amines, 35 such as diisopropylethylamine, triethylamine, 1,8-diazabicyclo[5,4,0]undec-7-ene, and inorganic bases, such as sodium hydroxide, sodium carbonate, potassium hydroxide, potassium carbonate, combinations thereof and the like. The bases can be used in quantities ranging from 1 to 3 equivalents, relative to compound 3. Reaction temperatures range from 0° C. to the boiling point of the solvent used; preferably between 0 and 40° C.; reaction completion times range from 1 h to 5 days.

In the case of tetrahydropyran-2-yl, compound 3 is treated 45 with 1 to 3 equivalents of 3.4-dihydro-2H-pyran in the presence of 1 to 10 mol % of acid catalyst. Suitable acid catalysts include pyridinium p-toluenesulfonic acid, p-toluenesulfonic acid, camphorsulfonic acid, methanesulfonic acid, hydrogen chloride, sulfuric acid, combinations thereof 50 and the like. Suitable solvents include dichloromethane, chloroform, tetrahydrofuran, 1,4-dioxane, 1,2-dimethoxyethane, toluene, benzene, and acetonitrile combinations thereof and the like. Reaction temperatures range from 0° C. to the boiling point of the solvent used; preferably between 55 0 and 60° C., and is complete in 1 h to 5 days.

In the case of trialkylsilyl, compound 3 is treated with 1 to 3 equivalents of chlorotrialkylsilyane in the presence of 1 to 3 equivalents of base. Suitable bases include tertiary amines, such as imidazole, diisopropylethylamine, triethylamine, 1,8-diazabicyclo[5,4,0]undec-7-ene, combinations thereof and the like. Reaction temperatures range from 0° C. to the boiling point of the solvent used; preferably between 0 and 40° C.; reaction completion times range from 1 to 48 h.

In Step 4, compound 4 is converted into boronic acid (5) through halogen metal exchange reaction. Compound 4 is treated with 1 to 3 equivalents of alkylmetal reagent relative

Case 1:18-cv-00202-IMK Document 1-3 Filed 10/30/18 Page 136 of 241 PageID #: 633

US 9,566,290 B2

to compound 4, such as n-butyllithium, sec-butyllithium, tert-butyllithium, isopropylmagnesium chloride or Mg turnings with or without an initiator such as diisobutylaluminum hydride (DiBA1), followed by the addition of 1 to 3 equivalents of trialkyl borate relative to compound 4, such as 5 trimethyl borate, triisopropyl borate, or tributyl borate. Suitable solvents include tetrahydrofuran, ether, 1,4-dioxane, 1,2-dimethoxyethane, toluene, hexanes, combinations thereof and the like. Alkylmetal reagent may also be added in the presence of trialkyl borate. The addition of butyl- 10 lithium is carried out at between -100 and 0° C., preferably at between -80 and -40° C. The addition of isopropylmagnesium chloride is carried out at between -80 and 40° C., preferably at between -20 and 30° C. The addition of Mg turnings, with or without the addition of DiBA1, is carried 15 out at between -80 and 40° C., preferably at between -35 and 30° C. The addition of the trialkyl borate is carried out at between -100 and 20° C. After the addition of trialkyl borate, the reaction is allowed to warm to room temperature, which is typically between -30 and 30° C. When alkylmetal 20 making a tetrahydropyran-containing boronic ester, said reagent is added in the presence of trialkyl borate, the reaction mixture is allowed to warm to room temperature after the addition. Reaction completion times range from 1 to 12 h. Compound 5 may not be isolated and may be used for the next step without purification or in one pot. 25

In Step 5, the protecting group of compound 5 is removed under acidic conditions to give compound of the invention. Suitable acids include acetic acid, trifluoroacetic acid, hydrochloric acid, hydrobromic acid, sulfuric acid, p-toluenesulfonic acid and the like. The acids can be used in 30 quantities ranging from 0.1 to 20 equivalents, relative to compound 5. When the protecting group is trialkylsilyl, basic reagents, such as tetrabutylammonium fluoride, can also be used. Suitable solvents include tetrahydrofuran, 1,4-dioxane, 1,2-dimethoxyethane, methanol, ethanol, pro- 35 panol, acetonitrile, acetone, combination thereof and the like. Reaction temperatures range from 0° C. to the boiling point of the solvent used; preferably between 10° C. and reflux temperature of the solvent; reaction completion times range from 0.5 to 48 h. The product can be purified by 40 methods known to those of skill in the art.

I or II, $R^1 = H$, $W = (CR^6R^7)m$, m = 0

In another aspect, the invention provides a method of ester having a structure according to the following formula:

wherein R^1 and R_2 are members independently selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl, and substituted or unsubstituted heteroaryl. R^1 and R^2 , together with the atoms to which they are attached, can be optionally joined to form a 4- to 7-membered ring. R^{9a}, R^{10a}, R^{11a} and R^{12a} are members independently selected from H, OR*, NR*R**, SR*, -S(O)R*, -S(O)₂R*, -S(O)₂NR*R**, nitro, halogen, cyano, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl, and substituted or unsubstituted heteroaryl. R* and R** is a member selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted cycloalkyl, substi-50 tuted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl, and substituted or unsubstituted heteroaryl. The method comprises: a) subjecting a first compound to Grignard or organolithium conditions, said first compound having a structure according to the following 55 formula:

b) contacting the product of step a) with a borate ester. thereby forming said tetrahydropyran-containing boronic ester. In an exemplary embodiment, halogen is a member selected from iodo and bromo. In another exemplary embodiment, the borate ester is a member 5 selected from $B(OR^1)_2(OR^2)$, wherein R^1 and R^2 are each members independently selected from H, substituted or unsubstituted methyl, substituted or unsubstituted ethyl, substituted or unsubstituted propyl, substituted or unsubstituted isopropyl, substituted or 10 unsubstituted butyl, substituted or unsubstituted t-butyl, substituted or unsubstituted phenyl and substituted or unsubstituted benzyl. R^1 and R^2 , together with the atoms to which they are joined, can optionally form a member selected from substituted or unsubstituted dioxaborolane, substituted or unsubstituted dioxabori-15 nane and substituted or unsubstituted dioxaborepane. In another exemplary embodiment, the borate ester is a member selected from $B(OR^1)_2(OR^2)$, wherein R^1 and R^2 , together with the atoms to which they are joined, form a member selected from dioxaborolane, substi- 20 tuted or unsubstituted tetramethyldioxaborolane, substituted or unsubstituted phenyldioxaborolane, dioxaborinane, dimethyldioxaborinane and dioxaborepane. In another exemplary embodiment, the Grignard or organolithium conditions further comprise diisobutyl 25 aluminum hydride. In another exemplary embodiment, the temperature of the Grignard reaction does not exceed about 35° C. In another exemplary embodiment, the temperature of the Grignard reaction does not exceed about 40° C. In another exemplary embodi-30 ment, the temperature of the Grignard reaction does not exceed about 45° C. In an exemplary embodiment, step (b) is performed at a temperature of from about -30° C. to about -20° C. In another exemplary embodiment, step (b) is performed at a temperature of from about 35 -35° C. to about -25° C. In another exemplary embodiment, step (b) is performed at a temperature of from about -50° C. to about -0° C. In another exemplary embodiment, step (b) is performed at a temperature of from about -40° C. to about -20° C. In another 40 exemplary embodiment, the tetrahydropyran-containing boronic ester is

In another aspect, the invention provides a method of making a compound having a structure according to the $_{55}$ following formula

114

said method comprising: a) subjecting a first compound to Grignard or organolithium conditions, said first compound having a structure according to the following formula:

b) quenching said subjecting reaction with water and a organic acid, thereby forming said compound. In an exemplary embodiment, wherein said organic acid is a member selected from acetic acid. In another exemplary embodiment, the quenching step is essentially not contacted with a strong acid. In another exemplary embodiment, the compound is 1,3-dihydro-5-fluoro-1-hydroxy-2,1-benzoxaborole. In another exemplary embodiment, the compound is purified by recrystallization from a recrystallization solvent, wherein said recrystallization solvent essentially does not contain acetonitrile. In an exemplary embodiment, the recrystallization solvent contains less than 2% acetonitrile. In an exemplary embodiment, the recrystallization solvent contains less than 1% acetonitrile. In an exemplary embodiment, the recrystallization solvent contains less than 0.5% acetonitrile. In an exemplary embodiment, the recrystallization solvent contains less than 0.1% acetonitrile. In an exemplary embodiment, the recrystallization solvent contains toluene and a hydrocarbon solvent. In an exemplary embodiment, the recrystallization solvent contains about 1:1 toluene:hydrocarbon solvent. In an exemplary embodiment, the recrystallization solvent contains about 2:1 toluene: hydrocarbon solvent. In an exemplary embodiment, the recrystallization solvent contains about 3:1 toluene:hydrocarbon solvent. In an exemplary embodiment, the recrystallization solvent contains about 4:1 toluene:hydrocarbon solvent. In an exemplary embodiment, the hydrocarbon solvent is a member selected from heptane, octane, hexane, pentane and nonane. In an exemplary embodiment, the recrystalli-45 zation solvent is 3:1 toluene:heptane.

Boronic Acid Preparation Strategy #2

In Scheme 2, Step 6, compound 2 is converted into boronic acid (6) via a transition metal catalyzed crosscoupling reaction. Compound 2 is treated with 1 to 3 50 equivalents of bis(pinacolato)diboron or 4,4,5,5-tetramethyl-1.3.2-dioxaborolane in the presence of transition metal catalyst, with the use of appropriate ligand and base as necessary. Suitable transition metal catalysts include palladium(II) acetate, palladium(II) acetoacetonate, tetrakis(triphenylphosphine)palladium, dichlorobis(triphenylphosphine)palladium, [1,1'-bis(diphenylphosphino)ferrocen] dichloropalladium(II), combinations thereof and the like. The catalyst can be used in quantities ranging from 1 to 5 mol % relative to compound 2. Suitable ligands include 60 triphenylphosphine, tri(o-tolyl)phosphine, tricyclohexylphosphine, combinations thereof and the like. The ligand can be used in quantities ranging from 1 to 5 equivalents relative to compound 2. Suitable bases include sodium carbonate, potassium carbonate, potassium phenoxide, triethylamine, combinations thereof and the like. The base can be used in quantities ranging from 1 to 5 equivalents relative to compound 2. Suitable solvents include N,N-dimethylfor-

5

115

mamide, dimethylsufoxide, tetrahydrofuran, 1,4-dioxane, toluene, combinations thereof and the like. Reaction temperatures range from 20° C. to the boiling point of the solvent used; preferably between 50 and 150° C.; reaction completion times range from 1 to 72 h.

Pinacol ester is then oxidatively cleaved to give compound 6. Pinacol ester is treated with sodium periodate followed by acid. Sodium periodate can be used in quantities ranging from 2 to 5 equivalents relative to compound 6. Suitable solvents include tetrahydrofuran, 1,4-dioxane, ¹⁰ acetonitrile, methanol, ethanol, combinations thereof and the like. Suitable acids include hydrochloric acid, hydrobromic acid, sulfuric acid combinations thereof and the like. Reaction temperatures range from 0° C. to the boiling point of the solvent used; preferably between 0 and 50° C.; reaction ¹⁵ completion times range from 1 to 72 h.

In Step 7, the carbonyl group of compound 6 is treated with a reducing agent in an appropriate solvent to give a compound of the invention. Suitable reducing agents include borane complexes, such as borane-tetrahydrofuran, borane-²⁰ dimethylsulfide, combinations thereof and the like. Lithium aluminum hydride, or sodium borohydride can also be used as reducing agents. The reducing agents can be used in quantities ranging from 0.5 to 5 equivalents, relative to compound 6. Suitable solvents include lower alcohol, such ²⁵ as methanol, ethanol, and propanol, diethyl ether, tetrahydrofuran, 1,4-dioxane and 1,2-dimethoxyethane, combinations thereof and the like. Reaction temperatures range from 0° C. to the boiling point of the solvent used; reaction completion times range from 1 to 24 h. ³⁰

Scheme 2 Scheme 2 Scheme 2 Step 6 Step 6 Step 7 B = 0 Step 7 B = 0 Step 7
Boronic Acid Preparation Strategy #3

In Scheme 3, Step 8, compounds of the invention can be prepared in one step from compound 3. Compound 3 is mixed with trialkyl borate then treated with alkylmetal 55 reagent. Suitable alkylmetal reagents include n-butyllithium, sec-butyllithium, tert-butyllithium combinations thereof and the like. Suitable trialkyl borates include trimethyl borate, triisopropyl borate, tributyl borate, combinations thereof and the like. The addition of butyllithium is carried out at 60 between -100 and 0° C., preferably at between -80 and -40° C. The reaction mixture is allowed to warm to room temperature after the addition. Reaction completion times range from 1 to 12 h. The trialkyl borate can be used in quantities ranging from 1 to 5 equivalents relative to compound 3. The 65 alkylmetal reagent can be used in quantities ranging from 1 to 2 equivalents relative to compound 3. Suitable solvents

116

include tetrahydrofuran, ether, 1,4-dioxane, 1,2-dimethoxyethane, toluene, hexanes, combinations thereof and the like. Reaction completion times range from 1 to 12 h. Alternatively, a mixture of compound 3 and trialkyl borate can be refluxed for 1 to 3 h and the alcohol molecule formed upon the ester exchange can be distilled out before the addition of alkylmetal reagent.

Boronic Acid Preparation Strategy #4

In Scheme 4, Step 10, the methyl group of compound 7 is brominated using N-bromosuccinimide. N-bromosuccinimide can be used in quantities ranging from 0.9 to 1.2 equivalents relative to compound 7. Suitable solvents include carbon tetrachloride, tetrahydrofuran, 1,4-dioxane, chlorobenzene, combinations thereof and the like. Reaction temperatures range from 20° C. to the boiling point of the solvent used; preferably between 50 and 150° C.; reaction completion times range from 1 to 12 h.

In Step 11, the bromomethylene group of compound 8 is converted to the benzyl alcohol 3. Compound 8 is treated with sodium acetate or potassium acetate. These acetates can be used in quantities ranging from 1 to 10 equivalents relative to compound 8. Suitable solvents include tetrahydrofuran, 1,4-dioxane, N,N-dimethylformamide, N,N-dimethylacetamide, N-methylpyrrolidone, dimethylsulfoxide, combinations thereof and the like. Reaction temperatures range from 20° C. to the boiling point of the solvent used; preferably between 50 and 100° C.; reaction completion times range from 1 to 12 h. The resulting acetate is hydrolyzed to compound 3 under basic conditions. Suitable bases include sodium hydroxide, lithium hydroxide, potassium hydroxide, combinations thereof and the like. The base can be used in quantities ranging from 1 to 5 equivalents relative to compound 8. Suitable solvents include methanol, ethanol, tetrahydrofuran, water, combinations thereof and the like. Reaction temperatures range from 20° C. to the boiling point of the solvent used; preferably between 50 and 100° C.; reaction completion times range from 1 to 12 h. Alternatively, compound 8 can be directly converted into compound 3 under the similar condition above.

Steps 3 through 5 convert compound 3 into a compound of the invention.

I or II, $R^{1} = H$, $W = (CR^{6}R^{7})m$, m = 0

Boronic Acid Preparation Strategy #5

In Scheme 5, Step 12, compound 2 is treated with (methoxymethyl) triphenylphosphonium chloride or (methoxymethyl)triphcnylphosphonium bromide in the 25 presence of base followed by acid hydrolysis to give compound 9. Suitable bases include sodium hydride, potassium tert-butoxide, lithium diisopropylamide, butyllithium, lithium hexamethyldisilazane, combinations thereof and the like. The (methoxymethyl)triphcnylphosphonium salt can be 30 used in quantities ranging from 1 to 5 equivalents relative to compound 2. The base can be used in quantities ranging from 1 to 5 equivalents relative to compound 2. Suitable solvents include tetrahydrofuran, 1,2-dimethoxyethane, 1,4dioxane, ether, toluene, hexane, N,N-dimethylformamide, 35 combinations thereof and the like. Reaction temperatures range from 0° C. to the boiling point of the solvent used; preferably between 0 and 30° C.; reaction completion times range from 1 to 12 h. The enolether formed is hydrolyzed under acidic conditions. Suitable acids include hydrochloric 40 acid, hydrobromic acid, sulfuric acid, and the like. Suitable solvents include tetrahydrofuran, 1,2-dimethoxyethane, 1,4dioxane, methanol, ethanol, combination thereof and the like. Reaction temperatures range from 20° C. to the boiling point of the solvent used; preferably between 50 and 100° 45 C.; reaction completion times range from 1 to 12 h.

Steps 2 through 5 convert compound 9 into a compound of the invention.

 $\begin{bmatrix} G \\ B \\ B \\ D \\ A \end{bmatrix}$

Boronic Acid Preparation Strategy #6

In Scheme 6, compound (I) wherein R¹ is H is converted into compound (I) wherein R¹ is alkyl by mixing with the corresponding alcohol, R¹OH. The suitable solvents include 15 tetrahydrofuran, 1,2-dimethoxyethane, 1,4-dioxane, toluene, combinations thereof and the like. The alcohol (R¹OH) can be used as the solvent as well. Reaction temperatures range from 20° C. to the boiling point of the solvent used; preferably between 50 and 100° C.; reaction completion ²⁰ times range from 1 to 12 h.

Boronic Acid Preparation Strategy #7

In Scheme 7, compound (Ia) is converted into its aminoalcohol complex (Ib). Compound (Ia) is treated with HOR¹NR^{1a}R^{1b}. The aminoalcohol can be used in quantities ranging from 1 to 10 equivalents relative to compound (Ia). Suitable solvents include methanol, ethanol, propanol, tetrahydrofuran, acetone, acetonitrile, 1,2-dimethoxyethane, 1,4-dioxane, toluene, N,N-dimethylformamide, water, combination thereof and the like. Reaction temperatures range from 20° C. to the boiling point of the solvent used; preferably between 50 and 100° C.; reaction completion times range from 1 to 24 h.

60 The compounds of the invention can be converted into hydrates and solvates by methods similar to those described above.

I. h.) Borinic Esters

Examples of how to prepare these compounds is shown below:

120

 ⁶⁵ Compounds 1-14 are produced by a final step (Lincecum, T. L. et al., *S. Molecular Cell*, 11: 951-963 (2003); Kim, B.-T. et al., *J. Bull. Korean Chem. Soc.*, 25: 243-248 (2004)):

Compounds 15-18 are produced by a final step (See Lincecum):

Methods for preparing dimers, trimers and higher homologs of small organic molecules, such as those of use in the present invention, as well as methods of functionalizing a polyfunctional framework molecule are well known to those of skill in the art. For example, an aromatic amine 55 of the invention is converted to the corresponding isothiocyanate by the action of thiophosgene. The resulting isothiocyanate is coupled to an amine of the invention, thereby forming either a homo- or heterodimeric species. Alternatively, the isothiocyanate is coupled with an amine-contain-60 ing backbone, such as polylysine, thereby forming a conjugate between a polyvalent framework and a compound of the invention. If it is desired to prepare a heterofunctionalized polyvalent species, the polylysine is underlabeled with the first isothiocyanate and subsequently labeled with one or 65 more different isothiocyanates. Alternatively, a mixture of isothiocyanates is added to the backbone. Purification pro122

ceeds by, for example, size exclusion chromatography, dialysis, nanofiltration and the like.

II. Assays for Inhibitors of tRNA Synthetase Editing Domains

Art-recognized techniques of genetics and molecular biology are of use to identify compounds that bind to and/or inhibit the editing domain of a tRNA synthetase. Moreover, these techniques are of use to distinguish whether a compound binds to and/or inhibits the synthetic domain, the editing domain, or both the editing and synthetic domains. In an exemplary assay, activity of a representative compound against the editing domain was confirmed. To identify the target of the novel boron-containing antifungal compound C10, mutants in S. cerevisiae showing resistance to compound C10 were isolated. Characterization of 11 mutants showed that they have an 8-64 fold increase in resistance to C10 over wildtype. The mutants were furthermore shown to be sensitive to various antifungal agents with known modes of action, suggesting that the cellular target of C10 is distinct from the target of the other antifungal agents. Isolation of three different plasmids bearing CDC60 from plasmid libraries generated from three independently isolated mutants implicated CDC60, the gene for the cytoplasmic leucyl-tRNA synthetase in resistance against C10. Sequence analysis of CDC60 from the 11 mutants revealed that the mutations were all located in the editing domain of this enzyme. In a further series of experiments, additional copies of the CDC60 gene were introduced in S. cerevisiae, which gave rise to an eight-fold increase in resistance to C10. These findings confirm a strong link between the editing activity of the enzyme and the inhibition of C10, 35 which entails a novel mechanism of tRNA synthetase inhibition

Assays to determine whether, and how effectively, a particular compound binds to and/or inhibits the editing domain of a selected tRNA synthetase are also set forth herein, and additional assays are readily available to those of skill in the art. Briefly, in an exemplary assay, an improperly charged tRNA and a tRNA synthetase that is capable of editing the improperly charged tRNA are combined. The resulting mixture is contacted with the putative inhibitor and the degree of editing inhibition is observed.

Another assay uses genetics to show that a drug works via the editing domain. In this assay, the compound is first tested against a strain of cells over-expressing copies of the tRNA synthetase gene. The compound's effect on the over-expressing strain is compared with a control strain to determine whether the compound is active against the synthetase. If the minimum inhibitory concentration (MIC) is 2-fold higher in the strain with extra copies of the synthetase gene than the MIC of the inhibitor against a wild type cell, a further genetic screen is conducted to determine whether the increased resistance is due to mutations in the editing domain. In this second screen, the control strain is challenged against a high concentration of the inhibitor. The colonies surviving the challenge are isolated and DNA from these cells is isolated. The editing domain is amplified using a proof-reading PCR enzyme and the appropriate primers. The PCR product can be purified using standard procedures. The sequence amplified mutant DNA is compared to wildtype. If the mutant DNA bears mutations in the editing domain, such results would suggest that the compound binds to the editing domain and affects the editing function of the molecule through this domain.

The assays set forth above are useful in essentially any microbial system, e.g., bacterial, fungal, parasitic, viral and the like.

Generally, the compounds to be tested are present in the assays in ranges from about 1 pM to about 100 mM, 5 preferably from about 1 pM to about 1 μ M. Other compounds range from about 1 nM to about 100 nM, preferably from about 1 nM to about 1 μ M.

The effects of the test compounds upon the function of the enzymes can also be measured by any suitable physiological 10 change. When the functional consequences are determined using intact cells or animals, one can also measure a variety of effects such as transmitter release, hormone release, transcriptional changes to both known and uncharacterized genetic markers, changes in cell metabolism such as cell 15 growth or pH changes, and changes in intracellular second messengers such as Ca²⁺, or cyclic nucleotides.

High throughput screening (HTS) is also of use in identifying promising candidates of the invention.

Utilizing the assays set forth herein and others readily 20 available in the art, those of skill in the art will be able to readily and routinely determine other compounds and classes of compounds that operate to bind to and/or inhibit the editing domain of tRNA synthetases.

In another aspect, the invention provides a method for 25 identifying a compound which binds to an editing domain of a tRNA synthetase comprising: a) contacting said editing domain with a test compound under conditions suitable for binding; and b) detecting binding of said test compound to said editing domain. In an exemplary embodiment, detecting 30 binding of said compound comprises use of at least one detectable element, isotope, or chemical label attached to said compound. In an exemplary embodiment, the element, isotope or chemical label is detected by a fluorescent, luminescent, radioactive, or absorbance readout. In an 35 exemplary embodiment, the contacting of said test compound with said editing domain also includes further contacting said test compound and said editing domain with a member selected from AMP and a molecule with a terminal adenosine. In an exemplary embodiment, said tRNA syn- 40 thetase is derived from a member selected from alanyl tRNA synthetase, isoleucyl tRNA synthetase, leucyl tRNA synthetase, methionyl tRNA synthetase, lysyl tRNA synthetase, phenylalanyl tRNA synthetase, prolyl tRNA synthetase, threonyl tRNA synthetase and valyl tRNA synthetase. In an 45 exemplary embodiment, the tRNA synthetase is derived from leucyl tRNA synthetase. In an exemplary embodiment, the tRNA synthetase is derived from a mutated tRNA synthetase, wherein said mutated tRNA synthetase comprises amino acid mutations in an editing domain. In another 50 exemplary embodiment, the mutated tRNA synthetase comprises amino acid mutations in the editing domain as listed in Table 4. In another exemplary embodiment, wherein said editing domain of a tRNA synthetase comprises the amino acid sequence of SEQ ID NOS: 1-15.

In another aspect, the invention provides a method for identifying a compound which binds to an editing domain of a tRNA synthetase, said assay comprising: a) contacting said editing domain of a tRNA synthetase with said compound under conditions suitable for binding of said compound with 60 said editing domain of a tRNA synthetase; b) comparing a biological activity of said editing domain of a tRNA synthetase contacting said compound to said biological activity when not contacting said compound; and c) identifying said compound as binding to said editing domain of a tRNA 65 synthetase if said biological activity of said editing domain of a tRNA synthetase is reduced when contacting said

124

compound. In an exemplary embodiment, the biological activity is hydrolysis of noncognate amino acid. In another exemplary embodiment, the hydrolysis of said noncognate amino acid is detected through the use of one or more labels. In another exemplary embodiment, the labels include a radiolabel, a fluorescent marker, an antibody, or a combination thereof. In another exemplary embodiment, said labels can be detected using spectroscopy. In another exemplary embodiment, the editing domain of a tRNA synthetase is derived from a member selected from alanyl tRNA synthetase, isoleucyl tRNA synthetase, leucyl tRNA synthetase, methionyl tRNA synthetase, lysyl tRNA synthetase, phenylalanyl tRNA synthetase, prolyl tRNA synthetase, threonyl tRNA synthetase and valyl tRNA synthetase. In another exemplary embodiment, said editing domain of a tRNA synthetase is derived from leucyl tRNA synthetase.

In another aspect, the invention provides a method of generating tRNA molecules with noncognate amino acid comprising: a) creating or isolating a mutated tRNA synthetase with altered amino acid editing domains; and b) contacting a tRNA molecule with said mutated tRNA synthetase and a noncognate amino acid. In another exemplary embodiment, the mutated tRNA synthetase contains one or more amino acid mutations in an editing domain. In another exemplary embodiment, the mutated tRNA synthetase is unable to bind with 1,3-dihydro-5-fluoro-1-hydroxy-2,1-benzoxaborole. In another exemplary embodiment, the mutated tRNA synthetase is able to bind with 1,3-dihydro-5-fluoro-1-hydroxy-2,1-benzoxaborole.

In another aspect, the invention provides a composition that comprises one or more tRNA molecules attached to noncognate amino acids, wherein said tRNA molecules are synthesized using one or more mutated tRNA synthetases isolated from a microorganism or a cell line derived from a microorganism. In an exemplary embodiment, the microorganism is a fungus or a yeast. In an exemplary embodiment, wherein said mutated tRNA synthetases contain amino acid mutations in their editing domains. In an exemplary embodiment, said mutated tRNA synthetases comprise point mutations in the editing domain as listed in Table 4.

III. Amino Acid and Nucleotide Sequences Used in Assays

tRNA Sequences that Interact with the tRNA Synthetase-C10-AMP Complex

Transfer RNAs (tRNAs) translate mRNA into a protein on a ribosome. Each transfer RNA contains an anti-codon region that hybridizes with mRNA, and an amino acid which
may be attached to the growing peptide. The structural gene of tRNA is about 72 to 90 nucleotides long and folds into a cloverleaf structure (Sharp S. J., Schaack J., Coolen L., Burke D. J. and Soll D., "Structure and transcription of eukaryotic tRNA genes", Crit. Rev. Biochem, 19:107 144
(1985); Geiduschek E. O., and Tocchini-Valentini, "Transcription by RNA polymerase III", Annu. Rev. Biochem. 57:873 914 (1988)).

In one embodiment, C10 contacts AMP and a tRNA synthetase, and the tRNA synthetase in turn contacts a tRNA molecule. In another embodiment, C10 contacts AMP from the tRNA molecules and a tRNA synthetase. The nucleotide sequence of the tRNA molecule can be determined by the identity of the tRNA synthetase involved. For example, for leucyl tRNA synthetase, the cognate tRNA molecule bound will be tRNA-leucine (SEQ ID NO: 3), but a noncognate tRNA, such as isoleucine, (SEQ ID NO: 4) may be bound under certain conditions. In this and other embodiments, the

25

term "noncognate" is meant to encompass both the singular and plural forms of the word, i.e. the phrase "noncognate amino acid" comprises one or more amino acids.

SEQ ID NO: 4 corresponds to the nucleotide sequence of the tRNA-Ile gene from *Saccharomyces cerevisiae*: gaaactataa ttcaattggt tagaatagta ttttgataag gtacaaatat aggttcaatc¹⁰ cctgttagtt tcatcca

Polypeptides Used in Binding and Inhibition Assays

In some binding and inhibition assays, it is more effective to use a portion of a tRNA synthetase molecule rather than the whole protein itself. In such assays, polypeptides derived ¹⁵ from tRNA synthetases are used in the experiment.

In one preferred embodiment, polypeptide fragments corresponding to the editing domain of a tRNA synthetase molecule are used in assay and binding experiments. Two such fragments are represented by SEQ ID NO: 1 and SEQ ²⁰ ID NO:2.

IV. Methods for Inhibiting the Editing Domain of tRNA Synthetase

According to another aspect of the invention, a method for binding to and/or inhibiting the editing domain of a tRNA 50 synthetase is provided which comprises contacting a tRNA synthetase with a compound that inhibits the editing domain under the conditions in which the tRNA synthetase interacts with its substrate to form an aminoacyl adenylate intermediate and, preferably, to form a charged tRNA. Such con- 55 ditions are known to those skilled in the art. In an exemplary embodiment, the compound is one described herein. The tRNA synthetase is contacted with an amount of inhibitor sufficient to result in a detectable amount of tRNA synthetase inhibition. This method can be performed on a tRNA 60 synthetase that is contained within an organism or which is outside an organism. In an exemplary embodiment, the method is performed on a tRNA synthetase that is contained within a microorganism or a microbial cell that is in, or on the surface of, a human or an animal. The method results in 65 a decrease in the amount of charged tRNA produced by the tRNA synthetase that has an inhibited editing domain. In an

exemplary embodiment, the inhibition takes place in a cell, such as a microbial cell. In another exemplary embodiment, the microbial cell is a bacteria, fungus, yeast or parasite. In another exemplary embodiment, the tRNA synthetase is a mitochondrial tRNA synthetase or a cytoplasmic tRNA synthetase.

In an exemplary embodiment, the invention provides a method of inhibiting conversion of a tRNA molecule into a charged tRNA molecule. The method involves contacting a tRNA synthetase with a compound effective to inhibit activity of an editing domain of said tRNA synthetase, under conditions sufficient to inhibit said activity, thereby inhibiting said conversion wherein the compound is a member selected from those compounds described herein. In an exemplary embodiment, the compound is a member selected from a cyclic boronic ester, cyclic borinic ester, 2'-amino ribofuranose moiety and a 3'-amino ribofuranose moiety. In an exemplary embodiment, the inhibition occurs within a cell, and the cell is a microbial cell. In another exemplary embodiment, the microbial cell is a member selected from a bacteria, fungus, yeast, and parasite. In an exemplary embodiment, the tRNA synthetase is a member selected from a mitochondrial tRNA synthetase and a cytoplasmic tRNA synthetase. In another exemplary embodiment, the tRNA synthetase is a member selected from alanyl tRNA synthetase, isoleucyl tRNA synthetase, leucyl tRNA syn-

thetase, methionyl tRNA synthetase, lysyl tRNA synthetase, phenylalanyl tRNA synthetase, prolyl tRNA synthetase, threonyl tRNA synthetase and valyl tRNA synthetase. In another exemplary embodiment, the compound has a

 30 K_{D, synthesis} of greater than 100 μM against a synthetic domain of said tRNA synthetase.

In certain embodiments, the mechanism of action of the compound is to inhibit the conversion of a tRNA molecule into a charged tRNA molecule by binding to and/or inhib-

³⁵ iting at least the editing domain of the synthetase. The compounds of use in this method may also inhibit or otherwise interact with the synthetic domain (e.g., the active site of the synthetic domain). In a presently preferred embodiment, the editing domain is inhibited selectively in

40 the presence of the synthetic domain. In a preferred embodiment, the synthetic domain is essentially uninhibited, while the editing domain is inhibited at least 50%, preferably at least 60%, more preferably at least 70%, still more preferably, at least 80% and even still more preferably at least 90%

⁴⁵ of the activity of the tRNA synthetase. In another preferred embodiment, the synthetic domain is inhibited by at most 50%, preferably at most 30%, preferably at most 20%, 10%, preferably at most 8%, more preferably at most 5%, still more preferably, at most 3% and even still more preferably
⁵⁰ at most 1%. Inhibition of the entiting domain produces a decrease in the amount of the properly charged tRNA which results in retardation or cessation of cell growth and division.

In another exemplary embodiment, the ratio of a minimum concentration of said compound inhibiting said editing domain to a minimum concentration of said compound inhibiting said synthetic domain of said tRNA synthetase, represented as $K_{D, edit}/K_{D, synthesis}$ is less than one. In another exemplary embodiment, the $K_{D, edit}/K_{D, synthesis}$ of the compound is a member selected from less than 0.5, less than 0.1 and less than 0.05.

V. Methods of Inhibiting Microorganism Growth or Killing Microorganisms

In a further aspect, the invention provides a method for inhibiting the growth, or killing, a microorganism, preferCase 1:18-cv-00202-IMK Document 1-3 Filed 10/30/18 Page 144 of 241 PageID #: 641

127

ably a bacteria, fungus, virus, yeast or parasite, comprising contacting the microorganism with an inhibitor of a tRNA synthetase, e.g., a compound described by a formula listed herein, under conditions which permit entry of the compound into the organism. In a further aspect, the invention 5 provides a method for inhibiting the growth, or killing, a microorganism, preferably a bacteria, fungus, virus, yeast or parasite, comprising contacting the microorganism with a compound which is a member selected from Formulae (I), (Ia), (Ib), (Ic), (Id) (Ie), (If), (Ig), (Ih) (Ii), (Ij), (Ik), (Il) (Im), 10 (In), (Io), (Ip) (Iq), (Ir), (Is), (It), (Iu), (Iv), (Iw), (Ix) (Iy), (Iz), (Iaa), (Iab), (Iac), (Iad), (Iae), (Iaf), (Iag), (Iah), (Iai), (Iaj), (Iak), (II), (IIa), (IIb), (IIc), (IId), (III), (VIII), (VIIIa), (VIIIb), (VIIIc), (VIIId), (VIIIe), (IX) e.g., a compound described by a formula listed herein, under conditions which 15 permit entry of the compound into the organism. In a further aspect, the invention provides a method for inhibiting the growth, or killing, a microorganism, preferably a bacteria. fungus, virus, yeast or parasite, comprising contacting the either FIG. 19 or FIG. 20 e.g., a compound described by a formula listed herein, under conditions which permit entry of the compound into the organism. In an exemplary embodiment, the compound inhibits the tRNA synthetase tions are known to one skilled in the art and specific conditions are set forth in the Examples appended hereto. This method involves contacting a microbial cell with a therapeutically-effective amount of an editing domain inhibitor to inhibit tRNA synthetase in vivo or in vitro.

In another aspect, the invention provides a method of inhibiting the growth of a microorganism, or killing a microorganism, or both, comprising contacting the microorganism with a compound described herein. Microorganteria and parasites. In another exemplary embodiment, the microorganism is inside, or on the surface of an animal. In an exemplary embodiment, the animal is a member selected from human, cattle, deer, reindeer, goat, honey bee, pig, sheep, horse, cow, bull, dog, guinea pig, gerbil, rabbit, cat, 40 camel, yak, elephant, ostrich, otter, chicken, duck, goose, guinea fowl, pigeon, swan, and turkey. In another exemplary embodiment, the animal is a human.

In an exemplary embodiment, the microorganism is a member selected from a fungus and a yeast. In another 45 exemplary embodiment, the fungus or yeast is a member selected from Candida species, Trichophyton species, Microsporium species, Aspergillus species, Cryptococcus species, Blastomyces species, Cocciodiodes species, Histoplasma species, Paracoccidioides species, Phycomycetes 50 species, Malassezia species, Fusarium species, Epidermophyton species, Scytalidium species, Scopulariopsis species, Alternaria species, Penicillium species, Phialophora species, Rhizopus species, Scedosporium species and Zygomycetes class. In another exemplary embodiment, the fungus or 55 yeast is a member selected from Aspergilus fumigatus (A. fumigatus), Blastomyces dermatitidis, Candida Albicans (C. albicans, both fluconazole sensitive and resistant strains), Candida glabrata (C. glabrata), Candida krusei (C. krusei), Cryptococcus neoformans (C. neoformans), Candida parapsilosis (C. parapsilosis), Candida tropicalis (C. tropicalis), Cocciodiodes immitis, Epidermophyton floccosum (E. floccosum), Fusarium solani (F. solani), Histoplasma capsulatum, Malassezia furfur (M. furfur), Malassezia pachydermatis (M. pachydermatis), Malassezia sympodialis (M. 65 sympodialis), Microsporum audouinii (M. audouinii), Microsporum canis (M. canis), Microsporum gypseum (M.

128

gypseum), Paracoccidioides brasiliensis and Phycomycetes spp, Trichophyton mentagrophytes (T. mentagrophytes), Trichophyton rubrum (T. rubrum), Trichophyton tonsurans (T. tonsurans). In another exemplary embodiment, the fungus or yeast is a member selected from Trichophyton concentricum, T. violaceum, T. schoenleinii, T. verrucosum, T. soudanense, Microsporum gypseum, M. equinum, Candida guilliermondii, Malassezia globosa, M. obtuse, M. restricta, M. slooffiae, and Aspergillus flavus. In another exemplary embodiment, the fungus or yeast is a member selected from dermatophytes, Trichophyton, Microsporum, Epidermophyton and yeast-like fungi.

In an exemplary embodiment, the microorganism is a bacteria. In an exemplary embodiment, the bacteria is a gram-positive bacteria. In another exemplary embodiment, the gram-positive bacteria is a member selected from Staphylococcus species, Streptococcus species, Bacillus species, Mycobacterium species, Corynebacterium species (Propionibacterium species), Clostridium species, Actinomicroorganism with a compound which is described in 20 myces species, Enterococcus species and Streptomyces species. In another exemplary embodiment, the bacteria is a gram-negative bacteria. In another exemplary embodiment, the gram-negative bacteria is a member selected from Acinetobacter species, Neisseria species, Pseudomonas species, through the editing domain of the synthetase. Such condi- 25 Brucella species, Agrobacterium species, Bordetella species, Escherichia species, Shigella species, Yersinia species, Salmonella species, Klebsiella species, Enterobacter species, Haemophilus species, Pasteurella species, Streptobacillus species, spirochetal species, Campylobacter species, 30 Vibrio species and Helicobacter species. In another exemplary embodiment, the bacterium is a member selected from Propionibacterium acnes; Staphylococcus aureus; Staphylococcus epidermidis, Staphylococcus saprophyticus; Streptococcus pyogenes; Streptococcus agalactiae; Streptococisms are members selected from fungi, yeast, viruses, bac- 35 cus pneumoniae; Enterococcus faecalis; Enterococcus faecium; Bacillus anthracis; Mycobacterium avium-intracellulare; Mycobacterium tuberculosis, Acinetobacter baumanii; Corynebacterium diphtheria; Clostridium perfrin-Clostridium botulinum; Clostridium tetani; gens; Clostridium difficile; Neisseria gonorrhoeae; Neisseria meningitidis; Pseudomonas aeruginosa; Legionella pneumophila; Escherichia coli; Yersinia pestis; Haemophilus influenzae; Helicobacter pylori; Campylobacter fetus; Campylobacter jejuni; Vibrio cholerae; Vibrio parahemolyticus; Treponema pallidum; Actinomyces israelii; Rickettsia prowazekii; Rickettsia rickettsii; Chlamydia trachomatis; Chlamydia psittaci; Brucella abortus; Agrobacterium tumefaciens; and Francisella tularensis.

In an exemplary embodiment, the microorganism is a bacteria, which is a member selected from acid-fast bacterium, including Mycobacterium species; bacilli, including Bacillus species, Corvnebacterium species (also Propionibacterium) and Clostridium species; filamentous bacteria, including Actinomyces species and Streptomyces species; bacilli, such as Pseudomonas species, Brucella species, Agrobacterium species, Bordetella species, Escherichia species, Shigella species, Yersinia species, Salmonella species, Klebsiella species, Enterobacter species, Haemophilus species, Pasteurella species, and Streptobacillus species; spirochetal species, Campylobacter species, Vibrio species; and intracellular bacteria including Rickettsiae species and Chlamydia species.

In an exemplary embodiment, the microorganism is a virus. In an exemplary embodiment, the virus is a member selected from hepatitis A-B, human rhinoviruses, Yellow fever virus, human respiratory coronaviruses, Severe acute respiratory syndrome (SARS), respiratory syncytial virus,

129

influenza viruses, parainfluenza viruses 1-4, human immunodeficiency virus 1 (HIV-1), human immunodeficiency virus 2 (HIV-2), Herpes simplex virus 1 (HSV-1), Herpes simplex virus 2 (HSV-2), human cytomegalovirus (HCMV), Varicella zoster virus, Epstein-Barr (EBV), polioviruses, ⁵ coxsackieviruses, echoviruses, rubella virus, neurodermatropic virus, variola virus, papoviruses, rabies virus, dengue virus, West Nile virus and SARS virus. In another exemplary embodiment, the virus is a member selected from picornaviridae, flaviviridae, coronaviridae, paramyxoviridae, ¹⁰ orthomyxoviridae, retroviridae, herpesviridae and hepadnaviridae. In another exemplary embodiment, the virus is a member selected from a virus included in the following table:

TABLE A

	Viruses	-
Vinis Category	Pertinent Human Infections	_
	RNA Viruses	_
Picomaviridae	Polio Human hepatitis A Human rhinovirus	
Togaviridae and Flaviviridae	Rubella - German measles	
Coronaviridae	Yellow fever Human respiratory coronavirus (HCV) Severe acute respiratory syndrome (SAR)	
Rhabdoviridae Paramyxoviridae	Lyssavirus - Rabies Paramyxovirus - Mumps Morbillvirus - measles

VI. Methods of Treating or Preventing Infections

In another aspect, the invention provides a method of treating or preventing an infection. The method includes administering to the animal a therapeutically effective amount of the compound of the invention, sufficient to treat or prevent said infection. In an exemplary embodiment, the compound is a compound described herein. In another exemplary embodiment, the compound has a structure according to Formulae (I) to (Iak) and (II) to (XI). In another exemplary embodiment, the compound has a structure which is described in FIG. 19. In another exemplary 20 embodiment, the compound has a structure which is described in FIG. 20. In another exemplary embodiment, the animal is a member selected from human, cattle, deer, reindeer, goat, honey bee, pig, sheep, horse, cow, bull, dog, guinea pig, gerbil, rabbit, cat, camel, yak, elephant, ostrich, 25 otter, chicken, duck, goose, guinea fowl, pigeon, swan, and turkey. In another exemplary embodiment, the animal is a

human. In another exemplary embodiment, the animal is a human. In another exemplary embodiment, the animal is a member selected from a human, cattle, goat, pig, sheep, horse, cow, bull, dog, guinea pig, gerbil, rabbit, cat, chicken

⁰ and turkey. In another exemplary embodiment, the infection is a member selected from a systemic infection, a cutaneous infection, and an ungual, periungual or subungual infection. In another exemplary embodiment, the treatment of a disorder or condition occurs through inhibition of an editing

domain of an aminoacyl tRNA synthetase. VI. a) Methods of Treating of Preventing Ungual and/or Periungual Infections

In another aspect, the invention provides a method of treating or preventing an ungual and/or periungual infection. The method includes administering to the animal a therapeutically effective amount of a compound or pharmaceutical formulation of the invention, sufficient to treat or prevent said infection. In another exemplary embodiment, the method includes administering the compound or pharmaceutical formulation of the invention at a site which is a member selected from the skin, nail hair hoof claw and the

member selected from the skin, nail, hair, hoof, claw and the skin surrounding the nail, hair, hoof and claw. VI. a) 1) Onychomycosis

50 Onychomycosis is a disease of the nail caused by yeast, dermatophytes, or other molds, and represents approximately 50% of all nail disorders. Toenail infection accounts for approximately 80% of onychomycosis incidence, while fingernails are affected in about 20% of the cases. Dermato-55 phytes are the most frequent cause of nail plate invasion, particularly in toenail onychomycosis. Onychomycosis caused by a dermatophyte is termed Tinea unguium. Trichophyton rubrum is by far the most frequently isolated dermatophyte, followed by T. mentagrophytes. Distal sub-60 ungual onychomycosis is the most common presentation of tinea unguium, with the main site of entry through the hyponychium (the thickened epidermis underneath the free distal end of a nail) progressing in time to involve the nail bed and the nail plate. Discoloration, onycholysis, and accumulation of subungual debris and nail plate dystrophy characterize the disease. The disease adversely affects the quality of life of its victims, with subject complaints ranging

10

from unsightly nails and discomfort with footwear, to more serious complications including secondary bacterial infections.

Many methods are known for the treatment of fungal infections, including the oral and topical use of antibiotics 5 (e.g., nystatin and amphotericin B), imidazole anti-fungal agents such as miconazole, clotrimazole, fluconazole, econazole and sulconazole, and non-imidazole fungal agents such as the allylamine derivatives terbinafine and naftifine, and the benzylamine butenafine.

However, onychomycosis has proven to be resistant to most treatments. Nail fungal infections reside in an area difficult to access by conventional topical treatment and anti-fungal drugs cannot readily penetrate the nail plate to reach the infection sites under the nail. Therefore, onycho- 15 mycosis has traditionally been treated by oral administration of anti-fungal drugs; however, clearly this is undesirable due to the potential for side effects of such drugs, in particular those caused by the more potent anti-fungal drugs such as itraconazole and ketoconazole. An alternative method of 20 treatment of onvchomycosis is by removal of the nail before treating with a topically active anti-fungal agent; such a method of treatment is equally undesirable. Systemic antimycotic agents require prolonged use and have the potential for significant side effects. Topical agents have usually been 25 of little benefit, primarily because of poor penetration of the anti-fungal agents into and through the nail mass.

In an exemplary embodiment, the invention provides a method of treating or preventing onychomycosis. The method includes administering to a human or an animal a 30 therapeutically effective amount of a compound of the invention, or a pharmaceutical formulation of the invention, sufficient to treat or prevent onychomycosis. In another exemplary embodiment, the method includes administering the pharmaceutical formulation of the invention at a site 35 which is a member selected from the skin. nail, hair, hoof, claw and the skin surrounding the nail, hair, hoof and claw. In another exemplary embodiment, the pharmaceutical formulation includes a compound described herein. The method includes administering to a human or an animal a 40 therapeutically effective amount of 1,3-dihydro-5-fluoro-1hydroxy-2,1-benzoxaborole, sufficient to treat or prevent onychomycosis.

VI. a) 2) Other Unugal and Periungual Infections

In an exemplary embodiment, the invention provides a 45 method of treating or preventing an ungual or periungual infection in a human or an animal. This method comprising administering to the human or the animal a therapeutically effective amount of a compound of the invention, thereby treating or preventing the ungual or periungual infection. In 50 an exemplary embodiment, the ungual or periungual infection is onychomycosis. In an exemplary embodiment, the ungual or periungual infection is a member selected from: onychomycosis, chloronychia, paronychias, erysipeloid, onychorrhexis, gonorrhea, swimming-pool granuloma, larva 55 migrans, leprosy, Orf nodule, milkers' nodules, herpetic whitlow, acute bacterial perionyxis, chronic perionyxis, sporotrichosis, syphilis, tuberculosis verrucosa cutis, tularemia, tungiasis, peri- and subungual warts, zona, nail dystrophy (trachyonychia), and dermatological diseases 60 with an effect on the nails, such as psoriasis, pustular psoriasis, alopecia aerata, parakeratosis pustulosa, contact dermatosis, Reiter's syndrome, psoriasiform acral dermatitis, lichen planus, idiopathy atrophy in the nails, lichin nitidus, lichen striatus, inflammatory linear verrucous epi- 65 dermal naevus (ILVEN), alopecia, pemphigus, bullous pemphigoid, acquired epidermolysis bullosa, Darier's disease,

pityriasis rubra pilaris, palmoplantar keratoderma, contact eczema, polymorphic erythema, scabies, Bazex syndrome, systemic scleroderma, systemic lupus erythematosus, chronic lupus erythematosus, dermatomyositus.

The compounds and pharmaceutical formulations of the invention useful for ungual and periungual applications also find application in the cosmetics field, in particular for the treatment of irregularities of the nails, koilonychias, Beau's lines, longitudinal ridging, ingrown nails.

In an exemplary embodiment, the infection is of the skin, nail, hair, claw or hoof, hair, ear and eye and is a member selected from Sporotrichosis, Mycotic keratitis, Extension oculomycosis, Endogenous oculomycosis, Lobomycosis, Mycetoma, Piedra, Pityriasis versicolor. Tinea corporis, Tinea cruris, Tinea pedis, Tinea barbae, Tinea capitis, Tinea nigra, Otomycosis, Tinea favosa, Chromomycosis, and Tinea Imbricata. In an exemplary embodiment, the compound useful for treating these infections is 1,3-dihydro-5fluoro-1-hydroxy-2,1-benzoxaborole.

VI. b) Methods of Treating Systemic Diseases

In another aspect, the invention provides a method of treating a systemic disease. The method involves contacting an animal with a compound of the invention. The method of delivery for treatment of systemic disesases can be oral, intravenous, transdermal, inhalation, intraperitoneal, and subcutaneous. In an exemplary embodiment, the compound administered is 1,3-dihydro-5-fluoro-1-hydroxy-2,1-benzoxaborole.

In an exemplary embodiment, the infection is systemic and is a member selected from candidiasis, aspergillosis, coccidioidomycosis, cryptococcosis, histoplasmosis, blastomycosis, paracoccidioidomycosis, zygomycosis, phaeohyphomycosis and rhinosporidiosis.

VI. c) Methods of Treating Diseases Involving Viruses

The compounds of the invention are useful for the treatment of diseases of both animals and humans, involving viruses. In an exemplary embodiment, the disease is a member selected from hepatitis A-B-C, yellow fever, respiratory syncytial, influenza, AIDS, herpes simplex, chicken pox, varicella zoster, and Epstein-Barr disease.

VI. d) Methods of Treating Diseases Involving Parasites

The compounds of the invention are useful for the treatment of diseases of both animals and humans, involving parasites. In an exemplary embodiment, the disease is a member selected from malaria, Chagas' disease, Leishmaniasis, African sleeping sickness (African human trypanosomiasis), giardiasis, toxoplasmosis, amebiasis and cryptosporidiosis.

In any of the methods according to the present invention set forth above, it is preferred that the aminoacyl tRNA synthetase is an aminoacyl tRNA synthetase comprising an editing domain. The editing domain is encoded by a portion of the aminoacyl tRNA synthetase involved in proofreading. The editing domain is preferably encoded by a DNA portion having at least conserved residues compared after alignment with the editing site of the leucyl-tRNA synthetase, valyltRNA synthetase and isoleucyl-tRNA synthetase. More preferably the synthetase is selected from the group consisting of the valyl-tRNA synthetase, isoleucyl-tRNA synthetase, leucyl-tRNA synthetase, alanyl-tRNA synthetase, prolyltRNA synthetase, threonyl-tRNA synthetase, phenyl-tRNA synthetase and lysyl-tRNA synthetase which are known to have an editing site or domain (see for Ile R S Baldwin, A. N. and Berg, P. (1966) J. Biol. Chem. 241, 839-845 and Eldred, E. W. and Schimmel, P. R. (1972) J. Biol. Chem. 247, 2961-2964; for Val R S, Fersht, A. R. and Kaethner, M. M. VII. Methods of Nail Penetration

It is believed that poor penetration of the active agent through the hoof or nail plate and/or excessive binding to 15 keratin, (the major protein in nails and hair) are the reasons for the poor efficacy of 8% ciclopirox w/w in commercial lacquer and other topical treatments that have failed in clinical trials. In mild cases of onychomycosis, the pathogenic fungi reside in the nail plate only. In moderate to 20 severe cases the pathogenic fungi establish a presence in the nail plate and in the nail bed. If the infection is cleared from the nail plate but not from the nail bed, the fungal pathogen can re-infect the nail plate. Therefore, to effectively treat onychomycosis, the infection must be eliminated from the 25 nail plate and the nail bed. To do this, the active agent must penetrate and disseminate substantially throughout the nail plate and nail bed.

It is believed that in order for an active agent to be effective once disseminated throughout the infected area, it 30 must be bioavailable to the fungal pathogen and cannot be so tightly bound to keratin that the drug cannot inhibit growth or kill the infecting fungi.

An understanding of the morphology of the nail plate suggests certain physicochemical properties of an active 35 agent that would facilitate penetration of the nail plate. The desired physicochemical properties are described throughout. The tested compounds of the present invention are able to penetrate the nail plate and were also active against *Trichophyton rubrum* and *mentagrophytes* and other species. 40 In addition, the tested compounds are also active against *Trichophyton rubrum* in the presence of 5% keratin powder.

In an exemplary embodiment, the invention provides a method of killing or inhibiting growth of a microorganism present in a human nail unit, wherein said human nail unit 45 comprises a nail plate. The method comprising contacting a dorsal layer of the nail plate with a compound capable of penetrating the nail plate, traveling through the nail plate to a nail bed underlying said nail plate, and contacting said microorganism, under conditions sufficient for said com- 50 pound to penetrate said nail plate. In this embodiment, the compound has a molecular weight of between about 100 Da and about 200 Da, a log P value of between about 1.0 and about 2.6, a water solubility greater than about 0.1 mg/mL octanol/saturated water, and an MIC of less than 16 µg/mL 55 against said microorganism, thereby killing or inhibiting the growth of said microorganism.

In an exemplary embodiment, the compound has a structure according to Formula (I) described herein. In another exemplary embodiment, the compound has a structure 60 according to Formula (Ia)-(Iaa) described herein. In another exemplary embodiment, the compound has a structure according to a member selected from Formula (I)-(Iaa), wherein \mathbb{R}^{9a} , \mathbb{R}^{10a} , \mathbb{R}^{11a} and \mathbb{R}^{12a} are members independently selected from members independently selected from 65 H, halogen, cyano, nitro, substituted or unsubstituted methoxy, substituted or unsubstituted methyl, substituted or

134

unsubstituted ethoxy, substituted or unsubstituted ethyl, trifluoromethyl, substituted or unsubstituted hydroxymethyl, substituted or unsubstituted hydroxyalkyl, substituted or unsubstituted benzyl, substituted or unsubstituted phenyl, substituted or unsubstituted phenyloxy, substituted or unsubstituted phenyl methoxy, substituted or unsubstituted thiophenyloxy, substituted or unsubstituted pyridinyloxy, substituted or unsubstituted pyrimidinyloxy, substituted or unsubstituted benzylfuran, substituted or unsubstituted methylthio, substituted or unsubstituted mercaptomethyl, substituted or unsubstituted mercaptoalkyl, substituted or unsubstituted phenylthio, substituted or unsubstituted thiophenylthio, substituted or unsubstituted phenyl methylthio, substituted or unsubstituted pyridinylthio, substituted or unsubstituted pyrimidinylthio, substituted or unsubstituted benzylthiofuranyl, substituted or unsubstituted phenylsulfonyl, substituted or unsubstituted benzylsulfonyl, substituted or unsubstituted phenylmethylsulfonyl, substituted or unsubstituted thiophenylsulfonyl, substituted or unsubstituted pyridinylsulfonyl, substituted or unsubstituted pyrimidinvlsulfonvl, substituted or unsubstituted sulfonamidyl, substituted or unsubstituted phenylsulfinyl, substituted or unsubstituted benzylsulfinyl, substituted or unsubstituted phenylmethylsulfinyl, substituted or unsubstituted thiophenylsulfinyl, substituted or unsubstituted pyridinylsulfinyl, substituted or unsubstituted pyrimidinylsulfinyl, substituted or unsubstituted amino, substituted or unsubstituted alkylamino, substituted or unsubstituted dialkylamino, substituted or unsubstituted trifluoromethylamino, substituted or unsubstituted aminomethyl, substituted or unsubstituted alkylaminomethyl, substituted or unsubstituted dialkylaminomethyl, substituted or unsubstituted arylaminomethyl, substituted or unsubstituted benzylamino, substituted or unsubstituted phenylamino, substituted or unsubstituted thiophenylamino, substituted or unsubstituted pyridinylamino, substituted or unsubstituted pyrimidinylamino, substituted or unsubstituted indolyl, substituted or unsubstituted morpholino, substituted or unsubstituted alkylamido. substituted or unsubstituted arylamido, substituted or unsubstituted ureido, substituted or unsubstituted carbamoyl, and substituted or unsubstituted piperizinyl. In another exemplary embodiment, R^{9a} , R^{10a} , R^{11a} and R^{12a} are members independently selected from H, fluoro, chloro, bromo, nitro, cyano, amino, methyl, hydroxylmethyl, trifluoromethyl, methoxy, trifluoromethyoxy, ethyl, diethylcarbamoyl, pyridin-2-yl, pyridin-3-yl, pyridin-4-yl, pyrimidinyl, piperizino, piperizinyl, piperizinocarbonyl, piperizinylcarbonyl, carboxyl, 1-tetrazolyl, 1-ethoxycarbonylmethoxy, carboxymethoxy, thiophenyl, 3-(butylcarbonyl) phenylmethoxy, 1H-tetrazol-5-yi, 1-ethoxycarbonylmethyloxy-, 1-ethoxycarbonylmethyl-, 1-ethoxycarbonyl-, carboxymethoxy-, thiophen-2-yl, thiophen-2-ylthio-, thiophen-3-yl, thiophen-3-ylthio, 4-fluorophenylthio, butylcarbonylphenylmethoxy, butylcarbonylphenylmethyl, butylcarbonylmethyl, 1-(piperidin-1-yl)carbonyl)methyl, 1-(piperidin-1-yl)carbonyl)methoxy, 1-(piperidin-2-yl)carbonyl)methoxy, 1-(piperidin-3-yl)carbonyl)methoxy, 1-(4-(pyrimidin-2-yl)piperazin-1-yl)carbonyl)methoxy, 1-(4-(pyrimidin-2-yl)piperazin-1-yl)carbonyl)methyl, 1-(4-(pyrimidin-2-yl)piperazin-1-yl)carbonyl, 1-4-(pyrimidin-2yl)piperazin-1-yl, 1-(4-(pyridin-2-yl)piperazin-1-yl) carbonyl), 1-(4-(pyridin-2-yl)piperazin-1-yl) carbonylmethyl, (1-(4-(pyridin-2-yl)piperazin-1-yl) carbonyl)-methoxy), 1-(4-(pyridin-2-yl)piperazin-1-yl, 1H-indol-1-yl, morpholino-, morpholinyl, morpholinocar-

bonyl, morpholinylcarbonyl, phenylureido, phenylcarbamoyl, acetamido, 3-(phenylthio)-1H-indol-1-yl, 3-(2-cyano15

ethylthio)-1H-indol-1-yl, benzylamino, 5-methoxy-3-(phenylthio)-1H-indol-1-yl, 5-methoxy-3-(2cyanoethylthio)-1H-indol-1-yl)), 5-chloro-1H-indol-1-yl, 5-chloro-3-(2-cyanoethylthio)-1H-indol-1-yl)), dibenzylamino, benzylamino, 5-chloro-3-(phenylthio)-1H-indol-1yi)), 4-(1H-tetrazol-5-yl)phenoxy, 4-(1H-tetrazol-5-yl)phenyl, 4-(1H-tetrazol-5-yl)phenylthio, 2-cyanophenoxy, 3-cyanophenoxy, 4-cyanophenoxy, 2-cyanophenylthio, 3-cyanophenylthio, 4-cyanophenylthio, 2-chlorophenoxy, 3-chlorophenoxy, 4-chlorophenoxy, 2-fluorophenoxy, 3-fluorophenoxy, 4-fluorophenoxy, 2-cyanobenzyloxy, 3-cyanobenzyloxy, 4-cyanobenzyloxy, 2-chlorobenzyloxy, 3-chlorobenzyloxy, 4-chlorobenzyloxy, 2-fluorobenzyloxy, 3-fluorobenzyloxy, and 4-fluorobenzyloxy. In another exemplary embodiment, wherein R^{9a} is H and R^{12a} is H. In another exemplary embodiment, the compound is 1,3-dihydro-5-fluoro-1-hydroxy-2,1-benzoxaborole.

In another exemplary embodiment, the invention provides a method of treating a disease caused by a microorganism 20 present in a human nail unit, wherein said human nail unit comprises a nail plate, said method comprising; contacting a dorsal layer of the nail plate with a compound capable of penetrating the nail plate, traveling through the nail plate to a nail bed underlying said nail plate, and contacting said 25 pound has a water solubility between about 0.1 mg/mL to 1 microorganism, under conditions sufficient for said compound to penetrate said nail plate and to treat said disease. In this embodiment, the compound has a molecular weight of between about 100 Da and about 200 Da; a log P value of between about 1.0 and about 2.6; a water solubility 30 greater than about 0.1 mg/mL octanol/saturated water, and an MIC of less than 16 µg/mL against said microorganism, thereby treating said disease. In an exemplary embodiment, the compound has a structure according to Formula (I) described herein. In another exemplary embodiment, the 35 compound has a structure which is a member selected from Formula (Ia)-(Iaa) described herein.

In another aspect, the invention provides a method of delivering a compound from the dorsal layer of the nail plate to the nail bed. This method comprises contacting the cell 40 with a compound capable of penetrating the nail plate, under conditions sufficient to penetrate the nail. The compound has a molecular weight of between about 100 and about 200 Da. The compound also has a log P value of between about 1.0 and about 2.6. The compound additionally has a water 45 solubility between about 0.1 mg/mL and 1 g/mL octanol/ saturated water, thereby delivering said compound.

In a preferred embodiment, the physicochemical properties of the compound of the invention, described by quantities predictive for migration of the compound through the 50 nail plate, including, but not limited to, molecular weight, log P and solubility in water, and the like, are effective to provide substantial penetration of the nail plate.

Compounds with a molecular weight of less than 200 Da penetrate the nail plate in a manner superior to the commer- 55 cially available treatment for onychomycosis. In one embodiment of the present invention the compound has a molecular weight of between 130 and 200. In another embodiment of this invention, the compound has a molecular weight of from about 140 to about 200 Da. In another 60 embodiment of this invention, the compound has a molecular weight of from about 170 to about 200 Da. In another embodiment of this invention, the compound has a molecular weight of from about 155 to about 190 Da. In another embodiment of this invention, the compound has a molecu- 65 lar weight of from about 165 to about 185 Da. In another embodiment of this invention, the compound has a molecu-

lar weight of from about 145 to about 170 Da. In yet another embodiment the molecular weight is either 151.93 or 168.39 Da.

In one embodiment of the present invention the compound has a log P value of between about -3.5 to about 2.5. In another exemplary embodiment, the compound has a log P value of from about -1.0 to about 2.5. In another exemplary embodiment, the compound has a log P value of from about -1.0 to about 2.0. In another exemplary embodiment, the compound has a log P value of from about -0.5 to about 2.5. In another exemplary embodiment, the compound has a log P value of from about -0.5 to about 1.5. In another exemplary embodiment, the compound has a log P value of from about 0.5 to about 2.5. In another exemplary embodiment, the compound has a log P value of from about 1.0 to about 2.5. In yet another exemplary embodiment, the compound has a log P value of 1.9 or 2.3.

Also contemplated by the present invention is a compound with a log P value less then 2.5, with a molecular weight less than 200 Da, that are still able to penetrate the nail plate.

In one embodiment of the present invention the comg/mL in octanol saturated water. In one embodiment of the present invention the compound has a water solubility of between 0.1 mg/mL and 100 mg/mL. In another embodiment of this invention, the compound has a water solubility of from about 0.1 mg/mL and 10 mg/mL. In another embodiment of this invention, the compound has a water solubility of from about 0.1 mg/mL and 1 mg/mL. In another embodiment of this invention, the compound has a water solubility of from about 5 mg/mL and 1 g/mL. In another embodiment of this invention, the compound has a water solubility of from about 10 mg/mL and 500 g/mL. In another embodiment of this invention, the compound has a water solubility of from about 80 mg/mL and 250 mg/mL.

In an exemplary embodiment, the present invention provides a compound with a log P value selected from a range above, with a molecular weight selected from a range above. that are still able to penetrate the nail plate.

In an exemplary embodiment, the present invention provides compounds with a molecular weight selected from a range above, with a water solubility selected from a range above, that are still able to penetrate the nail plate.

In an exemplary embodiment, the present invention provides compounds with a log P selected from a range above, with a water solubility selected from a range above, that are still able to penetrate the nail plate.

In an exemplary embodiment, the present invention provides compounds with a molecular weight selected from a range above, with a log P selected from a range above, and with a water solubility selected from a range above, that are still able to penetrate the nail plate.

Penetration of the nail by the active ingredient may be effected by the polarity of the formulation. However, the polarity of the formulation is not expected have as much influence on nail penetration as some of the other factors, such as the molecular weight or the log P of the active ingredient. The presence of penetration enhancing agents in the formulation is likely to increase penetration of the active agent when compared to similar formulations containing no penetration enhancing agent.

Some examples of molecules with optimal physicochemical properties are given in the table below.

Compound 3 below is an example of a compound similar in molecular weight to ciclopirox, and like ciclopirox, penetrates the nail plate poorly.

In a preferred embodiment the topical formulations including a compound described herein has a total molecular weight of less than 200 Da, has a Log P of less than 2.5, and a minimum inhibitory concentration against Trichophyton rubrum that is substantially unchanged in the presence of 5% keratin. 50

The efficacy coefficient (defined as flux over MIC) of a compound also informs one of skill regarding whether the compound may be effective in killing a microorganism, inhibiting the growth of a microorganism, or treating a disease which is caused by a microorganism present in a 55 excipient; and (b) a compound having a structure according human nail unit, wherein said human nail unit comprises a nail plate. The method comprises: contacting a dorsal layer of the nail plate with a compound capable of penetrating the nail plate, traveling through the nail plate to a nail bed underlying said nail plate, and contacting said microorgan- 60 ism, under conditions sufficient for said compound to penetrate said nail plate and to treat said disease, wherein the compound has an efficacy coefficient above 10.

In an exemplary embodiment, the compound has an efficacy coefficient between about 10 and about 1000. In an 65 exemplary embodiment, the compound has an efficacy coefficient between about 30 and about 100. In an exemplary

138

embodiment, the compound has an efficacy coefficient between about 100 and about 500. In an exemplary embodiment, the compound has an efficacy coefficient between about 25 and about 200.

This invention is still further directed to methods for treating a fungal infection mediated at least in part by dermatophytes, Trichophyton, Microsporum or Epidermophyton species, or a yeast-like fungi including Candida species, in a human or an animal, which methods comprise administering to a human or an animal, that has been diagnosed with said fungal infection or is at risk of developing said fungal infection, a pharmaceutical composition comprising a pharmaceutically acceptable diluent and a therapeutically effective amount of a compound described herein or mixtures of one or more of such compounds. In one embodiment the infection is onychomycosis.

Compounds contemplated by the present invention may have broad spectrum antifungal activity and as such may be candidates for use against other cutaneous fungal infections.

The methods provided in this aspect of the invention are useful in the penetration of nails and hoofs, as well as the treatment of ungual and periungual conditions.

VIII. Pharmaceutical Formulations

In another aspect, the invention is a pharmaceutical formulation which includes: (a) a pharmaceutically acceptable excipient; and (b) a compound of the invention. In another aspect, the invention is a pharmaceutical formulation which includes: (a) a pharmaceutically acceptable excipient; and (b) a compound having a structure which is a member selected from Formulae (I), (Ia), (Ib), (Ic), (Id) (Ie), (If), (Ig), (Ih) (Ii), (Ij), (Ik), (Il) (Im), (In), (Io), (Ip) (Iq), (Ir), (Is), (It), (Iu), (Iv), (Iw), (Ix) (Iy), (Iz), (Iaa), (Iab), (Iac), (Iad), (Iae), (laf), (lag), (lah), (lai), (laj), (lak), (ll), (lla), (llb), (llc), 35 (IId), (III). In another aspect, the invention is a pharmaceutical formulation which includes: (a) a pharmaceutically acceptable excipient; and (b) a compound which has a structure according to Formulae (VIII), (VIIIa), (VIIIb), (VIIIc), (VIIId), (VIIIe). In another aspect, the invention is 40 a pharmaceutical formulation which includes: (a) a pharmaceutically acceptable excipient; and (b) a compound which has a structure which is a member selected from D1-D19, E1-E19, (VIII), (VIIIa), (VIIIb), (VIIIc), (VIIId), (VIIIe). In another aspect, the invention is a pharmaceutical formulation which includes: (a) a pharmaceutically acceptable excipient; and (b) a acyclic boronic ester of the invention. In an exemplary embodiment, the compound is described in FIG. 19. In another exemplary embodiment, the compound is described in FIG. 20. In another exemplary embodiment, the invention is a pharmaceutical formulation which includes: (a) a pharmaceutically acceptable excipient; and (b) a acyclic boronic ester of the invention.

In another aspect, the invention is a pharmaceutical formulation comprising: (a) a pharmaceutically acceptable to Formula I:

5

139

wherein B is boron. R^{1a} is a member selected from a negative charge, a salt counterion. H, cyano, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl, and substituted or unsubstituted heteroaryl. M is a member selected from oxygen, sulfur and NR^{2a}. R^{2a} is a member selected from H. substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubsti-10 tuted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl, and substituted or unsubstituted heteroaryl. J is a member selected from $(CR^{3a}R^{4a})_{n1}$ and CR^{5a} . R^{3a} , R^{4a} , and R^{5a} are members independently selected from H, halogen, cyano, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl, and substituted or unsubstituted heteroaryl. The index n1 is an integer selected from 0 to 2. W is a member selected from C=O (carbonyl), (CR^{6a}R^{7a})_{m1} and CR^{8a}. R^{6a}, R^{7a}, and R^{8a} are members independently selected from H, halogen, cyano, substituted or unsubstituted alkyl, substi-25 tuted or unsubstituted heteroalkyl, substituted or unsubstituted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl, and substituted or unsubstituted heteroaryl. The index m1 is an integer selected 30 from 0 and 1. A is a member selected from CR^{9a} and N. D is a member selected from CR^{10a} and N. E is a member selected from CR^{11a} and N. G is a member selected from CR^{12a} and N. R^{9a}, R^{10a}, R^{11a} and R^{12a} are members independently selected from H, OR*, NR*R**, SR*, ---S(O)R*, $-S(O)_2R^*$, $-S(O)_2NR^*R^{**}$, $-C(O)R^*$, $-C(O)OR^*$, ---C(O)NR*R**, nitro, halogen, cyano, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl, and substituted or unsubstituted heteroaryl. Each R* and R** are members independently selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted cycloalkyl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted aryl, and substituted or unsubstituted heteroaryl. The combination of nitrogens (A+D+E+G) is an 50 integer selected from 0 to 3. A member selected from R^{3a} , R^{4a} and R^{5a} and a member selected from R^{6a} , R^{7a} and R^{8a} , together with the atoms to which they are attached, are optionally joined to form a 4 to 7 membered ring. R^{3a} and 55 R^{4a}, together with the atoms to which they are attached, are optionally joined to form a 4 to 7 membered ring. R^{6a} and R^{7a} , together with the atoms to which they are attached, are optionally joined to form a 4 to 7 membered ring. \mathbb{R}^{9a} and 60 R^{10a}, together with the atoms to which they are attached, are optionally joined to form a 4 to 7 membered ring. R^{10a} and R^{11a} , together with the atoms to which they are attached, are optionally joined to form a 4 to 7 membered ring. R^{11a} and 65 R^{12a} , together with the atoms to which they are attached, are optionally joined to form a 4 to 7 membered ring.

140

In another exemplary embodiment, there is a proviso that the compound cannot have a structure according to Formula (Ix):

wherein R^{7b} is a member selected from H, methyl, ethyl and phenyl. R^{10b} is a member selected from H, OH, NH₂, SH, halogen, substituted or unsubstituted phenoxy, substituted or unsubstituted phenylalkyloxy, substituted or unsubstituted phenylthio and substituted or unsubstituted phenylalkylthio. R^{11b} is a member selected from H, OH, NH₂, SH, methyl, substituted or unsubstituted phenoxy, substituted or unsubstituted phenylalkyloxy, substituted or unsubstituted phenylthio and substituted or unsubstituted phenylalkylthio. In another exemplary embodiment, there is a proviso that the compound cannot have a structure according to Formula (Ix) wherein R^{1b} is a member selected from a negative charge, H and a salt counterion. In another exemplary embodiment, there is a proviso that the compound cannot have a structure according to Formula (Ix) wherein R^{10b} and R^{11b} are H. In another exemplary embodiment, there is a proviso that the compound cannot have a structure according to Formula (Ix) wherein one member selected from R^{10b} and R^{11b} is H and the other member selected from R^{10b} and R^{11b} is a member selected from halo, methyl, cyano, methoxy, hydroxymethyl 35 and p-cyanophenyloxy. In another exemplary embodiment, there is a proviso that the compound cannot have a structure according to Formula (Ix) wherein R^{10b} and R^{11b} are members independently selected from fluoro, chloro, methyl, cyano, methoxy, hydroxymethyl, and p-cyanophenyl. In 40 another exemplary embodiment, there is a proviso that the compound cannot have a structure according to Formula (Ix) wherein R^{1b} is a member selected from a negative charge, H and a salt counterion; R^{7b} is H; R^{10b} is F and R^{11b} is H. In another exemplary embodiment, there is a proviso that the compound cannot have a structure according to Formula (Ix) wherein R^{11b} and R^{12b}, along with the atoms to which they are attached, are joined to form a phenyl group. In another exemplary embodiment, there is a proviso that the compound cannot have a structure according to Formula (Ix) wherein R^{1b} is a member selected from a negative charge, H and a salt counterion; R^{7b} is H; R^{10b} is 4-cyanophenoxy; and R116 is H.

In another exemplary embodiment, there is a proviso that the compound cannot have a structure according to Formula (ly)

(Iy)

(Ix)

(Ia)

wherein R^{10b} is a member selected from H, halogen, CN and substituted or unsubstituted C_{1-4} alkyl.

In an exemplary embodiment, the pharmaceutical formulation comprises a compound that has a structure according to Formula (Ia):

In another exemplary embodiment, each R^{3a} and R^{4a} is a member independently selected from H, cyano, substituted or unsubstituted methyl, substituted or unsubstituted ethyl, 20 trifluoromethyl, substituted or unsubstituted hydroxymethyl, substituted or unsubstituted hydroxyalkyl, substituted or unsubstituted benzyl, substituted or unsubstituted phenyl, substituted or unsubstituted mercaptomethyl, substituted or unsubstituted mercaptoalkyl, substituted or unsubstituted 25 aminomethyl, substituted or unsubstituted alkylaminomethyl, substituted or unsubstituted dialkylaminomethyl, substituted or unsubstituted arylaminomethyl, substituted or unsubstituted indolyl and substituted or unsubstituted amido. In another exemplary embodiment, each R^{3a} and R^{4a} is a member independently selected from cyano, substituted or unsubstituted methyl, substituted or unsubstituted ethyl, trifluoromethyl, substituted or unsubstituted hydroxymethyl, substituted or unsubstituted hydroxyalkyl, substituted or unsubstituted benzyl, substituted or unsubstituted phenyl, 35 substituted or unsubstituted mercaptomethyl, substituted or unsubstituted mercaptoalkyl, substituted or unsubstituted aminomethyl, substituted or unsubstituted alkylaminomethyl, substituted or unsubstituted dialkylaminomethyl, substituted or unsubstituted arylaminomethyl, substituted or 40 unsubstituted indolyl, substituted or unsubstituted amido.

In another exemplary embodiment, each R^{3a} and R^{4a} is a member selected from H, substituted or unsubstituted methyl, substituted or unsubstituted or unsubstituted or unsubstituted propyl, substituted or unsubstituted isopropyl, 45 substituted or unsubstituted butyl, substituted or unsubstituted t-butyl, substituted or unsubstituted phenyl and substituted or unsubstituted benzyl. In another exemplary embodiment, R^{3a} and R^{4a} is a member selected from methyl, ethyl, propyl, isopropyl, butyl, t-butyl, phenyl and benzyl. In 50 another exemplary embodiment, R^{3a} is H and R^{4a} is a member selected from methyl, ethyl, propyl, isopropyl, butyl, t-butyl, phenyl and benzyl. In another exemplary embodiment, R^{3a} is H and R^{4a} H.

In another exemplary embodiment, \mathbb{R}^{9a} , \mathbb{R}^{10a} , \mathbb{R}^{11a} and 55 \mathbb{R}^{12a} is a member independently selected from H, OR*, NR*R**, SR*, $-S(O)R^*$, $-S(O)_2R^*$, $-S(O)_2NR*R^{**}$, $-C(O)R^*$, $-C(O)R^*$, $-C(O)NR^*R^{**}$, halogen, cyano, nitro, substituted or unsubstituted methoxy, substituted or unsubstituted or unsubstituted or unsubstituted ethoxy, 60 substituted or unsubstituted hydroxymethyl, substituted or unsubstituted or unsubstituted bydroxyalkyl, substituted or unsubstituted benzyl, substituted or unsubstituted or unsubstituted phenyl, substituted phenyl 65 methoxy, substituted or unsubstituted phenyl 65 methoxy, substituted or unsubstituted phenyl 65 methoxy, substituted or unsubstituted or unsu

142

stituted pyrimidinyloxy, substituted or unsubstituted benzylfuran, substituted or unsubstituted methylthio, substituted or unsubstituted mercaptomethyl, substituted or unsubstituted mercaptoalkyl, substituted or unsubstituted phenylthio, substituted or unsubstituted thiophenylthio, substituted or unsubstituted phenyl methylthio, substituted or unsubstituted pyridinylthio, substituted or unsubstituted pyrimidinylthio, substituted or unsubstituted benzylthiofuranyl, substituted or unsubstituted phenylsulfonyl, substituted or 10 unsubstituted benzylsulfonyl, substituted or unsubstituted phenylmethylsulfonyl, substituted or unsubstituted thiophenylsulfonyl, substituted or unsubstituted pyridinylsulfonyl, substituted or unsubstituted pyrimidinylsulfonyl, substituted or unsubstituted sulfonamidyl, substituted or unsubstituted 15 phenylsulfinyl, substituted or unsubstituted benzylsulfinyl, substituted or unsubstituted phenylmethylsulfinyl, substituted or unsubstituted thiophenylsulfinyl, substituted or unsubstituted pyridinylsulfinyl, substituted or unsubstituted pyrimidinylsulfinyl, substituted or unsubstituted amino, substituted or unsubstituted alkylamino, substituted or unsubstituted dialkylamino, substituted or unsubstituted trifluoromethylamino, substituted or unsubstituted aminomethyl, substituted or unsubstituted alkylaminomethyl, substituted or unsubstituted dialkylaminomethyl, substituted or unsubstituted arylaminomethyl, substituted or unsubstituted benzylamino, substituted or unsubstituted phenylamino, substituted or unsubstituted thiophenylamino, substituted or unsubstituted pyridinylamino, substituted or unsubstituted pyrimidinylamino, substituted or unsubstituted indolyl, substituted or unsubstituted morpholino, substituted or unsubstituted alkylamido, substituted or unsubstituted arylamido, substituted or unsubstituted ureido, substituted or unsubstituted carbamoyl, and substituted or unsubstituted piperizinyl. In an exemplary embodiment, R^{9a}, R^{10a}, R^{11a} and R^{12a} are selected from the previous list of substituents with the exception of $-C(O)R^*$, $-C(O)OR^*$, $-C(O)NR^*R^{**}$.

In another exemplary embodiment, R^{6a}, R^{7a}, R^{9a}, R^{10a} R^{11a} and R^{12a} are members independently selected from fluoro, chloro, bromo, nitro, cyano, amino, methyl, hydroxylmethyl, trifluoromethyl, methoxy, trifluoromethyoxy, ethyl, diethylcarbamoyl, pyridin-2-yl, pyridin-3-yl, pyridin-4-yl, pyrimidinyl, piperizino, piperizinyl, piperizinocarbonyl, piperizinylcarbonyl, carboxyl, 1-tetrazolyl, 1-ethoxycarbonylmethoxy, carboxymethoxy, thiophenyl, 1H-tetrazol-5-yl, 3-(hutylcarbonyl) phenylmethoxy, 1-ethoxycarbonylmethyloxy-, 1-ethoxycarbonylmethyl-, 1-ethoxycarbonyl-, carboxymethoxy-, thiophen-2-yl, thiophen-2-ylthio-, thiophen-3-yl, thiophen-3-ylthio, 4-fluorophenylthio, butylcarbonylphenylmethoxy, butylcarbonylphenylmethyl. butylcarbonylmethyl, 1-(piperidin-1-yl) carbonyl)methyl, 1-(piperidin-1-yl)carbonyl)methoxy, 1-(piperidin-2-yl)carbonyl)methoxy, 1-(piperidin-3-yl)carbonyl)methoxy, 1-(4-(pyrimidin-2-yl)piperazin-1-yl)carbonyl)methoxy, 1-(4-(pyrimidin-2-yl)piperazin-1-yl)carbonyl) methyl, 1-(4-(pyrimidin-2-yl)piperazin-1-yl)carbonyl, 1-4-(pyrimidin-2-yl)piperazin-1-yl, 1-(4-(pyridin-2-yl) piperazin-1-yl)carbonyl), 1-(4-(pyridin-2-yl)piperazin-1-yl) carbonylmethyl, (1-(4-(pyridin-2-yl)piperazin-1-yl) carbonyl)-methoxy), 1-(4-(pyridin-2-yl)piperazin-1-yl, 1H-indol-1-yl, morpholino-, morpholinyl, morpholinocarbonyl, morpholinylcarbonyl, phenylureido, phenylcarbamoyl, acetamido, 3-(phenylthio)-1H-indol-1-yl, 3-(2-cyanoethylthio)-1H-indol-1-yl, benzylamino, 5-methoxy-3-(phenylthio)-1H-indol-1-yl, 5-methoxy-3-(2cyanoethylthio)-1H-indol-1-yl)), 5-chloro-1H-indol-1-ył, 5-chloro-3-(2-cyanoethylthio)-1H-indol-1-yl)), dibenzylamino, benzylamino, 5-chloro-3-(phenylthio)-1H-indol-1-

161 maceutical formulation comprises a compound that has a structure which is a member selected from

In an exemplary embodiment, the pharmaceutical formu- 65 lation comprises a compound that has a structure that is a member selected from

15 In another exemplary embodiment, there is a proviso that the pharmaceutical formulation cannot comprise a structure according to Formula (Iaa):

(lan)

wherein R^{6b}, R^{9b}, R^{10b}, R^{11b} and R^{12b} have the same substituent listings as described for Formulae (Ix) and (Iy) above.

The pharmaceutical formulations of the invention can take a variety of forms adapted to the chosen route of 35 administration. Those skilled in the art will recognize various synthetic methodologies that may be employed to prepare non-toxic pharmaceutical formulations incorporating the compounds described herein. Those skilled in the art will

- 40 recognize a wide variety of non-toxic pharmaceutically acceptable solvents that may be used to prepare solvates of the compounds of the invention, such as water, ethanol, propylene glycol, mineral oil, vegetable oil and dimethylsulfoxide (DMSO).
- 45 The compositions of the invention may be administered orally, topically, parenterally, by inhalation or spray or rectally in dosage unit formulations containing conventional non-toxic pharmaceutically acceptable carriers, adjuvants and vehicles. It is further understood that the best method of
- administration may be a combination of methods. Oral 50 administration in the form of a pill, capsule, elixir, syrup, lozenge, troche, or the like is particularly preferred. The term parenteral as used herein includes subcutaneous injections, intradermal, intravascular (e.g., intravenous), intra-
- 55 muscular, spinal, intrathecal injection or like injection or infusion techniques.

The pharmaceutical formulations containing compounds of the invention are preferably in a form suitable for oral use, for example, as tablets, troches, lozenges, aqueous or oily suspensions, dispersible powders or granules, emulsion, 60 hard or soft capsules, or syrups or elixirs.

Compositions intended for oral use may be prepared according to any method known in the art for the manufacture of pharmaceutical formulations, and such compositions may contain one or more agents selected from the group consisting of sweetening agents, flavoring agents, coloring agents and preserving agents in order to provide pharma-

163

ceutically elegant and palatable preparations. Tablets may contain the active ingredient in admixture with non-toxic pharmaceutically acceptable excipients that are suitable for the manufacture of tablets. These excipients may be for example, inert diluents, such as calcium carbonate, sodium 5 carbonate, lactose, calcium phosphate or sodium phosphate; granulating and disintegrating agents, for example, corn starch, or alginic acid; binding agents, for example starch, gelatin or acacia; and lubricating agents, for example maguncoated or they may be coated by known techniques to delay disintegration and absorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glyceryl monostearate or glyceryl distearate may be employed.

Formulations for oral use may also be presented as hard gelatin capsules wherein the active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules wherein the active ingredient is mixed with water or an oil 20 medium, for example peanut oil, liquid paraffin or olive oil.

Aqueous suspensions contain the active materials in admixture with excipients suitable for the manufacture of aqueous suspensions. Such excipients are suspending agents, for example sodium carboxymethylcellulose, meth- 25 vlcellulose, hydroxypropylmethylcellulose, sodium alginate, polyvinylpyrrolidone, gum tragacanth and gum acacia; and dispersing or wetting agents, which may be a naturally-occurring phosphatide, for example, lecithin, or condensation products of an alkylene oxide with fatty acids, 30 for example polyoxyethylene stearate, or condensation products of ethylene oxide with long chain aliphatic alcohols, for example heptadecaethyleneoxycetanol, or condensation products of ethylene oxide with partial esters derived from fatty acids and a hexitol such as polyoxyethylene sorbitol 35 glycols. monooleate, or condensation products of ethylene oxide with partial esters derived from fatty acids and hexitol anhydrides, for example polyethylene sorbitan monooleate. The aqueous suspensions may also contain one or more preservatives, for example ethyl, or n-propyl p-hydroxyben- 40 zoate, one or more coloring agents, one or more flavoring agents, and one or more sweetening agents, such as sucrose or saccharin.

Oily suspensions may be formulated by suspending the active ingredients in a vegetable oil, for example arachis oil, 45 olive oil, sesame oil or coconut oil, or in a mineral oil such as liquid paraffin. The oily suspensions may contain a thickening agent, for example beeswax, hard paraffin or cetyl alcohol. Sweetening agents such as those set forth above, and flavoring agents may be added to provide pal- 50 atable oral preparations. These compositions may be preserved by the addition of an anti-oxidant such as ascorbic acid

Dispersible powders and granules suitable for preparation of an aqueous suspension by the addition of water provide the active ingredient in admixture with a dispersing or wetting agent, suspending agent and one or more preservatives. Suitable dispersing or wetting agents and suspending agents are exemplified by those already mentioned above. Additional excipients, for example sweetening, flavoring 60 and coloring agents, may also be present.

Pharmaceutical formulations of the invention may also be in the form of oil-in-water emulsions and water-in-oil emulsions. The oily phase may be a vegetable oil, for example olive oil or arachis oil, or a mineral oil, for example liquid 65 paraffin or mixtures of these. Suitable emulsifying agents may be naturally-occurring gums, for example gum acacia

164

or gum tragacanth; naturally-occurring phosphatides, for example soy bean, lecithin, and esters or partial esters derived from fatty acids and hexitol; anhydrides, for example sorbitan monooleate; and condensation products of the said partial esters with ethylene oxide, for example polyoxyethylene sorbitan monoolcate. The emulsions may also contain sweetening and flavoring agents.

Syrups and elixirs may be formulated with sweetening agents, for example glycerol, propylene glycol, sorbitol or nesium stearate, stearic acid or talc. The tablets may be 10 sucrose. Such formulations may also contain a demulcent, a preservative, and flavoring and coloring agents. The pharmaceutical formulations may be in the form of a sterile injectable aqueous or olcaginous suspension. This suspension may be formulated according to the known art using 15 those suitable dispersing or wetting agents and suspending agents, which have been mentioned above. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally acceptable diluent or solvent, for example as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil may be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid find use in the preparation of injectables.

The composition of the invention may also be administered in the form of suppositories, e.g., for rectal administration of the drug. These compositions can be prepared by mixing the drug with a suitable non-irritating excipient that is solid at ordinary temperatures but liquid at the rectal temperature and will therefore melt in the rectum to release the drug. Such materials are cocoa butter and polyethylene

Alternatively, the compositions can be administered parenterally in a sterile medium. The drug, depending on the vehicle and concentration used, can either be suspended or dissolved in the vehicle. Advantageously, adjuvants such as local anesthetics, preservatives and buffering agents can be dissolved in the vehicle.

For administration to non-human animals, the composition containing the therapeutic compound may be added to the animal's feed or drinking water. Also, it will be convenient to formulate animal feed and drinking water products so that the animal takes in an appropriate quantity of the compound in its diet. It will further be convenient to present the compound in a composition as a premix for addition to the feed or drinking water. The composition can also added as a food or drink supplement for humans.

Dosage levels of the order of from about 5 mg to about 250 mg per kilogram of body weight per day and more preferably from about 25 mg to about 150 mg per kilogram of body weight per day, are useful in the treatment of the above-indicated conditions. The amount of active ingredient that may be combined with the carrier materials to produce a single dosage form will vary depending upon the condition being treated and the particular mode of administration. Dosage unit forms will generally contain between from about 1 mg to about 500 mg of an active ingredient.

Frequency of dosage may also vary depending on the compound used and the particular disease treated. However, for treatment of most disorders, a dosage regimen of 4 times daily or less is preferred. It will be understood, however, that the specific dose level for any particular patient will depend upon a variety of factors including the activity of the specific compound employed, the age, body weight, general health,

sex, diet, time of administration, route of administration and rate of excretion, drug combination and the severity of the particular disease undergoing therapy.

Preferred compounds of the invention will have desirable pharmacological properties that include, but are not limited 5 to, oral bioavailability, low toxicity, low serum protein binding and desirable in vitro and in vivo half-lives. Penetration of the blood brain barrier for compounds used to treat CNS disorders is necessary, while low brain levels of compounds used to treat peripheral disorders are often 10 methyl ether-alt-maleic acid monobutyl ester); about 10% preferred.

Assays may be used to predict these desirable pharmacological properties. Assays used to predict bioavailability include transport across human intestinal cell monolayers, including Caco-2 cell monolayers. Toxicity to cultured 15 hepatocyctes may be used to predict compound toxicity. Penetration of the blood brain barrier of a compound in humans may be predicted from the brain levels of laboratory animals that receive the compound intravenously.

Serum protein binding may be predicted from albumin 20 binding assays. Such assays are described in a review by Oravcova, et al. (Journal of Chromatography B (1996) volume 677, pages 1-27).

Compound half-life is inversely proportional to the frequency of dosage of a compound. In vitro half-lives of 25 compounds may be predicted from assays of microsomal half-life as described by Kuhnz and Gieschen (Drug Metabolism and Disposition, (1998) volume 26, pages 1120-1127)

The amount of the composition required for use in treat- 30 ment will vary not only with the particular compound selected but also with the route of administration, the nature of the condition being treated and the age and condition of the patient and will ultimately be at the discretion of the attendant physician or clinician. 35

In an exemplary embodiment, the pharmaceutical formulation excipient comprises ethanol and the pharmaceutical formulation compound is 1,3-dihydro-5-fluoro-1-hydroxy-2,1-benzoxaborole. In another exemplary embodiment, the pharmaceutical formulation excipient comprises propylene 40 glycol and the pharmaceutical formulation compound is 1,3-dihydro-5-fluoro-1-hydroxy-2,1-benzoxaborole. In an exemplary embodiment the pharmaceutical formulation comprises: about propylene glycol:ethanol 1:4, with 1:10 wt/volume of 1,3-dihydro-5-fluoro-1-hydroxy-2,1-benzoxa- 45 borole. In an exemplary embodiment the pharmaceutical formulation comprises: about 70% ethanol; about 20% poly (vinyl methyl ether-alt-maleic acid monobutyl ester); about 10% 1,3-dihydro-5-fluoro-1-hydroxy-2,1-benzoxaborole. In an exemplary embodiment the pharmaceutical formulation 50 comprises: about 56% ethanol; about 14% water; about 15% poly(2-hydroxyethyl methacrylate); about 5% dibutyl sebacate; about 10% 1,3-dihydro-5-fluoro-1-hydroxy-2,1-benzoxaborole. In an exemplary embodiment the pharmaceutical formulation comprises: about 55% ethanol; about 15% ethyl 55 acetate; about 15% poly(vinyl acetate); about 5% dibutyl sebacate; about 10% 1,3-dihydro-5-fluoro-1-hydroxy-2,1benzoxaborole. In another exemplary embodiment, 1,3dihydro-5-fluoro-1-hydroxy-2,1-benzoxaborole is present in a pharmaceutical formulation in a concentration which is a 60 member selected from 1%, 2.5%. 5%, 7.5%, 10% and 15% w/v. In another exemplary embodiment, the pharmaceutical formulation is a lacquer.

In an exemplary embodiment, the pharmaceutical formulation excipient comprises ethanol and the pharmaceutical 65 formulation compound is 5-(4-cyanophenoxy)-1,3-dihydro-1-hydroxy-2,1-benzoxaborole. In another exemplary

166

embodiment, the pharmaceutical formulation excipient comprises propylene glycol and the pharmaceutical formulation compound is 5-(4-cyanophenoxy)-1,3-dihydro-1-hydroxy-2,1-benzoxaborole. In an exemplary embodiment the pharmaceutical formulation comprises: about 20% propylene glycol; about 70% ethanol; about 10% 5-(4-cyanophenoxy)-1,3-dihydro-1-hydroxy-2,1-benzoxaborole. In an exemplary embodiment the pharmaceutical formulation comprises: about 70% ethanol; about 20% poly(vinyl 5-(4-cyanophenoxy)-1,3-dihydro-1-hydroxy-2,1-benzoxa-

borole. In an exemplary embodiment the pharmaceutical formulation comprises: about 56% ethanol; about 14% water; about 15% poly(2-hydroxyethyl methacrylate); about 5% dibutyl sebacate; about 10% 5-(4-cyanophenoxy)-1,3dihydro-1-hydroxy-2,1-benzoxaborole. In an exemplary embodiment the pharmaceutical formulation comprises: about 55% ethanol; about 15% ethyl acetate; about 15% poly(vinyl acetate); about 5% dibutyl sebacate; about 10% 5-(4-cyanophenoxy)-1,3-dihydro-1-hydroxy-2,1-benzoxa-

borole. In another exemplary embodiment, 5-(4-cyanophenoxy)-1,3-dihydro-1-hydroxy-2,1-benzoxaborole is present in a pharmaceutical formulation in a concentration which is a member selected from 1%, 2.5%, 5%, 7.5%, 10% and 15% w/v. In another exemplary embodiment, the pharmaceutical formulation is a lacquer.

In an exemplary embodiment, the pharmaceutical formulation excipient comprises ethanol and the pharmaceutical formulation compound is a compound described herein. In another exemplary embodiment, the pharmaceutical formulation excipient comprises propylene glycol and the pharmaceutical formulation compound is a compound described herein. In an exemplary embodiment the pharmaceutical formulation comprises: about 20% propylene glycol; about 70% ethanol; about 10% of a compound described herein. In an exemplary embodiment the pharmaceutical formulation comprises: about 70% ethanol; about 20% poly(vinyl methyl ether-alt-maleic acid monobutyl ester); about 10% of a compound described herein. In an exemplary embodiment the pharmaceutical formulation comprises: about 56% ethanol; about 14% water; about 15% poly(2-hydroxyethyl methacrylate); about 5% dibutyl sebacate; about 10% of a compound described herein. In an exemplary embodiment the pharmaceutical formulation comprises: about 55% ethanol; about 15% ethyl acetate; about 15% poly(vinyl acetate); about 5% dibutyl sebacate; about 10% of a compound described herein. In another exemplary embodiment, a compound described herein is present in a pharmaceutical formulation in a concentration which is a member selected from 1%, 2.5%, 5%, 7.5%, 10% and 15% w/v. In another exemplary embodiment, the pharmaceutical formulation is a lacquer.

VII. a) Topical Formulations

In a preferred embodiment, the methods of the invention can be used employed through the topical application of the compounds described herein.

The compositions of the present invention comprises fluid or semi-solid vehicles that may include but are not limited to polymers, thickeners, buffers, neutralizers, chelating agents, preservatives, surfactants or emulsifiers, antioxidants, waxes or oils, emollients, sunscreens, and a solvent or mixed solvent system. The solvent or mixed solvent system is important to the formation because it is primarily responsible for dissolving the drug. The best solvent or mixed solvent systems are also capable of maintaining clinically relevant levels of the drug in solution despite the addition of a poor solvent to the formulation. The topical compositions

167

useful in the subject invention can be made into a wide variety of product types. These include, but are not limited to, lotions, creams, gels, sticks, sprays, ointments, pastes, foams, mousses, and cleansers. These product types can comprise several types of carrier systems including, but not 5 limited to particles, nanoparticles, and liposomes. If desired, disintegrating agents can be added, such as the cross-linked polyvinyl pyrrolidone, agar or alginic acid or a salt thereof such as sodium alginate. Techniques for formulation and administration can be found in Remington: The Science and Practice of Pharmacy, supra. The formulation can be selected to maximize delivery to a desired target site in the body.

Lotions, which are preparations that are to be applied to 15 the skin, nail, hair, claw or hoof surface without friction, are typically liquid or semi-liquid preparations in which finely divided solid, waxy, or liquid are dispersed. Lotions will typically contain suspending agents to produce better dispersions as well as compounds useful for localizing and 20 glycols. holding the active agent in contact with the skin, nail, hair, claw or hoof, e.g., methylcellulose, sodium carboxymethylcellulose, or the like.

Creams containing the active agent for delivery according to the present invention are viscous liquid or semisolid 25 consist of a single emulsifying agent or may be a nonionic, emulsions, either oil-in-water or water-in-oil. Cream bases are water-washable, and contain an oil phase, an emulsifier and an aqueous phase. The oil phase is generally comprised of petrolatum or a fatty alcohol, such as cetyl- or stearyl alcohol; the aqueous phase usually, although not necessarily, ³⁰ exceeds the oil phase in volume, and generally contains a humectant. The emulsifier in a cream formulation, as explained in Remington: The Science and Practice of Pharmacy, supra, is generally a nonionic, anionic, cationic or 35 emulsifying wax, glyceryl monostearate. Other examples amphoteric surfactant.

Gel formulations can also be used in connection with the present invention. As will be appreciated by those working in the field of topical drug formulation, gels are semisolid. Single-phase gels contain organic macromolecules distrib- 40 uted substantially uniformly throughout the carrier liquid, which is typically aqueous, but also may be a solvent or solvent blend.

Ointments, which are semisolid preparations, are typically based on petrolatum or other petroleum derivatives. As 45 will be appreciated by the ordinarily skilled artisan, the specific ointment base to be used is one that provides for optimum delivery for the active agent chosen for a given formulation, and, preferably, provides for other desired characteristics as well, e.g., emolliency or the like. As with 50 other carriers or vehicles, an ointment base should be inert, stable, nonirritating and non-sensitizing. As explained in Remington: The Science and Practice of Pharmacy, 19th Ed. (Easton, Pa.: Mack Publishing Co., 1995), at pages 1399-1404, ointment bases may be grouped in four classes: 55 oleaginous bases; emulsifiable bases; emulsion bases; and water-soluble bases. Oleaginous ointment bases include, for example, vegetable oils, fats obtained from animals, and semisolid hydrocarbons obtained from petroleum. Emulsifiable ointment bases, also known as absorbent ointment 60 bases, contain little or no water and include, for example, hydroxystearin sulfate, anhydrous lanolin and hydrophilic petrolatum. Emulsion ointment bases are either water-in-oil (W/O) emulsions or oil-in-water (O/W) emulsions, and include, for example, cetyl alcohol, glyceryl monostearate, 65 lanolin and stearic acid. Preferred water-soluble ointment bases are prepared from polyethylene glycols of varying

168

molecular weight; again, reference may be had to Remington: The Science and Practice of Pharmacy, supra, for further information.

Useful formulations of the invention also encompass sprays. Sprays generally provide the active agent in an aqueous and/or alcoholic solution which can be misted onto the skin, nail, hair, claw or hoof for delivery. Such sprays include those formulated to provide for concentration of the active agent solution at the site of administration following delivery, e.g., the spray solution can be primarily composed of alcohol or other like volatile liquid in which the drug or active agent can be dissolved. Upon delivery to the skin, nail, hair, claw or hoof, the carrier evaporates, leaving concentrated active agent at the site of administration.

The topical pharmaceutical compositions may also comprise suitable solid or gel phase carriers. Examples of such carriers include but are not limited to calcium carbonate, calcium phosphate, various sugars, starches, cellulose derivatives, gelatin, and polymers such as polyethylene

The topical pharmaceutical compositions may also comprise a suitable emulsifier which refers to an agent that enhances or facilitates mixing and suspending oil-in-water or water-in-oil. The emulsifying agent used herein may anionic, cationic or amphoteric surfactant or blend of two or more such surfactants; preferred for use herein are nonionic or anionic emulsifiers. Such surface-active agents are described in "McCutcheon's Detergent and Emulsifiers." North American Edition, 1980 Annual published by the McCutcheon Division, MC Publishing Company, 175 Rock Road, Glen Rock, N.J. 07452, USA.

Preferred for use herein are high molecular weight alcohols such as cetearyl alcohol, cetyl alcohol, stearyl alcohol, are ethylene glycol distearate, sorbitan tristearate, propylene glycol monostearate, sorbitan monooleate, sorbitan monostearate (SPAN 60), diethylene glycol monolaurate, sorbitan monopalmitate, sucrose diolcate, sucrose stearate (CROD-ESTA F-160), polyoxyethylene lauryl ether (BRIJ 30), polyoxyethylene (2) stearyl ether (BRIJ 72), polyoxyethylene (21) stearyl ether (BRIJ 721), polyoxyethylene monostearate (Myrj 45), polyoxyethylene sorbitan monostearate (TWEEN 60), polyoxyethylene sorbitan monooleate (TWEEN 80), polyoxyethylene sorbitan monolaurate (TWEEN 20) and sodium oleate. Cholesterol and cholesterol derivatives may also be employed in externally used emulsions and promote w/o emulsions.

Especially suitable nonionic emulsifying agents are those with hydrophile-lipophile balances (HLB) of about 3 to 6 for w/o system and 8 to 18 for o/w system as determined by the method described by Paul L. Lindner in "Emulsions and Emulsion", edited by Kenneth Lissant, published by Dekker, New York, N.Y., 1974, pages 188-190. More preferred for use herein are one or more nonionic surfactants that produce a system having HLB of about 8 to about 18.

Examples of such nonionic emulsifiers include but are not limited to "BRIJ 72", the trade name for a polyoxyethylene (2) stearyl ether having an HLB of 4.9; "BRIJ 721", the trade name for a polyoxyethylene (21) stearyl ether having an HLB of 15.5, "Brij 30", the trade name for polyoxyethylene lauryl ether having an HLB of 9.7; "Polawax", the trade name for emulsifying wax having an HLB of 8.0; "Span 60", the trade name for sorbitan monostearate having an HLB of 4.7; "Crodesta F-160", the trade name for sucrose stearate" having an HLB of 14.5. All of these materials are available from Ruger Chemicals Inc.; Croda; ICI Americas, Inc.;

Spectrum Chemicals; and BASF. When the topical formulations of the present invention contain at least one emulsifying agent, each emulsifying agent is present in amount from about 0.5 to about 2.5 wt %, preferably 0.5 to 2.0%, more preferably 1.0% or 1.8%. Preferably the emulsifying agent comprises a mixture of steareth 21 (at about 1.8%) and steareth 2 (at about 1.0%).

The topical pharmaceutical compositions may also comprise suitable emollients. Emollients are materials used for the prevention or relief of dryness, as well as for the 10 protection of the skin, nail, hair, claw or hoof. Useful emollients include, but are not limited to, cetyl alcohol, isopropyl myristate, stearyl alcohol, and the like. A wide variety of suitable emollients are known and can be used herein. See e.g., Sagarin, Cosmetics, Science and Technol-15 ogy, 2nd Edition, Vol. 1, pp. 32-43 (1972), and U.S. Pat. No. 4,919,934, to Deckner et al., issued Apr. 24, 1990, both of which are incorporated herein by reference in their entirety. These materials are available from Ruger Chemical Co, (Irvington, N.J.). 20

When the topical formulations of the present invention contain at least one emollient, each emollient is present in an amount from about 0.1 to 15%, preferably 0.1 to about 3.0, more preferably 0.5, 1.0, or 2.5 wt %. Preferably the emollient is a mixture of cetyl alcohol, isopropyl myristate 25 and stearyl alcohol in a 1/5/2 ratio. The emollient may also be a mixture of cetyl alcohol and stearyl alcohol in a 1/2 ratio.

The topical pharmaceutical compositions may also comprise suitable antioxidants, substances known to inhibit 30 oxidation. Antioxidants suitable for use in accordance with the present invention include, but are not limited to, butylated hydroxytoluene, ascorbic acid, sodium ascorbate, calcium ascorbate, ascorbic palmitate, butylated hydroxyanisole, 2,4,5-trihydroxybutyrophenone, 4-hydroxymethyl-2,6- 35 di-tert-butylphenol, erythorbic acid, gum guaiac, propyl gallate, thiodipropionic acid, dilauryl thiodipropionate, tertbutylhydroquinone and tocopherols such as vitamin E, and the like, including pharmaceutically acceptable salts and esters of these compounds. Preferably, the antioxidant is 40 butylated hydroxytoluene, butylated hydroxyanisole, propyl gallate, ascorbic acid, pharmaceutically acceptable salts or esters thereof, or mixtures thereof. Most preferably, the antioxidant is butylated hydroxytoluene. These materials are available from Ruger Chemical Co, (Irvington, N.J.).

When the topical formulations of the present invention contain at least one antioxidant, the total amount of antioxidant present is from about 0.001 to 0.5 wt %, preferably 0.05 to about 0.5 wt %, more preferably 0.1%.

The topical pharmaceutical compositions may also com- 50 prise suitable preservatives. Preservatives are compounds added to a pharmaceutical formulation to act as an antimicrobial agent. Among preservatives known in the art as being effective and acceptable in parenteral formulations are benzalkonium chloride, benzethonium, chlorohexidine, phe-55 nol, m-cresol, benzyl alcohol, methylparaben, propylparaben, chlorobutanol, o-cresol, p-cresol, chlorocresol, phenylmercuric nitrate, thimerosal, benzoic acid, and various mixtures thereof. See, e.g., Wallhausser, K.-H., Develop. Biol. Standard, 24:9-28 (1974) (S. Krager, Basel). Preferably, the preservative is selected from methylparaben, propylparaben and mixtures thereof.

These materials are available from Inolex Chemical Co (Philadelphia, Pa.) or Spectrum Chemicals.

When the topical formulations of the present invention 65 contain at least one preservative, the total amount of preservative present is from about 0.01 to about 0.5 wt %, 170

preferably from about 0.1 to 0.5%, more preferably from about 0.03 to about 0.15. Preferably the preservative is a mixture of methylparaben and proplybarben in a 5/1 ratio. When alcohol is used as a preservative, the amount is usually 15 to 20%.

The topical pharmaceutical compositions may also comprise suitable chelating agents to form complexes with metal cations that do not cross a lipid bilayer. Examples of suitable chelating agents include ethylene diamine tetraacetic acid (EDTA), ethylene glycol-bis(beta-aminoethyl ether)-N,N, N',N'-tetraacetic acid (EGTA) and 8-Amino-2-[(2-amino-5methylphenoxy)methyl]-6-methoxyquinoline-N,N,N',N'tetraacetic acid, tetrapotassium salt (QUIN-2). Preferably the chelating agents are EDTA and citric acid. These mate-

rials are available from Spectrum Chemicals.
When the topical formulations of the present invention contain at least one chelating agent, the total amount of chelating agent present is from about 0.005% to 2.0% by weight, preferably from about 0.05% to about 0.5 wt %,
20 more preferably about 0.1% by weight.

The topical pharmaceutical compositions may also comprise suitable neutralizing agents used to adjust the pH of the formulation to within a pharmaceutically acceptable range. Examples of neutralizing agents include but are not limited to trolamine, tromethamine, sodium hydroxide, hydrochloric acid, citric acid, and acetic acid. Such materials are available from are available from Spectrum Chemicals (Gardena, Calif.).

When the topical formulations of the present invention contain at least one neutralizing agent, the total amount of neutralizing agent present is from about 0.1 wt to about 10 wt %, preferably 0.1 wt % to about 5.0 wt %, and more preferably about 1.0 wt %. The neutralizing agent is generally added in whatever amount is required to bring the formulation to the desired pH.

The topical pharmaceutical compositions may also comprise suitable viscosity increasing agents. These components are diffusible compounds capable of increasing the viscosity of a polymer-containing solution through the interaction of the agent with the polymer. CARBOPOL ULTREZ 10 may be used as a viscosity-increasing agent. These materials are available from Noveon Chemicals, Cleveland, Ohio.

When the topical formulations of the present invention contain at least one viscosity increasing agent, the total 45 amount of viscosity increasing agent present is from about 0.25% to about 5.0% by weight, preferably from about 0.25% to about 1.0 wt %, and more preferably from about 0.4% to about 0.6% by weight.

The topical pharmaceutical compositions may also comprise suitable nail penetration enhancers. Examples of nail penetration enhancers include mercaptan compounds, sulfites and bisulfites, keratolytic agents and surfactants. Nail penetration enhancers suitable for use in the invention are described in greater detail in Malhotra et al., *J. Pharm. Sci.*, 91:2, 312-323 (2002), which is incorporated herein by reference in its entirety.

The topical pharmaceutical compositions may also comprise one or more suitable solvents. The ability of any solid substance (solute) to dissolve in any liquid substance (solvent) is dependent upon the physical properties of the solute and the solvent. When solutes and solvents have similar physical properties the solubility of the solute in the solvent will be the greatest. This gives rise to the traditional understanding that "like dissolves like." Solvents can be characterized in one extreme as non-polar, lipophilic oils, while in the other extreme as polar hydrophilic solvents. Oily solvents dissolve other non-polar substances by Van der Wals

171

interactions while water and other hydrophilic solvents dissolve polar substances by ionic, dipole, or hydrogen bonding interactions. All solvents can be listed along a continuum from the least polar, i.e. hydrocarbons such as decane, to the most polar solvent being water. A solute will 5 have its greatest solubility in solvents having equivalent polarity. Thus, for drugs having minimal solubility in water, less polar solvents will provide improved solubility with the solvent having polarity nearly equivalent to the solute pro-10 viding maximum solubility. Most drugs have intermediate polarity, and thus experience maximum solubility in solvents such as propylene glycol or ethanol, which are significantly less polar than water. If the drug has greater solubility in propylene glycol (for example 8% (w/w)) than 15 in water (for example 0.1% (w/w)), then addition of water to propylene glycol should decrease the maximum amount of drug solubility for the solvent mixture compared with pure propylene glycol. Addition of a poor solvent to an excellent solvent will decrease the maximum solubility for the blend 20 compared with the maximum solubility in the excellent solvent.

When compounds are incorporated into topical formulations the concentration of active ingredient in the formulation may be limited by the solubility of the active ingredient 25 in the chosen solvent and/or carrier. Non-lipophilic drugs typically display very low solubility in pharmaceutically acceptable solvents and/or carriers. For example, the solubility of some compounds in the invention in water is less than 0.00025% wt/wt. The solubility of the same compounds 30 in the invention can be less than about 2% wt/wt in either propylene glycol or isopropyl myristate. In one embodiment of the present invention, diethylene glycol monoethyl ether (DGME) is the solvent used to dissolve the compounds of the invention. The compounds in the invention useful in the 35 present formulation are believed to have a solubility of from about 10% wt/wt to about 25% wt/wt in DGME. In another embodiment a DGME water cosolvent system is used to dissolve the compounds of the invention. The solvent capacity of DGME drops when water is added; however, the 40 DGME/water cosolvent system can be designed to maintain the desired concentration of from about 0.1% to about 5% wt/wt active ingredient. Preferably the active ingredient is present from about 0.5% to about 3% wt/wt, and more preferably at about 1% wt/wt, in the as-applied topical 45 formulations. Because DGME is less volatile than water, as the topical formulation evaporates upon application, the active agent becomes more soluble in the cream formulation. This increased solubility reduces the likelihood of reduced bioavailability caused by the drug precipitating on 50 the surface of the skin, nail, hair, claw or hoof.

Liquid forms, such as lotions suitable for topical administration or suitable for cosmetic application, may include a suitable aqueous or nonaqueous vehicle with buffers, suspending and dispensing agents, thickeners, penetration 55 enhancers, and the like. Solid forms such as creams or pastes or the like may include, for example, any of the following ingredients, water, oil, alcohol or grease as a substrate with surfactant, polymers such as polyethylene glycol, thickeners, solids and the like. Liquid or solid formulations may 60 include enhanced delivery technologies such as liposomes, microsomes, microsponges and the like.

Additionally, the compounds can be delivered using a sustained-release system, such as semipermeable matrices of solid hydrophobic polymers containing the therapeutic 65 palene and the like. Anti-aging agents lished and are well known by those skilled in the art.

172

Topical treatment regimens according to the practice of this invention comprise applying the composition directly to the skin, nail, hair, claw or hoof at the application site, from one to several times daily.

Formulations of the present invention can be used to treat, ameliorate or prevent conditions or symptoms associated with bacterial infections, acne, inflammation and the like.

In an exemplary embodiment, the pharmaceutical formulation includes a simple solution. In an exemplary embodiment, the simple solution includes an alcohol. In an exemplary embodiment, the simple solution includes alcohol and water. In an exemplary embodiment, the alcohol is ethanol, ethylene glycol, propanol, polypropylene glycol, isopropanol or butanol. In another exemplary embodiment, the simple solution is a member selected from about 10% polypropylene glycol and about 90% ethanol; about 20% polypropylene glycol and about 80% ethanol; about 30% polypropylene glycol and about 70% ethanol; about 40% polypropylene glycol and about 60% ethanol; about 50% polypropylene glycol and about 50% ethanol; about 60% polypropylene glycol and about 40% ethanol; about 70% polypropylene glycol and about 30% ethanol; about 80% polypropylene glycol and about 20% ethanol; about 90% polypropylene glycol and about 10% ethanol.

In an exemplary embodiment, the pharmaceutical formulation is a lacquer. Please see Remington's, supra, for more information on the production of lacquers.

In an exemplary embodiment, the compound is present in said pharmaceutical formulation in a concentration of from about 0.5% to about 15%. In an exemplary embodiment, the compound is present in said pharmaceutical formulation in a concentration of from about 0.1% to about 12.5%. In an exemplary embodiment, the compound is present in said pharmaceutical formulation in a concentration of from about 1% to about 10%. In an exemplary embodiment, the compound is present in said pharmaceutical formulation in a concentration of from about 1% to about 5%. In an exemplary embodiment, the compound is present in said pharmaceutical formulation in a concentration of from about 0.5% to about 5%. In an exemplary embodiment, the compound is present in said pharmaceutical formulation in a concentration of from about 0.5% to about 7.5%. In an exemplary embodiment, the compound is present in said pharmaceutical formulation in a concentration of from about 5% to about 7.5%. In an exemplary embodiment, the compound is present in said pharmaceutical formulation in a concentration of from about 2% to about 8%. In an exemplary embodiment, the compound is present in said pharmaceutical formulation in a concentration of from about 4% to about 9%.

VII. b) Additional Active Agents

The following are examples of the cosmetic and pharmaceutical agents that can be added to the topical pharmaceutical formulations of the present invention. The following agents are known compounds and are readily available commercially.

Anti-inflammatory agents include, but are not limited to, bisabolol, mentholatum, dapsone, aloe, hydrocortisone, and the like.

Vitamins include, but are not limited to, Vitamin B, Vitamin E, Vitamin A, Vitamin D, and the like and vitamin derivatives such as tazarotene, calcipotriene, tretinoin, adapalene and the like.

Anti-aging agents include, but are not limited to, niacinamide, retinol and retinoid derivatives, AHA, Ascorbic

25

acid, lipoic acid, coenzyme Q 10, beta hydroxy acids, salicylic acid, copper binding peptides, dimethylaminoethyl (DAEA), and the like.

Sunscreens and or sunburn relief agents include, but are not limited to, PABA, jojoba, aloe, padimate-O, methoxy- 5 cinnamates, proxamine HCl, lidocaine and the like. Sunless tanning agents include, but are not limited to, dihydroxyacctone (DHA).

Psoriasis-treating agents and/or acne-treating agents include, but are not limited to, salicylic acid, benzoyl peroxide, coal tar, selenium sulfide, zinc oxide, pyrithione (zinc and/or sodium), tazarotene, calcipotriene, tretinoin, adapalene and the like.

Agents that are effective to control or modify keratinization, including without limitation: tretinoin, tazarotene, and adapalene.

The compositions comprising an compound/active agent of the invention, and optionally at least one of these additional agents, are to be administered topically. In a primary 20 application, this leads to the compounds of the invention and any other active agent working upon and treating the skin, nail, hair, claw or hoof. Alternatively, any one of the topically applied active agents may also be delivered systemically by transdermal routes.

In such compositions an additional cosmetically or pharmaceutically effective agent, such as an anti-inflammatory agent, vitamin, anti-aging agent, sunscreen, and/or acnetreating agent, for example, is usually a minor component (from about 0.001% to about 20% by weight or preferably from about 0.01% to about 10% by weight) with the remainder being various vehicles or carriers and processing aids helpful for forming the desired dosing form. VII. c) Testing

Preferred compounds for use in the present topical for- 35 mulations will have certain pharmacological properties. Such properties include, but are not limited to, low toxicity, low serum protein binding and desirable in vitro and in vivo half-lives. Assays may be used to predict these desirable pharmacological properties. Assays used to predict bioavail- 40 ability include transport across human intestinal cell monolayers, including Caco-2 cell monolayers. Serum protein binding may be predicted from albumin binding assays. Such assays are described in a review by Oravcova et al. (1996, J. Chromat. B677: 1-27). Compound half-life is 45 inversely proportional to the frequency of dosage of a compound. In vitro half-lives of compounds may be predicted from assays of microsomal half-life as described by Kuhnz and Gleschen (Drug Metabolism and Disposition, (1998) volume 26, pages 1120-1127). 50

Toxicity and therapeutic efficacy of such compounds can be determined by standard pharmaceutical procedures in cell cultures or experimental animals, e.g., for determining the LD50 (the dose lethal to 50% of the population) and the ED₅₀ (the dose therapeutically effective in 50% of the 55 population). The dose ratio between toxic and therapeutic effects is the therapeutic index and it can be expressed as the ratio between LD₅₀ and ED₅₀. Compounds that exhibit high therapeutic indices are preferred. The data obtained from these cell culture assays and animal studies can be used in 60 formulating a range of dosage for use in humans. The dosage of such compounds lies preferably within a range of circulating concentrations that include the ED₅₀ with little or no toxicity. The dosage can vary within this range depending upon the dosage form employed and the route of adminis- 65 tration utilized. The exact formulation, route of administration and dosage can be chosen by the individual physician in

174

view of the patient's condition. (See, e.g. Fingl et al., 1975, in "The Pharmacological Basis of Therapeutics", Ch. 1, p. 1).

VII. d) Administration

For any compound used in the method of the invention, the therapeutically effective dose can be estimated initially from cell culture assays, as disclosed herein.

For example, a dose can be formulated in animal models to achieve a circulating concentration range that includes the EC₅₀ (effective dose for 50% increase) as determined in cell culture, i.e., the concentration of the test compound which achieves a half-maximal inhibition of bacterial cell growth. Such information can be used to more accurately determine useful doses in humans.

In general, the compounds prepared by the methods, and from the intermediates, described herein will be administered in a therapeutically or cosmetically effective amount by any of the accepted modes of administration for agents that serve similar utilities. It will be understood, however, that the specific dose level for any particular patient will depend upon a variety of factors including the activity of the specific compound employed, the age, body weight, general health, sex, diet, time of administration, route of administration, and rate of excretion, drug combination, the severity of the particular disease undergoing therapy and the judgment of the prescribing physician. The drug can be administered from once or twice a day, or up to 3 or 4 times a day.

Dosage amount and interval can be adjusted individually to provide plasma levels of the active moiety that are sufficient to maintain bacterial cell growth inhibitory effects. Usual patient dosages for systemic administration range from 0.1 to 1000 mg/day, preferably, 1-500 mg/day, more preferably 10-200 mg/day, even more preferably 100-200 mg/day. Stated in terms of patient body surface areas, usual dosages range from 50-91 mg/m²/day.

The amount of the compound in a formulation can vary within the full range employed by those skilled in the art. Typically, the formulation will contain, on a weight percent (wt %) basis, from about 0.01-10 wt % of the drug based on the total formulation, with the balance being one or more suitable pharmaceutical excipients. Preferably, the compound is present at a level of about 0.1-3.0 wt %, more preferably, about 1.0 wt %.

The invention is further illustrated by the Examples that follow. The Examples are not intended to define or limit the scope of the invention.

EXAMPLES

Proton NMR are recorded on Varian AS 300 spectrometer and chemical shifts are reported as δ (ppm) down field from tetramethylsilane. Mass spectra are determined on Micromass Quattro II.

Example 1

Preparation of 3 from 1

1.1 Reduction of Carboxylic Acid

To a solution of 1 (23.3 mmol) in anhydrous THF (70 mL) under nitrogen was added dropwise a BH₃THF solution (1.0 M, 55 mL, 55 mmol) at 0° C. and the reaction mixture was stirred overnight at room temperature. Then the mixture was cooled again with ice bath and McOH (20 mL) was added dropwise to decompose excess BH₃. The resulting mixture was stirred until no bubble was released and then 10%

5

15

35

40

175

NaOH (10 mL) was added. The mixture was concentrated and the residue was mixed with water (200 mL) and extracted with EtOAc. The residue from rotary evaporation was purified by flash column chromatography over silica gel to give 20.7 mmol of 3.

1.2 Results

Exemplary compounds of structure 3 prepared by the method above are provided below. 10

1.2.a 2-Bromo-5-chlorobenzyl Alcohol

¹H NMR (300 MHz, DMSO-d₆): 87.57 (d, J=8.7 Hz, 1H), 7.50-7.49 (m, 1H), 7.28-7.24 (m, 1H), 5.59 (t, J=6.0 Hz, 1H) and 4.46 (d, J=6.0 Hz, 2H) ppm.

1.2.b 2-Bromo-5-methoxybenzyl Alcohol

¹H NMR (300 MHz, DMSO-d₆): δ 7.42 (d, J=8.7 Hz, 1H), 7.09 (d, J=2.4 Hz, 1H), 6.77 (dd, J=3 Hz, J,=3 Hz, 1H), 5.43 20 (t, J=5.7 Hz, 1H), 4.44 (d, J=5.1 Hz, 2H), 3.76 (s, 3H).

Example 2

Preparation of 3 from 2

2.1. Reduction of Aldehyde

To a solution of 2 (Z=H, 10.7 mmol) in methanol (30 mL) was added sodium borohydride (5.40 mol), and the mixture was stirred at room temperature for 1 h. Water was ³⁰ method above are provided below. added, and the mixture was extracted with ethyl acetate. The organic layer was washed with brine and dried on anhydrous sodium sulfate. The solvent was removed under reduced pressure to afford 9.9 mmol of 3.

2.2 Results

Exemplary compounds of structure 3 prepared by the method above are provided below.

2.2.a 2-Bromo-5-(4-cyanophenoxy)benzyl Alcohol

¹H-NMR (300 MHz, CDCl₃) δ (ppm) 2.00 (br s, 1H), 4.75 (s, 2H), 6.88 (dd, J=8.5, 2.9 Hz, 1H), 7.02 (d, J=8.8 Hz, 1H), 7.26 (d, J=2.6 Hz, 1H), 7.56 (d, J=8.5 Hz, 1H), 7.62 (d, J=8.8 45 Hz, 2H).

2.2.b 2-Bromo-4-(4-cyanophenoxy)benzyl Alcohol

¹H NMR (300 MHz, DMSO-d₆): § 7.83 (d, 2H), 7.58 (d, 1H), 7.39 (d, 1H), 7.18 (dd, 1H), 7.11 (d, 2H), 5.48 (t, 1H) 50 and 4.50 (d, 2H) ppm.

2.2.c 5-(4-Cyanophenoxy)-1-Indanol

M.p. 50-53° C. MS (ESI+): m/z=252 (M+1). HPLC: 55 99.7% purity at 254 nm and 99.0% at 220 nm. ¹H NMR (300 MHz, DMSO-d₆): δ 7.80 (d, 2H), 7.37 (d, 1H), 7.04 (d, 2H), 6.98-6.93 (m, 2H), 5.27 (d, 1H), 5.03 (q, 1H), 2.95-2.85 (m, 1H), 2.75-2.64 (m, 1H), 2.39-2.29 (m, 1H) and 1.85-1.74 (m, 1H) ppm.

2.2.d 2-Bromo-5-(tert-butyldimethylsiloxy)benzyl Alcohol

¹H-NMR (300 MHz, CDCl₃) δ (ppm) 0.20 (s, 6H), 0.98 65 (s, 9H), 4.67 (br s, 1H), 6.65 (dd, J=8.2, 2.6 Hz, 1H), 6.98 (d, J=2.9 Hz, 1H), 7.36 (d, J=8.8 Hz, 1H).

176

Additional examples of compounds which can be produced by this method include 2-bromo-4-(3-cyanophenoxy) benzyl alcohol; 2-bromo-4-(4-chlorophenoxy)benzyl alcohol; 2-bromo-4-phenoxybenzyl alcohol; 2-bromo-5-(3,4dicyanophenoxy)benzyl alcohol; 2-(2-bromo-5fluorophenyl)ethyl alcohol: 2-bromo-5-fluorobenzyl alcohol; and 1-bromo-2-naphthalenemethanol.

Example 3

Preparation of 4 from 3

3.1 Protective Alkylation

Compound 3 (20.7 mmol) was dissolved in CH₂Cl₂ (150 mL) and cooled to 0° C. with ice bath. To this solution under nitrogen were added in sequence N,N-diisopropyl ethyl amine (5.4 mL, 31.02 mmol, 1.5 eq) and chloromethyl methyl ether (2 mL, 25.85 mmol, 1.25 eq). The reaction mixture was stirred overnight at room temperature and washed with NaHCO3-saturated water and then NaCl-saturated water. The residue after rotary evaporation was purified by flash column chromatography over silica gel to give 25 17.6 mmol of 4.

Example 4

Preparation of I from 4 via 5

4.1 Metallation and Boronylation

To a solution of 4 (17.3 mmol) in anhydrous THF (80 mL) at -78° C. under nitrogen was added dropwise tert-BuLi or n-BuLi (11.7 mL) and the solution became brown colored. Then, B(OMe)₃ (1.93 mL, 17.3 mmol) was injected in one portion and the cooling bath was removed. The mixture was warmed gradually with stirring for 30 min and then stirred with a water bath for 2 h. After addition of 6N HCl (6 mL), the mixture was stirred overnight at room temperature and about 50% hydrolysis has happened as shown by TLC analysis. The solution was rotary evaporated and the residue was dissolved in MeOH (50 mL) and 6N HCl (4 mL). The solution was refluxed for 1 h and the hydrolysis was completed as indicated by TLC analysis. Rotary evaporation 25 gave a residue which was dissolved in EtOAc, washed with water, dried and then evaporated. The crude product was purified by flash column chromatography over silica gel to provide a solid with 80% purity. The solid was further purified by washing with hexane to afford 7.2 mmol of I.

¹H-NMR (300 MHz, DMSO-d₆) δ ppm 5.03 (s, 2H), 7.76 (d, J 8.2 Hz, 1H), 7.89 (d, J=8.2 Hz, 1H), 7.90 (s, 1H), 9.53 (s, 1H).

4.2.g 1,3-Dihydro-1-hydroxy-5-methoxy-2, 1-benzoxaborole

5-methoxybenzo[c][1,2]oxaborol-1(3H)-ol (C7)

M.p. 102-104° C. MS ESI: m/z=165.3 (M+1) and 162.9 ³⁵ (M-1). ¹H NMR (300 MHz, DMSO-d₆): δ 8.95 (s, 1H), 7.60 (d, J=8.1 Hz, 1H), 6.94 (s, 1H), 6.88 (d, J=8.1 Hz, 1H), 4.91 (s, 2H), 3.77 (s, 3H) ppm.

4.2.h 1,3-Dihydro-1-hydroxy-5-methyl-2, 1-benzoxaborole

5-methylbenzo[c][1,2]oxaborol-1(3H)-ol (C8)

M.p. 124-128° C. MS ESI: m/z=148.9 (M+1) and 146.9 ⁴⁵ (M-1). ¹H NMR (300 MHz, DMSO-d₆): δ 9.05 (s, 1H), 7.58 (d, J=7.2 Hz, 1H), 7.18 (s, 1H), 7.13 (d, J=7.2 Hz, 2H), 4.91 (s, 2H), 2.33 (s, 3H) ppm.

4.2.i 1,3-Dihydro-1-hydroxy-5-hydroxymethyl-2,1benzoxaborole

5-(hydroxymethyl)benzo[c][1,2]oxaborol-1(3H)-ol (C9)

MS: m/z=163 (M-1, ESI-). ¹H NMR (300 MHz, DMSOd₆): δ 9.08 (s, 1H), 7.64 (d, 1H), 7.33 (s, 1H), 7.27 (d, 1H), 5.23 (t, 1H), 4.96 (s, 2H), 4.53 (d, 2H) ppm.

> 4.2.j 1,3-Dihydro-5-fluoro-1-hydroxy-2, 1-benzoxaborole

5-fluorobenzo[c][1,2]oxaborol-1(3H)-ol (C10)

M.p. 110-114° C. MS ESI: m/z=150.9 (M-1). ¹H NMR 65 (300 MHz, DMSO-d₆): δ 9.20 (s, 1H), 7.73 (dd, J_1 =6 Hz, J_2 =6 Hz, 1H), 7.21 (m, 1H), 7.14 (m, 1H), 4.95 (s, 2H) ppm.

180

4.2.k 1,3-Dihydro-2-oxa-1-cyclopenta[á]naphthalene

naphtho[1,2-c][1,2]oxaborol-1(3H)-ol (C11)

M.P. 139-143° C. MS ESI: m/z=184.9 (M+1). ¹H NMR (300 MHz, DMSO-d₆): δ 9.21 (s, 1H), 8.28 (dd, J₁=6.9 Hz, J₂=0.6 Hz, 1H), 7.99 (d, J=8.1 Hz, 1H), 7.95 (d, J=7.5 Hz, 1H), 7.59-7.47 (m, 3H), 5.09 (s, 2H) ppm.

4.2.m 1,3-Dihydro-6-fluoro-1-hydroxy-2, 1-benzoxaborole

6-fluorobenzo[c][1,2]oxaborol-1(3H)-ol (C13)

M.p. 110-117.5° C. MS (ESI): m/z=151 (M-1, negative). ¹⁵ HPLC (220 nm): 100% purity. ¹H NMR (300 MHz, DMSOd₆): δ 9.29 (s, 1H), 7.46-7.41 (m, 2H), 7.29 (td, 1H) and 4.95 (s, 2H) ppm.

> 4.2.n 3-Benzyl-1,3-dihydro-1-hydroxy-3-methyl-2, 1-benzoxaborole

3-benzyl-3-methylbenzo[c][1,2]oxaborol-1(3H)-ol (C14)

MS (ESI): m/z=239 (M+1, positive). HPLC: 99.5% purity at 220 nm and 95.9% at 254 nm. ¹H NMR (300 MHz, DMSO-d₆): δ 8.89 (s, 1H), 7.49-7.40 (m, 3H), 7.25-7.19 (m, 1H), 7.09-7.05 (m, 3H), 6.96-6.94 (m, 2H), 3.10 (d, 1H), 3.00 (d, 1H) and 1.44 (s, 3H) ppm.

4.2.0

3-Benzyl-1,3-dihydro-1-hydroxy-2,1-benzoxaborole

3-benzylbenzo[c][1,2]oxaborol-1(3H)-ol (C15)

MS (ESI+): m/z=225 (M+1). HPLC: 93.4% purity at 220 nm. ¹H NMR (300 MHz, DMSO-d₆): δ 9.08 (s, 1H), 7.63 (dd, 1H), 7.43 (t, 1H), 7.35-7.14 (m, 7H), 5.38 (dd, 1H), 3.21 (dd, 1H) and 2.77 (dd, 1H) ppm.

4.2.p 1,3-Dihydro-4-fluoro-1-hydroxy-2, 1-benzoxaborole

4-fluorobenzo[c][1,2]oxaborol-1(3H)-ol (C16)

¹H-NMR (300 MHz, DMSO-d₆) δ (ppm) 5.06 (s, 2H), 7.26 (ddd, J=9.7, 7.9, 0.6 Hz, 1H), 7.40 (td, J=8.2, 4.7 Hz, 1H), 7.55 (d, J=7.0 Hz, 1H), 9.41 (s, 1H).

> 4.2.al 5-(4-Carboxyphenoxy)-1,3 dihydro-1-hydroxy-2,1-benzoxaborole

4-(1-hydroxy-1,3-dihydrobenzo[c][1,2]oxaborol-5yloxy)benzoic acid (C38)

To a solution of 5-(4-cyanophenoxy)-1-hydroxy-2,1-benzoxaborole obtained in C17 (430 mg, 1.71 mmol) in ethanol (10 mL) was added 6 mol/L sodium hydroxide (2 mL), and the mixture was refluxed for 3 hours. Hydrochloric acid (6 mol/L, 3 mL) was added, and the mixture was extracted with ethyl acetate. The organic layer was washed with brine and dried on anhydrous sodium sulfate. The solvent was removed under reduced pressure, and the residue was purified by silica gel column chromatography (ethyl acetate) followed by trituration with diisopropyl ether to give the target compound (37 mg, 8%).

¹H-NMR (300 MHz, DMSO-d₆) & (ppm) 4.94 (s, 2H), 7.0-7.1 (m, 4H), 7.76 (d, J=7.9 Hz, 1H), 7.94 (d, J=8.8 Hz, 2H), 9.19 (s, 1H), 12.8 (br s, 1H).

4.2.am 1-Hydroxy-1, 3 dihydro-5-[4-(tetrazole-1-yl) phenoxy]-2,1-benzoxaborole

5-(4-(1H-tetrazol-5-yl)phenoxy)benzo[c][1,2]oxaborol-1(3H)-ol (C39)

A mixture of 5-(4-cyanophenoxy)-1-hydroxy-2,1-benzoxaborole (200 mg, 0.797 mmol), sodium azide (103 mg, 1.59 mmol), and ammonium chloride (85 mg, 1.6 mmol) in N,N-dimethylformamide (5 mL) was stirred at 80° C. for 65 two days.

Water was added, and the mixture was extracted with ethyl acetate. The organic layer was washed with water and

5

10

15

50

55

185

brine, and dried on anhydrous sodium sulfate. The solvent was removed under reduced pressure, and the residue was purified by silica gel column chromatography (cthyl acetate) followed by trituration with ethyl acetate to give the target compound (55 mg, 23%).

¹H-NMR (300 MHz, DMSO-d₆) δ (ppm) 4.95 (s, 2H), 7.0-7.1 (m, 2H), 7.23 (d, J-8.8 Hz, 2H), 7.76 (d, J=7.9 Hz, 1H), 8.05 (d, J=8.5 Hz, 2H), 9.18 (br s, 1H).

Example 5

Preparation of I from 2 via 6

5.1 Catalytic Boronylation, Reduction and Cyclization

A mixture of 2 (10.0 mmol), bis(pinacolato)diboron (2.79 g, 11.0 mmol), PdCl₂(dppf) (250 mg, 3 mol %), and potassium acetate (2.94 g, 30.0 mmol) in 1,4-dioxane (40 mL) was stirred at 80° C. for overnight. Water was added, and the 20 mixture was extracted with ethyl acetate. The organic layer was washed with brine and dried on anhydrous sodium sulfate. The solvent was removed under reduced pressure. The crude product was dissolved in tetrahydrofuran (80 mL), then sodium periodate (5.56 g, 26.0 mmol) was added. ²⁵ After stirring at room temperature for 30 min, 2N HCl (10 mL) was added, and the mixture was stirred at room temperature for overnight. Water was added, and the mixture was extracted with ethyl acetate. The organic layer was 30 washed with brine and dried on anhydrous sodium sulfate. The solvent was removed under reduced pressure, and the residue was treated with ether to afford 6.3 mmol of the corresponding boronic acid. To the solution of the obtained boronic acid (0.595 mmol) in methanol (5 mL) was added sodium borohydride (11 mg, 0.30 mmol), and the mixture was stirred at room temperature for 1 h. Water was added, and the mixture was extracted with ethyl acetate. The organic layer was washed with brine and dried on anhydrous sodium sulfate. The solvent was removed under reduced pressure, and the residue was purified by silica gel column 40 chromatography to give 0.217 mmol of I.

5.2 Results

Analytical data for exemplary compounds of structure I 45 are provided below. are provided below.

5.2.a 1,3-Dihydro-5-fluoro-1-hydroxy-2,1-benzoxaborole (C10)

Analytical data for this compound is listed in 4.2.j.

Example 6

Preparation of I from 3

6.1 One-Pot Boronylation and Cyclization

To a solution of 3 (4.88 mmol) and triisopropyl borate 60 (1.35 mL, 5.86 mmol) in tetrahydrofuran (10 mL) was added n-butyllithium (1.6 mol/L in hexanes; 6.7 mL, 10.7 mmol) dropwise over 15 min at -78° C. under nitrogen atmosphere, and the mixture was stirred for 2 h while allowing to warm to room temperature. The reaction was quenched with 2N 65 HCl, and extracted with ethyl acetate. The organic layer was washed with brine and dried on anhydrous sodium sulfate.

186

The solvent was removed under reduced pressure, and the residue was purified by silica gel column chromatography and treated with pentane to give 0.41 mmol of I.

6.2 Results

Analytical data for exemplary compounds of structure I are provided below.

6.2.a 1,3-Dihydro-5-fluoro-1-hydroxy-2,1-benzoxaborole (C10)

Analytical data for this compound is listed in 4.2.j.

Example 7

Preparation of I from 3

7.1 One-Pot Boronylation and Cyclization with Distillation

To a solution of 3 (4.88 mmol) in toluene (20 mL) was added triisopropyl borate (2.2 mL, 9.8 mmol), and the mixture was heated at reflux for 1 h. The solvent, the generated isopropyl alcohol and excess triisopropyl borate were removed under reduced pressure. The residue was dissolved in tetrahydrofuran (10 mL) and cooled to -78° C. n-Butyllithium (3.2 mL, 5.1 mmol) was added dropwise over 10 min, and the mixture was stirred for 1 h while allowing to warm to room temperature. The reaction was quenched with 2N HCl, and extracted with ethyl acetate. The organic layer was washed with brine and dried on anhydrous sodium sulfate. The solvent was removed under reduced pressure, and the residue was purified by silica gel column chromatography to give 1.54 mmol of I.

7.2 Results

Analytical data for exemplary compounds of structure I are provided below.

7.2.a 1,3-Dihydro-5-fluoro-1-hydroxy-2,1-benzoxaborole (C10)

Analytical data for this compound is listed in 4.2.j.

Example 8

Preparation of 8 from 7

8.1 Bromination

To a solution of 7 (49.5 mmol) in carbon tetrachloride (200 mL) were added N-bromosuccinimide (8.81 g, 49.5 mmol) and N,N-azoisobutylonitrile (414 mg, 5 mol %), and the mixture was heated at reflux for 3 h. Water was added, and the mixture was extracted with chloroform. The organic layer was washed with brine and dried on anhydrous sodium

sulfate. The solvent was removed under reduced pressure to give the crude methyl-brominated intermediate 8.

Example 9

Preparation of 3 from 8

9.1 Hydroxylation

To crude 8 (49.5 mmol) were added dimethylformamide (150 mL) and sodium acetate (20.5 g, 250 mmol), and the mixture was stirred at 80° C. for overnight. Water was added, and the mixture was extracted with ether. The organic 15 layer was washed with water and brine, and dried on anhydrous sodium sulfate. The solvent was removed under reduced pressure. To the residue was added methanol (150 mL) and 1N sodium hydroxide (50 mL), and the mixture was stirred at room temperature for 1 h. The reaction mixture 20 was concentrated to about a third of volume under reduced pressure. Water and hydrochloric acid were added, and the mixture was extracted with ethyl acetate. The organic layer was washed with water and brine, and dried on anhydrous sodium sulfate. The solvent was removed under reduced 25 pressure, and the residue was purified by silica gel column chromatography followed by trituration with dichloromethane to give 21.8 mmol of 3.

9.2 Results

Exemplary compounds of structure 3 prepared by the method above are provided below.

9.2.a 2-Bromo-5-cyanobenzyl Alcohol

¹H-NMR (300 MHz, DMSO-d₆) δ ppm 4.51 (d, J=5.9 Hz, 2H), 5.67 (t, J=5.6 Hz, 1H), 7.67 (dd, J=8.2, 2.0 Hz, 1H), 40 7.80 (s, J=8.2 Hz, 1H), 7.83 (d, J=2.0 Hz, 1H).

Additional examples of compounds which can be produced by this method include 2-bromo-5-(4-cyanophenoxy) benzyl alcohol.

Example 10

Preparation of 9 from 2

10.1 Reaction

A mixture of 2 (20.0 mmol), (methoxymethyl)triphenylphosphonium chloride (8.49 g, 24.0 mmol), and potassium 55 tert-butoxide (2.83 g, 24.0 mol) in N,N-dimethylformamide (50 mL) was stirred at room temperature for overnight. The reaction was quenched with 6 N HCl, and the mixture was extracted with ethyl acetate. The organic layer was washed with water (x2) and brine, and dried on anhydrous sodium 60 Science and Practice of Pharmacy, supra. sulfate. The solvent was removed under reduced. To the residue were added tetrahydrofuran (60 mL) and 6 N HCl, and the mixture was heated at reflux for 8 h. Water was added, and the mixture was extracted with ether. The organic layer was washed with brine and dried on anhydrous sodium 65 sulfate. The solvent was removed under reduced pressure to afford 16.6 mmol of 9.

188

Formulations

Compounds of the present invention can be administered to a patient using a therapeutically effective amount of a compound described herein in any one of the following three lacquer formulations and one solvent formulation. The lacquer formulation provides good durability while the solvent 45 formulation provides good ease of use. These compounds can also be applied using a spray formulation, paint-on lacquer, drops, or other.

- 1.1:4 propylene glycol:ethanol; 1:10 wt/vol compound of invention;
- 2. 1:4 poly(vinyl methyl ether-alt-maleic acid monobutyl ester:ethanol; 1:10 wt/vol compound of the invention;
 - 3. 56% ethanol; 14% water, 15% poly(2-hydroxyethyl methacrylate); 5% dibutyl sebacate; 10% compound of the invention:
- 4. 55% ethanol; 15% ethyl acetate; 15% poly(vinyl acetate); 5% dibutyl sebacate; 10% compound of the invention.

The preparation of these formulations is well known in the art and is found in references such as Remington: The

Example 14

Antifungal MIC Testing

All MIC testing followed the National Committee for Clinical Laboratory Standards (NCCLS) guidelines for anti-

189

microbial testing of yeasts (M27-A2 NCCLS) and filamentous fungi (Pfaller et al., NCCLS publication M38-A-Reference Method for Broth Dilution Antifungal Susceptibility Testing of Filamentous Fungi; Approved Standard. Wayne, Pa.: NCCLS; 2002 (Vol. 22, No. 16) 5 except the Malassezia species which was incubated in a urea broth (Nakamura et al., Antimicrobial Agents And Chemotherapy, 2000, 44(8) p. 2185-2186). Results of the MIC testing is provided in FIG. 1.

Example 15

Keratin Assay

Many antifungal agents strongly bind to keratin which not 15 only reduces their antifungal potency but also may restrict their penetration into the nail. The affinities of the compounds for keratin powder was determined by a method described in Tatsumi, Antimicrobial Agents and Chemotherapy, 46(12):3797-3801 (2002). 20

A comparison of MIC data for several compounds of the invention against T. rubrum, with and without the presence of 5% keratin, is provided in FIG. 1.

Example 16

(C10) Antifungal Spectrum of Activity

(C10) is a novel compound in development for use as a topical antifungal treatment. The purpose of this study was 30 to determine the minimum inhibitory concentration (MIC) for (C10) against 19 test strains of fungi including: Aspergillus fumigatus (A. fumigatus), Candida Albicans (C. albicans, both fluconazole sensitive and resistant strains), Candida glabrata (C. glabrata), Candida krusei (C. krusei), 35 C10 was determined by the following methodology. Cryptococcus neoformans (C. neoformans), Candida parapsilosis (C. parapsilosis), Candida tropicalis (C. tropicalis), Epidermophyton floccosum (E. floccosum), Fusarium solani (F. solani), Malassezia furfur (M. furfur), Malassezia pachydermatis (M. pachydermatis), Malassezia sympodialis (M. 40 sympodialis), Microsporum audouinii (M. audouinii), Microsporum canis (M. canis), Microsporum gypseum (M. gypseum), Trichophyton mentagrophytes (T. mentagrophytes), Trichophyton rubrum (T. rubrum), Trichophyton tonsurans (T. tonsurans). Fungal growth was evaluated after 45 exposure to different concentrations of (C10). In addition, the MIC for (C10) against T. rubrum in the presence of 5% keratin powder and the minimum fungicidal concentration (MFC) for (C10) against T. rubrum and T. mentagrophytes were also determined. Ciclopirox and/or terbinafine and/or 50 fluconazole and/or itraconazole were used as comparators and tested in a similar manner. These studies were conducted at NAEJA Pharmaceutical, Inc. Materials and Methods

(C10) was obtained from Anacor Pharmaceuticals, Inc. 55 (Palo Alto, Calif., USA). ATCC strains were obtained from ATCC (Manassas, Va., USA). Ciclopirox-olamine was obtained from Sigma-Aldrich Co. (St. Louis, Mo., USA). Terbinafine, fluconazole and itraconazole were synthesized at NAEJA Pharmaceutical Inc. (Edmonton, AB, Canada), 60 experimental procedures and analytical data for these standards are stored in NAEJA archives.

All MIC testing followed the National Committee for Clinical Laboratory Standards (NCCLS) guidelines for antimicrobial testing of yeasts and filamentous fungi (Pfaller et 65 al., 2002) except the Malassezia species which were incubated in a urea broth (Nakamura et al., 2000). The micro-

190

broth dilution method was used to test the in vitro activity of (C10) against 19 test strains of fungi. Briefly, compounds were dissolved in DMSO and diluted in sterile water to give a working stock. Two-fold serial dilutions of the working stock were prepared in 96-well plates and media was added. Media was RPMI, RPMI+MOPS, modified RPMI, or modified Urea broth. The plates were inoculated with the fungal suspensions to give a final inoculum size of $0.5-2.5 \times 10^3$ cells/mL for veasts or 0.4-5×10⁴ CFU/mL for filamentous 10 fungi and then incubated for 24-168 h at 35° C. The final concentration of DMSO did not exceed 5%. The MIC was defined as the lowest concentration that resulted in over 90% reduction of growth, as compared to a drug-free control. The MFC was defined as the lowest concentration that killed over 90% of the fungi, as compared to a drug-free control. Results and Conclusions

The results for the MIC of (C10) and reference compounds against 19 strains of fungi are shown in FIG. 2. The results for the MFC of C10 against 2 strains of fungi are shown in Table 2. (C10) had MIC values ranging from 0.25-2 µg/mL against all fungi tested. Addition of 5% keratin powder to the media did not effect the MIC against T. rubrum. (C10) had fungicidal activity against T. rubrum and T. mentagrophytes with MFC values of 8 and 16 µg/mL, 25 respectively. Reference compounds had MIC values in the range defined by NCCLS.

Example 17

The Solubility, Stability and Log P Determination of Compounds of the Present Invention by LC/MS/MS

The solubility, room temperature stability and Log P of **Reagents and Standards:**

Ethanol: 200 proof ACS Grade (EM Science, Gibbstown, N.J., USA); Octanol: Octyl alcohol (EM Science, Gibbstown, N.J., USA); Acetonitrile: HPLC Grade (Burdick & Jackson, Muskegon, Mich., USA); Ammonium Acetate: lot 3272X49621 (Mallinckrodt, Phillipsburg, N.J., USA); C10: lot A032-103 (Anacor Pharmaceuticals, Palo Alto, Calif., USA); p-Nitrophenol (PNP): lot OGNO1 (TCI America, Portland, Oreg., USA); Water: Deionized water (from Millipore systems, Billerica, Mass., USA)

Solubility

N-Octanol and water were mutually pre-saturated by vigorously stirring a mixture of both solvents for up to 12 h and the mixture was allowed to separate. Solubility in each solvent was determined by adding 10 µL of 20, 40, 200, 1000 and 5000 µg/mL of C10 in DMSO to the pre-saturated n-octanol or water. After the sample was vortexed for 10 sec, the sample was centrifuged for 10 min at ca. 3000 rpm. A visual inspection was made to determine if the sample was clear or if a pellet had formed on the bottom of the tube. Log P

C10 (10 μ L of 5000 μ /mL) at 2x the final concentration was added to 0.5 mL pre-saturated n-octanol and mixed. An equal volume (0.5 mL) of pre-saturated water was added, vortex mixed and then mixed on a rotating shaker for one hour and 24 h in triplicate at ca. 25° C. The organic and aqueous layers were separated by centrifugation for 5 min at ca. 2000 rpm. Twenty five L of the octanol (top) layer were removed and placed in a pre-labeled tube. Twenty five L of the aqueous layer (bottom) were removed, taking care to avoid octanol contamination, and placed in a pro-labeled tube.

191

Stability at Room Temperature

C10 (10 μ L of 5000 μ g/mL) was added both to 0.5 mL n-octanol and 0.5 mL water in triplicate. Samples were mixed. At 0 h and 24 h samples were stored at ca. -20° C. Twenty five L of sample was used for analysis. Extraction Procedure C10

For the octanol sample, 25 μ L of ethanol, 25 μ L of water and 300 μ L of acetonitrile containing the internal standard was added. For the water sample, 25 μ L of ethanol, 25 μ L of octanol and 300 μ L of acetonitrile containing the internal ¹⁰ standard [60 mL of acetonitrile add 6 μ L of PNP (1000 μ g/mL)] was added. For the calibrators 25 μ L of octanol, 25 μ L of water and 300 μ L of acetonitrile containing the internal standard was added. The sample was vortexed for 10 seconds. Two hundred μ L of the organic layer were transferred ¹⁵ into a clean deactivated autosampler vial.

A 1/concentration weighted linear regression was used for the quantitation of C10. All integration were performed with peak areas using Analyst version 1.3, Applied Biosystems.²⁰ For C10, peak area ratios analyte to internal standard PNP were used for all quantitation.

The partition coefficient (P) was calculated according to the equation detailed below:

P=[Sample concentration]_{octano}/[Sample concentration]_{water}

Log P-log10(partition coefficient)

Results:

As shown in Table 17A the solubility of C10 in both octanol and water is very good over the concentration range tested.

TABLE 17A

Targeted Cone (µg/mL)	Water Visual	Octanol Visual	40
0.800	Clear	Clcar	
4.00 20.0	Clear Clear	Clear Clear	
100	Clear	Clear	45

Table 17B shows the results of the log P determination after 1 h and 24 h for C10. The mean log P after 1 h was 1.97 (n=3). After 24 h the concentrations in both the octanol and water layer remained the same. The mean log P after 24 h 50 was 1.93 (n=3).

TABLE 17B

5:	Log P of C10				
	Log P	Conc. in Octanol (µg/mL)	Conc. in Water (µg/mL)	Sample	
_	1.93	108	1.26	1 ኬ-1	
	1.93	103	1.21	1 h-2	
60	2.04	115	1.05	1 h-3

Octanol-0 h	115	3.06	93
Octanol-24 h	107	6.11	

Example 18

Determination of Penetration of C10 into the Human Nail

Two nail penetration studies were performed based on the protocol in Hui et al., *Journal of Pharmaceutical Sciences*, 91(1): 189-195 (2002) ("Hui protocol"). The purpose of this study was to determine and compare the penetration and distribution of C10 in vehicle into the human nail plate in vitro relative to 8% ciclopirox w/w in commercial lacquer (Penlac®).

Materials and Methods

25

35

Test Article and Dosage Formulation

8% ciclopirox w/w in commercial lacquer was manufactured by Dermick (Berwyn, Pa.). The radiochemical purity and specific activity of the chemical was determined as >95% and 12.5 mCi/mmol, respectively.

The study was composed of two groups. The compositions (weight %) of the dosage formulations are as follows: Active radiolabeled compound in four groups.

Groups*	Dosing (×14 days)	Test Chemical (%)	Radioactivity (per 10 μL)
A (C10)	qd	10	0.19 µCi
C (Ciclopirox)	qd	8	0.22 μCi

*A = C10 group, C = Ciclopiriox group

Human Nails

Healthy human finger nail plates were collected from adult human cadavers and stored in a closed container at $0-4^{\circ}$ C. Before the experiment, the nail plates were gently washed with normal saline to remove any contamination, then re-hydrated by placing them for three hours on a cloth wetted with normal saline. The nail samples were randomly selected into four groups.

Dosing and Surface Washing Procedures

Dose Preparation:

Radioactivity of each group is approximately 0.19 ± 0.01 55 and $0.22\pm0.03 \ \mu\text{Ci}/10 \ \mu\text{L}$ solutions respectively, for ^{14}C ---

C10 (group A), and ¹⁴C-ciclopirox (group C).

193

W = once per day before dosing (9-10 AM).

D = once per day (9~10 AM).

C = changing/sampling cotton ball after surface washing before topical dosing.

N = Nail sampling.

Washing Procedure

Surface washing was started in morning 10 min prior to 20 next dosing, the surface of the nail was washed with cotton tips in a cycle, as follows:

a tip wetted with absolute ethanol, then

a tip wetted with 50% IVORY liquid soap, then

a tip wetted with distilled water, then

a final tip wetted with distilled water.

The washing samples from each cycle of each nail were pooled and collected by breaking off the cotton tip into scintillation glass vials. Aliquots of 3.0 mL methanol were added into each vial to extract test material. The radioac- 30 tivity of each sample was measured in a liquid scintillation counter.

Incubation System

A Teflon one-chamber diffusion cell (PermeGear, Inc., Hellertown, Pa.) was used to hold each nail. To approximate 35 physiological conditions, a small cotton ball wetted with 0.1 mL normal saline was placed in the chamber to serve as a nail bed and provide moisture for the nail plate. Every 3 days, 0.1 mL normal saline was injected through the inlet into the chamber to keep the cotton ball wet. The nail plate 40 was placed on a ledge inside the receptor (1.0 cm in diameter and 0.5 cm high). The ventral (inner) surface of the nail was placed face down and rested on the wet cotton ball. The cells were placed on a platform in a large glass holding tank filled with saturated sodium phosphate solution to keep the cells at 45 equivalent in nail, bedding material, and wash samples are a constant humidity of 40%.

Sampling Instrument

The nail sampling instrument had two parts, a nail sample stage and a drill.

The nail sampling stage consists of a copper nail holder, 50 three adjustments, and a nail powder capture. Three adjustments allow movement in vertical direction. The first coarse adjustment (on the top) was for changing the copper cell and taking powder samples from the capture. The other two adjustments (lower) were for sampling process. The second 55 coarse adjustment allowed movement of 25 mm and the fine adjustment provides movement of 0.20 mm. The nail powder capture was located between the copper cell and the cutter. The inner shape of the capture was inverted funnel and the end of funnel connects to a vacuum. By placing a 60 circle filter paper inside of the funnel, the nail powder samples were captured on the filter paper during the sampling process.

Sampling Procedure

After completion of the incubation phase, the nail plate 65 was transferred from the diffusion cell to a clean copper nail holder for sampling process. The nail plate was inverted so

194

that the ventral (nail bed) surface now faced up and the dorsal (outer) dosed surfaced faced down. The copper nail holder has an opening as it sits on top of the stage. When the sampling process initiated, the coarse adjustment was adjusted to move the position of the stage until the nail plate was just touching the tip of the cutter. Then the drill was turned on and the fine adjustment was turned to push the stage closer to the drill, removing a nail core sample. After the above process, approximate 0.40-0.50 mm in depth and 10 7.9 mm in diameter nail pulverized samples were harvested from the center of the ventral (nail bed) surface of the nail.

The powdered nail samples were collected into a glass scintillation vial and weighted. Aliquots of 5.0 mL Packard soluene-350 (Packard Instrument Company, Meriden, 15 Conn.) was added to the scintillation vial to dissolve the powder. The upper part, the intermediate and dorsal layers of the center of the nail, including the area of application of the dose was cut in the same diameter as the sampled area and was then placed into a glass scintillation vial with 5.0 mL packard soluene-350. The rest of the nail was also placed in a glass scintillation vial with 5.0 mL packard soluene-350.

The amount of nail sample removed was measured by the difference in weight of the nail plate before and after drilling, and collecting the core of powder.

25 Radioactivity Measurement

All radioactivity measurements were conducted with a Model 1500 Liquid Scintillation Counter (Packard Instrument Company, Downer Grove, Ill.). The counter was audited for accuracy using sealed samples of quenched and unquenched standards as detailed by the instrument manual. The ¹⁴C counting efficiency is equal to or greater than 95%. All nail samples pre-treated with packard solucne-350 were incubated at 40° C. for 48 hours followed by the addition of 10 mL scintillation cocktail (HIONIC-FLUOR, Packard Instrument Company, Meriden, Conn.). Other samples (standard dose, surface washing, and bedding material) were mixed directly with Universal ES scintillation cocktail (ICN Biomedicals, Costa Mesa, Calif.). Background control and test samples were counted for 3 minutes each for radioactivity.

Data Analysis

All sample counts (expressed as dpm) were transcribed by hand to a computerized spreadsheet (Microsoft Excel). The individual and mean (+S.D.) amount of test chemical presented as dpm, µCi, percent administered dose, and mg equivalent at each time point. The concentration of ¹⁴Clabeled test chemicals were calculated from the value based on the specific activity of each [14C]-test chemical. The information of concentration of non-labeled test chemical in the topical formulation was obtained from the manufactures. Total concentration of test chemical equivalent is the sum of the concentration of ¹⁴C-labeled test chemical and the concentration of non-labeled test chemical. The value of total amount of test chemical equivalent in each nail sample was calculated from those values based on radioactivity of the sample and the ratio of total mg test chemical equivalent and radioactivity of the test chemical. The data was further normalized by dividing with the weight of the sample. Statistical significant of nail samples from every two groups was analyzed by student t-test.

Results

Characteristics of Nail Samples

For both groups (Group A group and Group C) the thickness of whole nail plate, the depth of the ventral surface core sample removed by cutter, the percentage of the whole nail thickness, and the actual weight of powdered nail

Case 1:18-cv-00202-IMK Document 1-3 Filed 10/30/18 Page 178 of 241 PageID #: 675

20

sample were collected. No statistical difference is found between two groups (P>0.05).

Weight Normalized C10 and Ciclopirox Equivalent in Nail FIG. 3 shows summarized normalized drug equivalents in each part (layer) of nail samples. After weight normalization, the concentration of C10 equivalent in dorsal/intermediate center, ventral/intermediate center, and remainder nail samples was significantly higher than that of ciclopirox equivalent ($p \le 0.002$).

C10 and Ciclopirox Equivalent in Cotton Ball Nail Support- 10 ing Bed

FIG. 4 shows summarized C10 and ciclopirox equivalent in supporting bed cotton ball samples. Similar to weight normalized C10 equivalent in the nail plate samples, absolute amount of C10 equivalent per cotton ball sample in 15 group A (after 14 day dosing) was significantly higher than that of ciclopirox in group C ($p\leq0.004$). The difference of these two test chemicals was 250 times.

Mass Balance of Radioactivity of [¹⁴C]-C10 and [¹⁴C]-Ciclopirox after 14-Day Treatment

Table 5 shows summarized radioactive recovery from washing, nail samples, and supporting bed cotton ball samples. Cumulative radioactivity recoveries of carbon-14 were 88 ± 9.21 , and 89 ± 1.56 percent of applied dose in group A, and group C, respectively. 88% of the radiolabeled ²⁵ material was accounted for.

Conclusion

In this study, penetration rate of $[^{14}C]$ -C10 in Anacor topical formulation and $[^{14}C]$ -ciclopirox (8% w/w in commercial lacquer) into human nail with four different dosing ³⁰ and washing methods was studied.

Results show that much more amount of $[^{14}C]$ -C10 penetrating into the deeper parts of the nail when compared with $[^{14}C]$ -ciclopirox. Tables 3 and 4 show that the amount of $[^{14}C]$ -C10 equivalent in ventral/intermediate center of the ³⁵ nail layer and cotton ball supporting bed in the group A was statistically higher (p=0.002) than group C after a 14-day dosing period.

Example 19

Determination of Penetration of C10 into the Human Nail

The aim of the current study was to assess and compare 45 the perungual absorption of C10 in a simple vehicle using MedPharm's TurChub® model (see http://www.medpharm-.co.uk; specificaly http://www.medpharm.co.uk/downloads/ Skin%20and%20nail%2dec%202003.pdf viewed Feb. 14, 2006). in a full scale experiment. Six replicates involving 50 C10 were conducted and Formulations Y (8% ciclopirox w/w in commercial lacquer) and Z (Loceryl, 5% amorolfine w/v in commercial lacquer) were used as the reference formulations.

The following materials were used in these experiments. 55 These materials were used without any modifications.

A dose of 40 μ L/cm² of the test compound C10 in 50:50 propylene glycol:ethyl acetate was applied to a full thickness nail sample each day over a total duration of five days. Both the reference formulations were also applied at the same 60 dose.

TurChub® Zone of Inhibition Experiment

Placebo, test item C10 in vehicle and the reference formulations Y and Z were tested for their inhibition of *Trichophyton rubrum* (*T. rubrum*) growth after penetration 65 through a full thickness human nail using a zone of inhibition measurement.

196

Formulation Efficacy Testing

FIGS. 5-9 show the results obtained from the TurChub zone of inhibition assays. It can be observed that C10 is a potent antifungal agent, which can penetrate through a full thickness nail to elicit its effect against the target organism *T. rubrum.* No zones of inhibition were observed with reference formulations Y and Z or with the placebo for C10. The experiment using C10 was repeated for a second time to confirm the result and it can be observed from FIGS. 6 and 7 that C10 shows zones of inhibition of 100%, 67%, 46%,

57%, 38% and 71% in the first experiment and 74%, 86%, 100%, 82%, 100% and 84% in the second experiment. The measurement was taken from the nail to the first point of growth observed.

From the results obtained using MedPharm's TurChub zone of inhibition assay as a test system, the test item C10 was found to be a powerful antifungal agent and demonstrated superior results vs. the commercial reference formulations Y and Z. From these experiments it appears that the compound is permeating through a full thickness nail barrier to exhibit the antifungal activity.

Example 20

Determination of Penetration of C10 into the Human Nail: Dose Response

The optimal dose-response range for penetration into the human nail was determined to be between 1% and 15%. The experiments to determine the optimal dose-response was conducted as follows.

Tests at different test compound concentrations were conducted on nails derived from the same cadaver. Cadaver nails were hydrated overnight, cut into 4 equally sized squares and placed onto individual poloxomer supports. Test articles were formulated in a lacquer at 1%, 2.5%, 5%, 7.5%,

40 10% and 15% w/v. A 40 μ L/cm² dose is applied to the center of the nail piece and the nails are left for 24 hrs. Nails are removed from the poloxomer support. Poloxomer support is analyzed for quantity of compound using LC/MS/MS.

Example 21

Preparation of Pyridinyloxaboroles

21a. Metallation and Boronylation

To a solution of 3-bromo-4-hydroxymethylpyridine (10.7 mmol) and $B(OMe)_3$ (2.73 mL, 11.9 mmol) in anhydrous THF (20 mL) at -78° C. under nitrogen was added dropwise n-BuLi (13.6 mL, 21.8 mmol). The cooling bath was then removed. The mixture was warmed gradually with stirring for 30 min and then stirred with a water bath for 2 h. Brine was then added and the pH adjusted to 7 using 6N HCl. The mixture was washed with THF (x2) and the aqueous layer (containing product) was evaporated to dryness. The residue was washed with THF and the product was extracted into ethanol (x2). Ethanol was removed in vacuo. Toluene was added and removed in vacuo. The residue was triturated with diethyl ether and the product was collected by filtration to afford C12.

¹H-NMR (300 MHz, DMSO-d₆): δ ppm 5.00 (s, 2H), 7.45 (d, J=5.0 Hz, 1H), 8.57 (d, J=5.3 Hz, 1H), 8.91 (s, 1H), 9.57 5 (s, 1H). ESI-MS m/z 134 (M-H)⁻, $C_6H_6BNO_2=135$.

Example 22

Cyclic Borinic Esters

Additional compounds can be produced by the methods described herein. By choosing the appropriate starting material such as 1 or 3, Examples 1-7 can be used to formulate the following compounds. Where available, melting point characterization is provided for these compounds.

22. Results

Analytical data for exemplary compounds of structure I are provided below.

M.P. 134-137° C. Exemplary starting material: ethyl 35 2-(4-bromo-3-(hydroxymethyl)phenoxy)acetate.

22b 2-(1-hydroxy-1,3-dihydrobenzo[c][1,2]oxaborol-5-yloxy)acetic acid (C42)

M.P. 163-166° C. Exemplary starting material: ethyl 2-(4-bromo-3-(hydroxymethyl)phenoxy)acetate. The title compound is obtained after saponification of the corresponding ester.

198

M.P. 99-104° C. Exemplary starting material: (2-bromo-4-(thiophen-2-ylthio)phenyl)methanol.

22d 6-(4-fluorophenylthio)benzo[c][1,2]oxaborol-1 (3H)-ol (C44)

- M.P. 135-138° C. Exemplary starting material: (2-bromo-4-(4-fluorophenylthio)phenyl)methanol.
 - 22e 1-(3-((1-hvdroxy-1.3-dihvdrobenzo[c][1,2]oxaborol-5-yloxy)methyl)phenyl)pentan-1-one (C45)

M.P. 96-98° C. Exemplary starting material: 1-(3-((4bromo-3-(hydroxymethyl)phenoxy)methyl)phenyl)pentan-1-one.

22f 2-(1-hydroxy-1,3-dihydrobenzo[c][1,2]oxaborol-5-yloxy)-1-(piperidin-1-yl)ethanone (C46)

M.P. 158-163° C. Exemplary starting material: 2-(4bromo-3-(hydroxymethyl)phenoxy)-1-(piperidin-1-yl)etha-50 none.

> 22g 2-(1-hydroxy-1,3-dihydrobenzo[c][1,2]oxaborol-5-yloxy)-1-(4-(pyrimidin-2-yl)piperazin-1-yl) ethanone (C47)

Example 23

Alternative Preparation of 4 from 3

A 22.0 L 3-neck flask was equipped with a stir motor, N₂ inlet, addition funnel, heating mantle, and condenser. The

210

10

211

flask was charged with 3500 g (17.1 mol) of 2-bromo-5fluorobenzyl alcohol followed by the addition of 3556 g of tetrahydrofuran and 16.4 g (0.17 mol) of methanesulfonic acid. Next, 400 g (4.7 mol) of 3,4-dihydro-2H-pyran was added at 10° C. This step is exothermic so no additional 5 charges should be made until exotherm subsides. The temperature was increased to 27° C., stirred for 15 min and then charged with 400 g (4.7 mol) of 3,4-dihydro-2H-pyran at 24° C. Again the temperature increased (24° C. to 38° C.). The mixture was stirred for 15 min. Once the exotherm subsided, the flask was again charged with 400 g (4.7 mol) of 3.4-dihydro-2H-pyran at 35° C. The temperature again increased to 47° C. over a 20 min period. Once the exotherm subsided, the mixture was stirred for 15 min. Finally the remaining 400 g (4.7 mol) of 3,4-dihydro-2H-pyran was added at 44° C. The temperature increased to 51° C. After stirring for one hour, a sample was removed to check for removal of starting material. Upon reaction completion, contents were cooled to 20±5° C.

Example 24

212

Upon completion, the contents were cooled to $-25\pm5^{\circ}$ C. A solution of trimethylborate in THF was prepared by mixing 2665 g (25.7 mol) of trimethyl borate and 6666 g of tetrahydrofuran. This solution can be prepared in a drum with stirring

Next, the 9331 g of trimethyl borate in THF was added at a rate such that the temperature was kept between -35 and -20° C. (t=2.5 h). The mixture became very thick so THF was added. After stirring at -25±5° C. for 10 min, 50 mL aliquot was removed, quenched with 25 mL of 3N HCl, and submitted for CoR. Stirring continued at -25±5° C. for 1 h, and then the mixture was allowed to warm to ambient temperature, where it was stirred for at least 12 h. Pull two samples (one at 6 h and the other at 12 h).

15 Results:

¹H-NMR (300 MHz, DMSO-d₆) δ (ppm) 1.45-1.75 (m, 6H), 3.53 (s, 6H), 3.45 (m, 1H), 3.75 (m, 1H), 4.69 (t, J=3 Hz, 1H), 4.97 (d, J=14.1 Hz, 1H), 5.14 (d, J=14.1 Hz, 1H), 7.03 ((td, J=8.4, 2.7 Hz, 1H), 7.24 (dd, J=10.8, 2.1 Hz, 1H), ²⁰ 7.89 (t, J-7.8 Hz, 1H), 8.76 (s, 1H).

OTHE

Alternative Preparation of 5 from 4

To a 22.0 L 3-neck flask equipped with a stir motor, N₂ inlet, addition funnel, cooling bath, and condenser was charged 436 g (17.96 mol) of magnesium turnings. 5334 g of tetrahydrofuran was then added followed by 291 g (0.51 55 mol) of diisobutylaluminum hydride (DIBAL) (25% wt) in toluene. The mixture was stirred for 60 min at 20±5° C. Some gas evolution was seen. Next, 260-430 g ~3-5% (by weight if solution of 4 was dropped to drums) of 4 in THF was added. The mixture was stirred for 15-30 min at which 60 time a slight exotherm should be seen ($\Delta T=10-15^{\circ}$ C.). Once the exotherm was observed, the reaction mixture was cooled to 5±5° C. To this mixture, the remaining 8.22-8.39 kg of 4 in THF was added at a rate such that the temperature was kept below 30° C. (t=3 h). The reaction was stirred at 20-25° C. for 30 min, at which time an aliquot was removed, quench with 3 N HCl (10 mL), and analyzed.

Mol. Wt.: 151.93 To the reaction mixture above was added 5.3 kg of USP water. After stirring for 30 min, the mixture was charged 5.3 kg of acetic acid. Gas evolution was seen. After stirring for 30 min, an aliquot was removed for analysis. Mixture was 50 then heated to reflux for 36-48 hours. During the reflux period, 12-13 L of THF were removed.

When the reaction was complete, the contents were cooled by the reactor to $\leq 40^{\circ}$ C. by setting jacket and by charging 10.5 kg of USP water. THF was removed until distillate did not remain. Contents of the reactor were transferred to Rosenmund filter dryer and allowed to cool to 20±5° C. Reactor was rinsed with water, filtered, and then washed again with 10.5 kg of USP water. The flask was charged with 10.5 kg of 10% ACN in water (v/v) and agitated for 1 h. After filtering, the cake was washed with 10.5 kg of 10% ACN in water (v/v), and then charged with 10.5 kg 10% ACN in water (v/v). The contents were agitated for 1 h. The contents were subsequently washed with 10.5 kg of USP water, charged with 7.0 L of 5% Methyl t-Butyl Ether (MTBE)/Heptane (v/v), agitated for 1 h, filtered, charged with 7.0 L of 5% MTBE/Heptanes (v/v) and again agitated for 1 h. After filtering, the contents were charged

5

10

15

55

again with 7.0 L of heptane and filtered. Solids were dried at $\leq 45^{\circ}$ C. to constant weight. Solids were recrystallized from toluene:heptane 75:25.

Example 26

Alternative Preparation of C10-Intermediate

2-Bromo-5-fluorobenzyl alcohol (5 g, 24.4 mmol) was dissolved in dichloromethane (100 mL). To this solution was added 3,4-dihydro-2H-pyran (3.2 mL, 36.6 mmol) and (1S)-(+)-10-camphorsulfonic acid (117 mg, 0.5 mmol) and stirred at RT under nitrogen for 4 h. Saturated sodium bicarbonate was added to quench the reaction. It was extracted using dichloromethane and the organic layer was washed with brine and dried over sodium sulfate, then concentrated in 30 vacuo to give [1-bromo-4-fluoro-6-[(tetrahydro-2H-pyran-2-yl)oxy]methyl]benzene as a colorless oil (7 g, 100%).

[1-Bromo-4-fluoro-6-[(tetrahydro-2H-pyran-2-yl)oxy] methyl]benzene (1.8 g, 6.2 mmol) was dissolved in THF and cooled to -78° C. under nitrogen. To this solution was added n-butyllithium (1.6M in hexane)(6.2 mL, 9.3 mmol) dropwise, then added triisopropyl borate (2.2 mL, 9.3 mmol). The mixture was slowly warmed to RT and stirred for 3 h. Water was added to quench the reaction. It was then extracted using ethyl acetate, washed with brine, dried over sodium sulfate and concentrated in vacuo. After column chromatography (silica gel; hexane:ethyl acetate=4:1 to 2:1) purification, [[4-Fluoro-2-[(tetrahydro-2H-pyran-2-yl)oxy] methyl]phenyl]boronic acid was obtained as a white solid (1.1 g, 70%).

Results:

¹H-NMR (300 MHz, DMSO-d₆) δ (ppm) 1.45-1.74 (m, 6H), 3.44 (m, 1H), 3.75 (m, 1H), 4.58 (d, J=13.2 Hz, 1H), 4.64 (t, J=3 Hz, 1H), 4.79 (d, J=13.2 Hz, 1H), 7.03 (td, J=8.4, 2.7 Hz, 1H), 7.13 (dd, J=10.8, 2.7 Hz, 1H), 7.50 (t, J=6.9 Hz, 50 1H).

Example 27

Alternative Preparation of C10-Intermediate

[[4-Fluoro-2-[(tetrahydro-2H-pyran-2-yl)oxy] methyl]phenyl]boronic acid dimethyl ester

[[4-Fluoro-6-[(tetrahydro-2H-pyran-2-yl)oxy]methyl] phenyl]boronic acid (100 mg) was dissolved in dry methanol, the solution was distilled repeatedly to remove water. The resulting residue was immediately characterized by ²⁰ NMR and was found to be a mixture containing dimethyl ester and monomethyl ester.

> [[4-Fluoro-2-[(tetrahydro-2H-pyran-2-yl)oxy] methyl]phenyl]boronic acid dimethyl ester

¹H-NMR (300 MHz, DMSO-d₆) δ (ppm) 1.45-1.75 (m, 6H), 3.43 (s, 6H), 3.45 (m, 1H), 3.75 (m, 1H), 4.69 (t, J=3 Hz, 1H), 4.97 (d, J=14.1 Hz, 1H), 5.14 (d, J=14.1 Hz, 1H), 7.03 ((td, J=8.4, 2.7 Hz, 1H), 7.24 (dd, J=10.8, 2.1 Hz, 1H), 7.89 (t, J=7.8 Hz, 1H).

[[4-Fluoro-6-[(tetrahydro-2H-pyran-2-yl)oxy] methyl]phenyl]boronic acid monomethyl ester

¹H-NMR (300 MHz, DMSO-d₆) δ (ppm) 1.45-1.75 (m, 6H), 3.53 (s, 6H), 3.45 (m, 1H), 3.75 (m, 1H), 4.69 (t, J=3 Hz, 1H), 4.97 (d, J=14.1 Hz, 1H), 5.14 (d, J=14.1 Hz, 1H), 7.03 ((td, J=8.4, 2.7 Hz, 1H), 7.24 (dd, J=10.8, 2.1 Hz, 1H), 40 7.89 (t, J=7.8 Hz, 1H), 8.76 (s, 1H).

Alternative Preparation of C10-Intermediate

[(4-Fluoro-2-methoxoxymethoxyethyl)phenyl]boronic acid

[1-Bromo-4-fluoro-6-methoxymethoxymethyl]benzene 60 (525 mg, 2 mmol) was dissolved in THF and cooled to -78° C. under nitrogen. To this solution was added n-butyllithium (1.6M in hexane)(1.5 mL, 2.4 mmol) dropwise, then added triisopropyl borate (0.7 mL, 2.4 mmol). The mixture was slowly warmed to RT and stirred for 3 h. Water was added 65 to quench the reaction. It was then extracted using ethyl

acetate, washed with brine, dried over sodium sulfate and concentrated in vacuo. After recrystallization from hexane:

10

15

215

ethyl acetate=4:1 [(4-Fluoro-2-methoxymethoxymethyl) phenyl]boronic acid was obtained as a white solid (340 mg, 75%).

¹H-NMR (300 MHz, DMSO-d₆) δ (ppm) 3.28 (s, 3H), 4.70 (s, 2H), 5.02 (s, 2H), 7.04 (td, J=9.0, 3.0 Hz, 1H), 7.23 ₅ (dd, J=11.1, 2.4 Hz, 1H), 7.90 (t, J=7.8 Hz, 1H).

Example 29

Alternative Preparation of C17-Intermediate

[[4-[4-cyanophenoxy]-2-[(tetrahydro-2H-pyran-2-yl) oxy]methyl]phenyl]boronic acid

2-Bromo-5-(4-cyanophenoxy)benzyl alcohol (10.4 g, 34.2 mmol) was dissolved in dichloromethane (110 mL). To this solution was added 3,4-dihydro-2H-pyran (9.2 mL, 101 mmol) and (1S)-(+)-10-camphorsulfonic acid (156 mg, 0.67 mmol) and stirred at RT under nitrogen for 3 h. Methanesulfonic acid (50 μ L, 0.77 mmol) was then added and reaction was stirred overnight. Saturated sodium bicarbonate was added to quench the reaction. It was extracted using ethyl acetate and the organic layer was washed with brine and dried over sodium sulfate, then concentrated in vacuo to give [1-bromo-4-(4-cyanophenoxy)-6-[(tetrahydro-2Hpyran-2-yl)oxy]methyl]benzene as a colorless oil (13.3 g quant.).

[1-Bromo-4-(4-cyanophenoxy)-6-[(tetrahydro-2H-pyran-2-yl)oxy]methyl]benzene (13.3 g, 34.2 mmol) was dissolved 40 in THF (100 mL), triisopropyl borate (8.5 mL, 37 mmol) was added and the reaction was cooled to -78° C. under nitrogen. To this solution was added n-butyllithium (1.6M in hexane)(22 mL, 35.2 mmol) dropwise. The mixture was slowly warmed to RT and stirred overnight. THF was removed in vacuo and the residue was dissolved in ethyl acetate. It was then washed with water, brine, dried over sodium sulfate and concentrated in vacuo. After column chromatography (silica gel; hexane:ethyl acetate 2:1) purification of a portion of crude, [[4-(4-cyanophenoxy)-6-[(tetrahydro-2H-pyran-2-yl)oxy]methyl]phenyl]boronic 50 acid was obtained as a clear oil (500 mg, 4%).

¹H-NMR (300 MHz, DMSO- d_6 +D₂O) δ (ppm) 1.35-1.75 (m, 6H), 3.40 (m, 1H), 3.73 (m, 1H), 4.58 (d, J=13.2 Hz, 1H), 4.59 (s, 1H), 4.77 (d, J=12.7 Hz, 1H), 6.99 (dd, J=8.1, 2.2 Hz, 1H), 7.05 (m, 3H), 7.54 (d, J=7.9 Hz, 1H), 7.81 (d, 55 J=8.8 Hz, 2H).

216

Also isolated was [[4-(4-pentanoylphenoxy)-6-[(tetrahydro-2H-pyran-2-yl)oxy]methyl]phenyl]boronic acid as a clear oil (500 mg, 4%). ¹H-NMR (300 MHz, DMSO-d₆+ D₂O) δ (ppm)), 0.85 (t, J=7.5 Hz, 3H), 1.20-1.75 (m, 10H), 2.93 (t, J=7.0 Hz, 2H), 3.42 (m, 1H), 3.70 (m, 1H), 4.58 (d, J=12.8 Hz, 1H), 4.60 (s, 1H), 4.78 (d, J=13.2 Hz, 1H), 6.94 (d, J=8.4 Hz, 1H), 7.03 (d, J=8.4 Hz, 2H), 7.04 (s, 1H), 7.54 (d, J=8.4 Hz, 1H), 7.96 (d, J=8.4 Hz, 2H).

Example 30

Alternative Preparation of C17-Intermediate

[[4-[4-cyanophenoxy]-2-[(tetrahydro-2H-pyran-2-yl) oxy]methy]]phenyl]boronic acid dimethyl ester

Using the same method as in C10 Example IIE, a mixture of mono- and dimethyl esters of [[4-(4-cyanophenoxy)-2-[(tetrahydro-2H-pyran-2-yl)oxy]methyl]phenyl]boronic acid were synthesized.

¹H-NMR (300 MHz, DMSO-d₆) δ (ppm) 1.35-1.80 (m, 6H), 3.40-3.50 (m, 7H), 3.60-3.70 (m, 1H), 4.43 (d, J=12.7 Hz, 1H), 4.60-4.80 (m, 2H), 6.95-7.15 (m, 4H), 7.38 (d, J=8.4 Hz, 1H), 7.80-7.90 (m, 2H).

[[4-[4-cyanophenoxy]-6-[(tetrahydro-2H-pyran-2-yl) oxy]methyl]phenyl]boronic acid monomethyl ester

¹H-NMR (300 MHz, DMSO-d₆) δ (ppm) 1.35-1.80 (m, 6H), 3.40-3.50 (m, 1H), 3.55 (s, 3H), 3.60-3.70 (m, 1H), 4.55 (d, J=12.8 Hz, 1H), 4.60-4.80 (m, 2H), 6.95-7.15 (m, 4H), 7.53 (d, J=7.9 Hz, 1H), 7.80-7.90 (m, 2H), 8.77 (s, 1H).

Using the same method as above, a mixture of mono- and dimethyl esters of [[4-(4-pentanoylphenoxy)-2-[(tetrahydro-2H-pyran-2-yl)oxy]methyl]phenyl]boronic acid were synthesized.

[[4-(4-pentanoylphenoxy)-2-[(tetrahydro-2H-pyran-2-yl)oxy]methyl]phenyl]boronic acid dimethyl ester

¹H-NMR (300 MHz, DMSO-d₆) δ (ppm) 0.87 (t, J=7.3 Hz, 3H), 1.25-1.80 (m, 10H), 2.94 (t, J=7.3 Hz, 2H), 20 3.40-3.50 (m, 7H), 3.60-3.70 (m, 1H), 4.43 (d, J=12.8 Hz, 1H), 4.60-4.80 (m, 2H), 6.90-7.10 (m, 4H), 7.36 (d, J=7.9 Hz, 1H), 7.95-8.05 (m, 2H).

[[4-(4-pentanoylphenoxy)-6-[(tetrahydro-2H-pyran-2-yl)oxy]methyl]phenyl]boronic acid monomethyl ester

¹H-NMR (300 MHz, DMSO-d₆) δ (ppm) 0.87 (t, J=7.3 Hz, 3H), 1.25-1.80 (m, 10H), 2.94 (t, J=7.3 Hz, 2H), 3.40-3.50 (m, 1H), 3.55 (s, 3H), 3.60-3.70 (m, 1H), 4.55 (d, J=12.8 Hz, 1H), 4.60-4.80 (m, 2H), 6.95-7.15 (m, 4H), 7.52 (d, J=7.9 Hz, 1H), 7.95-8.05 (m, 2H), 8.75 (s, 1H).

Example 31

Alternative Preparation of C10-Intermediate

Borate

218

To a pre-recorded NMR tube containing a solution of 2-bromo-5-fluorobenzyl alcohol (16 mg, 0.078 mmol) in CDCl₃ (0.75 mL) was injected triisopropyl borate (0.036 mL, 2 eq, 0.156 mmol) and the solution was sonicated briefly for 30 second at room temperature. ¹H NMR determination indicated there were 74.3 mol % of the desired alcohol-borate intermediate, 19.3 mol % of an unknown intermediate and 6.3 mol % of unreacted alcohol. Results:

Results.

¹⁰ ¹H NMR (CDCl₃, 300 MHz) of (2-bromo-5-fluorobenzyl) diisopropyl borate: 8=7.45 (dd, J=8.7 Hz, J=5.1 Hz, 1H), 7.20 (dd, J=9.6 Hz, J=2.7 Hz, 1H), 6.84 (td, J₇=8.1 Hz, J₂=3.3 Hz, 1H), 4.84 (s, 2H), 4.44 (septet, J=6.0 Hz, 2H), 1.18 (d, J=6.0 Hz, 12H) ppm. ¹H NMR (CDCl₃, 300 MHz) of an unknown intermediate: 8⁻⁷.47-7.42 (1H overlap with product peaks), 7.16 (dd, 1H, partially overlap with product peak), 6.91-6.81 (1H, overlap with product peak), 4.94 (s, 2H), and other unknown peaks due to overlapping. ¹H NMR

(CDCl₃, 300 MHz) of 2-bromo-5-fluorobenzyl alcohol prerecorded before mixing: 8=7.48 (dd, J=9.0 Hz, J=5.4 Hz, 1H, overlap with product peaks after mixing with triisopropyl borate), 7.26 (dd, J-9.3 Hz, J=3.3 Hz, 1H, intensity decreased but resolved after mixing), 6.88 (td, J₂=8.3 Hz, J_a=3.0 Hz, 1H, overlap with product peaks after mixing), 4.71 (s, 2H, CH₂ intensity decreased but resolved after mixing), 2.04 (s, 1H, OH disappeared after mixing with triisopropyl borate) ppm.

Example 32

Alternative Preparation of C17-Intermediate

The procedure described in Example II I was followed for ¹H NMR characterization of the current alcohol-borate intermediate. ¹H NMR determination indicated there were 72.7 mol % of the desired alcohol-borate intermediate 60 [2-bromo-5-(4-cyanophenoxy)benzyl]diisopropyl borate, 20.7 mol % of an unknown intermediate and 6.5 mol % of unreacted alcohol. ¹H NMR (CDCl₃, 300 MHz) of [2-bromo-5-(4-cyanophenoxy)benzyl]diisopropyl borate: 8=7.61 (d, J=9.0 Hz, 2H), 7.52 (d, J=8.4 Hz, 1H), 7.15 (d, 65 J=3.0 Hz, 1H), 7.03 (d, J=8.7 Hz, 2H), 6.84 (dd, J=8.7 Hz, J=3.0 Hz, 1H), 4.85 (s, 2H), 4.35 (septet, J-6.1 Hz, 2H), 1.11 (d, J=6.1 Hz, 12H) ppm.

5

45

219 Example 33

Alternative Preparation

The procedure described in Example II I was followed for ¹H NMR characterization of the current alcohol-borate intermediate. ¹H NMR determination indicated there were 73.5 mol % of the desired alcohol-borate intermediate [2-bromo-4-(4-chlorophenylthio)benzyl]diisopropyl borate, 20.2 mol % of an unknown intermediate and 6.2 mol % of unreacted alcohol. ¹H NMR (CDCl₃, 300 MHz) of [2-bromo-4-(4-chlorophenylthio)benzyl]diisopropyl borate: 40 8=7.48 (d, J=1.8 Hz, 1H), 7.40 (d, J=8.3 Hz, 1H), 7.27 (s, 4H), 7.25 (dd, J=8.3 Hz, J=1.8 Hz, 1H), 4.86 (s, 2H), 4.42 (septet, J=6.3 Hz, 2H), 1.16 (d, J=6.3 Hz, 12H) ppm.

220

A mixture of 1,3-dihydro-5-fluoro-1-hydroxy-2,1-benzoxaborole (C10, 0.76 g, 5 mmol), adenosine (1.34 g, 5 mmol) and sodium acetate (0.41 g, 5 mmol) in dry DMF (100 mL) was stirred at 100° C. for 3 h under nitrogen atmosphere. The homogeneous solution was rotary evaporated at 50° C. under high vacuum. The residue was mixed with methylene chloride, sonicated and filtered under nitrogen atmosphere to give the desired complex as white solid that was pumped overnight (2.2 g, yield 100%). ¹H NMR indicated there were 5.7 mol % of unreacted adenosine, 5.5 mol % of unreacted C10, and the reaction conversion was more than 94%. ¹H NMR (DMSO-d₆, 300 MHz): δ=8.33 (s, 1H), 8.12 (s, 1H), 7.35-7.14 (broad m, 1H), 7.29 (s, 2H), 6.80 (broad m, 1H), 6.73 (d, J=9.9 Hz, 1H), 5.99 (broad d, J=2.1 Hz, 1H), 5.10 (very broad s, 1H), 4.71 (dd, J=5.7 Hz, J=3.9 Hz, 1H), 4.51 35 (s, 2H), 4.42 (dd, J=6.3 Hz, J=3.9 Hz, 1H), 4.07 (broad s, 1H), 3.64 (dd, J=12 Hz, J=3.6 Hz, 1H) and 3.52 (dd, J=12 Hz, J=5.1 Hz, 1H) ppm; M.p: started soften at 115° C. due to residue solvents, remained as soften solid and started decomposing at 230° C.; HPLC: 91.8% at 220 nm (adenosine was 5.3%); MS: m/z=423 (M-, ESI-), 392 (M-CH₂OH, ESI+).

Example 35

Example 34

C17-Adenosine Complex

40

50

The procedure described above was adapted for the 20 preparation of the title complex by replacing (C10) with 5-(4-cyanophenoxy)-1,3-dihydro-1-hydroxy-2,1-benzoxaborole (C17, 1.25 g, 5 mmol). White solid product (2.7 g, yield 100%) was obtained after pumping overnight. ¹H NMR indicated there were 3.5 mol % of unreacted adenos- 25 ine, 3.5 mol % of unreacted C17, and the reaction conversion was more than 96%. ¹H NMR (DMSO-d₆, 300 MHz): δ=8.35 (s, 1H), 8.13 (s, 1H), 7.76 (d, J=8.7 Hz, 2H), 7.45-7.36 (broad m, 1H), 7.29 (s, 2H), 7.00 (d, J=8.7 Hz, 2H), 6.81 (broad m, 1H), 6.73 (s, 1H), 6.01 (broad s, 1H), 30 5.10 (very broad s, 1H), 4.73 (dd, J=6.0 Hz, J=3.9 Hz, 1H), 4.54 (s, 2H), 4.45 (dd, J=6.0 Hz, J=3.9 Hz, 1H), 4.09 (broad s, 1H), 3.65 (dd, J=12 Hz, J=3.3 Hz, 1H) and 3.54 (dd, J=12 Hz, J=4.8 Hz, 1H) ppm; M.p: started soften at 120° C. due to residue solvents, remained as soften solid and started 35 decomposing at 230° C.; HPLC: 92.1% at 220 nm (adenosine was 3.8%).

Example 36

C28-Adenosine Complex

The procedure for the synthesis of C10-adenosine complex was adapted for the preparation of the title complex by replacing (C10) with 6-phenylthio-1,3-dihydro-1-hydroxy-2,1-benzoxaborole (C28, 1.21 g, 5 mmol). White solid product (2.8 g, yield 100%) was obtained after pumping overnight. 1H NMR indicated there was 5 mol % of unreacted C28, and the reaction conversion was 95%. ¹H NMR (DMSO-d₆, 300 MHz): δ =8.29 (s, 1H), 8.13 (s, 1H), 7.53 (broad s, 1H), 7.29 (s, 2H), 7.32-7.04 (m, 7H), 6.05-5.96 (broad m, 1H), 5.15 (very broad s, 1H), 4.73-4.70 (m, 1H), 4.58 (s, 2H), 4.46 (broad s, 1H), 4.12-4.03 (broad m, 1H), 3.63 (dd, J=11.7 Hz, J=3.3 Hz, 111) and 3.52 (dd, J=11.7 Hz, J=4.8 Hz, 1H) ppm; M.p: started soften at 110° C. due to residue solvents, remained as soften solid and started decomposing at 238° C. HPLC: 91.3% at 220 nm (adenosine was 3.8%).

Example 37

C2-Adenosine Complex

The procedure for the synthesis of C10-adenosine complex was adapted for the preparation of the title complex by replacing (C10) with 1,3-dihydro-1-hydroxy-2,1-benzoxa- 20 borole (C2, 0.67 g, 5 mmol). Cream solid product (2.18 g, yield 100%) was obtained after pumping overnight. ¹H NMR indicated there was 4.5 mol % of unreacted C2, and the reaction conversion was more than 94%. ¹H NMR (DMSO-d₆, 300 MHz): 8=8.33 (s, 1H), 8.13 (s, 1H), 7.42- 25 7.20 (broad m, 1H), 7.30 (s, 2H), 7.03-6.94 (m, 3H), 6.02 (d, J=3.6 Hz, 1H), 5.25 (very broad s, 1H), 4.73 (dd, J=5.7 Hz, J=4.2 Hz, 1H), 4.56 (s, 2H), 4.46 (dd, J-6.0 Hz, J=3.9 Hz, 1H), 4.10 (broad q, J-3.3 Hz, 1H), 3.66 (dd, J=12 Hz, J=2.7 Hz, 1H) and 3.52 (dd, J=11.7 Hz, J=4.8 Hz, 1H) ppm; M.p: 30 started soften at 115° C. due to residue solvents, remained as soften solid and started decomposing at 233° C. HPLC: 91.6% at 220 nm (adenosine was 5.9%).

Example 38

Synthesis of Methyl β-D-ribofuranoside

5 g of D-Ribose was dissolved in 100 mL of methanol and cooled to 0° C. 0.5 mL of concentrated sulfuric acid was added and the solution was stored at -20° C. for 48 hrs. Solution was neutralized by passage through a bed of sodium carbonate and evaporated under vacuum to a viscous oil. Crude material was purified on a silica column eluting with 10% methanol in ethyl acetate to yield 2.1 grams of methyl j-D-ribofuranoside.

¹H NMR 300 MHz (DMSO-d₆) & 4.97-4.99 (d, J=4.8 Hz, 1H), 4.76-4.79 (d, J=6.6 Hz, 1H), 4.57-4.62 (m, 2H), 3.76-65 3.80 (m, 1H), 3.72-3.74 (m, 1H), 3.66-3.71 (m, 1H), 3.44-3.50 (m, 1H), 3.26-3.34 (m, 1H), 3.19 (s, 3H)

300 mg of methyl β -D-ribofuranoside was dissolved in 20 m1 of dimethylformamide. To this solution was added 1 eq of boronic ester and 0.5 eq of finely powdered sodium carbonate. Reaction mixture was heated to 100° C. and stirred for 3 hours then stripped of solvent under vacuum. Residue was co-evaporated 2 times with ethyl acetate then 35 sonicated in dichloromethane and filtered to yield an offwhite solid.

Example 40

Mechanism of Action

The purpose of this study is to determine the mechanism 50 of action (MOA) of C10 in the model fungi Saccharomyces cerevisiae.

40.1 Methods

The haploid Saccharomyces cerevisiae strain ATCC 201388 was used in the selection of C10 resistant mutants. 55 Spontaneous and EMS-induced resistant mutants were isolated from YPD agar plates containing 4×, 8×, 16×MIC of C10. All minimal inhibitory concentrations (MIC) were determined using NCCLS protocol M27 with the exception of using YPD or synthetic defined media. All yeast and 60 molecular genetic manipulations were essentially performed as described by Guthrie C., et al., Methods in Enzymology, 350: Part B, (2002).

40.2 Results and Conclusions

A total of 11 C10 resistant mutants were isolated from S. 65 cerevisiae, all mutants were dominant and showed an 8 to 64-fold increase in the MIC to C10. Further characterization

226

of these mutants showed that they were not resistant to several known antifungals including amphotericin B, cerulenin, itraconazole, aculeacin A, terbinafine, tunicamycin, ciclopirox, cyclohexamide and nikkomycin Z. All 11 mutations in the C10 resistant mutants were mapped to 9 amino acid residues in the editing domain of CDC60, the essential cytoplasmic leucyl-tRNA synthetase, one of 40 aminoacyltRNA synthetases in *S. cerevisiae*. Furthermore, *S. cerevisiae* strains bearing multiple copies of CDC60 on a 2 μ M

¹⁰ plasmid were eight times more resistant to C10. The combination of mutant and over-expression data predicts that CDC60 is the target for C10. The fact that all mutations were present in the editing domain of CDC60 indicates that C10 inhibits CDC60 via a novel mechanism.

The lack of a genomic sequence or any genetic tools for *Trichophyton* spp. makes it difficult to study the mechanism of action of C10 in either *Trichophyton* species, therefore, the model fungi *Saccharomyces cerevisiae* was used. 20 40.3 Materials and Methods

40.3a Chemicals, Strains and Plasmids

C10 (5-fluoro-1,3-dihydro-1-hydroxy-2,1-benzoxaborole, was obtained from Anacor Pharmaceuticals, Inc. (Palo Alto, Calif., USA). All S. cerevisiae strains and plasmids were 25 obtained from ATCC (Manassas, Va., USA). The haploid Saccharomyces cerevisiae strain ATCC201388 (MATa his3 Δ 1 leu2 Δ 0 met5 Δ 0 ura3 Δ 0) was used for generating mutants, while ATCC 200901 (MATa leu2d0 lys2d0 ura3 Δ 0) was used to mate with C10 resistant mutants to 30 determine genetic dominance of the mutation. The yeast-E. coli shuttle plasmid pRS315 (Sikorski R S et al., Genetics 122: 19-27, (1989)), which has CEN6, leu2, ampR genes, and is a low copy plasmid in yeast was used in the construction of the genomic library. In the over-expression 35 experiment, the shuttle vector pRS425 (Christianson T W et al., Gene 110(1):119-22 (1992)), which has the leu2 and ampR genes, and is a high copy plasmid in yeast, was used.

40.3b Isolation of Spontaneous Resistant Mutants The haploid *S. cerevisiae* strain ATCC201388 was grown

40 overnight in YPD broth (BD, NJ USA) at 30° C. and 1 mL of cells was plated out onto YPD agar plates (YPD broth+ 1.5% Bacto-agar, BD, NJ USA) containing either 1.6, 3.2 or 6.4 µg/mL C10 (equivalent to 4×, 8×, 16×MIC of C10). Resistant mutants appeared after 2 d incubation at 30° C.
45 Frequency of resistance was determined by dividing the number of resistant mutants by the total number of cells plated as determined by plating dilutions of the overnight culture on YPD plates.

40.3c EMS (Ethylmethane Sulfonate) Mutagenesis

A 2.5 mL of the overnight culture, which was grown in YPD media, was centrifuged at 700×g for 5 minutes. The cell pellet was resuspended in 10 mL 50 mM potassium phosphate buffer, pH 7.0. The cell suspension was centrifuged again and the cell pellet was resuspended in phosphate buffer to obtain a cell density of 5×10⁷ cells/mL as determined by counting the cells using a Petroff Hausser Counting Chamber (Horsham, Pa. USA). The cell suspension was shaken with 300 µL of EMS (Alfa Aesar, Ward Hill, Mass., USA) for 30 min. at 30° C. The mutagenesis was stopped by adding 10% (w/v) sodium thiosulfate (Sigma-Aldrich, St. Louis, Mo., USA), and the cells were pelleted by centrifugation at 700×g for 5 min. and resuspended in 1 mL sterile H₂O. This was repeated once more before the cells were plated on YPD agar plates containing 1.6 µg/mL of C10. 40.3d Determination of MICs

The minimal inhibitory concentration (MIC) was essentially performed following the NCCLS guidelines outlined

10

35

227

in the M27 protocol with the exception of using YPD or synthetic defined media (SDM).

40.3e Yeast Mating Experiment

The haploid mutants derived from S. cerevisiae ATCC201388 were mixed with S. cerevisiae ATCC 200901, 5 and were incubated on YPD agar plates at 30° C. for 4 h. The cell mixture was streaked out on synthetic defined media agar (BD, NJ USA) without the amino acids lysine and methionine, which are selective for diploids. 40.3f Construction of Plasmid Genomic DNA Library

Genomic DNA from mutant strains was isolated using the DNeasy tissue kit from Qiagen (Valencia, Calif., USA). Genomic DNA fragments of 4-10 kb were generated by partial digestion with Mbo I from Fermantas (Hanover, Md., 15 USA), followed by purification using the Wizard®SV gel and PCR Clean-Up system (Promega, Madison Wis. USA). The purified DNA fragments were ligated into pRS315 digested with BamH I (Fermantas, Hanover Md. USA) using T4 DNA ligase (Fermantas, Hanover Md. USA). The liga- 20 to Other Antifungals tion mixture was dialyzed against water using the VSWP 0025 filters (Millipore, Billerica, Mass., USA) before it was electroporated into Escherichia coli E. cloni SUPREME cells (Lucigen, Middleton, Wis., USA) following the protocol of the manufacturer. Transformants were plated out on 25 LB plates with 200 µg/ml carbinicillin and incubated overnight at 37° C. The transformants were pooled and the plasmid DNA was isolated using Qiagen miniprep kit (Valencia, Calif., USA). The plasmid library was transformed 30 into S. cerevisiae (Gietz, R D et al., Methods in Enzymology 305: 87-96 (2002)).

40.3g Sequencing

All sequencing was performed by Sequetech Corporation (Mountain View, Calif. USA).

40.3g(1) Mapping Mutations

To further map the mutations to specific domains in CDC60, the following three pairs of primers were used 5' gcgaaaagaaacctaacgcatatte 3' and 5'ctatcgtgatccatacaagcttgac 3', 5' cgatagacaatccggtgaaggtgttac 3' and 5' catc- 40 ccaaggcaatetggtacetaace 3', and 5' gaaaaatacttagttgagtetttatca 3' and 5' caccatgaggcatcttgaaatattete 3'.

40.3h Cloning and Over-Expressing Wild Type CDC60 in S. cerevisiae

A 4.0 kb BamH I-Sal I DNA fragment containing the 45 entire CDC60 open reading frame (ORF) and 700 bp of upstream sequence was amplified using KOD DNA polymerase, S. cerevisiae genomic DNA (Novagen, Madison, Wis., USA), and the primers GAG GGA TCC GGT TAG 50 TTT TAG TTC GCG AGT GAC CTG and GAG GTC GAC GAT TTC TGG TTG CTG TTT ATT GAT CTT (Operon, Alameda, Calif., USA). This DNA fragment was then cloned into the 2 µM multi-copy plasmid pRS425, and transformed into S. cerevisiae ATCC201388 (Gietz, R D et al., Methods 55 in Enzymology 305: 87-96 (2002)).

40.4 Results and Discussions

40.4a Isolation of Resistant Mutants

From 5×10⁹ cells, 600 spontaneous C10 resistant mutants were isolated, which makes the frequency of resistance 60 1.2×10^{-7} at $4 \times MIC$. Similar frequencies of resistance were obtained for 8x and 16×MIC. We also used EMS to isolate C10 resistance mutants. Use of EMS increased the mutagenic frequency by 4,000 fold. The MICs of 8 spontaneous mutants and 3 EMS generated mutants were tested. All the 65 mutants showed an 8 to 64-fold increase in resistance to C10 (Table 1).

40.4b C10 Resistant Mutations do not Confer Resistance

To further characterize these resistant mutants, three C10 resistant mutants were tested against various antifungal agents with known mechanisms of action. The C10 resistant mutants did not show any resistance to these compounds (Table 2), which suggests that C10 acts very differently from these antifungal agents.

TABLE 2

40.4c Resistance to C10 is Dominant

In order to identify the gene that gives rise to C10 resistance, it was first determined whether the mutation was either dominant or recessive. The parental S. cerevisiae strain and three mutants were selected and mated with S. cerevisiae ATCC 200901. The MIC of the diploids generated from the C10 mutants were found to be 64-fold greater than the diploid generated from the parental strain (Table 3), which suggests that the mutations are dominant, and therefore, plasmid libraries were constructed from these three haploid C10 resistant mutants.

40.4d the CDC60 Gene Confers Resistance to C10

Plasmid libraries from the three mutants were transformed into S. cerevisiae ATCC201388 and selected on SDM minus leucine agar with 1 µg/mL of C10. Plasmid DNA was isolated from C10 resistant transformants and electroporated 5 into E. coli 10G cells. The plasmid DNAs from the resulting E. coli carbenicillin resistant transformants were then transformed into S. cerevisiae ATCC201388 to confirm that the plasmids bore the gene for C10 resistance. One plasmid 10 from each library that conferred C10 resistance was sequenced and analyzed using a BLASTN search against the S. cerevisiae genome database (http://seq.yeastgenome.org/ cgi-bin/nph-blast2sgd). The CDC60 gene was the only open reading frame identified in the cloned inserts from two plasmids derived from two of the plasmid libraries. Two genes were revealed, CDC60 and PET20, in the cloned insert from the remaining plasmid library. This suggests that these C10 resistant mutations are located in the CDC60 gene, which encodes for the cytoplasmic leucyl-tRNA syn-20 thetase. CDC60 (leucyl tRNA synthetase) is one of 20 essential aminoacyl-tRNA synthetases (ARS) that attach amino acids to the 2' or 3' end of tRNAs.

40.4e C10 Resistance Mutations Reside in the Editing Domain of CDC60

DNA sequence analysis of the plasmids derived from the ²⁵ three mutants showed that there was a single amino acid substitution in CDC60 from each of the three mutants (Table 4). An additional eight mutants were analyzed by amplifying CDC60 by colony PCR and transforming the resulting 30 product into S. cerevisiae ATCC201388. All transformants were resistant to C10 and subsequent sequence analysis showed that all of them contained a single amino acid change within the editing domain of CDC60 (Table 4). The function of the ARS is to charge the correct tRNA with the 35 correct amino acid. In leucyl-tRNA synthetases the active site for the editing mechanism is located in a separate domain, which is called the connective polypeptide 1 (CP1), from the synthetic active site (Schmidt E. et al. Biochemistry 34(35): 11204-10 (1995)). All of the amino acid substitu-40 tions from 11 mutants were located in this CP1 domain, demonstrating a link between the editing function of the enzyme and inhibitory activity of C10.

40.4f Over-Expression of Wild Type CDC60 in S. cerevisiae

Since all 11 C10 resistant mutants have single amino acid ⁴⁵ substitutions in the editing domain of leucyl-tRNA synthetase (Table 4), it strongly suggests that CDC60 is the target for C10. If leucyl-tRNA synthetase is the target, increasing the copies of CDC60 should increase resistance to C10. To test this hypothesis, the wild type CDC60 gene ⁵⁰ was cloned onto a multi-copy plasmid pRS425, and transformed into *S. cerevisiae* ATCC201388. As shown in Table 5, the MIC for this strain is eight times higher than the same strain bearing pRS425.

Example 41

Experiments to isolate mutant leucyl tRNA transferase molecules that were also resistant to C10.

The haploid wild type Saccharomyces cerevisiae strain ATCC 201388 (MATa his $3\Delta 1 \ln 2\Delta 0 \text{ met} 5\Delta 0 \text{ ura} 3\Delta 0$) was used for selection of clones showing resistance to C10.

Mutations in the leucyl tRNA transferase were isolated in two ways. In one set of experiments, EMS was used as a chemical mutagenic agent. 2.5 mL of an overnight culture was washed $2\times$ with 50 mM potassium phosphate buffer, pH 7.0, and resuspended in 10 mL of the buffer to reach approximately 5×10^7 cells/ml. 300 µL EMS (Alfa Aesar, Ward Hill, Mass.) was added to the cells, which were then incubated for 30 min at 30° C. with shaking. The mutagenesis process was halted with the addition of 10% (w/v) sodium thiosulfate (Sigma-Aldrich, St. Louis, Mo., USA). At the end of the mutagenesis cycle, the cells were washed $2\times$ with water and then plated out on YPD agar plates containing C10.

In the second method, spontaneous mutant clones were isolated from YPD plates containing large concentrations of
C10. Wild type haploid S. cerevisiae strain ATCC201388 (MATa his3∆1 leu2∆ 0 met5∆ 0 ura3∆ 0) was grown overnight in Difco YPD broth (1% yeast extract, 2% Bacto Peptone, 2% glucose) at 30° C. to reach ~1.0×10⁸ cells/ml. Cells were concentrated 10× in YPD broth, and 100 µL was
plated out onto each of 30 YPD agar (Difco YPD broth+ 1.5% Bacto agar) plates containing 1.6, 3.2, 6.4 µg/ml C10 (equivalent to 4×, 8×, and 16× minimal inhibitory concentration of C10). Resistant mutants appeared after 2 days of incubation at 30° C. Frequency of resistance was determined
by counting the number of the mutants, and the total number of cells

The minimal inhibitory concentration (MIC) test was performed using NCCLS protocol. Yeast mating experiment was conducted following the procedure in *Methods in Enzymology* by Guthrie, C etc.

The genomic plasmid library for each clone was constructed using the yeast-*E. coli* shuttle vector pRS315 and transformed into *S. cerevisiae* ATCC201388. Transformants were selected on synthetic defined media with 0.2 ug/ml C10 minus leucine. All sequencing work was done by Sequeteq. Blast search was performed using Sachammusca genome

Blast search was performed using Saccharomyces genome database. Yeast Transformation was carried out using LiAc/

5

PEG method. Over-expression of CDC60 construct was made by using *S. cerevisiae* genomic DNA, and two primers 5'GAGGGATCCGGTTAGT TTTAGTTCGCGAGTGACC TG 3', 5'GAGGTCGACGACTTTCTGGTTGCT GTTTATT-GATCTT 3'.

A total of 23 C10 resistant mutants were isolated from S. cerevisiae. All mutants were dominant and had 8-64 fold increased resistance to C10 over wildtype in the minimal inhibitory concentration test. Further characterization of these mutants showed that they were not cross resistant to 10 any anti-fungal agents with known mechanism of action. Determination of Dominance/Recessiveness

In order to identify the resistant gene in mutant strain, we first determined whether the mutation is dominant or recessive. The mutant was mated with a wild type strain with 15 opposite mating type to make mutant diploid. There were two sets of genes in the resulting mutant diploid cells, one from resistant mutant, and the other one from the C10sensitive wild type. If the mutant diploid was resistant to C10, the muted gene was dominant. To map the mutation, 20 we constructed a plasmid library from the mutant strain, and transformed the library into the C10-sensitive wild type strain to select for the resistant phenotype. If the mutant diploid was sensitive to C10, the muted gene would be identified as recessive. A12, F4, H4 was mated with a wild 25 type strain, respectively, as control; the parental strain was also mated with the same strain. Minimal inhibitory concentrations of both wild type diploid and 3 mutant diploids are shown in Table 3. Compared to wild type diploid, all 3 mutant diploids were resistant to C10, indicating that the 30 resistant mutation in these 3 mutants is dominant. Genetic Mapping of Mutation

All the mutations in the 23 isolated C10 resistant mutants were mapped to 11 residues in the editing domain of CDC60, the cytoplasmic leucyl-tRNA synthetase. 35

To identify the mutation in the resistant mutant, we constructed 3 plasmid genomic libraries from mutant A12, F4 and H4, respectively. Plasmids with random genomic DNA fragment insert, size from 4-10 kb, were transformed back into parental wild type strain. Transformants with 40 plasmids carrying resistant genes were selected on SDM-leu agar plates with addition of C10. Plasmids were then isolated and sent for sequencing. Nucleotide sequence of the insert was BLAST searched against S. cerevisiae genome database, and the results revealed that there was a single 45 ORF present in the insert of both plasmids isolated from F4 and H4 plasmid library. This ORF was identified as CDC60, the cytoplasmic leucyl tRNA synthetase, one of the 20 essential cytoplasmic aminoacyl-tRNA synthetases in S. cerevisiae (there are 20 more in mitochondrial). In addition 50 to CDC60, there was a second ORF pet20 present in the plasmid isolated from A12 plasmid library, which encoded the protein required for respiratory growth and stability of the mitochondrial genome. To confirm that the CDC60 from these 3 mutants conferred resistance to C10, we re-trans- 55 formed the 3 plasmids back to parental wild type strain. Compared to the control transformation of the plasmid without CDC60, ones with CDC60 from A12, F4, H4 gave >1,000 more resistant colonies on YPD agar containing C10, confirming that CDC60 from the 3 mutant strains contrib- 60 uted to C10 resistance.

Sequence in CDC60 from Each of the Mutants Contains Single Amino Acid Substitution

In order to identify whether there were any amino acid substitutions, the whole ORF of CDC60 from resistant 65 plasmids A12, F4, and H4 was sequenced. Comparing the sequence with wild type CDC60 showed that there was a 232

single amino acid substitution in each of the 3 CDC60 (Table 4). In addition, sequence analysis of CDC60 from the rest of 20 resistant mutants showed that each contains a single amino acid change within CDC60. DNA PCR fragments containing each mutation were transform back into wild type strain. These transformations conferred resistance, indicating that the resistance of all the mutants was due to the single amino acid substitution in CDC60.

CDC60 (leucyl tRNA synthetase) is one of the aminoacyltRNA synthetases (ARS) that belong to a family of essential enzymes that attach amino acids to the 2', or 3' end of tRNAs, the charged tRNAs are then used in protein synthesis. The aminoacylation of tRNA is a two-step reaction: a) activation of amino acids with ATP by forming aminoacyl adenvlates and b) transferring of the aminoacyl residue from the aminoacyl adenylate to the cognate tRNA substrate. The accuracy of aminoacylation depends on both the specific recognition of amino acids during their activations (coarse sieve) and the pre- or post transferring editing (fine sieve). Some of the ARS have evolved editing mechanism that specifically hydrolyzes structurally close related misactivated amino acids. Leucyl tRNA synthetase is one of such enzymes that can discriminate leucine from isoleucine, and valine. The region that carries out this editing function is called connective polypeptide 1 (CP1), it's a large insertion that interrupts the active site between the third and fourth b strands of the Rossman fold. All of the 11 amino acid substitutions from 23 mutants were located in this CP1 region, suggesting that there might be a link between the editing function of the enzyme and inhibition activity of C10.

Example 42

Assay for Determining that C10 Inhibits the Editing Domain of tRNA Synthetase in a Bacteria

This example sets forth a representative assay for determining whether a particular compound inhibits the editing domain of an ARS in a bacterium.

The [3H]-isoleucine mischarged tRNAleu was synthesized by incubating 1 µM of Saccharomyces cerevisiae editing defective Cdc60p (C326F) in 500 µL of 50 mM Tris-HCl (pH 8.0), 60 mM MgCl₂, 4 mM ATP, 1 mM DTT, 0.02% (w/v) BSA, 4 mg/mL crude E. coli tRNA tRNA (Roche), 0.1 mM isoleucine and 5 mCi L-[4,5-3H]isoleucine (100 Ci/mmole, GE Healthcare) and 20% (v/v) DMSO for 1 hour at 30° C. The reaction was stopped by adding 10 µL of 10% (v/v) acetic acid followed by two acidic phenol (Sigma) extractions. The mischarged tRNA in the top aqueous phase was removed and precipitated by adding two volumes of 96% (v/v) ethanol and incubating at -20° C. for 30 minutes. The precipitate was pelleted by centrifugation at 13,200×g for 30 minutes and the mischarged tRNA pellet was washed twice with 70% (v/v) ethanol and then resuspended in 50 mM potassium phosphate buffer pH 5.2.

The reaction was terminated after 2 hours incubation at 30° C. by the addition of acetic acid to 0.17% (v/v). The isoleucylated crude tRNA^{Leu} was purified by extracting twice with acidic phenol-chloroform extractions (pH 4.3), followed by ethanol precipitation. The tRNA pellet was washed twice with 70% ethanol, dried and then resuspended in 50 mM potassium phosphate (pH 5.0) and stored at -20° C. An aliquot was precipitated with 10% (w/v) TCA to quantify ile-tRNA^{Leu}.

Post-transfer editing hydrolysis assays were carried out at 30° C. in 50 mM Hepes (pH 8), 10 mM MgCl₂, 30 mM KCl,

with ³H-isoleucine-tRNA crude ($-0.3 \ \mu$ Ci/mL). Each reaction was initiated by addition of the 150 nM enzyme. At each time point three 20 μ L aliquots of the reaction mixture was added to 200 μ L of 10% (w/v) TCA in a Millipore filter plate and precipitated for 20 minutes at 4° C. The precipitate was ⁵ filtered and washed three times with 200 μ L of 5% (w/v) TCA, then dried and 20 μ L Supermix scintillation cocktail was added. The Millipore filter plates were counted in the MicroBeta Trilux. The IC₅₀ was determined by the amount of inhibitor that inhibited 50% activity, 100% post-transfer editing was calculated by taking the activity of the no enzyme control from the wild-type enzyme activity.

Compare the minimal inhibitory concentration (MIC) of a tolC *Escherichia coli* strain bearing a pUC derived plasmid $_{15}$ with and without an leuS gene insert.

If the MIC of the strain bearing the extra copies of leuS is greater than 2-fold more than the control strain then pour LB agar plates with four times the concentration of the MIC of the compound.

Plate 1×10^{10} E. coli on ten plates containing $4 \times MIC$ of the compound. Incubate for 1-2 days at 37° C. and pick ten colonies and restreak on $4 \times MIC$ LB agar plates to confirm resistance.

Take one large colony from each of the ten *E. coli* ²⁵ resistant mutants and resuspend in 50 μ L of PCR buffer.

Amplify the editing domain of CDC60 using a proofreading PCR enzyme and the following primers, ggcaccgtggacgtacgacaacatcgc and gggaaacaccccagtcgcgcaggcgg.

Purify the 980 bp PCR product using either Qiagen or ³⁰ Promega PCR cleanup kits.

Sequence amplify the mutant DNA and compared it to wild-type. If the mutant DNA bears mutations in the editing domain the inhibitor affects leucyl-tRNA synthetase via the 35 editing domain.

Example 43

Assay for Determining that C10 Inhibits the Editing Domain of tRNA Synthetase in a Fungi

This example details an exemplary assay for determining whether a selected compound inhibits the editing domain of an ARS in a fungus. 45

The [³H]-isoleucine mischarged tRNAleu was synthesized by incubating 1 µM of Saccharomyces cerevisiae editing defective Cdc60p (C326F) in 500 µL of 50 mM Tris-HCl (pH 8.0), 60 mM MgCl₂, 4 mM ATP, 1 mM DTT, 0.02% (w/v) BSA, 16 µM brewer's yeast tRNA (Roche), 0.1 50 mM isoleucine and 5 mCi L-[4,5-3H]isoleucine (100 Ci/mmole, GE Healthcare) and 20% (v/v) DMSO for 1 hour at 30° C. The reaction was stopped by adding 10 µL of 10% (v/v) acetic acid followed by two acidic phenol (Sigma) extractions. The mischarged tRNA in the top aqueous phase 55 was removed and precipitated by adding two volumes of 96% (v/v) ethanol and incubating at -20° C. for 30 minutes. The precipitate was pelleted by centrifugation at 13,200×g for 30 minutes and the mischarged tRNA pellet was washed twice with 70% (v/v) ethanol and then resuspended in 50 60 mM potassium phosphate buffer pH 5.2.

The reaction was terminated after 2 hours incubation at 30° C. by the addition of acetic acid to 0.17% (v/v). The isoleucylated crude tRNA^{Leu} was purified by extracting twice with acidic phenol-chloroform extractions (pH 4.3), 65 followed by ethanol precipitation. The tRNA pellet was washed twice with 70% ethanol, dried and then resuspended

in 50 mM potassium phosphate (pH 5.0) and stored at -20° C. An aliquot was precipitated with 10% (w/v) TCA to quantify ile-tRNA^{Leu}.

Post-transfer editing hydrolysis assays were carried out at 25° C. in 50 mM Hepes (pH 7.5), 10 mM MgCl₂, 30 mM KCl, with ³H-isoleucine-tRNA crude (-0.3 μ Ci/mL). Each reaction was initiated by addition of the 150 nM enzyme. At each time point three 20 μ L aliquots of the reaction mixture was added to 200 μ L of 10% (w/v) TCA in a Millipore filter plate and precipitated for 20 min. at 4° C. The precipitate was filtered and washed three times with 200 μ L of 5% (w/v) TCA, then dried and 20 μ L Supermix scintillation cocktail was added. The Millipore filter plates were counted in the MicroBeta Trilux. The IC₅₀ was determined by the amount of inhibitor that inhibited 50% activity, 100% activity was

calculated by taking the activity of the no enzyme control from the wild-type enzyme post-transfer editing activity.

Example 44

Equilibrium Dialysis

Equilibrium dialysis experiments were performed in 1×AARS buffer containing 50 mM Hepes-KOH (pH 8.0), 30 mM MgCl, and 30 mM KCl. Experiments were performed using 5k MWCO DispoEquilibrium Dialyzer apparatus (Harvard Apparatus, Holliston, Mass.). On one side of the dialysis membrane (side A), [methylene-14C]C10, 2.04 GBq/mmol (Amersham) was added at concentrations ranging from 1 to 200 µM in 20 µL. On the opposite side of the membrane (side B), 3 µM recombinant Cdc60p (Saccharomyces cerevisiae cytoplasmic LeuRS) and 10 mM AMP (adenosine 5'-monophosphate, Sigma) was added in 20 µL. Samples were incubated at room temperature (21° C.) while shaking for 4.5 hrs to establish C10 equilibrium across the membrane. At equilibrium, C10 on each side of the dialysis membrane was quantified by scintillation counting using a Wallac MicroBeta Trilux model 1450 liquid scintillation counter. The amount of C10 bound to Cdc60p was determined by subtracting [C10]A from $[C10]_B$.

PPi Exchange Assay

40

The PPi exchange assay was performed in 1×AARS buffer containing 50 mM Hepes-KOH (pH 8.0), 30 mM MgCl₂ and 30 mM KCl supplemented with 2 mM ATP and [³²P] PPi (10⁵ cpm/µmol), 2 mM leucine and 7 nM recombinant Cdc60p. Experiments were also performed in the presence or absence of C10 (1 μ M) and tRNA (16 μ M). After a 20 minute incubation at 30° C., reactions were initiated by the addition of ATP. At various time intervals, 45 µL of reaction mixture was added to 100 µL of 2% perchloric acid and 0.1 M Na₄P₂O₇ to quench the reaction. Radioactive ATP was then absorbed to activated charcoal by the addition of 30 µL of a 5% suspension of acid-washed Norit A. This mixture was filtered though GF/C glass filters and washed 2x with 200 µL of distilled water then 1x with 200 µL of 95% ethanol. Filters were dried and scintillation counted using a Wallac MicroBeta Trilux model 1450 liquid scintillation counter.

Synthesis of Tritiated Mischarged tRNA_{ley}

The [3 H]-isoleucine mischarged tRNAleu was synthesized by incubating 1 μ M of *Saccharomyces cerevisiae* editing defective Cdc60p (C326F) in 500 μ L of 50 mM Tris-HCl (pH 8.0), 60 mM MgCl₂, 4 mM ATP, 1 mM DTT, 0.02% (w/v) BSA, 1 μ M brewer's yeast tRNA (Roche), 0.1 mM isoleucine and 5 mCi L-[4,5-3H]isoleucine (100 Ci/mmole, GE Healthcare) and 20% (v/v) DMSO for 1 hour at 30° C. The reaction was stopped by adding 10 μ L of 10% (v/v) acetic acid followed by two acidic phenol (Sigma) extractions. The mischarged tRNA in the top aqueous phase was removed and precipitated by adding two volumes of 96% (v/v) ethanol and incubating at -20° C. for 30 minutes. The precipitate was pelleted by centrifugation at 13,200×g ⁵ for 30 minutes and the mischarged tRNA pellet was washed twice with 70% (v/v) ethanol and then resuspended in 50 mM potassium phosphate buffer pH 5.2. Post-Transfer Editing Assay

The [³H]-isoleucine mischarged tRNAleu substrate, 40 ¹⁰ nM, was added to 50 mM Hepes-KOH pH 8.0, 30 mM KCl, 30 mM MgCl₂, 0.02% (w/v) BSA, 1 mM DTT, 2.4 nM *S. cerevisiae* Cdc60p at 30° C. to start the reaction and 20 μ L aliquots, taken at set time points, were added to ice cold 200 μ L 10% (w/v) trichloroacetic acid (TCA). The TCA precipitates were washed twice with 200 μ l ice cold 5% (w/v) TCA and filtered through a Multiscreen HTS HA filter (Millipore). Optiphase (Perkin Elmer) scintillation cocktail was added to the filters and the TCA precipitate was counted in a Wallac MicroBeta Trilux model 1450 liquid scintillation ²⁰ counter.

Example 45

Assay for Determining that Compounds Inhibit ARS Synthesis Activity

Aminoacylation assays were performed to determine the rate of net leucine/tRNA^{Leu} synthesis by leucyl tRNA synthetase. Experiments were performed in 500 ul reaction 30 mixtures containing 1×AARS buffer (50 mM Hepes-KOH (pH 8.0), 30 mM MgCl₂ and 30 mM KCl) supplemented with 20 uM [14C]-leucine (PerkinElmer, 11.32 GBq/ mmol.), 16 uM crude yeast tRNA, 0.02% BSA, 1 mM dithiothreitol, 2 nM recombinant yeast LeuRS (CDC60) and 35 2 mM ATP. Reactions were performed at 30 deg Celsius. At time zero reactions were started by the addition of ATP. At various time intervals, 20 ul aliquots were added to 150 ul of 10% trichloroacetic acid (TCA) within a single well of a 96-well nitrocellulose membrane filterplate (Millipore Mul- 40 tiscreen HTS, MSHAN4B50). Each well was then washed 3x with 100 ul of 5% TCA. Filterplates were then dried under a heat lamp and the precipitated [14C]-leucine/ tRNA^{Leu} complexes were quantified by liquid scintillation counting using a Wallac MicroBeta Trilux model 1450 liquid 45 scintillation counter. The inhibitory effects of boron-containing compounds, was determined by addition of up to a 100 uM of the compound in the reaction mixture for 20 minutes prior to the addition of ATP.

Example 46

Test Article and Dosage Formulation

C10 (5-fluoro-1,3-dihydro-1-hydroxy-2,1-benzoxa- 55 borole), 5-fluoro-1,3-dihydro-1-phenyl-2,1-benzoxaborole, C1 (5-chloro-1,3-dihydro-1-hydroxy-2,1-benzoxaborole), and 5-fluoro-1,3-dihydro-1-(3-hydroxymethylphenyl)-2,1benzoxaborole were obtained from Anacor Pharmaceuticals, Inc. (Palo Alto, Calif.). [¹⁴C]-C10 was synthesized by Amer- 60 sham Biosciences UK Limited (Buckinghamshire HP& 9NA, UK) radiochemical purity and specific activity of >99.3% and 55 mCi/mmol, respectively.

Penlac[™] nail lacquer (ciclopirox 8% topical solution) was manufactured by Dermik (Berwyn, Pa.). [¹⁴C]- 65 Ciclopirox (pyridinone-6-(¹⁴C)-ciclopirox) was synthesized by PerkinElmer Life and Analytical Sciences (Boston,

Mass.). The radiochemical purity and specific activity of the chemical was >95% and 12.5 mCi/mmol, respectively. Experiment 1: Screening Four Oxaborole Compounds

C10, 5-fluoro-1,3-dihydro-1-phenyl-2,1-benzoxaborole, C1, and 5-fluoro-1,3-dihydro-1-(3-hydroxymethylphenyl)-2,1-benzoxaborole, formulated at 10% w/v in ethanol, were tested. A single aliquot (10 μ l) of each formulation was dosed to the top of human nail plates using the nail penetration procedure described below, and allowed to stand for 3-days. The dosed area was washed, and then the cotton ball bed supporting the nail and the nail samples were collected at the end of the incubation period, stored at 4° C. and analyzed for drug using LC/MS/MS.

Experiment 2: Effect of Vehicle on C10 Nail Penetration

The following formulations, all containing 10% C10 were tested. Formulation A: 70% ethanol, 20% poly (vinyl methyl ether alt maleic acid monobutyl ester (v/v); Formulation B: 6% ethanol, 14% water, 15% poly (2-hydroxyethyl methacrylate), 5% dibutyl sebacate (v/v); Formulation C: 55% ethanol, 15% ethyl acetate, 15% poly (vinyl acetate), 5% dibutyl sebacate (v/v); Formulation D: 20% propylene glycol, 70% ethanol (v/v). Using the nail penetration procedure described below, aliquots (10 µL) of the dose formulations were applied to human nail plates once per day for 14 days 25 with a daily wash before dosing. The cotton ball bed supporting the nail was collected from each cell chamber and replaced with a new one at day 5, 10, and 15 after the first dose. The nail samples were collected at the end of the 14-day dose period, stored at 4° C. and analyzed for drug by LC/MS/MS.

Experiment 3: Penetration of C10 Following a 14-Day Multiple Dose Treatment

Two test articles, C10, 10% in propylene glycol and ethanol (1:4, v/v) and ciclopirox, 8% in PenlacTM nail lacquer were compared for their penetration rate into and through the human nail plate. Trace amounts of carbon-14 radiolabelled C10 and ciclopirox were added to their respective formulations the day before the first dose. Using the nail penetration procedure described below, aliquots (10 μ) of the dose formulations were applied to human nail plates once per day for 14 days with a washing before each dose. The cotton ball bed supporting the nail was collected from each cell chamber and replaced with a new one every 72 hours after the first dose (days 3, 6, 9, 12, and 15). The nail samples were collected at the 14-day dose period. The radioactivity of all samples was analyzed and compared. Nail Penetration Procedure

Details of the nail incubation have been previously described^{9, 10}. Briefly, a healthy finger nail plate was 50 mounted in a one-chamber diffusion cell (FIG. 1, Permegear, Inc., Hellertown, Pa.) with the nail surface (top center) open to the air and the inner surface in contact with a small cotton ball acting as a supporting nail bed. The supporting cotton ball under the nail plate, and the degree of hydration was monitored and controlled during the experiment. The incubation period started 24 hours prior to the first dose, and ended 24 hours after the final dose. Aliquots (10 µL) were applied to the surface of the nail plate once daily.

Dosed surface area washing was conducted at the end of incubation period (for single dose study), or each morning before dosing starting on the second day (multiple dose study). The dosed surface area of the nail was washed with cotton tips in a cycle, as follows: two times with ethanol, then with 50% Ivory liquid soap (Procter & Gamble, Cincinnati, Ohio), then two times with distilled water. The washing samples from each cycle were pooled and the

237

radioactivity was measured. After completion of the dosing and the incubation phase, the nail plate was transferred to a cutting holder for sampling. Under the controlled humidity and temperature, we did not observe any abnormal situations such as the nail plate color change, hydration changes, or 5 fungal growth during the 14-day dosing period. The nail plate was secured in position so that the outer dorsal-dosed surface faced the holder. The cutting holder was moved to bring the plate surface just barely in contact with the cutter tip. The drill was then started and a fine adjustment moved 10 the stage toward the cutter tip, removing a powder sample from the nail. In this way, a hole approximately 0.3-0.4 mm in depth and 7.9 mm in diameter was drilled in each nail, enabling the harvest of powder sample from the center of each nail's ventral surface. These samples are referred to as 15 samples taken from the "ventral/intermediate nail plate center". Then the nail outside the dosing area (and also the sampling area) was cut away and saved as the "remainder nail plate". The layer above the powder sampling area was also saved as "the dorsal/intermediate center". All the nail 20 Calculations and Data Analysis plate samples were individually collected into a glass scintillation vial and weighed.

Ouantitative Analysis of Oxaboroles

LC/MS/MS (API3000, Applied Biosystems, Foster City, Calif.) was used to quantitate the amounts of non-radiola- 25 used with 1/x or 1/x squared weighting. All integrations beled oxaboroles, C10, 5-fluoro-1,3-dihydro-1-phenyl-2,1benzoxaborole, C1, and 5-fluoro-1,3-dihydro-1-(3-hydroxymethylphenyl)-2,1-benzoxaborole in samples from the nail penetration studies. For the cotton ball analysis eleven calibration standards were prepared fresh in normal saline. 30 A volume of 100 µL of each standard was spiked onto a fresh cotton ball with final calibration standard concentrations of 0, 2.5, 5, 10, 20, 40, 80, 160, 320, 640, 1280, and 2560 µg/mL. Acetonitrile (Burdick & Jackson, Muskegon, Mich.) containing the internal standard p-nitrophenol (PNP) was 35 added to all cotton balls. The cotton ball samples and any residual solvent were transferred to centrifuge filter tubes. After centrifugation, the filtrate from the cotton ball samples was transferred to autosampler vials and analyzed by LC/MS/MS. For the ciclopirox samples, the filtrate was first 40 derivatized with dimethylsulfate according to a previously described method before analysis by LC/MS/MS (Myoung and Choi, 2003). Samples with calculated concentrations above the highest calibration standard were diluted 10- or 20-fold with acetonitrile containing internal standard p-Ni- 45 trophenol (TCI America, Portland, Oreg.). For the nail analysis, two separate calibration curves were prepared, one for nail powder analysis and one for top of the nail analysis. Each curve contained eleven calibration standards. Standards were first prepared in dimethylsulfoxide. A volume of 50 10 µL of each standard was spiked onto keratin powder (6.5 mg for nail powder curve and 17 mg for top of the nail curve). Nail samples were digested with 1N NaOH overnight at 45° C. The next morning, before extraction with methylenechloride, the pH of the samples was adjusted to 55 pH 3. After extraction, the organic layer was transferred and evaporated. Samples were reconstituted in acetonitrile and analyzed by LC/MS/MS using an Eclipse XDB-C18 5 µm,

238

2.1×50 mm column (Agilent, Wilmington, Del.) and a gradient mobile phase from 5 mM ammonium acetate and acetonitrile.

Radioactivity Measurement

All radioactivity measurements were conducted with a Model 1500 Liquid Scintillation Counter (Packard Instrument Company, Downer Grove, Ill.). The counter was audited for accuracy using sealed samples of quenched and unquenched standards as detailed by the instrument manual. The ¹⁴C counting efficiency is equal to or greater than 95%. All nail samples pre-treated with Packard soluene-350 were incubated at 40° C. for 48 hours followed by the addition of 10 mL scintillation cocktail (HIONIC-FLUOR, Packard Instrument Company, Meriden, Conn.). Other samples (standard dose, surface washing, and bedding material) were mixed directly with Universal ES scintillation cocktail (ICN Biomedicals, Costa Mesa, Calif.). Background control and test samples were counted for radioactivity for 3 minutes each.

Quantitation of non-radioactive compounds was based on peak area ratios of compound to internal standard. The method of regression for the calibration curves was selected based on the best fit. Linear and quadratic regression was were performed using Analyst version 1.3 (Applied Biosystems, Foster City, Calif.). The concentrations of compound in the cotton balls were converted to absolute amounts by taking the sample volume of 100 µl into account. The amount of compound in the nail powder and top of the nail were adjusted for their respective weights and reported in µg/mg.

The individual and mean (±S.E.) amount of test chemical equivalent in nail, bedding material, and wash samples are presented as dpm, µCi, percent administered dose, and mg equivalent at each time point. The concentration of ¹⁴Clabeled test chemicals were calculated from the value based on the specific activity of each [¹⁴C]-labeled test chemical. The information of concentration of non-labeled test chemical in the topical formulation was obtained from the manufacturers. The total concentration of test chemical equivalent is the sum of the concentration of ¹⁴C-labeled test chemical and the concentration of non-labeled test chemical. The value of the total amount of test chemical equivalent in each nail sample was calculated from those values based on the radioactivity of the sample and the ratio of total mg test chemical equivalent and radioactivity of the test chemical. The data was further normalized by dividing by the weight of the sample. Statistical significant of nail samples from every two groups was analyzed by student t-test.

It is understood that the examples and embodiments described herein are for illustrative purposes only and that various modifications or changes in light thereof will be suggested to persons skilled in the art and are to be included within the spirit and purview of this application and scope of the appended claims. All publications, patents, and patent applications cited herein are hereby incorporated by reference in their entirety for all purposes.

What is claimed is:

1. A method of treating a human having onychomycosis of a toenail caused by *Trichophyton rubrum* or *Trichophyton mentagrophytes*, the method comprising:

topically administering to the toenail a pharmaceutical composition comprising an amount of 1,3-dihydro-5-³⁰ fluoro-1-hydroxy-2,1-benzoxaborole or a pharmaceutically acceptable salt thereof, effective to inhibit an aminoacyl tRNA synthetase in the *Trichophyton rubrum* or *Trichophyton mentagrophytes*.

2. The method of claim 1, wherein the pharmaceutical 35 composition is in the form of a solution comprising 5% w/w of 1,3-dihydro-5-fluoro-1-hydroxy-2,1-benzoxaborole or a pharmaceutically acceptable salt thereof.

3. The method of claim 1, wherein the pharmaceutical composition further comprises ethanol and propylene gly- $_{40}$ col.

4. The method of claim 1, wherein the aminoacyl tRNA synthetase is leucyl tRNA synthetase.

5. The method of claim 4, wherein the pharmaceutical composition is in the form of a solution comprising 5% w/w

²⁵ of 1,3-dihydro-5-fluoro-1-hydroxy-2,1-benzoxaborole or a pharmaceutically acceptable salt thereof.

6. The method of claim 5, wherein the pharmaceutical composition further comprises ethanol and propylene glycol.

7. The method of claim 1, wherein the administering of the pharmaceutical composition occurs once a day.

8. The method of claim 6, wherein the administering of the pharmaceutical composition occurs once a day.

9. The method of claim 1, wherein the method inhibits an aminoacyl tRNA synthetase in *Trichophyton rubrum*.

10. The method of claim 1, wherein the method inhibits an aminoacyl tRNA synthetase in *Trichophyton mentagrophytes*.

11. The method of claim 6, wherein the method inhibits leucyl tRNA synthetase in *Trichophyton rubrum*.

12. The method of claim 6, wherein the method inhibits leucyl tRNA synthetase in *Trichophyton mentagrophytes*.
